

NASA-JetBlue Airways Technical Interchange

DIP

DIGITAL INFORMATION PLATFORM

DIP Overview

Mirna Johnson

Digital Information Platform

*Accelerate NAS transformation with advanced, **data-driven, digital services** to promote **efficient aviation operations***

Cloud-based ecosystem that takes data from many sources and turns it into easily accessible, easy-to-use digital information to expand the development of reusable aviation services

Stakeholder Needs

Increase Access to NAS Information

Easy access to organized airspace data and information
Common, simplified API to fused information

Improved Data Quality

Trusted and **reliable** data sources with safeguards
Unified, aggregated, and **validated data** for consumption

High Reuse Solutions

Support **data-driven predictive** models
Scalable and **adaptable** services

Commercialization Methodology

Architecture that **connects high reuse solutions** for exchange of services and information to create an ecosystem

Services for Efficiency and Sustainability

Advanced services to increase efficiency and predictability
Digital Re-route, disruption management, trajectory optimization, etc

Sept – Nov 2019 - collected formulative input from **airline operators, airport operators, NBAA, FAA and vendor groups.**

March 2021 - **DIP** published a **Request for Information**; Received over 40 responses from flight operators, service providers, data integrators from traditional and emerging operations stakeholders

DIP Benefits

Data Integration

Faster Service development with fused data for simpler integration

Search & Discover

Ready to-use Services made available

Advanced Technologies

Accelerate Innovation to improve adaptability and extensibility of services

Sustainability

Enable services for sustainable aviation operations

DIGITAL INFORMATION PLATFORM ECOSYSTEM

Larger airspace cohort to provide services with secure access

Trusted Information

Reliable quality information with transparency and performance monitoring

Reusable Services

Building blocks for advanced services

Improve access and usability of NAS digital services for operator decision support tools

DIGITAL INFORMATION PLATFORM

SFNP-Ops Demos: Demonstrates DIP enabled services for flight and airspace management in operational environments

PS Evals: Demonstrate an ecosystem of reusable aviation services enabled by DIP

Common Platform

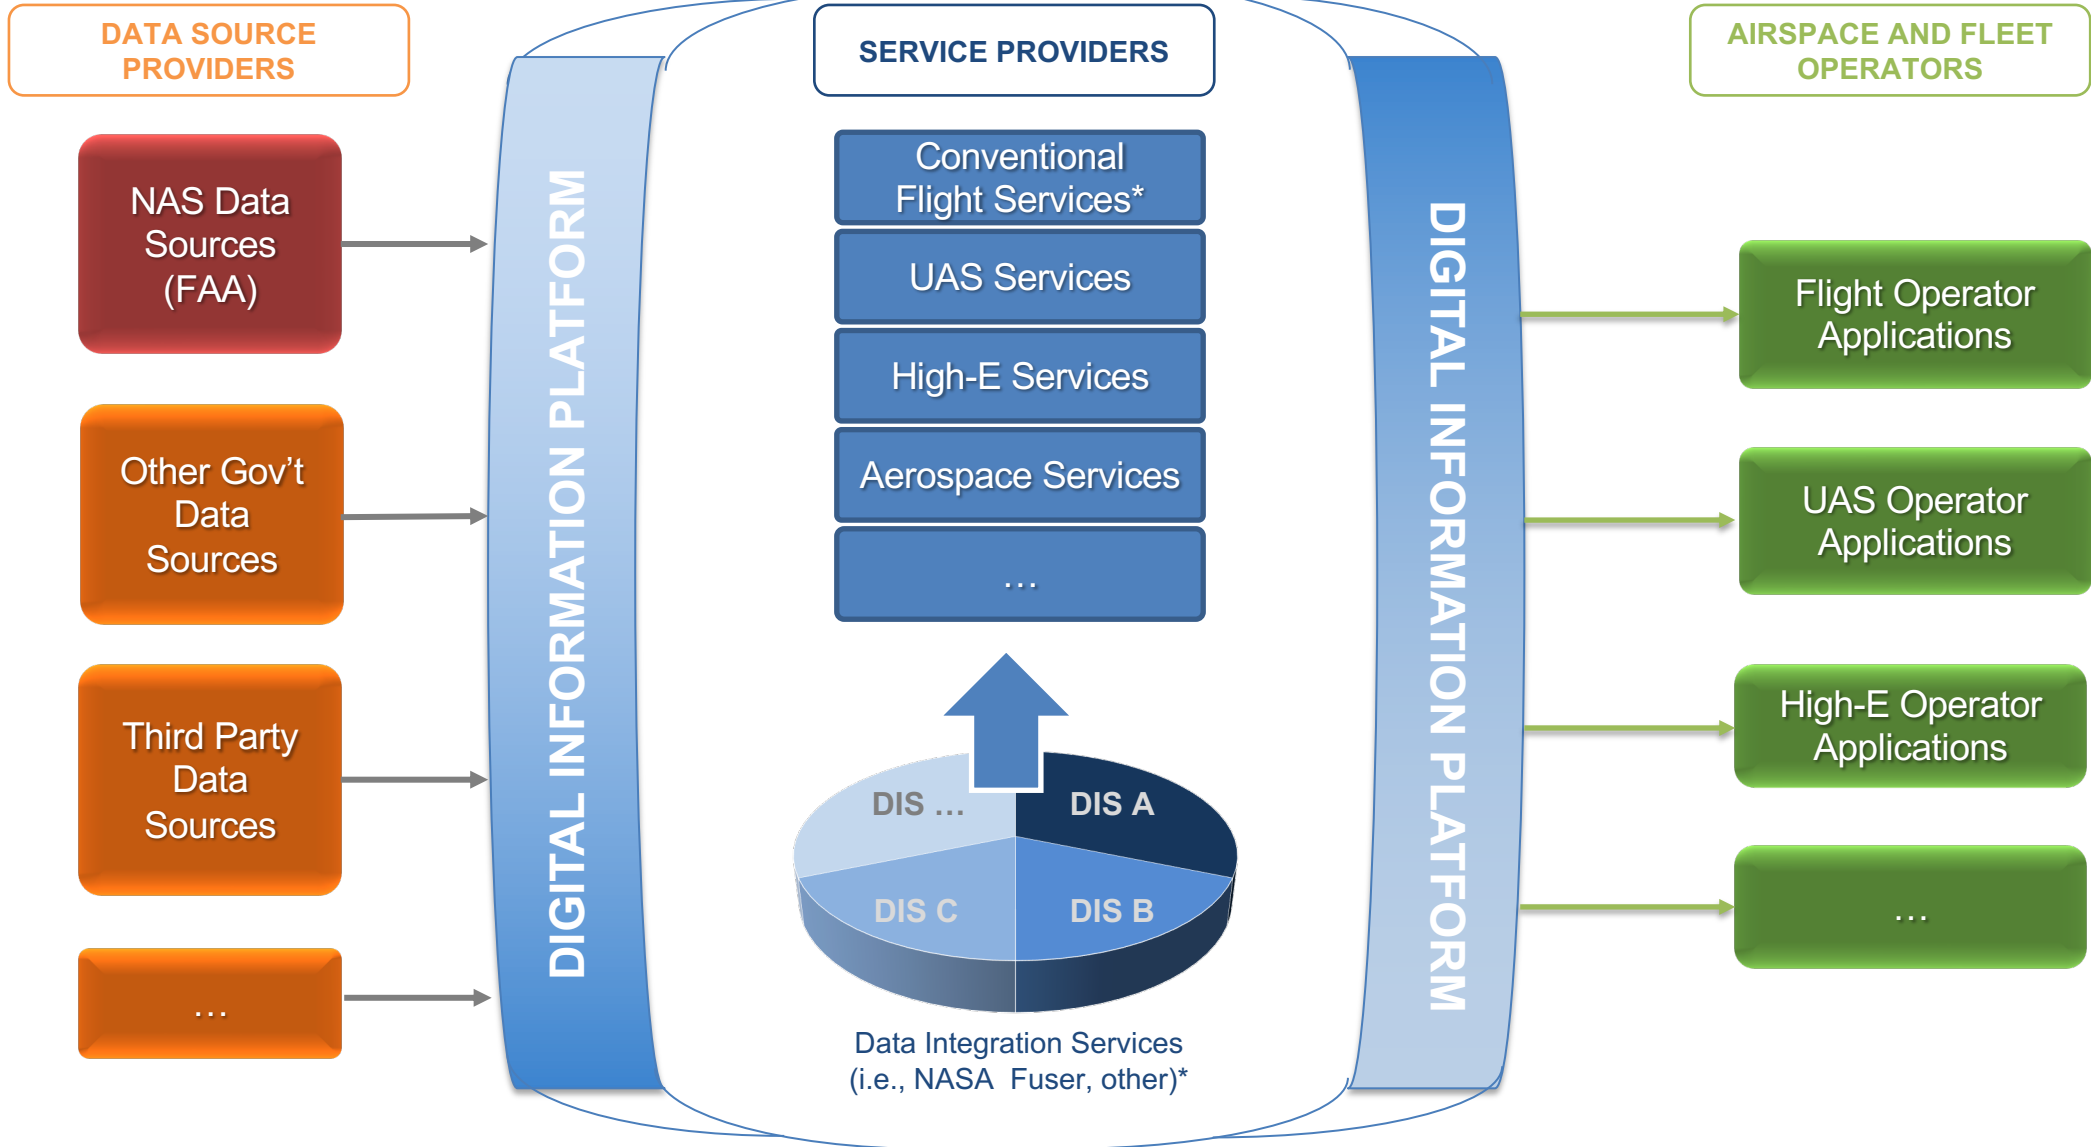

Data Integration Services

Data Sources

DIP Ecosystem

DIP Research Areas

NASA Led DIP-Enabled Services for Sustainability

Ground and flight deck services focused on improving the sustainability of aviation operations

“SFNP-Ops Demos”

Industry Led Partner Service Evaluations

Integration and demonstration of Partner services with DIP for validation of the platform

“PS Evals”

University Challenges

Development of innovative solutions and advanced algorithms for aviation services

Reference Digital Information Platform (DIP)

Development of a platform for advanced, data-driven, digital services for flight operators and service consumers

