

## How to Navigate the Technical Sessions

There are four primary resources to help you understand and navigate the Technical Sessions:

- This Technical Session listing, which provides the most detailed information. The listing is presented chronologically by day/time, showing each session and the papers/abstracts/authors within each session.

## The Session Codes

## Time Blocks

### Sunday - Monday

8:00am - 9:30am  
 10:00am - 10:50am  
 11:00am - 12:30pm  
 1:30pm - 3:00pm  
 3:10pm - 4:00pm  
 4:30pm - 6:00pm

### Tuesday

7:30am - 9:00am  
 9:30am - 10:20am  
 10:30am - 12:00pm  
 12:05pm - 1:35pm  
 2:00pm - 3:30pm  
 3:40pm - 4:30pm  
 4:35pm - 6:05pm

### Wednesday

8:00am - 9:30am  
 10:00am - 10:50am  
 11:00am - 12:30pm  
 3:20pm - 4:50pm

## Rooms and Locations /Tracks

All tracks / technical sessions will be held in the Phoenix Convention Center & Hyatt Regency Phoenix.

## Sunday, 8:00AM - 9:30AM

### SA01

### Adjustable and Distributionally Robust Optimization

Sponsored: Optimization/Optimization Under Uncertainty

Sponsored Session

Chair: Dimitri Papadimitriou, Nokia Bell Labs, Brussels, 1190, Belgium

#### 1 - Distributionally Robust Risk-constrained Dynamic Asset Allocation Model

Tito Homem-de-Mello, Universidad Adolfo Ibáñez, Santiago, Chile,  
 Davi Valladao, Thuener Silva

Dynamic stochastic programming for asset allocation suffer from low out-of-sample performance due to discrepancies between the underlying stochastic processes and the actual prices. To enhance performance, we propose a distributionally robust dynamic portfolio optimization with one-period risk constraints considering transaction costs and a Markovian temporal dependence with ambiguous transition matrix. Assuming a ambiguity set based on a nominal transition matrix and the total variation distance measure, we develop a computationally tractable reformulation and present out-of-sample results.

#### 2 - Efficient Stochastic Gradient Descent for Distributionally Robust Optimization

Soumyadip Ghosh, IBM TJ Watson Research Center, 1101  
 Kitchawan Road, Route 134, Yorktown Heights, NY, 10598,  
 United States, Mark S. Squillante, Ebisa Wollega

We propose a new stochastic gradient descent algorithm to efficiently solve min-max formulations that arise naturally in distributionally robust learning. Current approaches do not scale well because the formulations include as decision variables a probability mass function over the whole collection of data samples. Our proposal is to approximate the optimization over the uncertainty set by subsampling the support, progressively increasing this support to cover the entire dataset as the iterates proceed. We develop asymptotic guarantees on how fast the support set should grow to optimally, in a strong statistical sense, balance the computational effort with the required level of accuracy.

#### 3 - Distributionally Robust Optimization with Decision Dependent Ambiguity Sets

Sanjay Mehrotra, Northwestern University, Dept of I. E. / M. S.  
 C246 Tech Inst, 2145 Sheridan Road, Evanston, IL, 60208-3119,  
 United States, Fengqiao Luo

We study distributionally robust optimization models, where the ambiguity sets of probability distributions can depend on the decision variables. These models arise in situations with endogenous uncertainty. Two-stage decision dependent stochastic programs are a special case. We give dual formulations for ambiguity sets based on moment constraints, Wasserstein metric, phi-divergence and multi-variate Kolmogorov-Smirnov sets. In the finite scenario case, the dual formulations have a finite number of constraints. In certain more general cases, the dual problems are non-convex semi-infinite programs.

#### 4 - Benders Decomposition for Adjustable Robust Optimization Problems

Dimitri Papadimitriou, Nokia Bell Labs, Rue du Charme 24,  
 Brussels, 1190, Belgium

Consider two-stage adjustable robust programs with continuous second-stage variables and covering constraints with both left and right-hand side uncertainty. Such programs model situations where, for instance, without requiring optimal production conditions, both allocation and production variables adjust (per-customer and per-location, respectively) to satisfy uncertain demands, and allocation decisions are constrained by local production. We analyze the properties of the resulting Affinely Adjustable Robust Counterpart (AARC) formulation when the decision-making policies are limited to (piecewise) affine rules, i.e., the continuous adjustable variables are approximated by affine function of the uncertain data. Then, we propose a robust formulation of the uncertain mixed-integer linear program that exploits its decomposable structure into first and second stage decision problems. Next, we detail an exact algorithm for the solving of such problems that relies on the Benders decomposition method while accounting for the properties of the extreme points characterizing polyhedral uncertainty sets. This method relies on dynamic cutting-plane generation. More precisely, under the relatively complete recourse assumption, it performs by iteratively generating optimality cuts/cutting planes (obtained from the dual subproblem), adding them to the master problem and solving the resulting master problem such that its lower and upper bounds converge and thus, an optimal solution of the original uncertain problem can be obtained. This paper also investigates possible strategies to reduce the convergence time of the Benders decomposition algorithm to the optimal solution by maintaining balance between the number of iterations and the number as well as the type of cuts produced at each iteration.

### Joint Session OPT-Uncert/APS: Optimization in Statistics I

Sponsored: Optimization/Optimization Under Uncertainty

Sponsored Session

Chair: Robert Bassett, Naval Postgraduate School, Monterey, CA, United States

#### 1 - Variational Analysis of M-estimators

Johannes Royset, Naval Postgraduate School, Operations Research Department, Monterey, CA, 93943, United States

We present a framework for construction, analysis, and computations of M-estimators in the presence of soft information about shape, support, continuity, slope, location of modes, density values, and other conditions that, individually or in combination, restrict the family of estimates under consideration. The framework also leads to plug-in estimators with the exceptional property that convergence of densities and regression functions implies convergence of modes, maximizers, high-likelihood events, and related quantities. We illustrate the approach with several applications.

#### 2 - Approximation of Maximum a Posteriori Estimators Using Bayes Estimators

Julio Alejandro Deride Silva, Sandia National Laboratories, CERL/111, MS/1327, P.O. Box 5580, Albuquerque, NM, 87185-1327, United States, Robert Bassett

In this talk, we present an approximation scheme for statistical estimation using variational analysis techniques. In particular, we focus on the folk theorem that characterizes Maximum a posteriori estimators as a limit of a sequence of Bayes estimators under 0-1 loss. We first provide a counterexample, which shows that in general, this claim fails to hold true. Secondly, since both estimators are defined in terms of optimization problems, the tools of variational analysis find a natural application to Bayesian point estimation, and we analyze the convergence using notions of hypo-convergence. Finally, we provide conditions when this result holds true

#### 3 - Coupled Learning Enabled Optimization

Junyi Liu, University of Southern California, 30 Virginia Avenue, Los Angeles, CA, 91107, United States, Guangyu Li, Suvrajeet Sen

Empowered by machine learning techniques, diagnostic and predictive analytics are usually followed by decision-making problems in prescriptive analytics. We extend the above sequential prediction-optimization paradigm to a case in which prediction and optimization model are coupled so that the parameter estimation model can guide the optimization models to achieve higher levels of performance. Under certain assumptions on the problem and training data set, we show that the sequence of solutions provided by the coupled algorithm converges to the first-order stationary point of the original stochastic optimization problem.

#### 4 - Phase Retrieval Denoising via Rapid Eigenvalue Computation of Evolving Matrices

Will Wright, University of California, Davis, CA, United States, Zhaojun Bai

Phase retrieval has a wide range of solution methods, yet few exist for handling noisy observations (aka, phase retrieval denoising) without imposing additional restrictions such as signal sparsity. We focus on a recent phase retrieval denoising model: the gauge dual of the PhaseLift model (GD-PL). GD-PL can be solved with subgradient descent, with the main cost being a sequence of evolving eigenvalue problems. We establish optimal methods for handling this sequence of eigenvalue problems. We also establish probabilistic results of the optimality of the signal returned by the subgradient descent algorithm.

#### 5 - Fused Density Estimation for Data on Infrastructure Networks

Robert Bassett, Naval Postgraduate School, 1 University Circle, Monterey, CA, United States, James Sharpnack

We introduce a new method for nonparametric density estimation on geometric networks. By penalizing maximum likelihood estimation with a total variation penalty, we avoid overfitting and the dirac curse. We provide results which reduce the search space for the estimator from infinite dimensional function space to the finite-dimensional setting, and further demonstrate its computational tractability. We then focus on the asymptotic convergence rate of this density estimation method. Lastly, we review applications to infrastructure networks.

## ■ SA03

North Bldg 121C

### Creating Value in Innovation

Sponsored: Technology, Innovation Management & Entrepreneurship

Sponsored Session

Chair: Tian Chan, Emory University's Goizueta Business School, Atlanta, GA, 30322, United States

#### 1 - The Firm Productivity Implications of Technology Licensing: Evidence from Developing Asian Economy Manufacturing Firms

Xiaojin Liu, 100 Darden Boulevard, Charlottesville, VA, 22903, United States, Anant Mishra

This study focuses on the productivity implication of technology licensing in developing Asian economy manufacturing firms, and examines how it is affected by infrastructural factors in a firm's internal and external environment.

#### 2 - Delegating Innovation

Morvarid Rahmani, Georgia Institute of Technology, 800 West Peachtree Street NW, Room 4246, Atlanta, GA, 30308-1149, United States, Karthik Ramachandran

In many contexts such as product design and advertising, clients seek the expertise of external providers to generate innovative solutions for their business problems. In this paper, we explore how the client's flexibility in terminating the project can influence the progress and efficiency of the delegated innovation.

#### 3 - Search and Sequential Innovation in Mobile App Development

Nilam Kaushik, University College London, London, 02115, United Kingdom, Bilal Gokpinar

The process of search, identification, and acquisition of knowledge is essential for the success of products. This paper empirically characterizes the sequential innovation process in the setting of mobile app development using novel text-mining techniques.

#### 4 - Designing Internal Innovation Contests

Lakshminarayana Nittala, University of California-San Diego, Rady School of Management, 9500 Gilman Drive, La Jolla, CA, 92093, United States, Sanjiv Erat, Vish Krishnan

Firms can use internal contests to source solutions to problems associated with innovation. However, designing such contests involves nuanced understanding of the impact of such contests on the on-going projects within the firm. Optimal contest design is discussed along with managerial implications.

### Joint Session OPT/Practice Curated: Theory and Applications of MIP

Sponsored: Optimization/Integer and Discrete Optimization

Sponsored Session

Chair: Haochen Luo, Texas A&M University, College Station, TX, 77843-3131, United States

#### 1 - A Bounded Formulation for the School Bus Scheduling Problem

Liwei Zeng, Northwestern University, 2145 Sheridan Road, IEMS Department, Evanston, IL, 60208, United States, Karen Smilowitz, Sunil Chopra

This paper proposes a new formulation for the school bus scheduling problem (SBSP) which optimizes starting times for schools and associated bus routes to minimize transportation cost. Specifically, the problem determines the minimum number of buses required to complete all bus routes under the constraint that routes for the same school must arrive within a set time window before that school starts. We present a new integer linear programming (ILP) formulation for this problem which is based on a time-indexed formulation. We develop a randomized rounding algorithm based on the linear relaxation of the ILP that yields near-optimal solutions for large-scale problem instances.

#### 2 - Integer Programming for Learning Directed Acyclic Graphs

Hasan Manzour, University of Washington, Seattle, WA, United States, Simge K. Á. Kyavuz, Ali Shojaie

Bayesian Networks (BNs) are probabilistic graphical models that represent causal relationships among a set of random variables in the form of a Directed Acyclic Graph (DAG). We study the problem of DAG structural learning of a BN from observational data where the underlying causal mechanism in the network is linear. We propose a new optimization model for this learning problem and discuss the statistical implications of L1 versus L0 penalty in our model. The computational results, tested on both synthetic and real datasets, demonstrate that the proposed model is computationally more efficient to learn the optimal DAG when compared with the existing mathematical models in the literature.

### 3 - An MIP Approach to Finding Optimum Search Schemes for Approximate String Matching

Haochen Luo, Texas A&M University, 3131 TAMU,  
College Station, TX, 77843-3131, United States, Kiavash Kianfar,  
Christopher Pockrandt, Bahman Torkamandi, Knut Reinert

Finding approximate occurrences of a pattern in a text using a full-text index is a central problem in bioinformatics. Use of search schemes (partitioning the pattern and searching the pieces in certain orders with given bounds on errors) can yield significant speed-ups. However, finding optimal search schemes is a difficult combinatorial optimization problem. Here for the first time, we propose a mixed integer program (MIP) capable to solve this optimization problem for Hamming distance with given number of pieces. Our experiments show that the optimal search schemes found by our MIP significantly (up to 35 times) improve the performance of search in index upon previous ad-hoc solutions.

### Joint Session OPT/Practice Curated: Sparse Semidefinite Programs with Machine Learning Applications

Sponsored: Optimization/Linear and Conic Optimization

Sponsored Session

Chair: Somayeh Sojoudi, University of California, Berkeley, Berkeley, CA, 94703, United States

Co-Chair: Richard Zhang, UC Berkeley, Berkeley, CA, 94709, United States

#### 1 - Empirical Bayes Estimation of Parametric Gaussian Priors

Martin Skovgaard Andersen, Technical University of Denmark,  
Asmussens Allé, Kgs. Lyngby, 2800, Denmark

In Gaussian linear models, a maximum a posteriori estimate of a set of unknown parameters depends on a prior distribution that is typically unknown. Assuming that this prior is Gaussian with a structured or sparse precision matrix, we investigate the use of empirical Bayes estimation to estimate the prior directly from data. We also propose a method to solve the resulting estimation problem, which is a nonlinear semidefinite optimization problem, and demonstrate the usefulness of the approach with some numerical examples.

#### 2 - SDP Formulations for Fairness in Unsupervised Learning

Mahbod Olfat, PhD Student, University of California-Berkeley,  
1433 Dwight Way, Unit C, Berkeley, CA, 94702, United States,  
Anil Aswani

Though there is a growing body of literature on fairness for supervised learning, the problem of incorporating fairness into unsupervised learning has been less well-studied. This paper studies fairness applied to PCA. We first present a definition of fairness for dimensionality reduction, which can be interpreted as saying that a reduction is fair if information about a protected class cannot be inferred from the dimensionality-reduced data points. Next, we develop convex optimization formulations that can improve the fairness (with respect to our definition) of PCA and kernel PCA. These formulations are SDP's, and we demonstrate the effectiveness of our formulations using several datasets.

#### 3 - Linear-time Algorithm for Learning Large-scale Sparse Graphical Models

Richard Zhang, UC Berkeley, 621 Sutardja Dai Hall, University of California, Berkeley, CA, 94709, United States, Salar Fattahi,  
Somayeh Sojoudi

The sparse inverse covariance estimation problem is commonly solved using an  $l_1$ -regularized Gaussian maximum likelihood estimator known as "graphical lasso". This talk describes a Newton-CG algorithm to efficiently solve graphical lasso for large datasets. Assuming that the thresholded sample covariance matrix is sparse with a sparse Cholesky factorization, we prove that the algorithm converges to an  $\epsilon$ -accurate solution in  $O(n \log(1/\epsilon))$  time and  $O(n)$  memory. The algorithm is highly efficient in practice: we solve graphical lasso problems with as many as 200,000 variables to 7-9 digits of accuracy in less than an hour on a standard laptop computer running MATLAB.

### 4 - Control-theoretic Analysis of Smoothness for Stability-certified Reinforcement Learning

Ming Jin, UC Berkeley, Cory 406, Berkeley, CA, 94720,  
United States

It is critical to obtain stability certificate before deploying RL in real-world mission-critical systems. This work justifies smoothness as an important property for stability-certified RL from a control-theoretic perspective. The smoothness margin can be obtained by solving a feasibility problem based on SDP for both linear and nonlinear dynamical systems, and it does not need to access the exact parameters of the learned controllers. Numerical evaluation on nonlinear and decentralized frequency control for large-scale power grids is demonstrated using (deep) neural-network policies. The study opens up new opportunities for robust Lipschitz continuous policy learning.

North Bldg 122C

### Grey Box Optimization

Sponsored: Optimization/Computational Optimization and Software  
Sponsored Session

Chair: Fani Boukouvala, Georgia Institute of Technology, Atlanta, GA, 30312, United States

#### 1 - RBF Surrogate Global Optimization in Serial and Parallel that Dramatically Outperform Gaussian Process (ego) Methods in Dimensions Over 9

Christine A. Shoemaker, Distinguished Professor, National  
University of Singapore, 107 Clementi Road, Block F. 09-01,  
Singapore, 129790, Singapore

We show comparisons between Gaussian Process (GP) and Radial Basis Functions (RBF) based surrogate global optimization on a large number of problems (including deep learning). The comparisons have multiple versions of GP-EI (EGO). The RBF methods include the DYCORDS-MRS acquisition function. With a fixed number of objective function evaluations, multiple trials, and a large number of problems, the GP-EI solutions are much worse than RBF-DYCORDS on average for dimensions 10, 20, 30, and 40. The reasons for those differences are quantitatively assessed and explained. We also show RBF parallel results and beneficial impact of dynamic replacement of global surrogate by multiple local RBF surrogates

#### 2 - Integrating Sensitivity Analysis in Computationally Expensive Black-box Optimization

Juliane Mueller, Lawrence Berkeley National Lab,  
2453 Bonar Street, Berkeley, CA, 94702, United States

Computationally expensive simulations are used in many fields of science to study complex natural phenomena. These simulations often contain a large number of parameters that must be optimized efficiently because the simulation's computational expense limits the number of parameter combinations that can be tried. The effect of many of these parameters on the simulation's output may not be well understood. In this talk, we present a method in which we integrate sensitivity analysis (SA) in the iterative sampling procedure of an adaptive surrogate model optimization algorithm. We compare the approach with a method that does not use the SA information and a two-stage approach.