Opportunities for Demos

SFNP-Ops Demos

- Reach **Flight Operator** and **Consumer** stakeholders
- In a **High TRL** environment
- To demonstrate **airspace management** use cases
- With a **data-to-platform-to service-to-application** (E2E) system
- Achieve sustainability benefits using DIP

PS Evaluations

- Reach **service provider** and **platform host** stakeholders
- In a **Medium TRL** environment
- To demonstrate **service management** use cases
- With a **data-to-platform-to-services** system
- Achieve ecosystem of data and services

DIP-Enabled Services for Sustainability

GLOBAL Aviation Industry's Goal:
50% reduction in carbon emissions by 2050 relative to 2005 and possible net zero emissions by 2060 through these three means

Collaborative Digital Departure Reroute
(SFNP-Ops-1, FY22-25)

Sustainable Oceanic Airborne Re-Routing
(SFNP-Ops-2, FY26)

Irregular Ops Recovery/Disruption Management
(SFNP-Ops-3, FY27)

4D Trajectory Optimization
(SFNP-Ops-4, FY28)

SFNP-Ops = Sustainable Flight National Partnerships - Operations

DIP Supports Sustainability Goals: Deliver reduction in emissions and optimize air operations through digital services

Collaborative Digital Departure Re-Routing (CDDR) for SFNP-Ops-1

Jeremy Coupe

SFNP-Ops-1: Collaborative Digital Departure Re-Route (FY22 - 25)

Demonstrate CDDR via Trajectory Option Set (TOS) by rerouting flights and departures starting at NTX towards a high-density operational area

Benefits: Reduced fuel burn and emissions through reduced surface departure delay. Benefits rerouted flight as well as all departures

SFNP-Ops 1 system-wide aggregated savings (individually re-routed + other flights)
at D10 North Texas Metroplex (01 Jan 2022 – 16 Sep 2022)

Fuel Savings

Over **24K lbs.**

Emissions Savings

Over **76.6K lbs. CO²**

Over **569** urban trees

Delay Savings

OFF delay	IN delay
3.9+ hrs	4.7+ hrs

Cost Savings

Passenger	\$31.7K
Flight Crew	\$6.9K

1038 CANDIDATE flights ➔ 102 Airline Re-Route Requests ➔ 41 ATC-approved re-routes

DIP can scale these savings across the NAS; additional validation in FY24 in more complex airspace

Collaborative Digital Departure Re-Routing

1 Preconfigure TOS Parameters

Alternate Routes

TOS database

2 Monitor Demand & Capacity

System continuously assesses imbalance

3 Present Candidate TOS

Delay savings > Relative trajectory cost

4 Submit TOS to ATC

all users notified

5 Evaluate Post Operation

Benefits
Refinements
Lessons
Analyses
Reports

PROBLEM

Terminal airspace **demand/capacity imbalance** leads to **departure delays** on airport surfaces

Metroplex airports with departure fixes

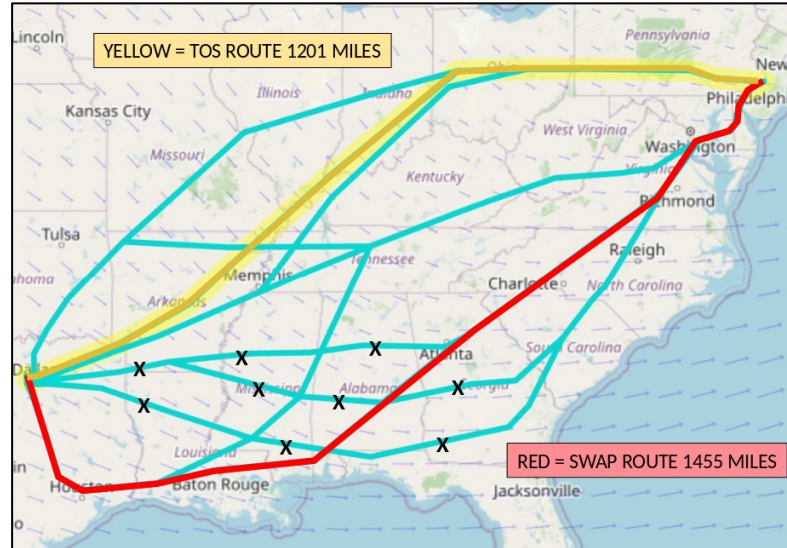

SOLUTION

CDDR system enables flight operators to **intelligently request reroutes** from the Air Traffic Control for **departure fix load balancing**

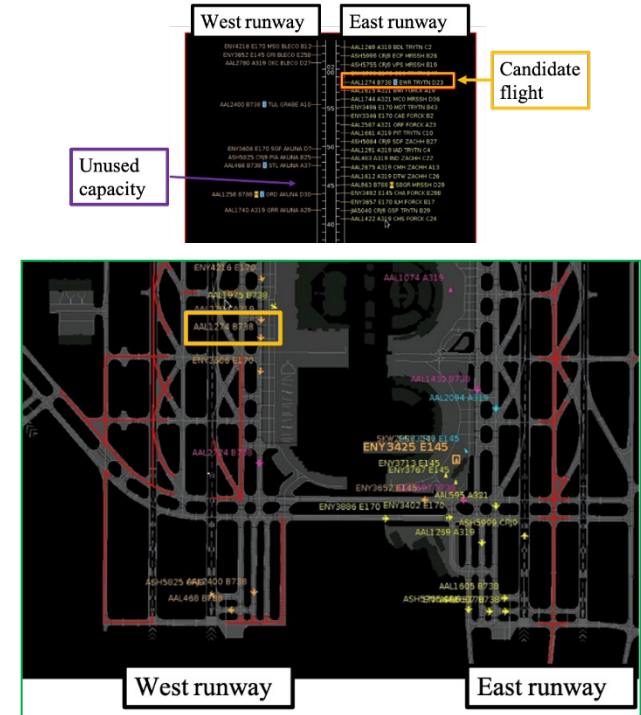

Traffic Management Initiative (TMI)

- Filed route is most direct route but subject to TMI
- Filed route remains through the original departure gate
- TOS route through adjacent departure gate and requires additional flight time
- TOS reroute reduces surface delay in exchange for increased flight time

Recovery from SWAP

- Filed route is amended by ATC through an adjacent departure gate during a SWAP event
- SWAP event ends and TOS routes through the original Filed departure gate much shorter than SWAP route
- TOS reroute reduces surface delay and also has shorter flight time compared to SWAP route

Non-TMI Tactical Reroutes

- Often occurs when the parking gate is physically closer to the TOS runway than the Filed route runway
- Provides tactical opportunities to load balance runway demand to take advantage of unused capacity

CDDR User Interface in North TX (SFNP-Ops-1a)

Front End User Experience is Unimpacted; Targeting first piece to Tech Transfer

Transition to SFNP-Ops-1b with CDDR in the Cloud

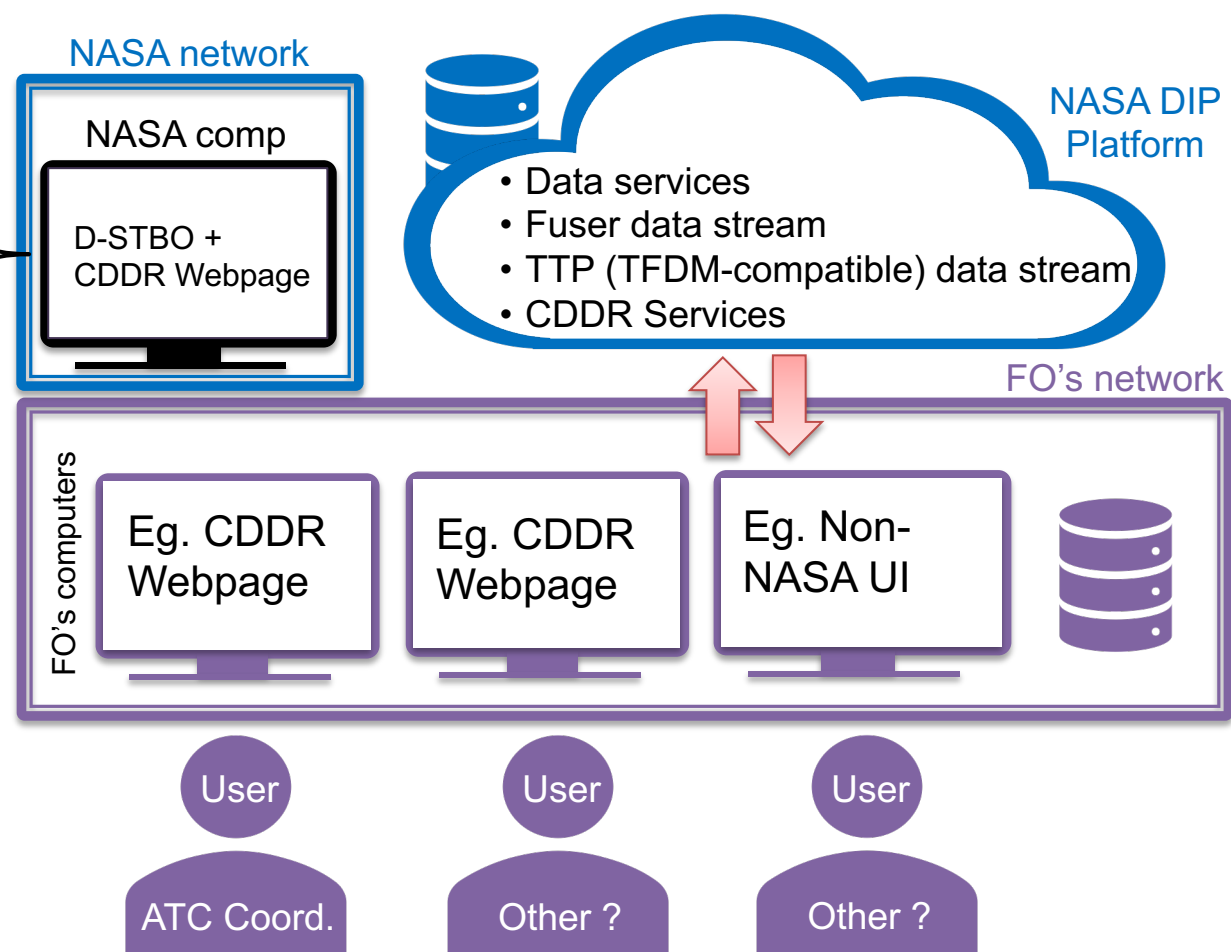

In FY22

Access to data, services and interface *is limited to* a NASA computer behind a firewall

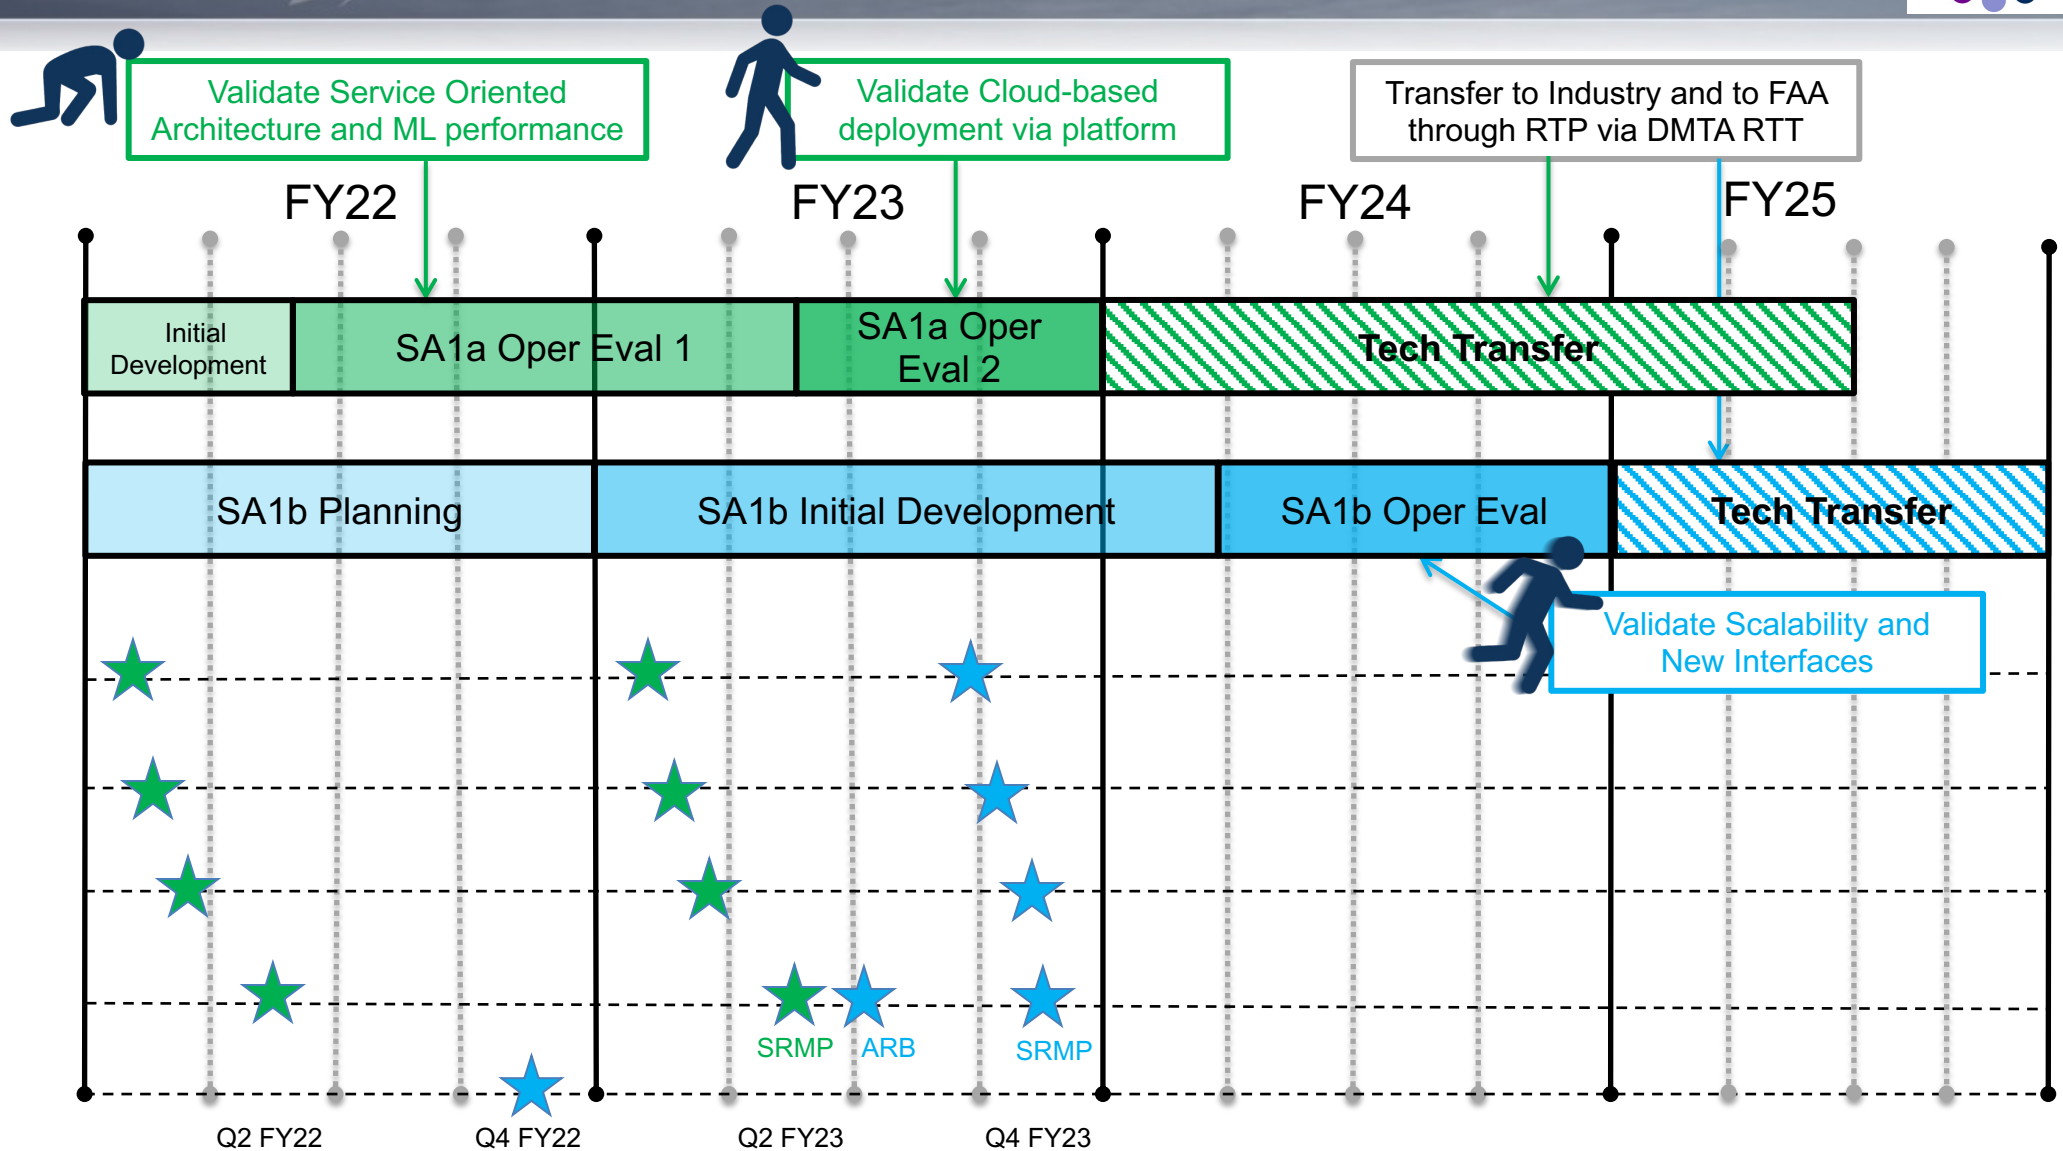

Starting in FY23 and beyond

Access to data, services and interface *is available* from the cloud

SNFP-Ops-1 Progress and Milestones

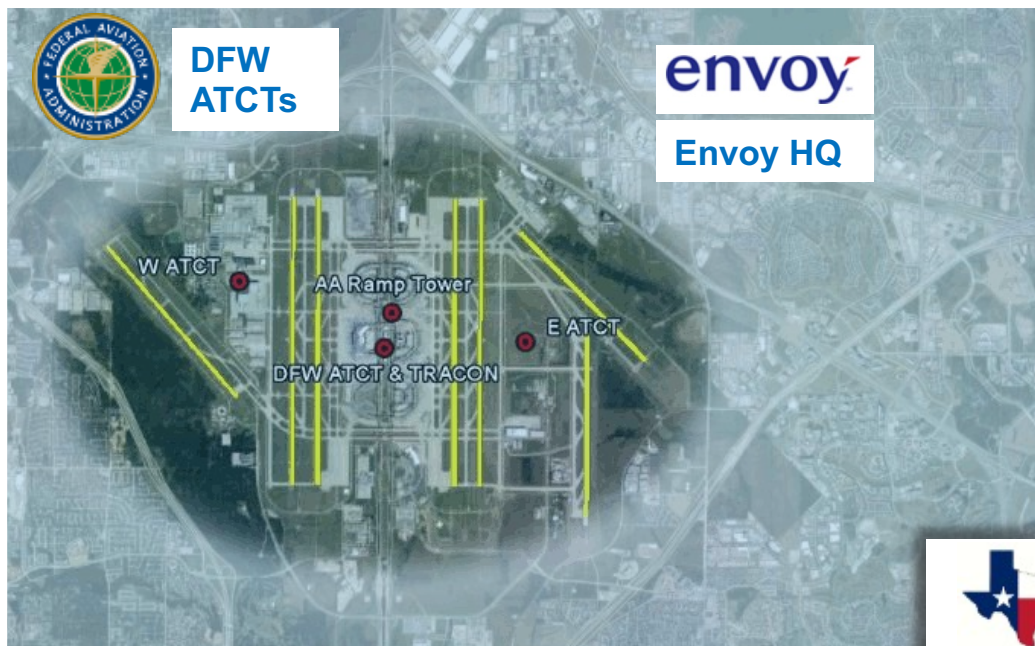

SNFP-Ops-1a North Texas Milestones in Green

SNFP-Ops-1b Complex Airspace Milestones in Blue

SNFP-Ops-1a Field Demo Partners and Locations

- 1a Field Demo partners leverage the existing relationships from ATD-2 Phase 3 Field Evaluation
- 1a plans to use the existing NTX NASA network installed at FAA and Flight Operator facilities
- 1a Field Demo partners already familiar with the CDDR concept, technologies, and workflow
- Provides an experienced field demo partner cadre to evaluate the 1a digital services that could be deployed to other locations