#### 3 - Combine Surrogate Based Global Search and Trust Region Local Search for Improved Global Optimization

Limeng Liu, PhD Student, National University of Singapore, 21  
Lower Kent Ridge Rd, Singapore, 138600, Singapore,  
Christine A. Shoemaker

We design a new surrogate based algorithm for black-box continuous function optimization. Since Local minima in the global surrogate are promising regions for the global optimum, our algorithm intelligently selects among local minima in the surrogate as starting points for derivative free trust region based local search (ORBIT). Results show that our algorithms have good performance with high accuracy especially on high dimensional problems. There is a convergence proof for our algorithm. In addition to high accuracy, this framework has an advantage of easy parallelization.

#### 4 - Spatial Branch-and-Bound Data-Driven Optimization Using Surrogate Approximations

Jianyuan Zhai, Georgia Tech University, Atlanta, GA, United States

Abstract not available.

North Bldg 123

### Optimization in Social Networks

Sponsored: Optimization/Network Optimization

Sponsored Session

Chair: Balabhaskar Balasundaram, Stillwater, OK, 74078, United States

#### 1 - Generalizations of the Dominating Set Problem on Social Networks

Rui Zhang, University of Colorado, Boulder, CO, 80309, United States, Subramanian Raghavan

The positive influence dominating set problem is a generalization of the dominating set problem that arises on social networks. First, we show that it can be solved in linear time on trees. Next, we provide a tight and compact extended formulation, and derive a complete description of its polytope on trees. The formulation is also valid on general graphs, thus providing a new and stronger one. Facet defining conditions for the new inequalities are provided. A computational study is conducted.

#### 2 - On Detecting Second-order 2-clubs in Graphs

Yajun Lu, Oklahoma State University, Stillwater, OK, United States, Baski Balasundaram

This talk will discuss a decomposition approach to detect a type of “second-order” 2-club in graphs, called an  $r$ -robust 2-club. The problem is to find a subset of vertices with maximum cardinality such that there are at least  $r$  internally vertex-disjoint paths of length at most two in the induced subgraph. Complexity results, formulations, and preprocessing ideas will be discussed. Effectiveness of the algorithmic techniques in solving the problem will be demonstrated on a test-bed of instances. The numerical results show that our approach reduces the running times significantly in many cases. Extensions of this idea to other second-order 2-clubs will also be discussed.

#### 3 - Interdicting Low-diameter Clusters in Graphs

Hao Pan, Oklahoma State University, 4508 Aggie Drive, Stillwater, OK, 74074, United States, Juan Sebastian Borrero, Baski Balasundaram

A  $k$ -club, for a positive integer  $k$ , is a subset of vertices that induces a subgraph of diameter at most  $k$ . It is a clique relaxation that can be used to model low-diameter clusters in graph-based data mining. The  $k$ -clubs have been used to detect cohesive subgroups in social networks and functional modules in protein interaction networks. In this talk, we will consider an interdiction counterpart: given a graph  $G$  and a positive integer  $b$ , the  $k$ -club interdiction problem is to find a vertex subset  $S$  of size at most  $b$  such that the maximum  $k$ -club in  $G-S$  is minimized. We will discuss formulation and solution techniques for this min-max problem and discuss our preliminary findings in solving the problem when  $k = 2$ .

#### 4 - An Integer Programming Framework for Identifying Duplicate Network Personas

Sean Suehr, North Carolina Agricultural and Technical State University, 1601 E. Market Street, Greensboro, NC, 27411, United States, Chrysafis Vogiatzis

In this talk, we present an integer programming framework at the intersection of social network analysis and law enforcement intelligence that can identify persons of interest. Criminal networks are complex due to the limited and imperfect information available and the fact that participating entities misrepresent themselves so as to stay hidden. We formally define this problem and derive its computational complexity. We finish the talk with results on the criminal network of 9/11. Our approach identifies two distinct clusters of criminals participating in two separate subplots.

## ■ SA08

North Bldg 124A

### Bilevel Models in Network Optimization

Sponsored: Optimization/Network Optimization

Sponsored Session

Chair: Colin P. Gillen, University of Pittsburgh, 1025 Benedum Hall, 3700 O'Hara Street, Pittsburgh, PA, 15261, United States

#### 1 - Sequential Shortest Path Interdiction with Incomplete Information and Limited Feedback

Jing Yang, University of Pittsburgh, United States, Juan Sebastian Borrero, Oleg A. Prokopyev, Denis Saure

We study a sequential interdiction problem where the interdictor has partial information about the network. At each period, interdictor blocks at most  $k$  arcs to maximize evader's cost and then evader traverses the shortest path from two fixed nodes in the remaining graph. The interdictor doesn't know real cost, and at

each time she only observes the total cost of the path traversed by the evader. We propose GRN policy and investigate its properties as well as necessity. Moreover, we show that convergence to the optimal solution takes a worst-case exponential time. In this sense, we consider different versions of imperfect and randomized feedback, and prove worst-case polynomial convergence bounds.

#### 2 - On Bilevel Minimum and Bottleneck Spanning Tree Problems

Xueyu Shi, University of Pittsburgh, 1, Pittsburgh, PA, United States, Bo Zeng, Oleg A. Prokopyev

We study a class of bilevel spanning tree problems (BSTs) that involve two independent decision-makers (DMs), who jointly construct a spanning tree in a graph. One DM firstly selects a subset of edges from the set under her control. The other then completes the spanning tree construction using the edges selected. We study BSTs with the sum- and bottleneck-type objective functions for the two DMs. The polynomial-time algorithms are proposed in both optimistic and pessimistic settings for BSTs where at least one of the DMs has the bottleneck-type objective. For BST with the sum-type objectives for two DMs, we provide an equivalent single-level linear mixed-integer programming formulation.

#### 3 - Minimum Cost Edge Blocker Clique Problem

Foad Mahdavi Pajouh, University of Massachusetts-Boston, 100 Morrissey Boulevard, Boston, MA, 02125-3393, United States

The minimum cost edge blocker clique problem (EBCP) is introduced as the problem of blocking a minimum cost subset of edges in a graph so that each clique's weight is bounded above by some threshold. Large-weight cliques effectively model clusters of important actors with quick communications in real-world settings such as social, communication, and biological systems. This talk presents complexity results, polyhedral results, and two exact algorithms for this problem. Computational results of solving EBCP on a collection of random graphs and power-law real-world networks by using our proposed exact algorithms are also provided.

#### 4 - Critical Elements for Network Cascade Control

Colin P. Gillen, University of Pittsburgh, 1025 Benedum Hall, 3700 O'Hara Street, Pittsburgh, PA, 15261, United States, Alexander Veremyev, Oleg A. Prokopyev, Eduardo Pasillao

Network cascades represent a number of real-life applications: social influence, electrical grid failures, viral spread, and so on. The commonality between these phenomena is that they begin from a set of seed nodes and spread to other regions of the network. We consider a robust critical elements detection problem where the decision-maker wishes to control the spread of cascading behavior via node threshold modification (within a budget). The arc weights - how much influence one node has on another - are uncertain. The solution approaches include robust mixed-integer programming and centrality-based heuristics. Extensive computational experiments demonstrate the value of these methods.

North Bldg 124B

### Advances in First-Order Methods

Sponsored: Optimization/Nonlinear Programming

Sponsored Session

Chair: Angelia Nedich, ASU, Tempe, AZ, 85281, United States

#### 1 - A Push-pull Gradient Method for Distributed Optimization in Networks

Shi Pu, ASU, Tempe, AZ, 85281, United States, Angelia Nedich

We consider a new gradient-based method for distributed optimization in a directed network, where each agent has its own convex cost function and the goal is to minimize the sum of the functions. Each node maintains two estimates, namely, an estimate of the optimal decision variable and an estimate of the average gradient of the cost functions. From the viewpoint of an agent, the information about the decision variable (resp. gradients) is pushed to (resp. pulled from) the neighbors. The method unifies the algorithms with different distributed architecture, including decentralized and centralized ones. We show the algorithm converges linearly for strongly convex and smooth objective functions.

#### 2 - A Dual Approach for Optimal Algorithms in Distributed Optimization Over Networks

Cesar A. Uribe, University of Illinois at Urbana-Champaign, Urbana, IL, 61801, United States, Soomin Lee, Alexander Gasnikov, Angelia Nedich

We study the optimal convergence rates for distributed convex optimization problems over networks, where the objective is to minimize the sum of local functions of the nodes in the network. We provide complexity bounds for four cases: each function is strongly convex and smooth, when it is either strongly convex or smooth, and when it is convex but neither strongly convex nor smooth. Our approach is based on the dual problem and includes the graph that models the communication restrictions. We show distributed algorithms with the same optimal rates as their centralized counterparts (up to logarithmic factors), with an additional cost related to the communication graph.

### 3 - Using Second-order Information to Accelerate Incremental Gradient Methods

Hoi-To Wai, Arizona State University, Tempe, AZ, United States,  
Wei Shi, Cesar A. Uribe, Angelia Nedich, Anna Scaglione

Finite sum problems arise in applications of machine learning and control systems. To handle them, one may apply incremental method that divides the objective into chunks, processed one-at-a-time. Existing methods suffer from slow convergence limited by number of chunks involved. This talk introduces a curvature aided technique for incremental gradient methods. We propose a CIAG method using the technique and show that its asymptotic convergence rate is independent of the number of chunks. Two extensions are discussed: Nesterov acceleration is applied and an accelerated rate can be achieved; for distributed optimization, we use a random-walk based method with a rate robust to graph topology.

### 4 - Projective Splitting with Forward Steps: Asynchronous and Block-iterative Operator Splitting

Patrick Johnstone, Rutgers, 100 Rockefeller Rd., Piscataway, NJ, 08854, United States, Jonathan Eckstein

For a recently proposed projective splitting framework, we show how to replace the fundamental subproblem calculation using a backward step with one based on two forward steps. The resulting algorithms have the same kind of coordination procedure and can be implemented in the same block-iterative, distributed, and asynchronous manner, but may perform backward steps on some operators and forward steps on others. Prior algorithms in the projective splitting family have used only backward steps. Forward steps can be used for Lipschitz-continuous operators if the stepsize is bounded by the inverse of the Lipschitz constant, or if a backtracking procedure is used. We also derive convergence rates.

### Joint Session MSOM/Practice Curated: Empirical and Analytical Research to Improve Humanitarian Service Delivery

Sponsored: Manufacturing & Service Oper Mgmt

Sponsored Session

Chair: Mahyar Eftekhari, Arizona State University, Tempe, AZ, 85287, United States

#### 1 - What Drives Humanitarian Organizations' Donation Income? An Empirical Investigation

Iman Parsa, Arizona State University, Mahyar Eftekhari,  
Charles J. Corbett

For their survival, humanitarian organizations greatly depend on donations they receive. We empirically study how different factors impact individual donations and government grants that medium and large humanitarian organizations receive to see whether, and how, they can adopt policies to attract more donations. These factors include elements related to organizations' internal operations, such as program spending ratio and transparency, as well as external factors, like media exposure.

#### 2 - A Field Study of Charitable Giving Reveals that Reciprocity Decays over Time

Amanda Chuan, University of Pennsylvania, Philadelphia, PA, United States, Judd Kessler, Katherine Milkman

We examine how reciprocity changes over time using a large field study. We analyze data from a hospital system on 18,000 donation requests to former patients in the four months following their first hospital visit. We exploit quasi-experimental variation in solicitation timing and find that an extra 30-day delay between the provision of medical care and a donation solicitation decreases the likelihood of a donation by 30%. Our findings have important implications for models of economic behavior, which currently fail to incorporate reciprocity's sensitivity to time. The fact that reciprocal behavior decays rapidly also suggests the importance of capitalizing quickly on quid pro quo opportunities.

#### 3 - Communities in the Crossfire: How Companies Can Do Well by Doing Good

Andres Fernando Jola-Sanchez, Texas A&M University,  
College Station, TX, United States, Alfonso J. Pedraza-Martinez

We study how social investments in conflict zones affect firms' operational performance. Social investments can improve the well-being of communities in war-torn areas, but how do firms benefit from making these investments? We collect data from all the oil firms in Colombia and examine a law that compelled a group of these firms to spend 1% of their budget on social investments—the Colombian civil war is rampant in oil regions. We find this group obtains higher operating margins compared to the group the law did not affect. By influencing workforce, sourcing and logistics processes, social investments reduce the frequency of disruptions affecting firms in conflict zones.

### 4 - Supply Management for Rapid-onset Disasters: Effects of Supply, Demand, and Budget Uncertainty

Mahyar Eftekhari, Arizona State University, BA 433, Main Campus,  
P.O. Box 874706, Tempe, AZ, 85287, United States, Jing-Sheng  
Jeannette Song, Scott Webster

To fulfill beneficiaries' demands, humanitarian organizations should design a cost-efficient and time-effective procurement policy. We consider and analyze two common supply management policies: pre-positioning and local-purchasing. Our analysis takes demand, supply, and budget uncertainties into account.

### 5 - Do Optimization Models for Humanitarian Operations Need a Paradigm Shift

Harwin de Vries, INSEAD, Boulevard de Constance, Fontainebleau,  
77210, France, Luk N. Van Wassenhove

Optimization approaches for planning and routing of humanitarian field operations have been studied a lot. Yet, their adoption in practice seems absent. Based on interviews, literature, and modeling results, we discuss the applicability and cost-effectiveness of such approaches and identify areas where future research is needed.

### Supply Chain Finance/Risk Management

Sponsored: Manufacturing & Service Oper Mgmt/IFORM

Sponsored Session

Chair: Heikki Peura, Imperial College Business School, London, SW7 2AZ, United Kingdom

#### 1 - Trade Credit Provision and Inventory Performance

Christopher J. Chen, London Business School, London Business  
School, Regent's Park, London, NW14SA, United Kingdom,  
Nitish Jain, S. Alex Yang

Long payment terms in the form of trade credit are believed to be harmful to suppliers and was a driving force behind French regulation in 2008 limiting its duration. Using data on European retailers, we exploit variation in firms' exposure to the law in order to quantify its impact on trade credit usage. Leveraging this natural experiment further, we test theories on the relationship between trade credit and operational decisions.

#### 2 - Supplier Diversification Under Buyer Risk

Nikos Trichakis, MIT, Jiri Chod, Gerry Tsoukalas

When should a firm diversify its supply base? Most extant theories attribute supplier diversification to supplier risk. We develop a new theory that attributes diversification to buyer risk. When suppliers are subject to buyer default risk, buyers may take costly action to signal creditworthiness so as to obtain more favorable terms. But once signaling costs are sunk, buyers sourcing from a single supplier become vulnerable to future holdup. Although ex ante supply base diversification can be effective at alleviating this problem, we show that it comes at the expense of higher upfront signaling costs. We resolve the ensuing trade-off and show that diversification emerges as the preferred strategy.

#### 3 - The Value of Supply Chain Disruption Duration Information

Bill Schmidt, Cornell University, Ithaca, NY, United States,  
Mili Mehrotra

Using the supply chain and production data from a multinational division of a Fortune 500 manufacturing firm, we quantify the operational performance impact of disruption duration information. We identify several factors that influence the value of information, helping the firm to eliminate anywhere from less than 1% to as much as 100% of the cost of the disruption.

### Joint Session OR Frontiers/Practice Curated: Novel Applications of Operations Research

Emerging Topic: OR Frontiers

Emerging Topic Session

Chair: Srinivas Bollapragada, GE Global Research Center,  
Niskayuna, NY, 12309, United States

#### 1 - Optimal Scheduling of Field Resources for Power Plant Outages

Rajeev Namboothiri, GE Global Research, John F. Welch  
Technology Centre, Plot # 122, EPIP Phase 2., Bangalore, 560066,  
India, Srinivas Bollapragada, Babu Narayanan, Guillaume Camard,  
Ahmed Khattab

Power plants around the world require field resources to carry out maintenance outages. A host of complex constraints restrict the eligibility and availability of a field resource to perform a maintenance task. We developed a Field Resource Scheduling algorithm minimizing the total cost associated with field services while meeting all the real-world constraints. Using exhaustive preprocessing, an intelligently designed cost function, and a novel approach that iteratively solves a series of linear programs, we achieve the optimal solution within a few minutes. GE Power has been using this tool in the Middle East Africa region, resulting in operational cost savings of millions of dollars.

#### 2 - Optimizing Maintenance Operations at GE Wind Sites

Rajesh Tyagi, GE Global Research Center, 1 Research Circle,  
Niskayuna, NY, 12309, United States, Nitish Umang

GE Renewable, a leading producer of wind turbines, also sells service agreements to guarantee their operating availability at wind sites. These sites have up to 200 turbines, with outstanding maintenance work for a subset of turbines at any given time. We present a Digital Plan of the Day (DPOD) system that has been developed to optimize the maintenance operations to determine which turbines will have maintenance performed that day and develops a schedule for each crew. DPOD has so far been implemented at over 50 wind farms in North America.

#### 3 - Rail Network Operations Optimization

Srinivas Bollapragada, Chief Scientist, GE Global Research Center,  
1 Research Circle, K1-4A50A, Niskayuna, NY, 12309, United States

Each of the seven major railroads (called Class 1 railroads) in North America owns over 20,000 miles of track and runs over 1000 trains per day. Moving freight on such complex networks requires meticulous planning and execution. Multiple opportunities exist to realize large savings from improving railroad operations. For example, increasing the average speed of freight trains by one mile per hour saves a Class 1 railroad around \$200 million per year. Improving terminal (rail yard) operations and decreasing fuel consumed by locomotives also result in similar sized savings. We will describe some of our work on developing algorithms to improve operations of rail networks.

#### 4 - Rail Network Operations Optimization

Srinivas Bollapragada, PhD, Chief Scientist, GE Global Research  
Center, Niskayuna, NY, USA.

### Hospital Operations

Sponsored: Manufacturing & Service Oper Mgmt/Healthcare  
Operations

Sponsored Session

Chair: Anita L. Tucker, Boston University, Boston, MA, 02215,  
United States

#### 1 - Gatekeeping Under Congestion: An Empirical Study of Referral Errors in the Emergency Department

Michael Freeman, INSEAD, 1 Ayer Rajah Avenue, Singapore  
138676, Singapore, Stefan Scholtes, Susan Robinson

Using data from an ED, we study the effect of congestion on the accuracy of gatekeeping decisions (hospital admission or discharge home) and the effectiveness of a second gatekeeping stage (a clinical decision unit) in reducing

errors. We find that when congestion increases, physicians prevent an increase in wrongful discharges by lowering the threshold for hospital admission. This leads to a surge in avoidable hospitalizations and creates "false demand for hospital beds when ED physicians should be protecting this constrained resource. Introducing a second gatekeeping stage - to which physicians can pass patients if they are unable to make an accurate referral decision - can mitigate this effect.