Meeting Performance Operational Goals

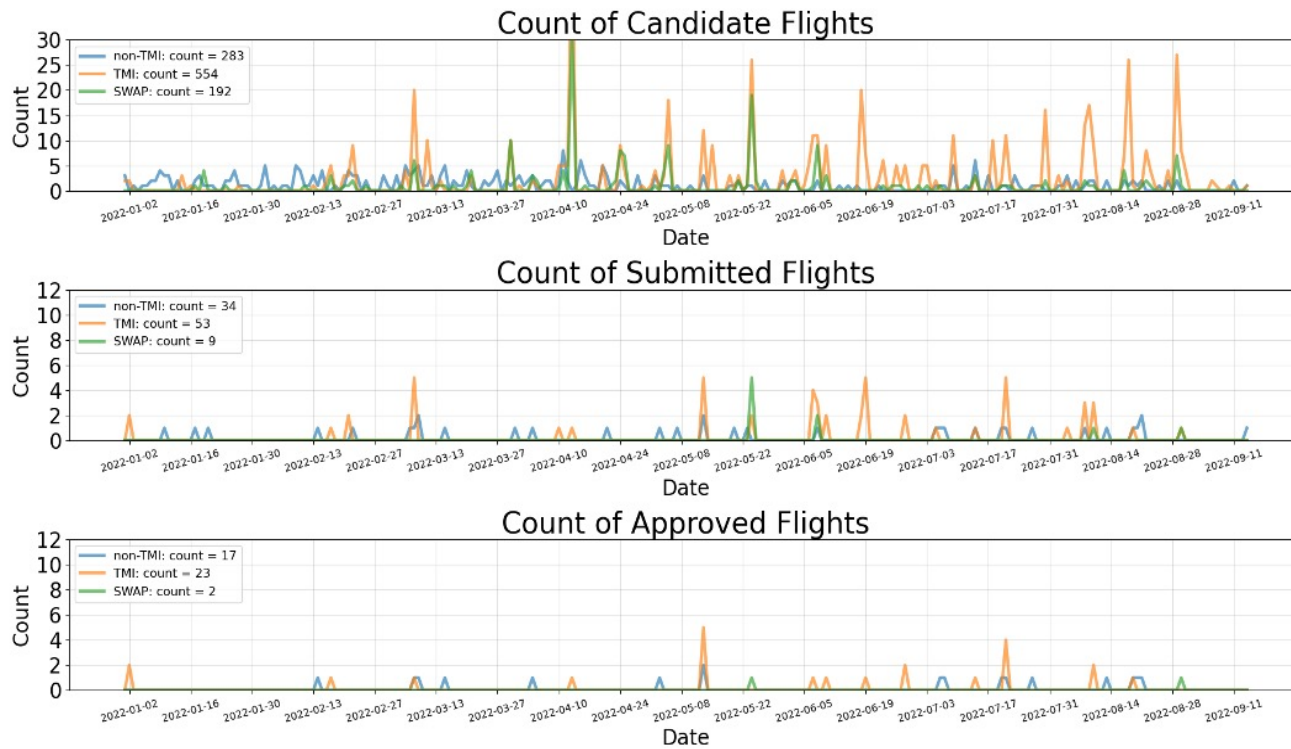

2022 CDDR Environmental Benefits

Between **January 1st, 2022** and **Sep 16th, 2022**

- 24.8K pounds of **fuel** saved
- 76.6K pounds of **CO₂ emission** reduced
- 569 **urban trees** saved
- Average reroute saves 15.4 urban trees **+3.5% YoY**

DIP Machine Learning vs Legacy ATD-2

- Arrival Runway Prediction: ML slightly outperforming
- ETOT: ML on par with ATD-2, outperforming TFMS

Arrival Runway Prediction

Estimated Take OFF Time (ETOT) Prediction

Legacy

ATD-2 Airport Surface Model

Requires **continuous** maintenance

Mental models encoded into **complex decision trees**

Similar to:
Skilled worker

Good at **specific** tasks
Requires detail knowledge

Current

Scalable DIP Machine Learning Airport Surface Model

Semi-automated maintenance

Absorbs information from multiple existing data sources

Similar to:
3D printer

Flexible to new tasks
Learns detailed knowledge

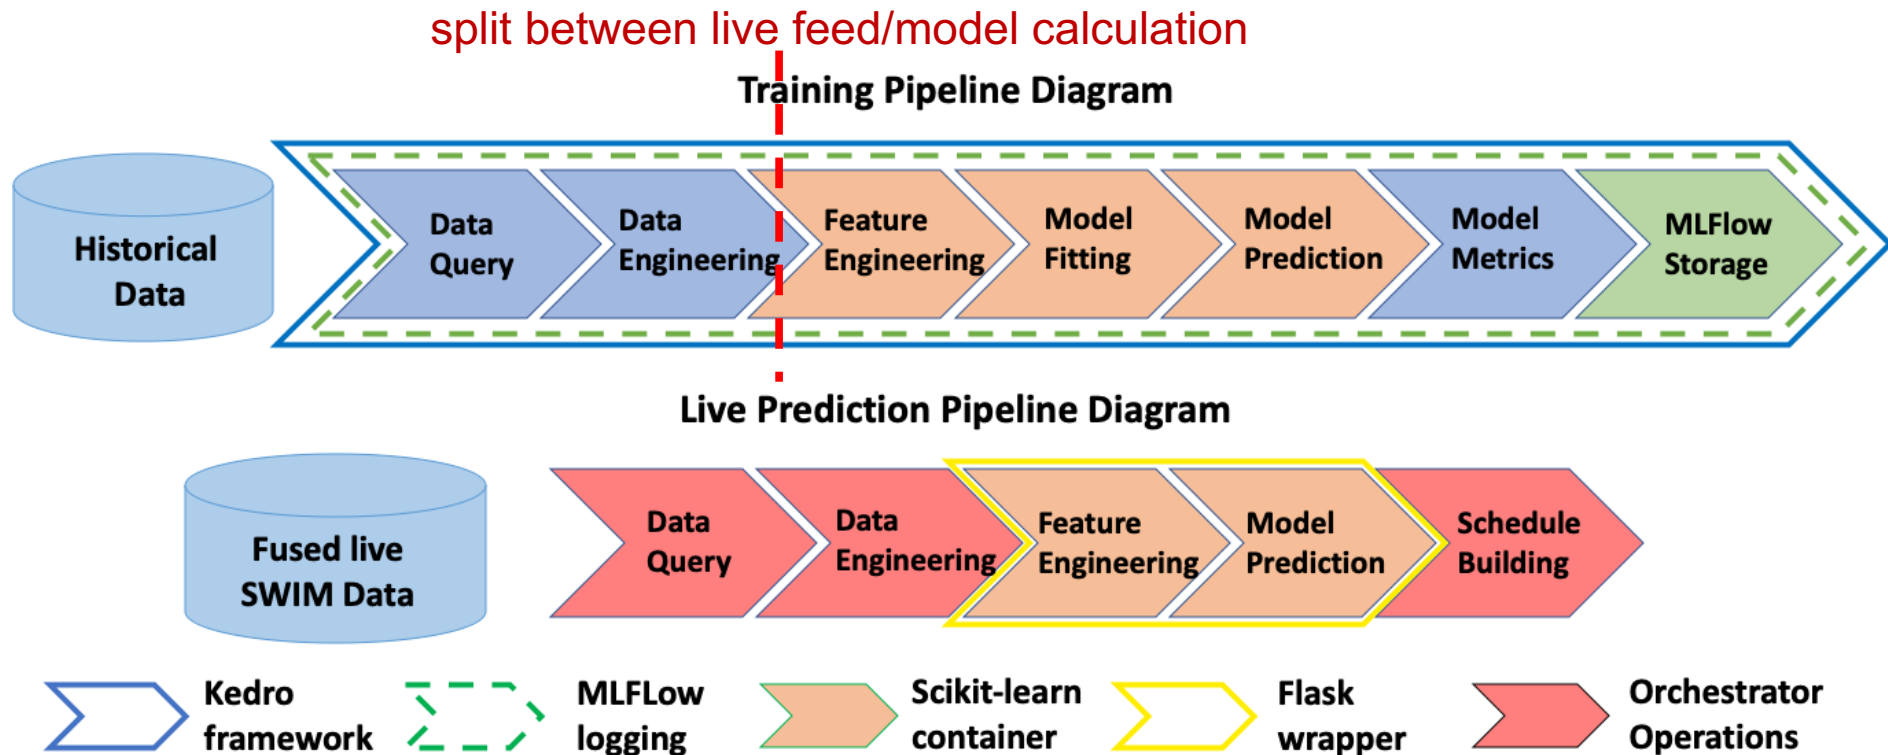

ML Pipelines Enable Scalable Solution

We developed our training pipelines in Python around mainly three Python libraries :

- Kedro : pipeline structures defined by DAGs, help to abstract inputs and to define a common design for the team
- Scikit-learn: used for the Pipeline class that allows to store some feature engineering into the model
- MLflow : keeps track of the models, their artifacts, performances, tags the latest models

ML service code available on GitHub : <https://github.com/nasa/ML-airport-configuration>

Arrival Runway Prediction at Other Locations

KBOS Arrival Runway accuracy = 95.1%

Confusion Matrix for KBOS

KPHL Arrival Runway accuracy = 87.1%

Confusion Matrix for KPHL

KIAH Arrival Runway accuracy = 76.1%

Confusion Matrix for KIAH

ML pipelines enable new models to be trained by simply changing configuration file