#### 2 - Inpatient Overflow: An Approximate Dynamic Programming Approach

Pengyi Shi, Purdue University, 403 W. State St, Krannert School of  
Management, Kran 472, West Lafayette, IN, 47907, United States,  
Jim Dai

Due to the inherent variations in arrivals and discharges, hospital managers may assign a patient to a non-primary inpatient ward, especially when the patient has boarded in the Emergency Department (ED) for several hours. Such overflow practice helps alleviate ward congestion but may compromise quality of care. We formulate this overflow decision problem as a Markov decision process (MDP) within a multi-class, multi-pool queueing network setting. To overcome the curse-of-dimensionality, we develop an approximate dynamic programming (ADP) algorithm, where we use a novel combination of a fluid control model and an integrated single-pool model to guide the choice of the basis functions.

#### 3 - Impact of Health Information Technology Enabled Coordination on Inpatient Length of Stay

Temidayo Adepoju, Boston University, Boston, MA, 02215, United  
States, Helen Jin, Anita Tucker, Rebecca Lara, Chris Manasseh

Preparing patients for discharge is a complex process that involves the aggregate effort of multiple care providers. We examine how health IT-enabled coordination in discharge process can improve inpatient length of stay (LOS) through the use of an electronic tool called a pre-discharge order (PDO). A pre-discharge order is a tool in the EHR to facilitate discharge process. When completed, it appears as an electronic signal in a patient's chart to alert care providers of any discharge barriers a patient may have. We find that inpatient LOS is reduced when discharge process is coordinated using the pre-discharge order, particularly for patients with complex discharge placement.

#### 4 - Capacity Pooling in Hospitals: The Hidden Consequences of Off-service Placement

Hummy Song, The Wharton School, University of Pennsylvania,  
Philadelphia, PA, United States, Anita L. Tucker, Ryan Graue,  
Sarah Moravick, Julius J. Yang

Given a highly variable patient census at the service level yet a fixed allocation of inpatient beds to services, a significant portion of admitted patients become "off-service" patients. These patients are physically located in a bed that belongs to a different service (e.g., general surgery) while still being cared for by a physician of the service (e.g., cardiac medicine). We examine the tradeoffs and consequences of assigning incoming patients to an off-service bed as opposed to an on-service bed.

#### 1 - Information, Subsidies or Surge? An Experimental Approach to Drivers Relocation

Guangwen Kong, MN, United States, Yinghao Zhang,  
Zhongzhong Jiang

Relocating drivers to different geographical regions to reduce the mismatch between the demand and supply is important for on-demand ride hailing platform. We consider a variety of policies to incentivize drivers for relocation, including sharing information about supply and demand, suggestions for relocation, relocation cost subsidies, surge pricing, and their combinations. We examine the effectiveness of those policies to relocate drivers in a series of controlled lab experiments.

#### 2 - Examining Links Between Service Design and Customer Performance in High Anxiety Settings

Michelle A. Shell, Harvard Business School, 1 Upland Woods  
Circle, Unit 406, Norwood, MA, 02062, United States, Ryan Buell

Many service settings are rife with anxiety, yet the impact of anxiety on service relationships is not well understood, nor is it often factored into service design. Through a series of lab and field experiments, conducted in the high-anxiety domain of financial services, we document the negative effects of anxiety on customer performance. We further demonstrate how providing customers with access to human contact when they're feeling anxious can improve customers' willingness to engage, elevate their satisfaction with their own decisions, and engender greater trust in the company.

### 3 - Optimal Practice Processes for Performance

Guillaume Roels, INSEAD, Boulevard de Constance,  
Fontainebleau, 77305, France

Throughout their lifetime, people engage in many activities to learn new skills or develop their abilities. Although endurance sports training, motor learning, and cognitive learning have their own idiosyncrasies, they can all be viewed as processes of repeated practice to increase performance. Yet, there exist few guidelines to optimize such processes. Building upon research in endurance sports training and learning, this paper proposes a behavioral model of a practice process and optimizes it to maximize performance on a predefined date. We demonstrate the optimality of distributing practice over time, of tapering, and of periodization.

### 4 - Quality and Product Cycles in Fast Fashion

Xiaoyang Long, University of Wisconsin-Madison, Wisconsin  
School of Business, 975 University Avenue, Madison, WI, 53706,  
United States, Javad Nasiry

A “fast fashion business model allows firms to react quickly to changing consumer trends by introducing new products. We study the effect of this business model on a firm’s new product introduction frequency and product quality decisions when consumer taste changes over multiple periods.

### Appointment and Capacity Planning in Health Care

Sponsored: Manufacturing & Service Oper Mgmt/Service  
Operations

Sponsored Session

Chair: Itai Gurvich, Cornell University, New York, NY, 10044,  
United States

Co-Chair: Benjamin Grant, Kellogg School of Management,  
Evanston, IL, 60201, United States

#### 1 - Managing Appointment Booking Under Customer Choices

Nan Liu, Boston College, 140 Commonwealth Avenue, Fulton  
Hall, Room 340, Chestnut Hill, MA, 02467, United States,  
Peter Van de Ven, Bo Zhang

Motivated by the increasing use of online appointment booking platforms, we study how to offer appointment slots to customers in order to maximize the total number of slots booked. We develop two models, non-sequential offering and sequential offering, to capture different types of interactions between customers and the scheduling system. In these two models, the scheduler offers either a single set of appointment slots for the arriving customer to choose from, or multiple sets in sequence, respectively. Given the ongoing growth of online and mobile appointment booking platforms, our research findings can inform user interface design of these booking platforms.

#### 2 - The Zocdoc Effect: How Does Online Information Impact Appointment Availability in Outpatient Care?

Yuqian Xu, University of Illinois at Urbana-Champaign, Wohlers  
Hall 487, 1206 S. 6th St, Champaign, IL, 61820, United States,  
Mor Armony

In this paper, we propose a queueing model to study the impact of online information on doctor’s service decisions. We characterize the equilibrium strategy of the doctor, and show the impact of market size on the equilibrium strategy.

#### 3 - Optimal Dynamic Appointment Scheduling of Base and Surge Capacity

Benjamin Grant, Kellogg School of Management, 1881 Oak  
Avenue, # 1307W, Evanston, IL, 60201, United States,  
Itai Gurvich, Jan A. Van Mieghem, R. Kannan Mutharasan

We study dynamic stochastic appointment scheduling when delaying appointments increases the risk of incurring costly failures, such as readmissions in health care or engine failures in preventative maintenance. When near-term base appointment capacity is full, the scheduler faces a trade-off between delaying an appointment at the risk of costly failures versus the additional cost of scheduling the appointment sooner using surge capacity.

### Electricity Demand Side Management

Sponsored: Manufacturing & Service Oper Mgmt/Sustainable  
Operations

Sponsored Session

Chair: Ali Fattahi, University of California-Los Angeles, Los Angeles,  
CA, 90095, United States

#### 1 - Demand Response Planner for Building Districts

Juan Alejandro Gomez-Herrera, Polytechnique Montreal,  
Montreal, QC, Canada, Miguel F. Anjos, Luce Brotcorne

We present a demand response planner for a district with heterogeneous buildings. This approach allows to aggregate a large number of end-users by identifying and selecting power capacity profiles. The user engagement combined with storage and local generation resources allows to provide demand response services to the grid operator. We use a multi-objective optimization model to trade off the total cost of energy consumption and the user’s dissatisfaction generated by load shifting. Computational experiments validate the performance of the proposed approach.

#### 2 - A Computational General Equilibrium Model for Power Interruption Contracts

Lakshmi Palaparambil Dinesh, Purdue Fort Wayne, Fort Wayne,  
IN, United States

Demand Response (DR) is reduces consumer electricity bills and energy consumption. There are several models incorporating DR technology into customer bill reduction models. Our model focuses on large scale mixed integer linear programming. In this paper, we plan to look at a DR customer bill reduction when there are back up storage devices such as batteries or solar photovoltaic cells available to the customer. We explore three possible scenarios (i) Does the customer bill reduce further when there are batteries/solar as well as DR? (ii) If there is a reduction, how sizable is that reduction? (iii) How do the solution times change when back up storage is included in the model?

#### 3 - That’s Not Fair: Tariff Structures for Electricity Markets with Rooftop Solar

Siddharth Prakash Singh, Carnegie Mellon University, Tepper  
School of Business, 5000 Forbes Avenue, Pittsburgh, PA, 15213,  
United States, Alan Scheller-Wolf

Increased penetration of rooftop solar has led to decreased utility profitability and undesirable cross-subsidization among customers. Regulatory responses have been controversial; changes in Nevada induced SolarCity, the market leader in solar systems, to suspend operations. We show analytically that for a regulator to induce a socially desirable outcome, two tariff features are essential — the ability to discriminate among customer tiers and the ability to discriminate between solar and non-solar customers. We present a tariff, featuring full retail price repurchasing from residential solar customers with these features. We use data from Nevada and New Mexico to illustrate our findings.

#### 4 - An Analysis of Demand Response Programs in the Wholesale Electricity Market

Asligul Serasu Duran, Haskayne School of Business, University of  
Calgary, Calgary, AB, Canada, Baris Ata, Ozge Islegen

We build a model to explore the participation and the compensation of demand response (DR) providers in the wholesale electricity market, motivated by the Federal Energy Regulatory Commission’s (FERC) order that authorized DR resources to receive the same market clearing prices that generating resources receive. We consider alternative compensation schemes for DR providers, and explore the changes in the investment decisions, electricity prices, generators and DR providers’ profits, and consumer welfare.

#### 5 - Peak Load Energy Management by Direct Load Control Contracts

Ali Fattahi, University of California-Los Angeles, Anderson School  
of Management, B501, Los Angeles, CA, 90095, United States,  
Sriram Dasu, Reza Ahmadi

We study peak load energy management by direct load control contracts (DLCCs) that utilities use to curtail electricity consumption of the participating customers during peak load periods. These contracts stipulate a limit on the number of times (calls) and the total number of hours of power reduction per customer as well as the duration of each call. This is a provably difficult (NP-hard) optimization problem. We develop an approximation scheme and analyze its asymptotic behavior. We show that the relative error approaches zero as problem size (length of the horizon) approaches infinity. We apply our solution approach to the data provided by three major utility companies in California.

Sponsored Session

Chair: Jayashankar M. Swaminathan, University of North Carolina-Chapel Hill, Chapel Hill, NC, 27599-3490, United States

Co-Chair: Ali Kemal Parlakturk, University of North Carolina Kenan-Flagler, Chapel Hill, NC, 27599-3490, United States

**1 - Retailing with 3D Printing**

Yao Cui, Cornell University, 401N Sage Hall, Ithaca, NY, 14853, United States, Li Chen, Hau Leung Lee

In this paper, we study the impact of adopting 3D printing in a dual-channel (i.e., online and in-store) retail setting, on a firm's product offering and pricing decisions for the two channels, as well as supply chain operations.

**2 - Decentralized Customization with 3D Printing: Drivers of Retail Level 3D Printing**

Nagarajan Sethuraman, UNC Chapel Hill, Chapel Hill, NC, 27514, United States, Ali Kemal Parlakturk, Jayashankar M. Swaminathan

In this paper, we study the trade-offs involved in decentralized customization enabled by 3D printing at retail stores. We develop an analytical model that considers in-store 3D printing as a component of the firm's broader product line strategy. Managerial insights from our novel model can guide the adoption of 3D printing at retail stores.

**3 - Product Management and Innovation in a Supply Chain**

Hyoduk Shin, Junghee Lee, Vish Krishnan

In a technology-intensive supply chains, intellectual property invented by an upstream firm must be embedded in a manufactured subsystem which is then integrated into a full system sold to end consumers. Upstream technology providers face key business model decisions about how to monetize their innovation, which is the focus on this study. They typically employ a royalty-driven business model, but the royalty-based approach has gotten complicated in industrial multi-lateral supply chains. We consider these business model decisions in the context of the industry structure of the subsystem and full system markets.

**4 - Printing Spare Parts at Remote Locations. Fulfilling the Promise of Additive Manufacturing**

Rob Basten, Associate Professor, Eindhoven University of Technology, Eindhoven, Netherlands, Bram Westerweel, Geert-Jan Van Houtum

We investigate the benefits of on-site printing of spare parts at remote geographical locations. We consider a periodic-review inventory control system with two supply sources. Regular replenishments occur according to a fixed interval. In between replenishments, spare parts can be printed that possess a lower reliability than regular parts. We characterize the optimal inventory control policy and conduct experiments to investigate the benefits of on-site printing. Using case studies with the Royal Netherlands Army we show that simple AM technology can create significant benefits. Our results show that remote locations are a prime candidate for implementing AM technology to print spare parts.

**New Problems in Supply Chain**Sponsored: Manufacturing & Service Oper Mgmt/Supply Chain  
Sponsored Session

Chair: Georgia Perakis, Massachusetts Institute of Technology, Cambridge, MA

**1 - Value of Failure Prediction Models for Efficient Network Inspection Operations**

Mathieu Dahan, Massachusetts Institute of Technology, 77 Massachusetts Avenue, Room 1-253c, Cambridge, MA, 02139, United States, Steven B. Link, Saurabh Amin, Georgia Perakis

Can infrastructure utilities significantly improve their network inspection operations using predictive failure models? To address this question, we formulate a multi-stage stochastic problem for scheduling regions to visit and inspecting each region. The objective is to maximize failure localization performance under timing, sensing, and routing constraints. We apply techniques for solving submodular function optimization under matroid constraints, and evaluate the solution quality under offline prediction, dynamic customer calls, and strategic probing. We estimate the value of diagnostic information in these cases using data from SF Bay area's gas pipeline inspection operations.

**2 - Inducing Fresh Food Spending Through Optimal Incentives**

Elisabeth Paulson, MIT, Retsef Levi, Georgia Perakis

We consider a two-stage scenario where a planner first allocates a fixed budget across possible interventions, and the consumer then decides how to allocate his food budget between fresh food and other options. The goal of the planner is to maximize the consumer's spending on fresh food. We formulate this game as a two-stage optimization problem with equilibrium constraints, and consider both single-period and stationary multi-stage versions. We present structural results on the planner's optimal budget allocation, validate our results on a nationally representative data set, and compare these results to the current status quo of federal spending.

**3 - Pricing For Heterogeneous Products: Analytics for Tickets Reselling**

Rim Hariss, Massachusetts Institute of Technology, Operations Research Center, 1 Amherst Street, Cambridge, MA, 02142, United States, Max R. Biggs, Charles Herrmann, Michael Li, Georgia Perakis

In collaboration with a major secondary ticket exchange, we study a trading strategy for buying and reselling tickets for events. We look at classifying whether each individual ticket will sell at a given price, in the presence of confounding factors. We construct an optimization based ticket trading strategy that is the reseller is piloting as well as a novel method for heterogeneous treatment effect estimation for classification. On synthetic datasets this approach beats state-of-the-art machine learning approaches for estimating treatment effects. We show using our approach to trade on NBA ticket listings yields a seller's revenue up to \$9.6 million (27% return) for a single season.

**4 - Performance Guarantees for Revenue Maximization in Online Type Matching**

Elahleh Fata, Massachusetts Institute of Technology, 125 Massachusetts Avenue, Aeronautics and Astronautics, Cambridge, MA, 02139, United States, Will Ma, David Simchi-Levi

In today's online marketplaces, the problem of dynamically matching agents in real-time is becoming increasingly prevalent. It captures important tradeoffs faced by the emerging sharing economy, as well as classical inventory and production decisions faced by the transportation industries. The dynamic matching of agents is an inherently challenging task due to the uncertainty in the future agents' arrival. We consider this problem from the perspective of a central platform who, through historical data, has established the types of agents that could potentially arrive and the relationships between them. The platform's goal is to maximize the total reward earned by matching agents over time.

**Platform Ecosystem Management**Sponsored: Revenue Management & Pricing  
Sponsored Session

Chair: Hemant K. Bhargava, University of California, Davis, CA, 95616, United States

Co-Chair: Ramnik Arora, Facebook, Menlo Park, CA, 9, United States

**1 - Salesforce Incentives for Selling Platforms**

Hemant K. Bhargava, University of California, Gh-3108, Graduate School of Management, Davis, CA, 95616, United States, Olivier J. Rubel

We present a model of salesforce incentives for selling platforms, considering both direct and cross-market network effects, which distort the traditional tensions inherent in designing salesforce compensation plans.

**2 - Impact of Platform Venture Capital Investments on the Entry and Exit of Complementary Applications in Ecosystems**

Arvind Karunakaran, McGill University, Montreal, QC, H3H 2P2, Canada, Joey Van Angeren

We examine how platform venture capital (PVC) investments affect the entry and exit of complementary applications. We hypothesize that complementors are more likely to introduce and less likely to retract apps in their market niche following a PVC investment. We test this using data collected from a B2B platform.

**3 - Economic Analysis of Peer-to-peer Insurance**

Hong Guo, University of Notre Dame, 356 Mendoza College Of Business, University of Notre Dame, Notre Dame, IN, 46556-5646, United States, Yu-Chen Yang, Yong Jin

Peer-to-peer (P2P) insurance is an emerging form of insurance contract enabled by InsurTech advancements. Building upon classic principal-agent model with moral hazard, this paper studies the key characteristics of P2P insurance as a form of insurance contract and compares it to traditional insurance contracts. We identify conditions under which P2P insurance alleviates moral hazard and evaluate its efficiency.

#### 4 - Formal Barriers to Proof of Stake Protocols

Christos-Alexandros Psomas, Carnegie Mellon University, PA,  
United States, Jonah Brown-Cohen, Arvind Narayanan,  
Seth Matthew Weinberg

The security of most existing cryptocurrencies is based on a concept called Proof of Work, in which users must solve a computationally hard cryptopuzzle to authorize transactions ("one unit of computation, one vote"). Proof of Stake is an alternative concept that instead selects users to authorize transactions proportional to their wealth ("one coin, one vote"). In this work we focus on incentive-driven deviations (participants deviate if doing so yields higher reward) instead of adversarial corruption (an adversary controls part of the network, but everyone else is honest) and show several formal barriers to designing incentive-compatible PoS cryptocurrencies.