Extrapolating NTX Benefits to Other Airspaces

North Texas: Model Candidates as a Function of TMI

Model Applied to Other Airspaces

TRACON	Model with # of MIT (min)	Model with # of MIT (hour)
D10	675+-299	11.3+-5.0
N90	997+-443	16.6+-7.4
PCT	380+166	6.3+-2.8

Benefits vary Depending on Operations & TMIs; EX: N90 ~1.5x; PCT ~.5x of North Tx

Platform & NASA Services

Platform Features

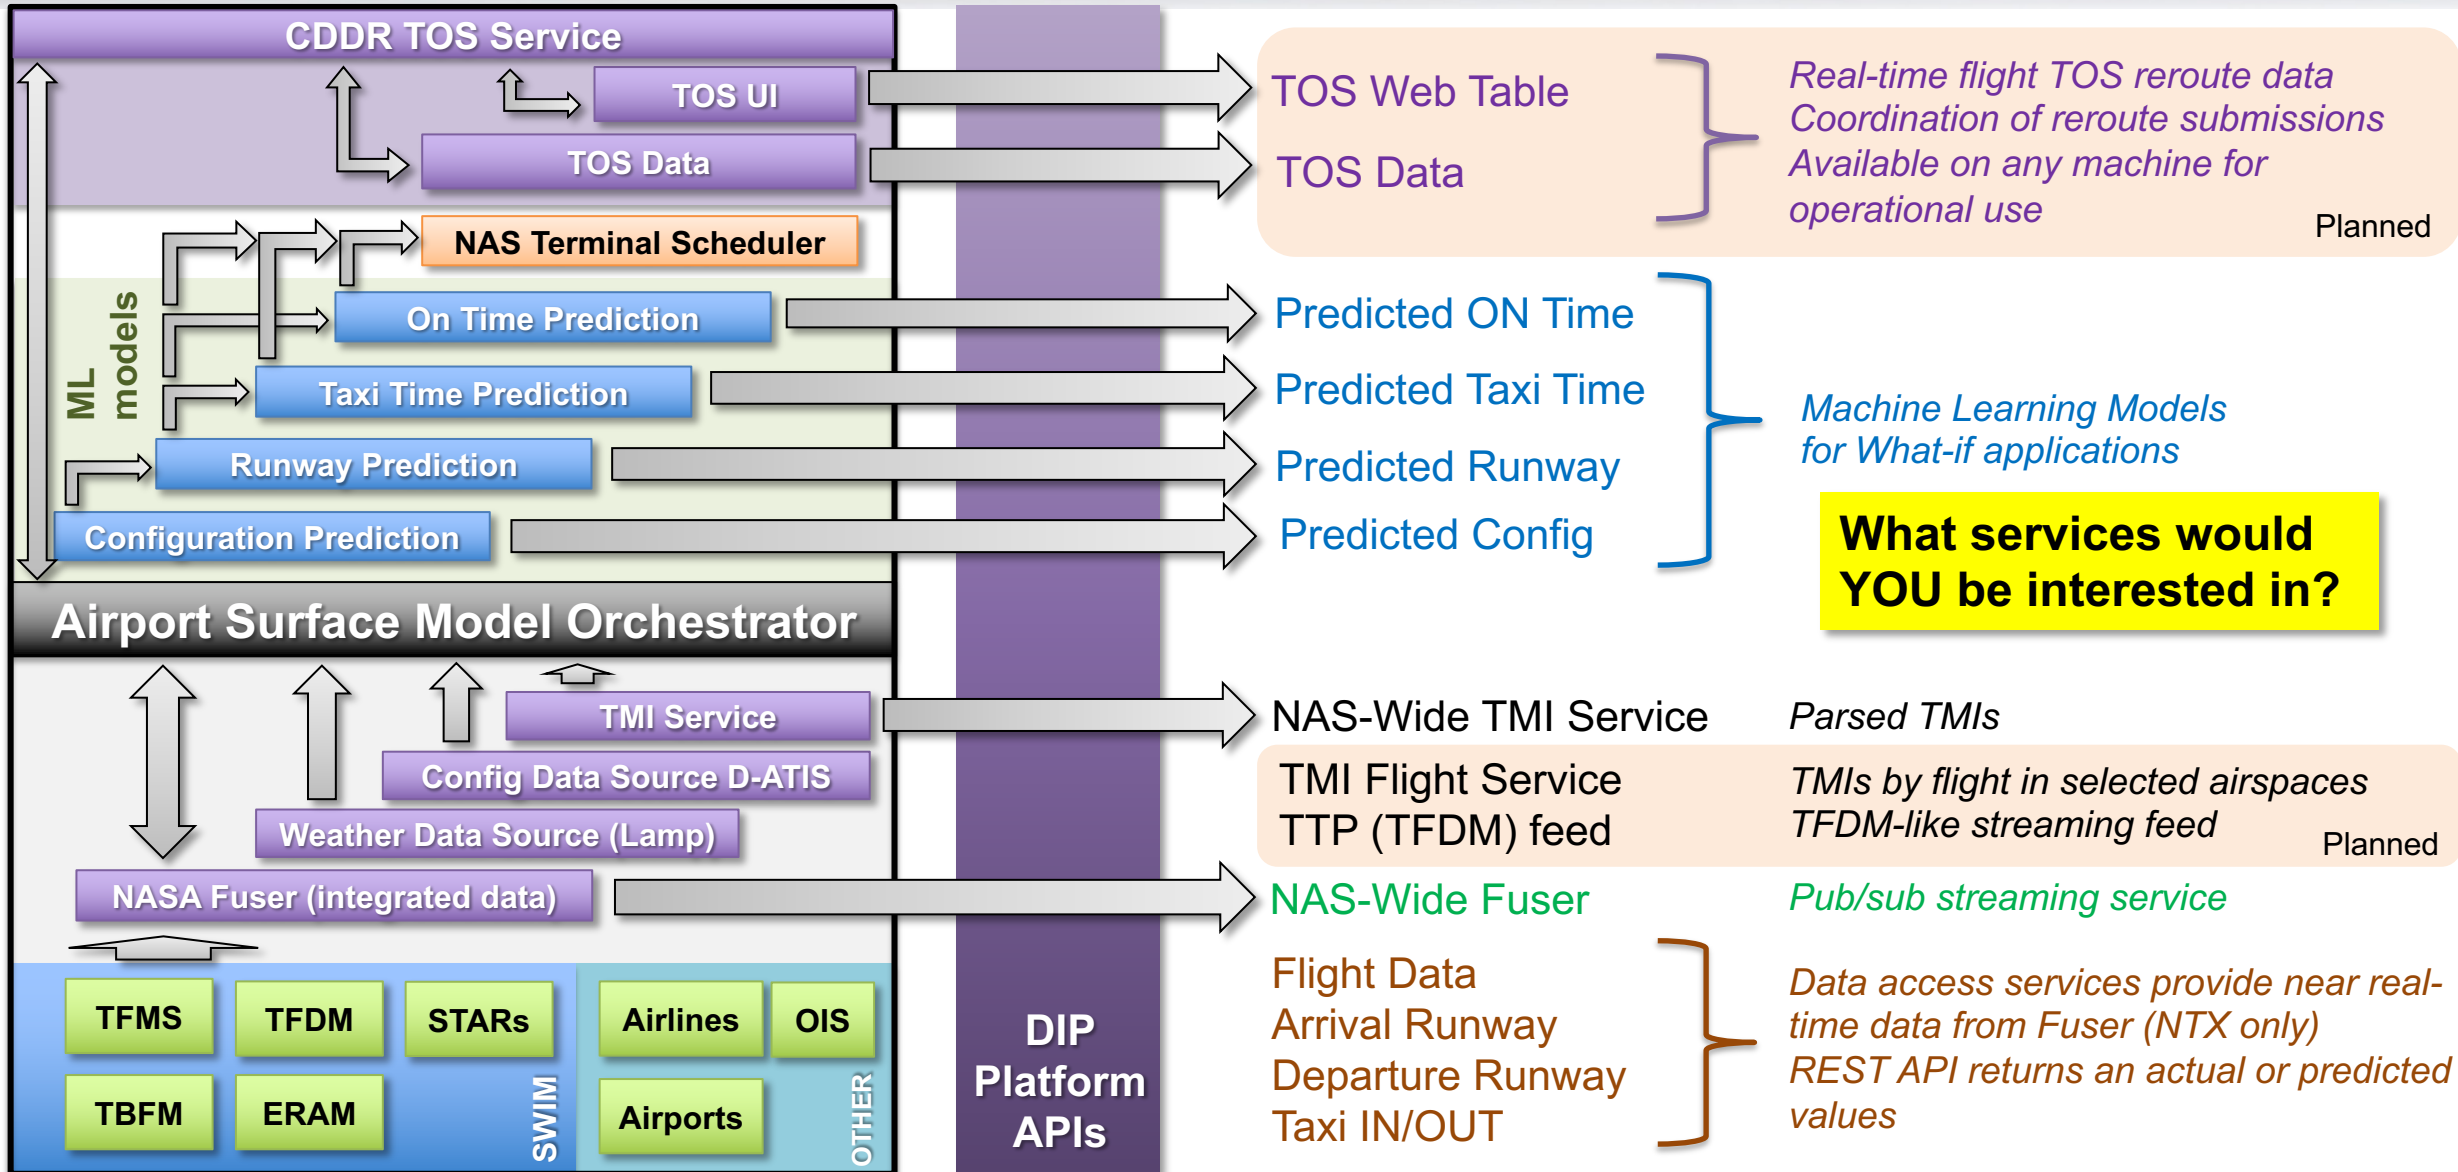

Features	Description	Scope
DIP Catalog	The DIP Catalog is a repository of information about services provided and available to the aviation community. The catalog allows users to register, browse, search, try, subscribe, and connect to services.	FY2022
Reporting and Monitoring	The platform facilitates Reporting and Monitoring Dashboard to visualize metrics at various levels	FY2023
Data Storage and Data Archival Service	Platform provides historical data archival and Data Archival service to access stored data	FY2023
Streaming Data API Solutions	Abstract implementation for Streaming and pub-sub solution using Distributed Application Runtime (DAPR)	FY2023
Data Governance - Identity	The DIP Identity Management Service (DIMS) provides the necessary APIs for entities to query, manage and verify identities within the DIP ecosystem	FY2023
P2P Communication & Payment Delegation	DIP enables P2P interaction between the DIP Platform and Partner infrastructure, facilitating the subscribers with URLs provided by service owners to pay for services using a payment gateway	FY2023-24
Distributed Architecture	The long-term vision for the platform is to move towards a distributed architecture approach where the network traffic is distributed using P2P-enabled interactions	FY2024

NASA Services via the Platform

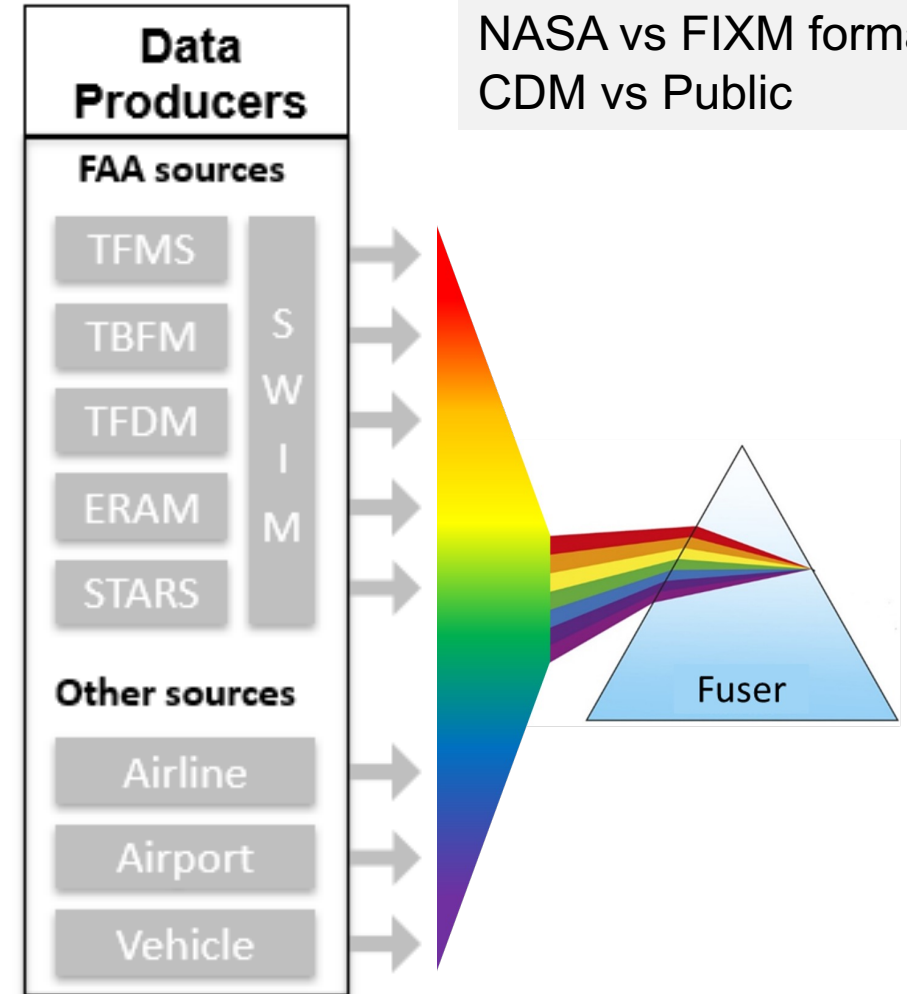

NASA's Building Blocks

Fuser Streaming Service

- System that can mediate between disparate sources of data, pulling in *the right data at the right time*
- Composed of multiple components providing
 - Parsers for various data sources
 - Matching Services providing a global unique identifier (GUFI)
 - Fusion Services
 - Transformation
 - Filtering
 - Updating
 - Mediation
 - Common well-defined schema

Versions available:
NASA vs FIXM format
CDM vs Public

Flight Data Service

- Source of data: Subset of archived Fuser data stored in databases
- Domain of Applicability: 30 days and data available for DFW and DAL
- Type of Data: Predictions and resources for a set of flights within +/- 3 hours based on a user defined timestamp (can be set to current up to 30 days in the past)
- Configurable list of fields set in the API call
 - ACID, departure and arrival airports, IGTD,
 - Runways: departure and arrival runway configuration, actual and predicted departure and arrival runways (+source), actual and estimated runway on and off times, departure runway detection model confidence,
 - Taxi times: ramp and AMA arrival and departure undelayed and estimated taxi times,
 - Terminal resources time: departure fix transit, estimated and actual departure fix times,
 - Timestamp

Traffic Management Initiative Service

- Source of data: parsed data available in SWIM TFM data and ATCSCC's webpages
- Domain of Applicability: 30 days and data available for DFW and DAL
- Type of Data: Active restrictions based on a user defined timestamp (can be set to current restrictions up to 30 days in the past)
- Restrictions (combinations of a single or all TMI type)
 - Airspace Flow Programs (manage excess demand in constrained airspace, impacted flights will get an EDCT)
 - Approval Requests – APREQ (wheels-up time to control the timing of flights at constraint point in the airspace)
 - Flow Constrained Areas (restricted piece of airspace that is usually associated with an AFP or reroute advisory)
 - Ground Delay Programs (manage excess demand at destination airports, impacted flights will get an EDCT)
 - Ground Stops (stop departures to specified destinations for a given period of time)
 - Miles/Minutes In Trail (requested in-trail spacing between flights at specified resources (e.g. runway, fix, route))
 - Reroute Advisories (impose flight routes to specified destinations based on specified origins)
 - Resource Closures (runway, fix, route)
- Each restriction provides fields, such as: start/end time, requesting/providing facility, type, reason, constrained resource, value, TMI id, associated TMI, TMI action (add/ remove/modify)...

Identified High-Value Services From RFI Responses

- | | |
|---|--|
| • NAS-wide Fuser Service | NASA's ATD-2 service expanded to the NAS |
| • NAS-wide TMI Service | NASA's TMI service expanded to the NAS |
| • TOS related Services | NASA's CDDR service expanded to new airspaces |
| • Landing runway prediction service | NASA's EON prediction service |
| • IROP Disruption Management | Potential multi-partners solution |
| • NAS-wide Wind Miles Prediction | Potential service |
| • Weather Data Integration Service | Potential service |
| • NAS simulation and Playback | Potential solution |
| • Earliest Off Block Time (EOBT) generation | Potential service for traditional aviation |
| • Surface congestion prediction (Bank overlap) | Potential prediction service |
| • Surveillance Data Integration Service | Potential service for traditional and new entrants |
| • Noise Prediction for New Entrants | Potential service for new entrants |
| • ... | |

- Services and Solutions as identified by the Community who responded to the DIP Request For Information (RFI)
- Via next ACO, DIP will seek Service Providers who can support the development of innovative solutions
- DIP will continue to contribute to identified needs, however,
- DIP ecosystem will enable the development of collaborative solutions across Partners

Agile Development and Partner Evaluation

Goals

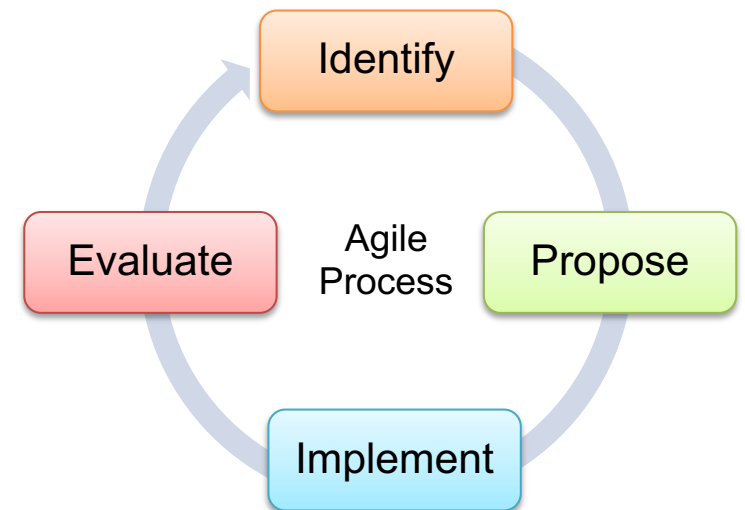

- Establish a cohort of partners of Service Consumers and Service Providers
- Complete PS-1 and conduct PS-2 evaluations
- Support partners to develop their use cases and facilitate high-value solutions that leverage DIP services

Approach

- Onboarding process and familiarization with Platform
- Individual Meetings (identify needs and use cases, provide support, get feedback on proposal and use)
- Group Meetings (provide updates, discuss topics, get feedback, eco-system events)
- Data Collection (usability + actual platform and services use)