North Bldg 129A

#### Data Driven Models for Revenue Management and Pricing in Industry

Sponsored: Revenue Management & Pricing

Sponsored Session

Chair: Ravi Kumar, PROS, Inc. World Headquarters, Houston, TX

##### 1 - Methods of Handling Flexible Capacity in Hotel Revenue Management

Matthew Maxwell, SAS Institute, Inc., 500 SAS Campus Drive,  
Cary, NC, 27513, United States

One of the fundamental assumptions of revenue management is that capacity is fixed. In some situations this restriction is relaxed by using one type of capacity to fulfill requests for a different type of capacity. The most common practice of this concept is upgrading where a request for a lower class of capacity is satisfied by a higher class of capacity. An alternate form of flexible capacity is that of component rooms, or virtual suites. In this scenario, a set of rooms can either be closed off and sold as separate individual units or combined and sold as a larger, more valuable suite. We explore methods for handling this type of flexible capacity.

##### 2 - Reinforcement Learning for Revenue Management and Pricing

Manu Chaudhary, PROS, Houston, TX, 77054, United States,  
Warren Scott

We discuss two algorithms to automatically and dynamically generate optimal prices for non-negotiated settings. For the first algorithm, dynamic pricing problem is posed as a Multi Armed bandit problem and is solved using Beta-Bernoulli-Thompson Sampling (TS). The second algorithm is based on more traditional approach of calculating demand response models but the optimization method considers confidence intervals around mean demand to reduce risk. We compare the performance of these algorithms using simulations.

##### 3 - Flexible Products in Air Cargo Revenue Management

Dirk Daniel Sierag, PROS, Houston, TX, United States

Air Cargo is a highly volatile business, especially regarding uncertainty in the volume and weight of the shipments and capacity of the plane. Moreover, a full flight often consists of only a small number of shipments. We propose a revenue optimization model that deals with the uncertainty in two ways: first, demand is modeled as flexible products; and second, a robust optimization approach is proposed.

##### 4 - Holistic Approach to Predicting the Wholesale Energy Market Prices

Bokan Chen, CA, United States, Ana Radovanovic, Tommaso Nesti

Electricity market price predictions enable energy market participants to shape their consumption or supply while meeting their economic and environmental objectives. By utilizing the basic properties of the supply-demand matching process performed by grid operators, we developed a method to recover energy market's structure and predict the resulting prices as a function of generation mix and system load on the grid. Our methodology uses the latest advancements in compressed sensing and statistics to cope with the highly dimensional and sparse real grid topology graphs, underlying physical laws, as well as scarce and public market data.

#### Bridging Machine Learning and Revenue Management

Sponsored: Revenue Management & Pricing

Sponsored Session

Chair: Xi Chen, NYU Stern School of Business

##### 1 - Data Driven Algorithms for Assortment Planning Under Nested Logit Model

Yuan Zhou, Indiana University at Bloomington, Xi Chen,  
Yining Wang

Dynamic assortment planning concerns about the optimal displaying strategy to maximize total revenue over the selling season with no a priori information on consumers' choice model parameters. Combining combinatorial techniques and the powerful lower-upper confidence bound (LUCB) method, we develop data-driven algorithms to simultaneously learn consumers' model (the Nested Logit model) and optimize assortment selection decisions. Our algorithms' performance guarantees surprisingly do not depend on the number of candidate products, which is particularly useful in settings such as fast fashion retailing and online advertising.

##### 2 - Learning Preferences with Side-information: Near Optimal Recovery of Tensors

Andrew Li, MIT, Cambridge, MA, United States, Vivek Farias

Many recent problems in e-commerce can be cast as large-scale problems of tensor recovery. Thus motivated, we study the problem of recovering tensors from their noisy observations. We provide an efficient algorithm to recover structurally simple tensors given noisy observations of their entries; our version of simplicity subsumes low rank tensors for various definitions of tensor rank. Our algorithm is practical for massive datasets and provides a significant performance improvement over incumbent approaches to Tensor recovery. Further, we show a near-optimal recovery guarantee. Experiments on music streaming data demonstrate the performance and scalability of our algorithm.

##### 3 - Attribute Based Dynamic Learning Approach to Assortment Selection

Avadhanula Vashist, Columbia University, Shipra Agrawal,  
Vineet Goyal, Assaf Zeevi

We consider an online assortment optimization problem, where in every round, the retailer offers an assortment of  $N$  substitutable products to a consumer, and observes the consumers response. We assume that the products are described by a set of attributes and the mean utility of a product is linear in the values of attributes. We model consumer choice behavior using the widely used multinomial logit (MNL) model, and consider the retailer's problem of dynamically learning the model parameters, while optimizing cumulative revenues over the selling horizon  $T$ . We present an algorithm whose regret only depends on the number of attributes and is independent on the number of products.

##### 4 - Dynamic Assortment Selection with Features

Wang Yining, Carnegie Mellon University

We consider the problem of dynamic assortment planning with features. More specifically, each item is associated with a known revenue parameter and a known feature vector (which changes over time), and the customers' preferences are modeled by items' feature vectors together with an unknown linear model. We discuss intuitive policies for dynamic planning (i.e., learning preference models and maximize expected revenues at the same time) and give near-optimal regret analysis.

##### 1 - Spot Scheduling for Cable Networks

Xin Ma, Turner Broadcasting System, Inc., 1050 Techwood Dr NW,  
Atlanta, GA, 30318, United States, J. Antonio Carbajal

Spot scheduling is a media planning process in which TV commercials are placed into buckets of commercial airtime for airing. In this presentation, we provide some background information of media planning, and review different types of deals, constraints, and requirements involved in this process. Then we introduce the spot scheduling problem, and discuss how we decompose it in a multi-stage optimization framework that realizes spot prioritization and best use of Turner's commercial airtime.

## 2 - A Probabilistic Modeling Framework to Optimize Volume Pricing Settings

Jose Luis P. Arreola, Home Depot (Blacklocus), Austin, TX,  
United States, Joseph Nipko

We optimize volume pricing settings in terms of tier quantity ( $Q_i$ ) and discount ( $d_i$ ) over retail price in order to perform constrained optimization on performance metrics such as Margin, Revenue and Unit Sellthrough. Our inference approach is based on probabilistic modeling of the order size distribution of similar products, under an observed array of ( $Q_i$ ,  $d_i$ ) settings. Further, our methodology allows for the overlaying of product-specific context parameters in a modular way. We apply our approach to three different groups of construction material products and we conduct market price tests on them. We observe that our framework predicts directionally correct revenue and margin lift estimates.

## 3 - DP Based Efficient Frontier in Revenue Management

Wei Wang, PROS Inc, 3100 Main St, Suite #900, Houston, TX,  
77002, United States, Fangzhou Sun, Darius Walczak,  
Subhash C. Sarin

In this paper, we consider jointly optimizing expected profit contribution and resource utilization for revenue management problems. In particular we use a constrained Markov decision process-based approach to find the corresponding efficient frontier.

## 4 - Predicting Users' Forecast Influences via Machine Learning

Ang Li, PROS, Inc., 3100 Main Street, Suite #900, Houston, TX,  
77002, United States, Stephanie Zipkin

Airline RM analysts spend a significant amount of time monitoring and influencing forecasted demand. In this innovation study, we developed several supervised learning models to predict demand and influences based on historical data. In particular, we derived features which mimic a variety of influence criteria and rules the analysts apply through surveying domain experts. Our numerical experiments show that a medium-complexity decision tree model reliably predicts user influences with low error rate. We discuss how the RM system may be augmented with our model, and outline our next steps of study.

## Joint Session FSS/Practice Curated: Financial Engineering Applications

Sponsored: Finance

Sponsored Session

Chair: Justin Sirignano, University of Illinois at Urbana-Champaign,  
Irvine, CA, 92617, United States

Co-Chair: Alexandra Chronopoulou, University of Illinois,  
Urbana-Champaign, Urbana, IL

## 1 - Optimal Kernel Estimation of Spot Volatility of Stochastic Differential Equations

Jose E. Figueroa-Lopez, Washington University-St Louis, One  
Brookings Drive, St Louis, MO, 63130, United States

A feasible method of bandwidth and kernel selection for spot volatility kernel estimators is proposed, under some mild conditions on the volatility process, which not only cover classical Brownian motion driven dynamics but also some processes driven by long-memory fractional Brownian motions. The optimal selection of the kernel function is also investigated. For Brownian Motion type volatilities, the optimal kernel turns out to be an exponential function, while, for fractional Brownian motion type volatilities, numerical results to compute the optimal kernel are devised. Simulation studies further confirm the good performance of the proposed methods. This is based on joint work with Cheng Li.

## 2 - Delta-hedging in Fractional Volatility Models

Alexandra Chronopoulou, University of Illinois, Urbana-Champaign,  
104 South Mathews Avenue, 117 Transportation Building, Urbana, IL, 61801, United States, Qi Zhao

In this talk, we propose a delta-hedging strategy for a long memory stochastic volatility model (LMSV). This is a model in which the volatility is driven by a fractional Ornstein-Uhlenbeck process with long-memory parameter  $H$ . We compute the so-called hedging bias, i.e. the difference between the Black-Scholes delta and the LMSV delta as a function of  $H$ , and we determine when a European-type option is over-hedged or under-hedged. Finally, we apply our approach to SP 500 data.

## 3 - Mean Field Analysis of Neural Networks in Machine Learning

Alexandra Chronopoulou, University of Illinois, Urbana-Champaign,  
104 South Mathews Avenue, 117 Transportation Building, Urbana, IL, 61801, United States, Justin Sirignano,  
University of Illinois at Urbana-Champaign, Irvine, CA, USA.

Neural network models in machine learning have revolutionized fields such as image, text, and speech recognition. There's also growing interest in using neural

networks for applications in science, engineering, medicine, and finance. Despite their immense success in practice, there is limited mathematical understanding of neural networks. We mathematically study neural networks in the asymptotic regime of simultaneously (A) large network sizes and (B) large numbers of stochastic gradient descent training iterations. We rigorously prove that the neural network satisfies a Law of Large Numbers (LLN) and a Central Limit Theorem (CLT). The LLN is the solution of a nonlinear partial differential equation while the CLT satisfies a stochastic partial differential equation.

## 4 - Deep Learning in Asset Pricing

Markus Pelger, Stanford University, 312 Huang Engineering  
Center, 475 Via Ortega, Stanford, CA, 94305, United States

We estimate a general non-linear asset pricing model and optimal portfolios with a deep-neural network applied to all U.S. equity data combined with all relevant macroeconomic and firm-specific information. No-Arbitrage Pricing theory implies that the conditional expectation of the discounted excess returns are zero under the risk-neutral probability. Our data-driven approach estimates the stochastic discount factor that explains all asset prices from this basic assumption. Our model allows us to identify the key factors for asset prices, find mis-pricing of stocks and generate the optimal portfolio with the highest Sharpe ratio.

## 1 - Beauty Contest and Social Value of Fintech: An Economic Analysis

Anurag Garg, University of Florida, Gainesville, FL, 32603,  
United States, Liangfei Qiu, Subhrajyoti Bandyopadhyay

With the advance of Fintech, traders in financial markets use the information available on social media to gauge investor sentiment and form higher order beliefs. Following the insight of Keynes (1936) on beauty contest, we develop an analytical model to analyze how higher order beliefs, driven by the Fintech revolution, affect market efficiency. We find that higher order beliefs tend to reduce market efficiency because public information is over weighted. Since accounting disclosure is a main source of public information, our results highlight that the optimal level of accounting disclosure (transparency) can be dramatically affected by the use of Fintech in financial trading.

## 2 - Clustering of Heterogeneous Retailers at Heterogeneous Locations

Hong Guo, University of Notre Dame, 356 Mendoza College Of  
Business, University of Notre Dame, Notre Dame, IN, 46556-5646,  
United States, Chao Ding, Xuying Zhao,  
Jing-Sheng Jeannette Song

In this paper, we investigate the clustering phenomenon of heterogeneous retailers at heterogeneous locations. Specifically, we develop a game theoretical model to analyze mainstream and niche retailers' incentives to locate close to each other and their choices between central and peripheral locations.

## 3 - An Empirical Investigation of Online Crowd-funding Performance

Lina Zhou, University of North Carolina-Charlotte, Charlotte, NC,  
USA, Kexin Zhao, Anamika Paul, Xia Zhao

Online crowdfunding is an emerging platform that facilitates raising money for a for-profit or non-profit project from a large number of people. The determinants of online crowdfunding performance may depend on the type of a project. We conducted an empirical investigation of one type of crowdfunding project to gain insights into its performance.

## 4 - Search Engine Advertising; Optimal Contractual Strategies Between Firms and Their Affiliates

Siddharth Bhattacharya, Fox School of Business, Temple  
University, Alter Hall, 1801 Liacouras Walk, Philadelphia, PA,  
19122, United States, Subodha Kumar, Sunil Wattal

Firms increasingly utilize third party affiliates to advertise on their behalf. The focus of our research is to find what optimal pricing and advertising strategies between firms and affiliates maximize profits and how does product quality, customer heterogeneity, affiliate type and type of ad contract (with Google) affect those strategies.

### Approximations and Controls of Queues

Sponsored: Applied Probability

Sponsored Session

Chair: Yunan Liu, NCSU

#### 1 - Staffing and Scheduling to Differentiate Service Levels in Multiclass Overloaded Queues with Time-varying Arrivals

Xu Sun, Columbia University, Kyle Hovey, Yunan Liu

Motivated by large-scale service systems (e.g., emergency departments), we study an overloaded multi-class queueing system having time-varying arrivals. Our objective is to devise appropriate staffing and scheduling policies to achieve differentiated service levels for each customer class. Our proposed policy is both time dependent (coping with the time variability in arrival pattern) and state dependent (capturing the stochastic variability in service times and arrival times). Effectiveness of our staffing and scheduling rules are confirmed by heavy traffic limit theorems (with the system scale increases) and computer simulation experiments.

#### 2 - Many Server Scaling of the N-system Under FCFS-LISF

Dongyuan Zhan, University College London, Gideon Weiss

The N-System with independent Poisson arrivals and exponential server-dependent service times under first come first served and assign to longest idle server policy has explicit steady state distribution. We scale the arrival and the number of servers simultaneously, and obtain the fluid and central limit approximation for the steady state. This is the first step towards exploring the many server scaling limit behavior of general parallel service systems.

#### 3 - On the Stability of Large-scale Markovian Parallel Server Networks

Guodong Pang, PhD, Penn State University

We will discuss stability of Markov parallel server networks with/without abandonment in the Halfin-Whitt regime. In particular, exponential ergodicity properties are presented for both the limiting controlled diffusions and the diffusion-scaled queueing processes under various scheduling policies.

#### 4 - State Dependent Pricing in Naor Model with Arrival Rate Uncertainty

Chengcheng Liu, The University of Texas at Austin, Austin, TX, United States, John Hasenbein

This paper examines extensions of Naor's observable queueing model in which arrival rate is not known with certainty by either customers or system managers. We consider the arrival rate as a non-degenerate random variable with unknown realizations. This work is also an extension of the study of Chen and Hasenbein on a related model in that their model only considers homogeneous customer populations. In view of a social optimizer (SO) and a revenue maximizer (RM), we analyze the social benefit rate and revenue rate, and investigate optimal state-dependent pricing policies in the presence of arrival rate uncertainty.

#### 5 - On Brownian Approximation for Superposition of Renewal Processes

Shuangchi He, National University of Singapore, 1 Engineering Drive 2, Dept. of Industrial and Systems Engineering, Singapore, 117576, Singapore

We investigate the superposition of many stationary renewal processes. A centered and scaled version of this superposition process is known to weakly converge to a Gaussian process, which is in general not a Brownian motion. By an expansion of the covariance function, we discuss when the superposition process can be accurately approximated by a Brownian motion. We also discuss an application to many-server queues with a general service time distribution in the efficiency-driven regime.

### Joint Session MSOM/APS: Supply Chain Management: Pricing, Shipping, and Expansion

Sponsored: Manufacturing & Service Oper Mgmt

Sponsored Session

Chair: Nan Yang, University of Miami, Coral Gables, FL, 33146, United States

Co-Chair: Panos Kouvelis, Washington University in St. Louis, One Brookings Drive, Campus Box 1156, Saint Louis, MO, 63130-4899, United States

#### 1 - Shipping Consolidation Across Two Warehouses with Delivery Deadline and Expedited Options for E-commerce and Omni-channel Retailers

Lai Wei, University of Michigan, Ann Arbor, MI, United States, Stefanus Jasin, Roman Kapuscinski

Shipment consolidation is commonly used to avoid some of the shipping costs. However, when pending current orders are consolidated with future orders it may require more expensive expedited shipment to meet shorter deadlines. In this paper, we study the optimal consolidation policy focusing on the trade-off between economies of scale and expedited shipping cost. The optimal policies and their structures are characterized, where the impact of expedited shipment on both shipping policy and order fulfillment policy are explored. Two easily implementable heuristics are proposed, which perform within 1-2% of the optimal in intensive numerical tests.

#### 2 - Joint Pricing and Inventory Optimization Under Minimax Regret

Chengzhang Li, Purdue University, West Lafayette, IN, United States, Qi Feng, Mengshi Lu

We study a robust pricing newsvendor problem under the min-max regret framework where the firm only knows the interval in which the random factor lies with high confidence in the demand model. We characterize the optimal decisions with a general demand model and further study the impact of inventory risk by comparing the optimal price and the risk-free price. We also study comparative statics of the optimal price with different unit cost and degree of demand ambiguity. Finally, our approach outperforms the traditional one in a data-driven setting with small sample sizes, high demand variability, or demand model misspecification.

#### 3 - Supply Chain Competition: A Market Game Approach

C Gizem Korpeoglu, University College London, Gower Street, London, WC1E 6BT, United Kingdom, Ersin Korpeoglu, Soo-Haeng Cho

We study expansion and integration of supply chains where multiple suppliers sell to multiple retailers through a wholesale market. While the prior literature fails to capture retailers' influence on the wholesale price, we develop a novel model based on a market-game mechanism that captures it. We show that more retailers raise the wholesale price and improve retailer profits, and hence the supply chain expansion is more beneficial than the prior literature finds. We then analyze integration of local supply chains, and find that this integration raises the total profit of all firms, but may reduce the total profit of firms in a retailer-oriented local supply chain with more retailers than suppliers.