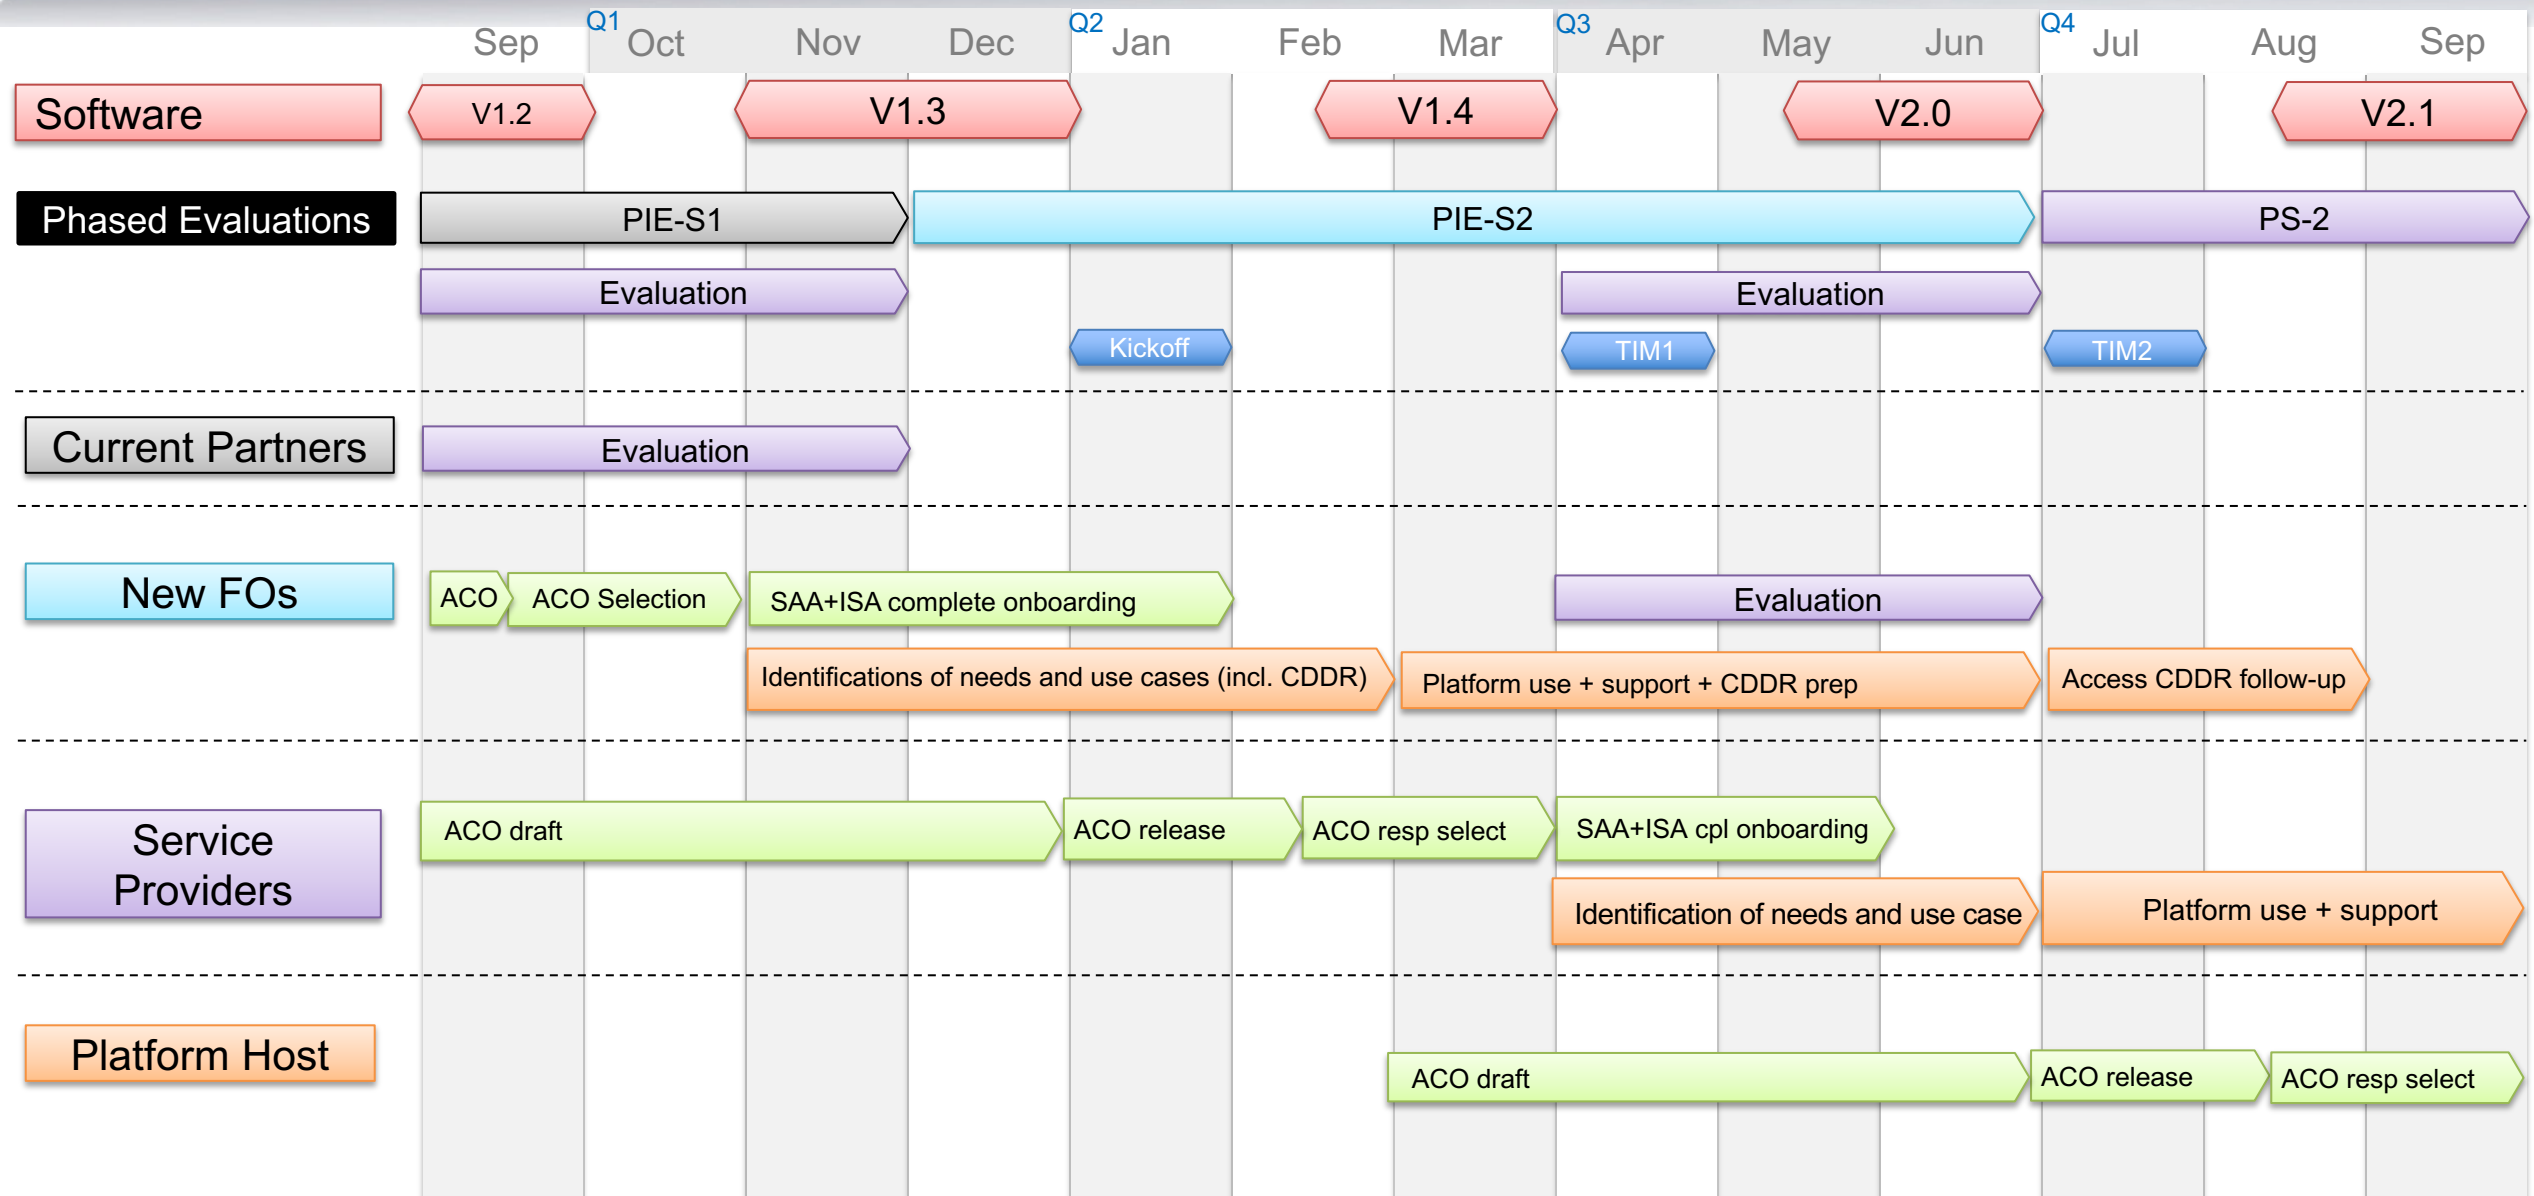

Outcome

- Recommendations of Platform and Service development
- Lessons Learned and Benefits Analyses

Timeline With Partners

Version 1.0.0

Serving 3 Users

About This Service

NASA Flight Service
CONNECT
API
UNSUBSCRIBE

The Flight Service returns a collection of predictions and resources for a set of flights within +/- 3 hours of a user defined timestamp for a given airport. The service will return a configurable set of identifier fields based on dynamic field definitions that are part of the user input. All results would be pulled from the NAS Model flight summary and model extension tables.