#### 4 - Impact of Price Postponement and Risk Aversion Under Supply Random Yield

Panos Kouvelis, Washington University in St. Louis, One Brookings Drive, Campus Box 1156, Saint Louis, MO, 63130-4899, United States, Guang Xiao, Nan Yang

In this paper, we investigate the impact of price postponement and risk aversion under supply yield risk. More specifically, we study a risk averse monopoly firm's production and pricing decisions under supply random yield with two distinct pricing schemes: ex ante pricing and responsive pricing. We adopt the conditional-value-at-risk (CVaR) as the risk aversion measurement, and investigate the impact of the firm's risk aversion level on its optimal decisions and the corresponding profit.

### Joint Session TSL/Urb/Practice Curated: Activity Modeling and Applications in Urban Transport

Sponsored: TSL/Urban Transportation

Sponsored Session

Chair: Jee Eun Kang, University at Buffalo, Buffalo, NY, 14260, United States

#### 1 - Strategic Public Parking Locations with Routing Considerations of Individual Autonomous Vehicles

Somayeh Dejbord, University at Buffalo, Tonawanda, NY, United States

Use of personal Autonomous vehicles (AV) will lead to increased Vehicle-Miles-Traveled (VMT) particularly due to empty trips. While a decision maker makes the parking location decision (public), the decision of using the parking is made by individual private AV owners, households. A location siting model uses flow-based demand data as an input but the actual decision of using parking is made individually with finer details such as what household members' daily itineraries are. We develop a methodology to approximate input data for the location model using data available to the decision maker.

#### 2 - Integrating Augmented Reality, Gamification and Social Interactions in Mobile Apps to Influence Short- and Long-term Travel Decisions

Yuntao Guo, Purdue University, West Lafayette, IN, United States, Srinivas Peeta, Shubham Agrawal, Irina Benedyk, Mohammad Miralinaghi

This study develops a framework that integrates augmented reality (AR), gamification and social interactions through mobile apps to influence short- and long-term travel decisions by using a popular location-based AR gaming app, Pok mon GO, as a case study. A survey was designed and implemented to evaluate impacts of the integrated mobile apps on travel decisions using participants with different levels of familiarity and experience with Pok mon GO. Descriptive statistics and econometric model estimation results illustrate that such integrated mobile apps can be leveraged for implementing behavioral intervention strategies to influence travel decisions of subpopulations of travelers.

#### 3 - Household Activity and Travel Patterns with Shared Autonomous Vehicles

Marjan Mosslemi, University of California-Irvine, Irvine, CA, United States, R. Jayakrishnan

Access to shared autonomous vehicles can create new opportunities for performing daily activities and will change traveler behavior. We explore the potential impacts by modifying the constraints of the Household Activity Pattern Problem (HAPP). The new constraints include two new specifications of the supply environment (shared mobility and driverless vehicles) and reflect following new opportunities: more vehicle resources than personal vehicles, possibility to perform activities in-vehicle, some activities that can travel.

### Where To Next? Dynamic Fleet Optimization for Urban Transportation

Sponsored: TSL/Urban Transportation

Sponsored Session

Chair: Konstantina Mellou, Massachusetts Institute of Technology, Cambridge, MA, 02141, United States

#### 1 - Dynamically Route Deviation and Fair Cost Allocation for a Flexible Transit Service

Saeid Rasulkhani, New York University, Brooklyn, NY, 11209, United States, Joseph Y. J. Chow

In this study we are extending conventional MAST system which is a flexible transit system that a vehicle can deviate from its fixed path to pick up or drop off passengers. Unlike conventional MAST system, passengers may need to walk a block or so to be served rather than in their request point. Moreover, a fair cost allocation based on concept of Shapley Value from cooperative game, divides cost of deviation between served users.

#### 2 - Routing the Boston School Buses

Sebastien Martin, Massachusetts Institute of Technology, Cambridge, MA, 02139, United States, Dimitris Bertsimas, Arthur J. Delarue

In this talk, we focus on the major problem of school transportation, as part of a collaboration with Boston Public Schools (BPS). School transportation involves delivering students to school every morning and back home every afternoon

using a fleet of specialized vehicles (around 700 hundred school buses for Boston), we identify a multistage decomposition of the problem and propose integer programming formulations and efficient heuristics for each stage, improving on the state of the art. We also highlight interesting aspects of a collaboration with a public organization. This work allowed the city of Boston to save a yearly 4+ million dollars starting in 2017-18, reinvested in education.

#### 3 - Stable Matching in Large Scale Ridesharing Systems

Amir Tafreshian, University of Michigan Ann Arbor, 2350 Hayward St., 1430 Gg Brown Bldg., Civil And Environmental Engineering, Ann Arbor, MI, United States, Neda Masoud

Ride-sharing systems require an effective and efficient optimization methodology to match drivers and riders in large-scale transportation networks. This matching problem can be modeled as an assignment game in a 2-sided market. The core of this game provides a set of stable matchings between riders and drivers. However, the solutions in this set are not equivalent from the perspective of different participants in the system. This paper proposes a framework to establish stable matches in a 2-sided market while considering a secondary objective function on the optimal payoffs.

#### 4 - Dynamic Redistribution of Bike Sharing Systems

Konstantina Mellou, Massachusetts Institute of Technology, Cambridge, MA, 02141, United States, Patrick Jaillet

This talk focuses on the redistribution of bike sharing systems. Spatial and temporal imbalances of the user demand often lead to empty and full bike stations. Since reliable service is essential for the viability of these systems, operators use a fleet of vehicles to redistribute bikes across the network. We propose a mixed integer programming formulation for the dynamic version of the problem, and, combined with heuristics and decomposition techniques, we are able to solve large real-world instances. Since accurate estimation of the user demand is essential to plan for efficient rebalancing, we also develop approaches to consider lost and shifted demand, which very often are not taken into account.

### Joint Session TSL/ICS: Approximate Dynamic Programming and Reinforcement Learning for Routing I

Sponsored: TSL/Freight Transportation & Logistics

Sponsored Session

Chair: Dirk C. Mattfeld, University of Braunschweig, Braunschweig, 38106, Germany

#### 1 - Approximate Dynamic Programming for Planning Driverless Fleets of Electric Vehicles

Lina Al-Kanj, Princeton University, Warren B. Powell

The combination of a centrally managed fleet of driverless vehicles, along with the operating characteristics of electric vehicles, is creating a transformative new technology that offers significant cost savings. This problem involves a control problem for assigning requesters to cars, a planning problem for deciding on the fleet size and a pricing problem all of which are high dimensional stochastic dynamic programs. We use approximate dynamic programming to develop high-quality operational control strategies which are then used to determine the optimal fleet size. We also discuss surge pricing to smooth out daily peaks using an optimal learning approach in a real-time setting.

#### 2 - Policy Search for Bike Sharing Systems

Dirk C. Mattfeld, University of Braunschweig, Wirtschaftsinformatik, Braunschweig, 38106, Germany, Jan Brinkmann, Marlin Ulmer

We present the stochastic-dynamic inventory routing problem for bike sharing systems (SDIRP). The objective of the SDIRP is to avoid unsatisfied demand by dynamically relocating bikes during the day. To anticipate potential future demands in the current inventory decisions, we present a dynamic lookahead policy (DLA). The policy simulates future demand over a predefined horizon. Because the demand patterns change over the course of the day, the DLA horizons are time-dependent and autonomously parametrized by means of value function approximation, a method of approximate dynamic programming. We compare the DLA with conventional relocation strategies from the literature and lookahead policies with static horizons. Our study based on real-world data by the BSS of Minneapolis (Minnesota, USA) reveals the benefits of both anticipation by lookahead as well as the time-dependent horizons of the DLA. We additionally show how the DLA is able to autonomously adapt to the demand patterns.

### 3 - Route-based Approximate Dynamic Programming for Demand Management in Attended Home Delivery

Sebastian Koch, University of Augsburg, Universitätsstrasse 16, Augsburg, 86159, Germany, Robert Klein

Attended home delivery describes the delivery of goods or services to a customer at an appointed time, often called the service time window, in order to avoid failure of delivery. In this talk, we re-consider the problem of integrated dynamic pricing for demand management regarding the customers' time window choices and the subsequent operational vehicle routing. Thereby, we propose a novel approximate dynamic programming approach, anticipating the future value of the demand management decisions based on temporal features from dynamically generated route plans. In a simulation study, we compare our approach with state-of-the-art benchmarks, showing its profit potential.

### 4 - Restoration of Disrupted Services Through Reinforcement Learning

Aybike Ulsan, Northeastern University, Boston, MA, United States, Ozlem Ergun

In the case of a disruptive event, the roads of a transportation network may be blocked with debris. Thus, many emergency response operations are hampered. In order to build a post-disruption resiliency, connectivity between supply and demand points within the service network should be maintained by effective clearance of the debris. We tackle this problem (road network recovery problem) with stochastic demands. We model this problem as MDP and develop a framework to aid the scheduling of road clearance decisions by modeling and simulating an intelligent clearance agent through reinforcement learning. Then, we use a linear function approximation to generate policies for large-sized instances.

## SA33

### Disaster and Humanitarian Logistics

Sponsored: Transportation Science & Logistics

Sponsored Session

Chair: Zhijie Dong, Texas State University, San Marcos, TX, 78640, United States

#### 1 - Hospital Coordination Strategies for Managing Emergency Patients in Disaster

Elise Miller-Hooks, Professor, George Mason University, 208 Rosalie Cove Ct, Silver Spring, MD, 20905, United States, Bahar Shahverdi, Mersedeh Tariverdi

A discrete event simulation framework is presented for assessing the benefits of coordinated response of hospitals in a disaster incident involving area-wide damage and mass casualties. Impacts on critical resources, physical spaces and demand are modeled. Findings from numerical experiments on a case study involving multiple hospitals spaced over a large metropolitan region show the potential of strategies involving resource sharing and joint capacity enhancement alternatives.

#### 2 - Pre-positioning of Relief Supplies and Supplier Selection in Humanitarian Relief

Zhijie Dong, Texas State University, RFM 4227B, 601 University Drive, San Marcos, TX, 78640, United States

This paper integrates supplier selection into the pre-positioning of relief supplies. The supplier selection criteria include price discounts offered by suppliers based on order quantity and required lead time as well as suppliers' own physical inventories. By considering failure risks, this paper presents a two-stage stochastic programming model to produce plans including facility location and inventory, supplier selection, and distribution of relief supplies. A case study focused on hurricane threat in the Gulf Coast area of the US illustrates application of the model. Sensitivity analysis of comparison experiments offers managerial insights for relief agencies.

#### 3 - A Dynamic Team Orienteering Model of Dynamic Urban Search and Rescue Deployment Decision-making with Social Data Inputs

Erin Mullin, University of Arkansas, Walnut Creek, CA, 94596, United States, Ashlea Bennett Milburn

Deployment decisions for urban search and rescue (USAR) teams are critical in saving as many lives as possible. One challenge is having accurate information regarding the locations and needs of disaster survivors. Another is the simultaneous consideration of multiple inputs and constraints in a highly dynamic and uncertain environment. This research addresses these challenges by permitting social data during deployment planning and by modeling the USAR deployment problem as a dynamic variant of the team orienteering problem with time windows. A first-come-first-served strategy, often employed in practice, is compared with an optimal offline approach for a small set of test instances.

### 4 - A Generalized Routing and Accessibility Analysis System for Flooding: Iowa Testbed

Peng Chen, The University of Iowa, Ann Melissa Campbell, Ibrahim Demir

In this study, a generalized routing and accessibility analysis system is developed for flooding events. The system helps people find alternative routes and understand which areas in the disaster zone have limited travel accessibility. Our system can support emergency response activities with a real-time and dynamic routing framework for evacuation, rescuing civilians, delivering supplies, and deciding emergency center placement.

### Joint Session AAS/TSL-Air: Passenger Flow Forecasting and Airport Operations

Sponsored: Aviation Applications

Sponsored Session

Chair: Heng Chen, University of Nebraska-Lincoln, Lincoln, NE, 68588, United States

#### 1 - Forecasting Airport Transfer Passenger Flow Using Machine Learning and Real-time Data

Xiaoja Guo, PhD Student, University College London, International Hall, Lansdowne Terrace, London, WC1N 1AS, United Kingdom, Yael S. Grushka-Cockayne, Bert De Reyck

Air passengers missing their connection can have a major impact on satisfaction and airline delays. Accurate forecasts of the flow of passengers and their journey times through an airport can help improve the experience of connecting passengers and support airline, airport, and air space punctuality. In collaboration with Heathrow Airport, we utilize real-time data to develop a predictive system based on a regression tree and Copula-based simulations. These real-time predictions can be used to inform target off-block time adjustments and determine resourcing levels at security and immigration.

#### 2 - Runway Scheduling Under Winter Conditions

Maximilian Pohl, Technical University of Munich, Munich, Germany, Rainer Kolisch

We address the runway scheduling problem under consideration of winter operations. During periods of snowfall, runways have to be intermittently closed in order to clear them from snow, ice and slush. We propose an integrated discrete optimization model to simultaneously plan snow removal for multiple runways and to assign runways and starting and landing times to aircraft. To improve the computation times of our model formulation, problem specific pruning rules and valid inequalities are presented. We also discuss a method to derive initial start solutions heuristically. The model is tested and validated with real-world data from Munich International Airport.

### 3 - Optimal Gate Assignment Under the Consideration of Airport Retailing

Tulay Flamand, Colorado School of Mines, Division of Economics and Business, Engineering Hall 816 15th Street, Room 313, Golden, CO, 80401, United States, Heng Chen

We address a gate assignment problem and its impact on airport retail sales. We develop a mixed-integer programming model that assigns flights to gates in a way that optimizes several objectives, as well as the retail sales. A column generation methodology is used to solve this challenging problem and the results of the computational study are reported.

### 4 - A Variable Neighborhood Search Approach for the Flight-to-gate Reassignment Problem

Moschoula Pternea, University of Maryland, College Park, MD, 20740, United States, Ali Haghani

The reallocation of flights to gates in case of schedule disruptions is a key airport recovery operation. Especially in hub airports, disruptions affect connecting passengers by causing failed connections or lost baggage. At the same time, introducing passenger transfers in mathematical programming models makes the problem intractable. In this context, we develop a Variable Neighborhood Search approach to generate near-optimal solutions with the objective to minimize additional schedule disturbances, as well as passenger and baggage misconnections. Our preliminary experiments indicate that our metaheuristic approach shows promising results in terms of both solution quality and time.

### Airline Recovery Operations and Route Planning

Sponsored: Aviation Applications

Sponsored Session

Chair: Vikrant Vaze, Dartmouth College, Hanover, NH, 03755, United States

#### 1 - An Integrated Model for Airline Operations Recovery: Emphasizing Passenger Compensation Impacts

Luis Cadarso, Rey Juan Carlos University, Camino del Molino s/n, Fuenlabrada, 28943, Spain, Vikrant Vaze

The European flight delay compensation regulation (EC) No 261/2004 establishes common rules on compensation to passengers in the event of disruptions. We develop an integrated approach that recovers airline timetable, fleet assignment, aircraft routings, and passenger itineraries capturing the impacts of airlines' decisions on passenger compensation. We evaluate scenarios involving disruptions, and optimize recovery decisions to maximize profits by modeling passenger no-shows after disruptions.

#### 2 - Fleet Operations - Combining Tail Assignment and Schedule Recovery

Andreas Westerlund, Jeppesen, Odinsgatan 9, Gothenburg, 411 03, Sweden, Mattias Gronkvist

Tail assignment is the process of planning the assignment of aircraft to flights from the day of operations and a few days, or weeks, into the future. Schedule recovery is the process of deciding how to operate the aircraft at an airline when operational disruptions happen. In this presentation we will discuss how a combined tail assignment system and schedule recovery system gives benefits compared to using separate systems. We will also show how integration with crew tracking and flight planning can give additional benefits. Computational results on real-world data will be presented.

#### 3 - A Two Stage Route Planning Algorithm for Light Aircraft Transportation Systems

Shadi Sharif Azadeh, Assistant Professor, Erasmus University Rotterdam, Burgemeester Oudlaan 50, Rotterdam, 3062 PA, Netherlands

This paper presents a route planning algorithm for light aircraft operating system under visual flight rules. The problem aims to find a minimum duration, collision free route in three spatial dimensions. The calculated route takes into account the aircraft kinodynamic characteristics and its interaction with external wind. A data processing approach is presented to recast the flying environment as a series of polyhedrons based on which a mixed integer linear model is formulated. A two stage route planning heuristic is developed to solve real life instances. Computational experiments depict the efficiency of this approach.

### Information and Dynamic Decision Making

Sponsored: Applied Probability

Sponsored Session

Chair: Kuang Xu, Stanford Graduate School of Business, Stanford, CA

#### 1 - Privacy and Incentives in Dynamic Games

Rachel Cummings, Georgia Tech, 755 Ferst Drive NW, Atlanta, GA, 30332-0205, United States

When strategic agents play repeated games against the same opponents, they may be concerned about information leakage across rounds. Examples include repeated posted pricing and repeated auctions, where a seller can learn a buyer's value to charge higher prices in future rounds. In this talk, we will explore differential privacy as a tool for mitigating these incentive issues and bringing behavior in each round closer to that of the stage game.

#### 2 - Satisficing in Time-sensitive Bandit Learning

Daniel Russo, Columbia University, New York, NY, United States, Benjamin Van Roy

Much of the recent literature on bandit learning focuses on algorithms that aim to converge on an optimal action. One shortcoming is that this orientation does not account for time sensitivity, which can play a crucial role when learning an optimal action requires much more information than near-optimal ones. We consider instead learning a satisficing action, which is near-optimal while requiring less information, and propose satisficing Thompson sampling, an algorithm that serves this purpose. We establish a general bound on expected discounted regret and discuss relations with the theory of rate distortion, which offers guidance on the selection of satisficing actions.