The last 30 days (current time - 30 days) are available to return as part of the time range for the NASA Flight Service for the following airports: KDFW, KDAL

Back up Slides

DIP FY22-FY25 Progression with SFNP-Ops 1

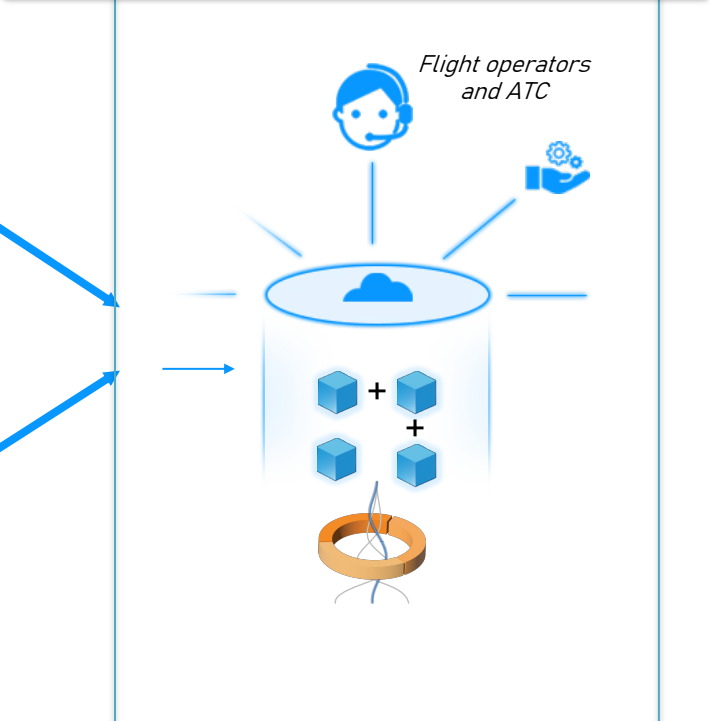

TODAY – SFNP-Ops 1a CDDR w/ML @ NorTx

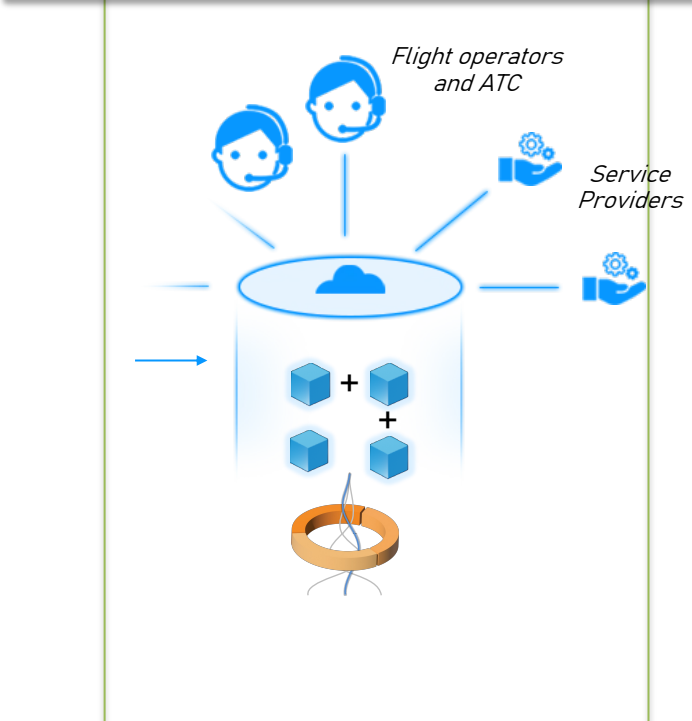

TODAY – Platform Build Up

FY23 @North TX – SFNP-Ops1a Integration of CDDR w/Platform

FY24/25 @ TBD – SFNP-Op1b Scale and Adapt to New Airspace

Immediate impact to RW Operations; Agile build up

Leveraging ATD-2 to Build-Up Initial Ecosystem

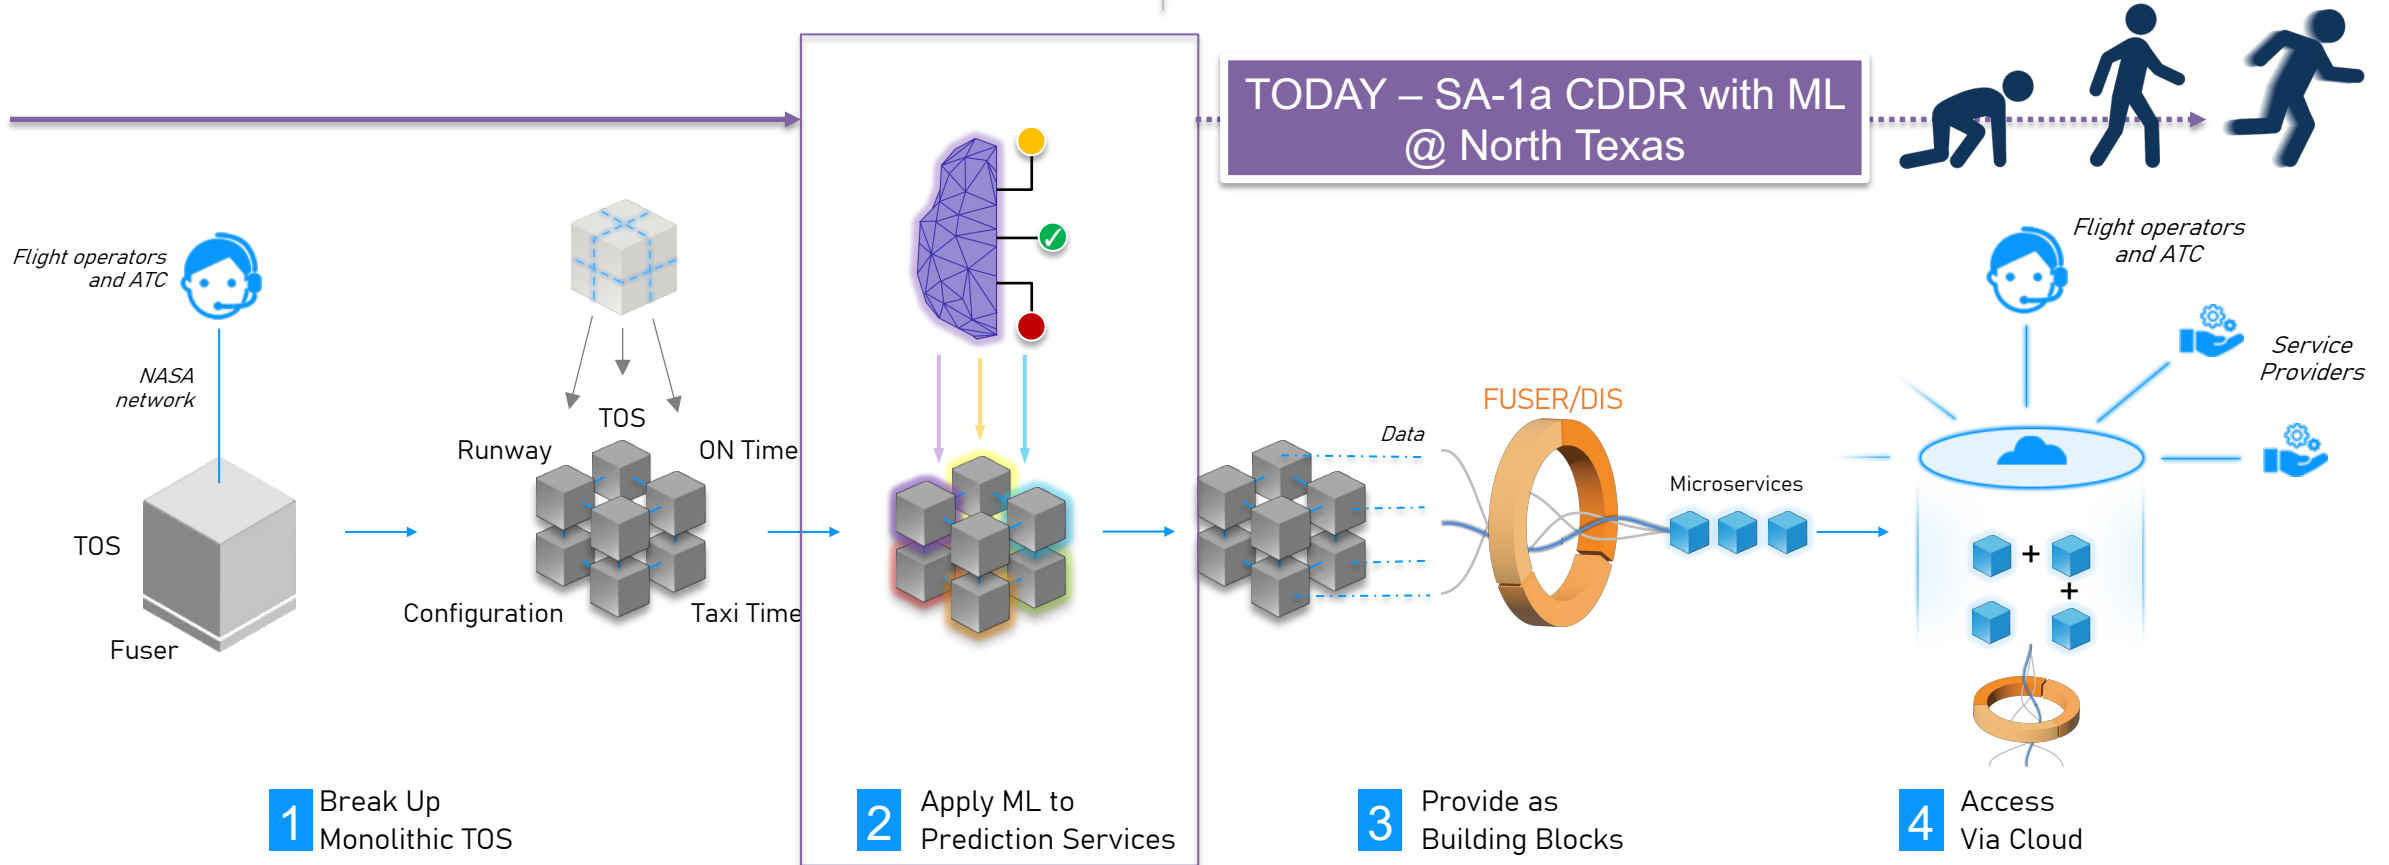

BEFORE: ATD-2

Monolithic service for single application, using adaptation-based algorithms to generate trajectory predictions as input to terminal scheduler; requiring site-to-site deployment

FUTURE: DIP

Transformed into service-oriented architecture of highly reusable digital services accessible on the platform to support many advanced applications; upgraded to machine learning-based algorithms for predictions to enable NAS-wide scalability

Advancing Technology to scale and adapt for reusability in the NAS

Partner Engagement – Technical Approach – Platform Use Scope

Onboarding

NASA Data Storage

• Data Storage

- RDS Database
 - Loaded continuously
 - Data will roll off after 1 month
- S3 Buckets
 - Nightly process to export from Postgres, convert to parquet, load to S3
 - Data will roll off after 3 months
- Sherlock
 - Process to copy from S3 buckets and store in Sherlock

Ways to Access NASA services and Data

- **Query data access API:** prediction services write results to data archive which can be queried for near real-time or historical results
- **Query model API:** machine learning models can be queried in what-if mode where user provides required input and model returns the prediction
- **Consume real-time Fuser data:** prediction services write results to the real-time Fuser data feed which can be consumed as pub/sub service
- **CDDR cloud-based TOS table:** prediction services write results to the backend system which show real-time data in cloud-based User Interface