#### 3 - Capacity of Resource Allocation Under Information Loss

Yuan Zhong, Booth School of Business, University of Chicago, Kuang Xu

We consider the problem of dynamic resource allocation under information loss, in general stochastic processing systems. Information loss is modeled as an information channel. We characterize the capacity region under various channel models, and analyze the role of memory in policy design.

### Applied Probability in Machine Learning and Optimization II

Sponsored: Applied Probability

Sponsored Session

Chair: Chang-Han Rhee, Centrum Wiskunde and Informatica, Amsterdam, 1018 MZ, Netherlands

#### 1 - Optimal Sampling Algorithms for Empirical Risk Minimization

Harsha Honnappa, Purdue University, 315 N. Grant Street, West Lafayette, IN, 47906, United States, Raghu Pasupathy, Prateek Jaiswal

We present a large deviations analysis of sample average approximation (SAA), specifically focused on empirical risk minimization (ERM) problems relevant to machine learning and M-estimation. We focus on situations where it is feasible to sample independently and without replacement at predefined grid-points in the design space. The resulting LD rate function is then used to extract a computational-effort allocation algorithm, that efficiently trades-off computational-effort against statistical accuracy. We prove the asymptotic consistency and efficiency of the resulting estimators.

#### 2 - Infinitely Many Armed Bandit Problem with Learned Rewards

Yang Cao, University of Southern California, Los Angeles, CA, United States

There are infinitely many arms with arm  $i$ ,  $i=1$  having value  $v_i$  where  $v_i$  are the values of i.i.d non-negative random variables following a known distribution  $F$ . The values  $v_i$  are initially unknown to the player, and will be learned once being played. In each game the player can choose either an observed arm or a new arm to play, and will receive a reward equal to the chosen arm's value. The objective is to find a policy that maximizes the expected sum of the rewards in  $N$  games. We show that the optimal policy is a threshold stopping policy when  $N$  is deterministic or a random variable having increasing failure rate. We also propose heuristic policies for the case when  $N$  has a general distribution.

### 3 - Testing Safety of Autonomous Vehicles Using Data-driven Rare-event Simulation

Hongseok Namkoong, Stanford University, Stanford, CA, 94305, United States

Despite recent progress in autonomous vehicles (AVs), rigorous tests are yet to be designed. Viewing this as a data-driven rare-event simulation problem, we first study a stylized i.i.d. random walk setting and give finite-sample minimax bounds and asymptotic rates for estimating the large deviation rate from data. Then, we implement a simulation framework (pseudo-reality) which can test the deep-learning based perception and control pipeline as a whole system. Use a learned behavior of environmental agents as our underlying model, we demonstrate our framework on a highway driving scenario, and show that rare-event simulation techniques can accelerate AV system evaluation.

### 4 - Ranking and Selection with High Dimensional Covariates

Xiaocheng Li, Stanford University, Stanford, CA, United States, Zeyu Zheng

Ranking and selection is concerned with making the best selection among many alternatives, whose unknown performances can be learned via sampling. Examples include selecting medicine and treatment regimes in healthcare systems and selecting online advertisements targeting Internet users. In this talk, we consider the settings in which the mean performance of each alternative depends on some observable high dimensional random covariates, where existing methods may become inefficient and even inapplicable. Our procedure effectively incorporate machine learning tools such as regularization and variable selection. Certain statistical guarantee is established under moderate assumptions.

### Inventory Control

Sponsored: Applied Probability

Sponsored Session

Chair: Eugene A. Feinberg, Stony Brook University, Stony Brook, NY, 11794-3600, United States

Co-Chair: Mark S. Squillante, IBM Thomas J. Watson Research Center, IBM Thomas J. Watson Research Center, Yorktown Heights, NY, 10598, United States

#### 1 - Asymptotic Optimality of Constant-order Policies in Joint Pricing and Inventory Control Models

Linwei Xin, University of Chicago, 5807 S. Woodlawn Avenue, Chicago, IL, 60637, United States, Xin Chen, Alexander Stolyar

We consider a joint pricing and inventory control problem with positive replenishment lead times. Although this problem has been extensively studied in the literature, the structure of the optimal policy remains poorly understood. In this work, we propose a class of so-called constant-order list-price policies. We prove that the best constant-order list-price policy is indeed asymptotically optimal as the lead time grows large, which is exactly the setting in which the problem becomes computationally intractable due to the curse of dimensionality. We also show that the best constant-order list-price policy can be computed effectively.

#### 2 - Optimize Inventory Freshness in Supply Chain

Zhengliang Xue, IBM T.J. Watson Research Center, Yorktown Heights, NY, 10598, United States, David D. Yao, Markus Ettl

This paper studies the management of inventory freshness and optimization of the local inventory policy for all the members in a decentralized supply chain. We approximate the expected profit by the closed-form solutions, and use them to study the efficiency and security for all the transactions of selling and buying the fresh products at different ages of the product life-cycle.

#### 3 - Equicontinuity Conditions for Markov Decision Processes with Application to Inventory Control

Eugene A. Feinberg, Stony Brook University, Department of Applied Mathematics, and Statistics, Stony Brook, NY, 11794-3600, United States, Pavlo O. Kasyanov, Yan Liang

This talk discusses the equicontinuity condition and its generalization, the lower semi-equicontinuity condition, for Markov decision processes with average costs per unit time. These conditions imply the validity of average-cost optimality equations, convergence of discounted-cost relative value functions to average-cost value functions, and continuity properties of average-cost value functions. Periodic-review stochastic inventory models typically satisfy these conditions. This implies the validity of average-cost optimality equations for inventory models with average cost criteria and provides useful tools to derive structural properties of average-cost optimal policies.

### 4 - Stochastic Setup Cost Inventory Model with Backorders and Quasiconvex Cost Functions

Yan Liang, Stony Brook University, A-149, Math Tower, Stony Brook, NY, 11794, United States, Eugene A. Feinberg

This talk is concerned with a periodic-review setup-cost inventory model with backorders and holding/backlog costs satisfying quasiconvexity assumptions. We show that this model satisfies assumptions that imply the validity of optimality equations for discounted and average-cost criteria and the family of discounted relative value functions is equicontinuous. We establish two groups of results: (i) optimality of (s,S) policies for infinite-horizon problems under discounted and average-cost criteria, and (ii) convergence of optimal discounted lower thresholds and discounted relative value functions to their average-cost counterparts as the discount factor converges to 1.

### Spatial Queueing and Matching Systems

Sponsored: Applied Probability

Sponsored Session

Chair: Varun Gupta, The University of Chicago Booth School of Business, Chicago, Illinois

Co-Chair: Ankur Mani, University of Minnesota, Minneapolis, MN

#### 1 - Pooling Policies in Ridesharing

Daniel Freund, Cornell University, 109 Lake St, Ithaca, NY, 14850, United States, Siddhartha Banerjee, Varun Gupta, Samitha Samaranayake

The ascent of ride-sharing platforms like Lyft, Didi, and Uber triggered a line of research investigating queueing-theoretic models of such systems. The fundamental matching task of interest in this area is to match drivers and passengers. In this work, we take that analysis one step further to analyze shared-ride modes like Lyft Line. For these settings we need to not only match drivers and passengers, but also match passengers with each other. We propose several (asymptotically optimal) policies of interest and discuss their tradeoffs in non-asymptotic regimes.

#### 2 - Matching Users Online: Balancing Matching Cost and Waiting Cost

Sai Sandeep, CMU, Pittsburgh, PA, United States, Varun Gupta, Ravishankar Krishnaswamy

In ride sharing platforms, the primary goal is to match drivers with riders to ensure that riders are paired to nearby drivers without waiting too long. This gives rise to an optimization problem where requests of two types arrive online, and the objective is to pair requests of different types so as to minimize sum of matching cost, and waiting cost. In this project, we consider this problem and its variant, also known as Min-Cost Perfect Matching with Delay (MPMD), survey the existing results and present new algorithms.

#### 3 - Matrix Geometric Analysis of Polling Queues in Series

Ravi Suman, University of Wisconsin-Madison, Madison, WI, 53726, United States, Ananth Krishnamurthy

We analyze a network of queues where the customers are served at each station in a fixed cyclic exhaustive manner. Under Markovian assumptions for arrival and service times, we conduct an exact analysis using matrix geometric approach. Exact solutions for queue length distributions and mean waiting times are determined and the effect of buffer sizes on performance measures are explored.

#### 4 - Walking vs. Waiting: Trade-offs when Pooling Resources Serving a Large Area

Daniel F. Silva, Auburn University, 3301 Shelby Center, Auburn, AL, 36849, United States, Mathias A. Klapp

We study the trade-offs between travel time and queue time in a two dimensional area, where stations are spatially separated. Customer demand appears randomly in a designated area, then each customer walks to a station to get service and then either walks to an exit or back to where they began. Examples include stadium concessions; department store check-outs; bars in a night club. We make assumptions about demand distribution, potential station locations and user preferences, then attempt to optimize a user utility function, subject to a budget on the available stations and servers.

#### 5 - A Spatial Queueing Model for Evaluating Feasibility of Last-mile On-demand Public Transportation Service

Alexander Vinel, Auburn University, 2479 Churchill Cir, Auburn, AL, 36832, United States, Daniel F. Silva

We consider modeling approaches for analysis of last-mile on-demand public transportation service. Specifically, we are interested in enabling evaluation of whether specific demand profiles and other system parameters allow for efficient implementation of such a service. We develop a series of models employing spatially and temporally distributed queueing systems. We will present some analytical conclusions as well as simulation results.

**Joint Session DAS/Practice Curated:  
Risk and Decision Analytics**

Sponsored: Decision Analysis

Sponsored Session

Chair: Sayanti Mukhopadhyay, PhD, Purdue University, West Lafayette, IN, 47907, United States

**1 - Optimizing Inspection Routes in Pipe Networks**

Thomas Ying-Jeh Chen, University of Michigan, Ann Arbor, MI, 48105, United States, Connor Riley, Pascal Van Hentenryck, Seth Guikema

The inspection of aging water distribution pipes is a vital process for utilities to aid better decision making for risk-based management. To facilitate cost-efficient deployment of inspection robotics, a process that finds high risk pipe while accounting for the tool limitations is needed. We formulate the problem as an integer program, and explore a variety of methods to identify optimal routes: branch and bound, constraint generation, breadth-first search, depth-first search, and depth-first search with pruning. While only three factors are used to characterize tool limitations, the formulation can be extended to include technology-specific complexities in real world applications.

**2 - Optimizing Design for Hybrid Renewable Energy Systems Under Long-range Uncertainties**

Ramin Giah, Iowa State University, Ames, IA, 50010, United States

Understanding the potential for new applications and different environments under which a system will operate is important in engineering design. This presentation focuses on design with long-range uncertainty. We identify and model significant uncertainties that will impact the use and lifespan of a system. This research explores designing a hybrid renewable energy system design while taking into account long-range uncertainties of 20 years.

**3 - Modeling the Impact of Natural Hazards on the Serviceability of Infrastructure Systems: A Bayesian Approach**

Jin-Zhu Yu, Vanderbilt University, Nashville, TN, United States, Mackenzie G. Whitman, Hiba Baroud

The ability to make accurate predictions of failure or recovery measures for infrastructure systems is often hindered by the lack of data and uncertainty of hazards. To address this challenge, this study presents a framework that incorporates a Bayesian updating mechanism of network component fragility into the evaluation of the overall serviceability of an infrastructure network under multiple hazard scenarios. This framework allows for better understanding of the subsequent performance of the individual components and the entire network as new data becomes available. A case study of a water distribution network is presented to illustrate the framework.

**4 - Multi-stage Prediction for Zero-inflated Hurricane Induced Power Outages**

Sara Shashaani, University of Michigan, Ann Arbor, MI, 48105, United States, Seth Guikema, Chengwei Zhai, Jordan V. Pino, Steven M. Quiring

Predictive models on hurricane power outages can be built via statistical learning methods that use past hurricanes data to capture the effects of several climatological and environmental variables on the power systems. Classical data minim methods and accuracy metrics are misleading for datasets with the majority of their response variables being zero. To deal with the zero-inflation in the power outage datasets, we develop and validate a 3-stage framework for three historic hurricanes and predict the outages of three recent hurricanes in the central Gulf region. The results show improvement over the traditional approaches.

**5 - Impact of Climate Model Uncertainties in Projecting Long Term Regional Energy Demand**

Sayanti Mukherjee, Purdue University, West Lafayette, IN, United States, Panteha Alipour, Roshanak Nateghi

The uncertainties in projecting long-term energy demands are not only associated with stochasticity in future socio-economic conditions, population changes or technology infusion, but also with climate projections as provided by the General Circulation Models (GCMs). Uncertainties attributed to climate projections mostly arise from the structure and processes within the GCMs, leading to projection divergence across the models. The purpose of this study is to provide an assessment of how the divergence in climate projections influence the long-term regional energy demand projections. The proposed framework will help the stakeholders in risk-informed long-term utility planning.

**Joint Session ISim/APS: Rare Events and Stochastic Optimization**

Sponsored: Simulation

Sponsored Session

Chair: Raghu Sasupathy, Purdue University, West Lafayette, IN, 47907, United States

**1 - Simulation of Bipartite or Directed Graphs with Prescribed Degree Sequences Using Maximum Entropy Probabilities**

Enrique Lelo de Larrea, Columbia University, 403 Uris Hall, Columbia Business School, New York, NY, 10027, United States, Paul Glasserman

We propose an algorithm for simulating bipartite or directed graphs with given degree sequences, motivated by the study of financial networks with partial information. Our algorithm sequentially computes certain "maximum entropy matrices, and uses the entries of these matrices to assign probabilities to edges between nodes. We prove the correctness of the algorithm, showing that it always returns a valid graph and that it generates all valid graphs with positive probability. We illustrate the algorithm in an example of an inter-bank network.

**2 - Asymptotically Optimal Chance Constrained Optimization Approximations in Rare Event Regimes**

Fan Zhang, Stanford University, 450 Serra Mall, Stanford, CA, 94305, United States, Jose Blanchet, Bert Zwart

Chance constrained optimizations are known to be NP hard, but it can be approximated by scenario approach when the tolerance-violation is small. The number of sampled constraints in conventional scenario approach is inversely proportional to the tolerance-violation, which is computationally expensive when the chance constraints become increasingly rare. In this talk, we applied importance sampling to construct a rare event simulation estimator, and the number of sampled constraints logarithmically grows with respect to the tolerance-violation

**3 - Feasibility Check with Recycled Observations**

Yuwei Zhou, Georgia Institute of Technology, Atlanta, GA, United States, Sigrun Andradottir, Seong-Hee Kim, Chuljin Park

We consider the problem of repeatedly finding a set of feasible or near-feasible systems among a finite number of simulated systems in the presence of stochastic constraints when the values of thresholds in the constraints change. Instead of restarting feasibility check from scratch for a new set of constraint threshold values, we recycle every observation collected from the previous feasibility check. We show that feasibility check with recycled observations achieves higher statistical guarantee and higher efficiency in terms of the number of observations than feasibility check with restart.

**4 - A Decomposition Approach for Generating Correlated Random Vectors**

Oscar O. Guaje, Universidad de los Andes, Cra. 1 #18a-12, Bogotá, 111021, Colombia, Andres L. Medaglia, Jorge A. Sefair

Current methods for generating correlated random numbers often rely on specific properties of the probability distributions of the input variables. We present a method based on mixed-integer programming that induces correlations to a set of random vectors without making any strong assumptions on the distribution of the random variables nor on the correlation structure. To improve the computational performance of our method we propose a column generation procedure. Our results compare favorably against the state-of-practice in terms of speed and solution quality. Finally, we illustrate its use in simulation where multiple input variables share a correlation structure within a flow process.

### The Future of Energy: A Systems Perspective

Emerging Topic: Energy and Climate

Emerging Topic Session

Chair: Benjamin D. Leibowicz, University of Texas-Austin, Austin, TX, 78712-1591, United States

#### 1 - U.S. Energy Infrastructure of the Future: Electricity Capacity Planning through 2050

Gopika G. Jayadev, University of Texas-Austin, Austin, TX, United States, Benjamin D. Leibowicz, Erhan Kutanoglu

We develop an integrated mixed-integer programming framework that optimizes long-term capacity investments and operational schedules for energy supply and end-use technologies. Our methodology extends an existing energy-economic modeling framework. Our framework simultaneously optimizes generation investments, the locations of these investments as well as the transmission network linking the generation facilities to different demand regions. We analyze our model for the US electricity market and present our findings.

#### 2 - A Stochastic Model of Socio-technical Regime Transitions Featuring the Impact of Policy Decisions

Max Brozynski, University of Texas, Austin, 1240 Barton Hills Dr, #107, Austin, TX, 76109, United States

The study of energy transitions has enjoyed much attention recently due to the scientific community's focus on stabilizing greenhouse gas emissions. But, while historical perspectives on how energy systems transition from one regime to another are informative, a formal mathematical theory of energy system transitions is needed to bridge the gap between observing past experiences and predicting future behavior. In this paper, we present a model of socio-technical regime transitions formulated as a Markov decision process. This stochastic model captures key features of such transitions, including economies of scale, path dependence, consumer choice, and the impacts of policy decisions.

#### 3 - Grid-integrated Renewable Energy Resource Assessments: Wind and Solar Supply Curves for China

Michael R. Davidson, Harvard Kennedy School, One Brattle St., 356H, Cambridge, MA, 02138, United States

Renewable energy resource assessments are important for long-term power systems planning but typically ignore or downplay operational details. In this study, building on earlier wind-focused work, we present an efficient algorithm for creating a combined solar and wind "supply curve for China building on fine geographic and hourly resolution data. We compare operational outcomes with traditional economic dispatch optimizations.

#### 4 - Improved Energy Systems Planning and Decision-making using Integrated Assessment Research

Zarrar Khan, Pacific Northwest National Laboratory, 5825 University Research Court, Suite 3500, College Park, MD, 20740, United States, Gokul Iyer

This talk will discuss recent forays in integrated assessment research to improve representations of spatial, temporal, and process detail in representations of the energy sector. The talk will present applications of a U.S. focused version of the Global Change Assessment Model (GCAM-USA) to highlight the value of detailed modeling of the U.S. energy sector within the context of broader interactions of the energy sector with the economy, agriculture, land-use, climate, and water systems.

#### 1 - Data Driven Power Flow Analysis in Distribution Grids with Incomplete System Information

Yang Weng, Arizona State University, 551 E. Tyler Mall, ERC 563, Engineering Research Center (ERC), Tempe, AZ, 85281, United States, Jiafan Yu, Ram Rajagopal

The increasing integration of distributed energy resources calls for new monitoring and operational planning tools to ensure stability and sustainability in distribution grids. One idea is to use existing tools in transmission grids and some primary distribution grids. However, they usually depend on the knowledge of

the system model. To solve the modeling problem, we propose a support vector regression (SVR) approach to reveal the mapping rules between different variables and recover useful variables based on physical understanding and data mining. We illustrate the advantages of using the SVR model over traditional regression method which finds line parameters in distribution grids.

#### 2 - Real-time Prediction of the Duration of Distribution System Outages

Baosen Zhang, University of Washington, Seattle, WA, United States, Aaron Jaech, Mari Ostendorf, Daniel Kirschen

This paper addresses the problem of predicting duration of unplanned power outages, using historical outage records to train a series of neural network predictors. The initial duration prediction is made based on environmental factors, and it is updated based on incoming field reports using natural language processing to automatically analyze the text. Experiments using 15 years of outage records show good initial results and improved performance leveraging text. Case studies show that the language processing identifies phrases that point to outage causes and repair steps.

#### 3 - Data-driven Learning Methods for Detecting and Mitigating Load Redistribution Attacks

Lalitha Sankar, Arizona State University, 551 E. Tyler Mall, Tempe, AZ, 85281, United States

The electric power grid is a critical cyber-physical infrastructure that is vulnerable to data injection attacks. We present data-driven detection techniques against a wide class of cyberattacks that maliciously redistribute loads by modifying measurements including nearest neighbor, SVM, and neural networks. The detectors are both trained and tested using publicly available PJM zonal load data. Mapping the dataset to the IEEE 30-bus system, the efficacy of the detectors, designed in a semi-supervised manner with labeled non-anomalous historical data, is tested with both attacked and non-anomalous data. We show that all three detectors designed are very accurate.

#### 1 - An Accurate Charging Model of Battery Energy Storage

Mrvoje Pandzic, University of Zagreb, Unska 3, Zagreb, 10000, Croatia

Battery storage is becoming an important part of modern power systems and its operation model needs to be integrated in the market clearing and investment models. However, models that commonly represent the operation of large-scale battery energy storage used in scientific literature are inaccurate. In case energy storage is unable to absorb or deliver scheduled quantities, market players might suffer monetary losses and power system operation might be jeopardized. In this work, an accurate battery charging model is formulated, which closely reflects the actual battery charging constraints.

#### 2 - Enhancing Distribution Resilience with Mobile Energy Storage: A Progressive Hedging Approach

Yury Dvorkin, New York University, Metrotech Center, Fay Street, Brooklyn, NY, 11201, United States

We propose a two-stage optimization model that optimizes investments in transportable ES units, i.e. those that can be moved using regular transportation routes, in the first stage and can re-route them in the second stage to form dynamic microgrids and to avoid the expected load shedding caused by natural disasters. We show that this model cannot be solved efficiently with off-the-shelf solvers, even in relatively small instances, and therefore apply a progressive hedging algorithm.

#### 3 - Robust Estimation of Reactive Power for an Active Distribution System

Zhengshuo Li, Southern Methodist University, Dallas, TX, United States, Jianhui Wang, Hongbin Sun, Feng Qiu, Qinglai Guo

Reactive power potential (RPP) of an active power system (DPS) is the range between the maximal inductive and capacitive reactive power the DPS can reliably provide to transmission networks. This paper proposes a robust RPP estimation method based on two-stage robust optimization, where the RPP is pre-estimated in the first stage and its robust feasibility for every instance of the uncertainty in the DPS is checked in the second stage. The column-and-constraint generation algorithm is adopted to solve this model in finite iterations. Case studies confirm that this robust method excels in yielding a completely reliable RPP.

#### 4 - Communication-constrained Expansion Planning for Resilient Distribution Systems

Russell Bent, Los Alamos National Laboratory, Lanl, Mail Stop C933, P.O. Box 1663, Los Alamos, NM, 87545, United States, Geunyeong Byeon, Pascal Van Hentenryck, Harsha Nagarajan

We discuss the Optimal Resilient Design Problem for Distribution and Communication Systems (ORDPDC). The ORDPDC is formulated as a two-stage stochastic mixed-integer program that captures the physical laws of distribution systems, the communication connectivity of smart grid components, and a set of scenarios which specifies which components are affected by potential disasters. We discuss an exact branch-and-price algorithm for the ORDPDC which features a strong lower bound and a variety of acceleration schemes to address degeneracy. The results demonstrate the significant impact of the network topologies on the expansion plans and costs, and the computational benefits of the approach.

Co-Chair: Matteo Spada, Paul Scherrer Institut, Villigen PSI, 5232, Switzerland

#### 1 - Coordinated Operations of Power Grid and Water System with Renewable Integration

Daniel Zuniga, Neng Fan, University of Arizona, Tucson, AZ, USA.

In this talk, we propose the multi-level robust optimization model for the coordinated operations of power grid and water system with the integration of renewable energy. To solve this complex and large-scale problem, some decomposition-based algorithms will be designed. Some numerical experiments will be performed to validate model and check the efficiency of proposed algorithms.

#### 2 - Resilient Planning of Power Grid and Water System with Renewable Integration

Daniel A. Zuniga Vazquez, University of Arizona, Tucson, AZ, United States, Neng Fan

In this talk, we propose the multi-level robust optimization model for the coordinated planning of power grid and water system with the integration of renewable energy. To solve this complex and large-scale problem, some decomposition-based algorithms will be designed. Some numerical experiments will be performed to validate model and check the efficiency of proposed algorithms.

#### 3 - Secure Allocation of Power Reserves with Large Renewable Penetration Under Gas Transmission Constraints

Giovanni Sansavini, ETH Zurich, Zurich, Switzerland, Andrea Antenucci

Gas-fired generation provides flexibility to the power system for peak-load shaving and reserve allocation. Large penetration of renewables strengthens the gas-electric coupling. Constraints to the operations of the gas transmission system endanger the security of power supply. We assess the impact of gas constraints on the day-ahead electric power and reserve scheduling. The day-ahead scheduling of generator dispatch and reserves is determined via a stochastic, N-1 secure optimization. Minimum pressure constraints update the scheduling. In scarce-wind conditions, reserve planning including gas constraints prevents pressure violations caused by unexpected wind fluctuations.

#### 4 - Robust Co-optimization Planning of Interdependent Electricity and Natural Gas Systems with a Joint N-1 and Probabilistic Reliability Criterion

Lei Wu, Clarkson University, 8 Clarkson Avenue, P.O. Box 5720, Potsdam, NY, 13676, United States

As the sharp growth of gas-fired power plants and the emergence of Power-to-Gas (PtG) intensify interdependency between electricity and gas systems, it is imperative to co-optimize the two systems for improving overall efficiency. A long-term robust co-optimization planning model is discussed, for minimizing total investment and operation costs. Beside generators, transmission lines, gas suppliers, and pipelines, PtGs and gas compressor stations are also considered as investment candidates to effectively handle wind uncertainty and compensate pressure losses. A joint N-1 and probabilistic reliability criterion to promote economical and reliable planning solutions is also considered.

#### 5 - Estimating the Impact of Natural Gas Transmission Pipeline Network Disruptions on Power Generation

Charles M. Macal, Argonne National Laboratory, Lemont, IL, United States, Eric Tatara, Jordan Jalying, Victor M. Zavala, Stephen Folga, Guenter Conzelmann

Reliable natural gas delivery is critical for operators of gas-fired electric generation plants. Gas pressures and flows at delivery points must be maintained at the required conditions of the plant to ensure continuous operation. We present a method to estimate the impacts of gas pipeline disruptions on power generation using a model of dynamic flow and pressure using the graph-based modeling framework Plasmio.jl. Cases studies are presented to illustrate the model capabilities in an interstate-scale natural gas transmission pipeline that include compressor station power disruptions and pipeline breaks. The model time and space resolution enable us to provide near real-time capabilities.

#### 6 - Risk-based Distributionally Robust Optimal Power Flow with Dynamic Line Rating

Rui Gao, Georgia Institute of Technology, 755 Ferst Drive NW, ISyE Main Building, Atlanta, GA, 30332-0205, United States

We propose a risk-based data-driven distributionally robust approach to investigating the optimal power flow with dynamic line rating. The risk terms, including penalties for load shedding, wind generation curtailment and line overload, are embedded into the objective function. To robustify the solution, we consider a distributional uncertainty set based on the second order moment, that captures the correlation between wind generation outputs and line ratings, and also the Wasserstein distance, that hedges against data perturbations. We show that the proposed model can be reformulated as a convex conic program. Approximations of the proposed model are suggested, which leads to a significant reduction of the number of the constraints. For practical large-scale test systems, a distributionally robust optimal power flow model with Wasserstein-distance-based distributional uncertainty set and its convex reformulation are also provided. Simulation results on the 5-bus, the IEEE 118-bus and the Polish 2736-bus test systems validate the effectiveness of the proposed models.

### Change Detection and Prognostics for Transient Real-World Processes Using Streaming Data

Emerging Topic Session

Chair: Lewis Ntamo, Texas A&M University, 3131 TAMU, College Station, TX, 77843, United States

#### 1 - Change Detection and Prognostics for Transient Real-World Processes Using Streaming Data

Satish Bukkapatnam, Texas A&M University, 3131 TAMU, 4020 Emerging Technologies Building, College Station, TX, 77843, United States, Ashif Sikandar Iquebal

Recent advances in sensor arrays and imaging systems have spurred interest in analyzing high-dimensional, streaming time series data from real-world complex systems. These time series data capture the dynamic behaviors and causalities of the underlying processes and provide a computationally efficient means to predict and monitor system state evolution. More pertinently, they can provide the ability to detect incipient and critical changes in a process, which is essential for real-time system integrity assurance. However, effective harnessing of information from these data sources is currently impeded by the mismatch between the key assumption of stationarity underlying most change detection methods and by the nonlinear and nonstationary (transient) dynamics of most real-world processes. The current approaches are slow or simply unable to detect qualitative changes in the behaviors that lead to anomalies. For most real-world systems, the vector field of state dynamics is a nonlinear function of the state variables, i.e., the relationship connecting intrinsic state variables with their autoregressive terms and exogenous variables is nonlinear. Time series emerging from such complex systems exhibit aperiodic (chaotic) patterns even under steady state. Also, since real-world systems often evolve under transient conditions, the signals so obtained tend to exhibit myriad forms of nonstationarity. This tutorial presents a delineation of these diverse transient behaviors, and a review of advancements in change detection and prognostication methods for nonlinear and nonstationary time series. We also provide a comparison of their performances in certain real-world manufacturing and health informatics applications.

Chair: Gokul C. Iyer, Pacific Northwest National Laboratory, 5825 University Research Court, College Park, MD, 20740, United States

**1 - Introduction to Integrated Multi-model Frameworks to Improve Decision-making Capabilities Across Spatial and Temporal Scales in the Energy Systems**

Gokul Iyer, Pacific Northwest National Laboratory, 5825 University Research Court, Suite 3500, College Park, MD, 20740, United States

This talk will give an overview of modeling efforts to integrate models with different degrees of temporal, spatial, and sectoral detail to provide improved decision-making capabilities about energy systems and infrastructure planning within the context of the broader energy-water-land-climate nexus.

**2 - Structural Uncertainty Across Disparate Energy-economy Modeling Frameworks: Reeds and GCAM-USA Consistency Under Alternative Earth Futures**

Stuart Cohen, National Renewable Energy Laboratory, 15013 Denver West Parkway, RSF 300, Golden, CO, 80401, United States, Gokul Iyer, Maxwell Brown

Robust decision support assimilates information from multiple tools across the relevant scale and scope. However, these tools often differ in structure and function, yielding inconsistent results that confound the decision process. Previous work sought a robust electric sector expansion model framework by harmonizing GCAM-USA, a multi-sector human-Earth system model, with the ReEDS electricity sector model. I'll describe progress achieving consistent electricity and energy-economy solutions under many socioeconomic, technology, and market futures. I'll examine structural uncertainties affecting solution consistency and consider the broader implications for decision support.

**3 - The Future of Natural Gas Infrastructure Development in the United States**

Felipe A. Feijoo, Pontificia Universidad Católica de Valparaíso, Av. Brasil 2241, Office 6-8, Valparaíso, Chile, Gokul Iyer, Charalampos Avraam, Sauleh Ahmad Siddiqui, Leon Clarke, Matthew T. Binsted, Sriram Sankaranarayanan, Sriram Sankaranarayanan, Pralit Patel, Marshall Wise, Nathalia Prates, Evelyn Torres-Alfaro

This study couple a global human-Earth system model with state-level detail in the U.S. (GCAM-USA) with a natural gas infrastructure investment model (NANGAM) to examine inter-state natural gas pipeline infrastructure development in the U.S. We show that existing pipeline infrastructure is insufficient to satisfy the increasing demand. The geographic distribution of investments within the U.S. is heterogeneous and depends on the capacity of existing infrastructure as well as the magnitude of increase in demand. Our results also illustrate the risks of under-utilization of pipeline capacity

**4 - Interconnection Cost Implications of Future Power Generation Capacity Expansion in the United States**

Chris Vernon, Pacific Northwest National Laboratory, WA, United States, Gokul Iyer, Ian P. Kraucunas, Nathalie Voisin, Mohamad Hejazi, Matthew T. Binsted, Matthew O'Connell, Pratik L. Patel

Long-term electric power sector planning is a complex process that is rooted in system dynamics to assess the timing and magnitude of investments in infrastructure within the context of potential vulnerabilities. Assessing these dynamics requires a multi-sector, multi-scale modeling approach that captures socioeconomics, electricity supply and demand, and the impediments and distribution of the power generation sources. This research evaluates the impact of achieving future capacity expansion plans to the resulting technology-specific interconnection costs by pairing an integrated human-Earth system model (GCAM-USA) with the Capacity Expansion Regional Feasibility model (CERF).

**Joint Session ENRE/Practice Curated: Advanced Analytics in Oil & Gas Production and Exploration**Sponsored: Energy, Natural Res & the Environment/Natural Resources Petrochemicals  
Sponsored Session

Chair: Damian Burch, ExxonMobil Upstream Research Company, Houston, TX, United States

**1 - Bayesian Modeling and Decision Making for a Well System**  
Rujian Chen, Massachusetts Institute of Technology

We are interested in modeling a large off-shore oil well system with complex multi-phase fluid flows. Previous optimization-based learning methods failed to capture the high uncertainty in the system arising from noisy and missing measurements. In this work, we adopt a Bayesian framework to infer system parameters as well as characterize their uncertainty. We use a Gaussian process to model the flow simulation and develop an approximate model with a tractable inference method. We use synthetic to data show the fidelity of the approximate model and use Bayesian model validation techniques to show the predictive accuracy of the model. Finally, we develop new experiment design approach which brings time and cost savings compared to previously used empirical methods.

**2 - The Effect of Technology on Importance of Geologic Parameters for Shale Well Productivity: Cross-Play Analysis**

Svetlana Ikonnikova, University of Texas at Austin, Austin, TX, United States, Katie Smye, Scott Hamlin, Robin Dommissie, Frank Male

This study of Haynesville, Fayetteville, and Marcellus shale plays explores the role of geologic parameters versus completion technology? Applied machine learning methods (random forest and model-based recursive partitioning) reveal the set of variables, which explain individual well productivity. The analysis focuses on exceptionally good wells in geologically mediocre, e.g. ductile, areas to understand whether "poor rock quality can be compensated by completions and be economical. We find that good "outliers exist, with productivity being statistically explained by technology-related changes, such as optimized completions (and field experience) making "poor zones economic.

**3 - Transdimensional Full Waveform Inversion Using a Hamiltonian Formulation**

Mrinal K. Sen, University of Texas at Austin

Abstract not available.

**4 - Data-driven Methods for Well Connectivity**

Damian Burch, PhD, ExxonMobil Upstream Research Company, 22 S. Peaceful Canyon Circle, The Woodlands, TX, 77381, United States, Akash Mittal, Tripti Kumari

Making the best development and production decisions in the oil & gas industry requires a detailed understanding of subsurface flow paths. Most critically, we need to understand if and how pressure from injection wells might affect nearby producer wells. Unfortunately, this information usually cannot be directly imaged, so indirect methods are required to infer subsurface flow paths from sparse surface measurements. In this talk, we will discuss methods that combine simple physical models with data-analytic algorithms for detecting and quantifying well connectivity.

**5 - Real-time Solution of a Pursuit-Evasion Game for Ice Management**

Matthew W. Harris, ExxonMobil Upstream Research, Magnolia, TX, United States

Ice management systems provide a rational basis for risk-based decisions, and they involve estimating the probability of an ice impact and associated time. A differential pursuit-evasion game perspective provides conservative estimates for miss distance and time. Such problems are generally difficult to solve since the direct methods of optimal control do not apply. However, the state space can be partitioned to identify closed-form solutions or a reduced set of algebraic equations. It so happens that the degenerate solution types admit closed-form solutions while regular solution types do not. Examples of each are shown.

### Advances in Project Management

Emerging Topic: Project Management and Scheduling, in Memory of Joe Leung,

Emerging Topic Session

Chair: Janne Kettunen, The George Washington University, Washington, DC, 20052, United States

#### 1 - Using Reminders to Focus Attention

Suvrat Dhanorkar, Pennsylvania State University, 466 Business Building, University Park, PA, 16802, United States, Enno Siemsen

How does one ensure that tasks get done, even if one has only limited authority and control over them? This is a fundamental problem of project management. Additionally, since tasks do not exist in a vacuum, organizations constantly require their employees to multi-task and switch attention from one task to another. We use energy efficiency projects as the research context and use a combination of archival and experimental data to show that reminders serve as a key managerial lever to focus the employee attention to specific tasks.

#### 2 - Project Portfolio Selection: Disjunctive Stochastic Programming Formulations with Joint Chance Constraint

Janne Kettunen, The George Washington University, Department of Decision Sciences, 2201 G. Street NW, Washington, DC, 20052, United States, Miguel Lejeune

The main goals of start-up companies in new product development (NPD) are to attain a reliable return level and deliver this return level fast. Achieving these goals is complicated due to uncertainties in projects' returns and durations. We develop new models for the NPD capturing the above goals. The first model is static representing the waterfall product development process whereas the second model is dynamic representing the agile product development process. We design a reformulation method and a new decomposition algorithm to solve these problems. We apply our models to an US-based software start-up company and derive managerial insights.

#### 3 - Information Exchange in Parallel Search

Fang Ni, University of Cologne, Cologne, Germany, Fabian J. Sting

This paper studies parallel search for technological innovation by multiple teams, which is a relevant context for organizational innovation. Within such a setting, a critical issue is how to organize information exchange among the searching teams. The study employs an agent-based simulation approach to identify optimal communication strategies for the firm.

#### 4 - Planning, Tracking, and Reducing Project Value at Risk

Tyson R. Browning, Texas Christian University, Neeley School of Business, TCU Box 298530, Fort Worth, TX, 76129, United States

Uncertainty, risk, and rework challenge projects to meet goals and deliver anticipated value. Conventional techniques for planning and tracking earned value do not account for these. I present a methodology for planning and tracking

cost, schedule, and performance in terms of a project's key value attributes and threats to them. It considers how high the "bar is set for a project (its set goals) and therefore how challenging and risky it will be. A project's capabilities as a "jumper (to clear the bar and meet its goals) determine the portion of its value at risk (VaR). Progress occurs as VaR is reduced: activities "add value by chipping away at the project's "anti-value, the risks that threaten value.

#### 5 - Capacity Planning for Project Management by Adjustable Distributionally Robust Optimization

Daniel Zhuoyu Long, Chinese University of Hong Kong, Room 605, William M. W. Mong Engineering Building, Hong Kong, Antonio J. Conejo, Nicholas G. Hall, Runhao Zhang

Many project companies use outsourced providers which require capacity reservation. Capacity reservation decisions provide access to outsourced services that enable project crashing, but must be made before task durations are realized. We model these decisions with the consideration of worst case distribution. Once task durations are realized, the project company makes decisions about fast tracking and outsourced crashing. We model the company's objective using the target-based measure. We compare the performance of the model against benchmarks from the literature, and show that it provides lower risk and greater robustness to distributional information.

## ■ SA52

North Bldg 231C

### Social Media and Financial Information

Emerging Topic: Social Media Analytics

Emerging Topic Session

Chair: Soo Jeong Hong, PhD, Michigan State University, East Lansing, MI, United States

#### 1 - Social Media Disclosure and Analysts as Information Intermediaries

Kwangjin Lee, Michigan State University, 31 Middlevale Road, 1645 f, East Lansing, MI, 48823, United States

Social media provide chances of direct communication between firms and investors. On one hand, it may reduce the information intermediary role of financial analysts. On the other hand, information overload increases the demand for financial analysts' role as information intermediaries. Therefore, it is an empirical question whether prevalence of social media disclosure substitute or complement the traditional intermediaries, financial analysts. I investigate the effect of social media disclosure on the market reaction to forecast revisions and find social media disclosures complement rather than substitute for the intermediary role of financial analysts, consistent with mosaic theory.

#### 2 - Variational Autoencoders and Infinite Edge Partition Models for Text Modeling and Community Detection: Evidence from Yelp.com Review

Hyunsang Son, The University of Texas at Austin, Austin, TX, United States

Recent works from Natural Language Process (NNP) found that variational autoencoders (VAE) with appropriate decoders such as Long short-term memory (LSTM) better on generative text modeling. By adopting another newly emerged research trends in social network analysis called community detection, this paper will investigate how user networks differ in yelp.com review conditioning on sentiment label.

#### 3 - The Role of Public Sentiment and Firm Crisis Response Strategy on Twitter in Stock Markets During Firm Crisis Situations

Soo Jeong Hong, Michigan State University, 404 Wilson Rd, Room 309, East Lansing, MI, 48824, United States, Kwangjin Lee, Jinse You

The importance of social media in prediction of stock prices is increasing as the individual investors' and firm's social media usage has become prevalent. We seek the associations between sentiment of Twitter messages and stock price behavior during firm crisis situations. This paper is focused on gaining deeper insights into investors' behavior in order to minimize financial and reputational damages on the firms.

North Bldg 232A

### Auction Markets with Non-convexities

Sponsored: Auction and Marketing Design

Sponsored Session

Chair: Robert Day, University of Connecticut, Storrs, CT, 06269-1041, United States

#### 1 - Investment Effects of Pricing Schemes for Non-convex Markets

Jacob Mays, Northwestern University, 2145 Sheridan Road, Room C230, Evanston, IL, 60208, United States

Jacob Mays, Federal Energy Regulatory Commission, Washington, DC, United States, David Morton, Richard O'Neill

Non-convex markets, such as those organized by electricity system operators, lack uniform clearing prices. To help resolve the incentive compatibility issues that arise when clearing these markets, operators have introduced a variety of price formation and uplift payment schemes. We investigate the impact that the choice of pricing scheme can have on generator entry and exit decisions. Our results suggest that despite the presence of fixed production cost elements, prices derived from marginal costs support the optimal capacity mix.

#### 2 - Economizing the Uneconomic: Markets for Sustainable, Reliable, and Price Efficient Electricity

Mohammad Rasouli, Stanford University, 473 Via Ortega, Room 268, MS 4020, Stanford, CA, 94305, United States, Demosthenis Teneketzis

The electricity policy targets aim to provide sustainable and reliable electricity with efficient prices under uncertain demand. Any solution addressing a subset of the policy targets can affect the others. Whereas most of the existing studies focus on one of the targets and analyze existing solutions, we focus on implementing all of the above policy targets by adopting a design approach. We develop a framework for designing efficient auctions with constraints that results in market implementations of the above electricity policy targets. Our results highlight that all policy targets can be achieved without any price-cap or market monitoring, and provide clear answers to major policy debates.

#### 3 - Fast Core Pricing for Rich Advertising Auctions

Rad Niazadeh, Stanford University, 353 Serra Mall, Gate BLDG, Office 484, Stanford, CA, 94305, United States, Jason Hartline, Nicole Immorlica, Mohammad Reza Khani, Brendan Lucier

As online ad offerings become increasingly complex, the sale of web advertising space increasingly resembles a combinatorial auction with complementarities. In this setting, GSP is not well-defined and truthful combinatorial auctions, e.g. VCG, can yield unacceptably low revenue. Core selecting auctions (Day and Milgrom [2007]) boost revenue. Motivated by this, we give a combinatorial algorithm to find a bidder-optimal core point with almost linear calls to welfare-maximization oracle. We also run experiments on the Microsoft Bing Ad Auction platform with decorations: core pricing generates almost 100% more revenue than VCG, and 20% more revenue than the standard GSP auction on average.

#### 4 - Simple and Approximately Optimal Pricing for Proportional Complementarities

Kira Goldner, University of Washington, Seattle, WA, United States

Most work in optimizing revenue with complementary valuations models the buyer's value for a bundle as additive over independent values for each subset. Instead, we model the complementarities as proportional to the buyer's base valuations for each item, and these proportionalities are known market parameters. We give a simple pricing scheme that achieves approximately-optimal revenue and affirms the intuition that selling separately is not a good mechanism to use in the case of complementarities. Our scheme achieves an approximation factor of a constant for pairwise item boosts, and when the boosts are for larger subsets given by a hypergraph, of the minimum of two parameters of the hypergraph.

## ■ SA54

North Bldg 232B

### BOM Session (TONG)

Sponsored: Behavioral Operations Management

Sponsored Session

Chair: Jordan Tong, PhD, University of Wisconsin, Madison, WI, United States

#### 1 - Increased Transparency in Procurement: The Role of Peer-Effects

Ignacio Rios, Stanford, Ruth Beer, Daniela Saban

We study the effects of increased transparency in settings where purchasing decisions are delegated to individual employees as opposed to being centrally managed by the organization. We show that there exists a spillover region where an employee is more likely to choose the expensive supplier when he observes that his peer did so, and we confirm this finding experimentally. We also find that

employees whose decisions are observed are less likely to choose the expensive supplier, and this behavior is aligned with what is considered more socially appropriate. Thus, we argue that these peer-pressure effects are better explained by a model of social norms rather than a model of reciprocity.

#### 2 - On the Non-equivalence of Trade-ins and Upgrades in the Presence of Framing Effect: Experimental Evidence and Implications for Theory

Mahdi Mahmoudzadeh, Georgia Institute of Technology, Scheller College of Business, 800 West Peachtree Street NW, Atlanta, 30308, Georgia

Manufacturers of durable goods often buy back older versions of their products from customers to induce them to switch to improved versions. Classical model has long ignored the framing of these buyback schemes, i.e., trade-ins or upgrades, and its relevance for consumer behavior and theory. Using reference-point shift mechanism, through controlled experiments we find that the alternative frames are not isomorphic and that they shift customers' reference points. We then use the experimental findings to extend a reference-dependence version of the classical model of trade-ins and upgrades and show that the behavioral extension modifies predictions of the classical model in line with reality.

#### 3 - Sustainable Operations Versus Corporate Social Responsibility: How Value Chain Transparency Influences Choice

Ryan Buell, Harvard Business School, Morgan Hall 429, Boston, MA, 02163, United States, Basak Kalkanci

Amid calls for value chain transparency and greater social and environmental stewardship, companies employ a variety of strategies to mitigate the adverse effects of their operations on people and the environment. Some engage in internal sustainability initiatives, such as paying living wages to workers or investing in innovations that reduce the environmental impact of their processes. Others engage in external initiatives, such as contributing to social causes, or offsetting their emissions to compensate for the impact of their processes. Through a series of field and lab experiments, we investigate how and when transparency into these internal and external efforts affect consumer choice.

#### 4 - Mean Service Metrics: Biased Quality Judgement and the Customer-server Quality Gap

Robert Batt, Wisconsin School of Business, UW-Madison, 5279 Grainger Hall, 975 University Ave., Madison, WI, 53706, United States, Jordan D. Tong

We show that a commonly-observed data aggregation technique can lead to systematic biases in how people infer service quality due to a mathematical gap between the quality that servers deliver and that which customers experience. We use a stylized model to characterize how the gap depends on the structure of the service environment, and we use lab experiments to show that people generally fail to fully correct for differences between server-level and customer-experienced metrics. Finally, we use secondary data in the contexts of education and the air travel industry to get a sense of the potential magnitude of judgment biases in real-world settings.

## ■ SA55

North Bldg 232C

### Topics in New Product Development

General Session

Chair: Evgeny Kagan, Ann Arbor, MI, 48103, United States

#### 1 - Smart Manufacturing via Crowd Sourcing

Onesun Steve Yoo, University College London, London, United Kingdom, Kevin F. McCardle, Christopher S. Tang

We examine a smart crowd-sourcing model of manufacturing practiced widely by leading manufacturers in China. A key feature is the use of virtual images of their products to learn whether there is sufficient demand for them before engaging in costly physical production. Using virtual images are less attractive for consumers (uncertainty of getting the item, delays), so the firms must charge a lower price. We analyze the optimal hybrid approach that combines both use of virtual images (made-to-order) and more traditional production (made-to-stock). We compare it with the current practice of some of the leading Chinese manufacturing firms (e.g., Alibaba, Gaofan), and discuss its efficacy.

#### 2 - Truth or Funds for Your Project

Jochen Schlapp, University of Mannheim, Wilhelm-Leuschner-Str. 241, Griesheim, 64347, Germany, Nektarios Oraopoulos, Niyazi Taneri, Ozge Tuncel

We examine the effectiveness of monetary incentives in eliminating managerial misconduct in competitive resource allocation processes. Whereas economic theory predicts that formal incentives should be sufficient to align managers with the organization's best interests, our laboratory experiments reveal that current theory falls short of acknowledging the importance of the level of trust and trustworthiness between managers competing for resources. We show how an organization can induce higher levels of mutual trust, thus improving the overall effectiveness of the resource allocation process.

### 3 - Revisiting the Role of Collaboration in Creating Breakthrough Inventions

Manuel Emilio Sosa, INSEAD, 1 Ayer Rajah Avenue, Singapore, 138676, Singapore, Tian Chan, Jurgen Mihm

We use utility and design patent data for 1985-2009 to compare the probability of creating a breakthrough of working alone versus working in a team. Consistent with literature, for utility patents we find that working alone reduces the probability of achieving a breakthrough. Yet this disadvantage of lone inventors disappears for design patents. We theorize and show empirically that the holistic (i.e., nearly non-decomposable) nature of design is a major factor contributing to the relative efficacy of lone designers at achieving breakthroughs. Finally, we show that lone inventors with a large number of past collaborators has improved likelihood of creating breakthroughs and can outperform teams.

### 4 - Gender Preference for Tech & Competition: Very-Large-Scale Field Experimental Evidence from an Internet-of-Things Platform

Nilam Kaushik, University College London, Boston, MA, 02115, United States, Kevin Boudreau

This paper presents results from a field experiment on 112,000 students and alumni of an American university to understand willingness to participate in working on innovation problems related to a new area of technological innovation and commercialization, the Internet-of-Things.

## ■ SA56

West Bldg 101A

### Operations Analytics in Healthcare

Sponsored: Health Applications

Sponsored Session

Chair: Tolga Tezcan, London Business School, London, NW14SA, United Kingdom

#### 1 - Integrating Prediction Algorithms with Physician Decisions

Junchao Ma, Yale School of Management, Yale School of Management, New Haven, CT, 06520, United States, Edieal J. Pinker

Attempts to use machine learning techniques to create personalized predictions in healthcare are becoming common. Adoption of such methods in practice will require integrating them into the decisionmaking processes of physicians. In this talk we will discuss our attempt to better understand how a mortality prediction algorithm for advanced cancer patients can augment physician predictions and decision making regarding end-of-life care.

#### 2 - Dynamic Server Assignment in Multiclass Queues with Shifts

Carri Chan, Columbia Business School, 3022 Broadway, Uris Hall, New York, NY, 10027, United States, Vahid Sarhangian

Nurse staffing decisions in emergency departments (EDs) are typically assigned weeks in advance, which can create staffing imbalances as patient demand fluctuates. In this work, we consider the potential benefits of assigning nurses to different areas within an ED at the beginning of each shift. We study the problem of optimal reassignment of nurses to areas by considering a multiclass queueing model of the system. We analyze an associated fluid control problem and use the solution to develop policies that achieve asymptotically optimal performance under fluid-scaling for the original stochastic system. We find this additional flexibility can substantially reduce waiting times for patients.

#### 3 - Joint Patient Selection and Scheduling: Theory and Application in Proton Therapy

Ruihao Zhu, MIT, Cambridge, MA, United States, Soroush Saghaian, Nikolaos Trichakis

Motivated by the practice of our partner proton therapy center, we develop joint patient selection and scheduling mechanisms. The center has a tight capacity to serve patients, and any patient scheduled beyond the regular capacity incurs an overtime cost. Developing simulations calibrated with data as well as a variety of analytical bounds, we show that an intuitive index policy that takes into account estimations of both class-dependent and time-dependent (a) no-show probabilities, and (b) service durations achieves a good performance. We also shed light on ways to identify the number of patient classes, estimate time-dependent no-show probabilities, and determine patient service durations.

#### 4 - Transfer Rates and Routing of Patients from ICUs to Downstream Units

Andrew Schaefer, Rice University, Department of Computational and Applied Mathematics, United States

We present a model for determining the transfer rates and routing of patients from intensive care units (ICUs) to downstream units within a hospital. Using a utility maximizing objective, we offer a decomposition approach that allows for an efficient solution algorithm in which each ICU determines its individual transfer rate while a network model determines the specific patient routing. We illustrate the model and solution approach with numerical examples and explore how flexible capacity, unit occupancy, fairness constraints, and network topology play a role in the optimal solution.

### 5- A Holistic Data Analytic Approach to Determine Impacts of the Caregiver Advise, Record, Enable (CARE) Act on Reducing Readmission and Mortality Rates among Older Adults

Nichalin S. Summerfield, University of Massachusetts Lowell, OIS Department, One University Avenue, Lowell, MA, 01854, United States, Asil Oztekin

Family caregivers are the front line of providing post-discharge care to patients and preventing hospital readmissions. CARE Act, enacted in 36 states, allows a patient to designate a caregiver and requires hospitals to provide post-discharge training to the caregivers. In this research, we evaluate the impact of the act by examining hospital 30-day readmission and mortality rates before and after the act implementation in New Jersey. We deploy a data analytic approach on 2013 and 2016 Medicare inpatient claims data of patients 65 years and older.

## ■ SA57

West Bldg 101B

### Innovation in Healthcare Delivery

Sponsored: Health Applications

Sponsored Session

Chair: Kamalini Ramdas, London Business School, London, NW1 4SA, United Kingdom

#### 1 - The Effects of Home Health Visit Length on Hospital Readmission

Hummy Song, The Wharton School, University of Pennsylvania, Philadelphia, PA, United States, Elena Andreyeva, Guy David

This study uses a novel dataset on home health care visits to quantify the effects of the length of a post-acute home health visit on hospital readmissions for patients with conditions that are subject to readmission penalties under the Hospital Readmission Reduction Program. Using an instrumental variable approach, we find that an extra minute relative to the average length of a patient's home health visits reduces their readmission likelihood by about 8 percent.

#### 2 - Increasing Patient Engagement Through Shared Medical Appointments

Ryan Buell, Harvard Business School, Morgan Hall 429, Boston, MA, 02163, United States, Kamalini Ramdas, Nazli Sonmez

Through a randomized control trial, we examine the impact of shared medical appointments (SMAs), in which a group of patients with similar chronic conditions meet with a doctor simultaneously, on levels of patient engagement. Relative to traditional one-on-one care models, we study how SMAs affect engagement levels, both during the appointment (such as making eye contact with the physician, engaging in the proceedings, and asking questions) and after (such as complying with prescribed medications in the home). Although SMAs hold obvious promise for improving the efficiency of healthcare, to the extent that they may lead to increased patient engagement, they may result in improved outcomes as well.

#### 3 - Structural Estimation of Kidney Transplant Candidates' Quality of Life Scores

A. Cem Randa, University of Chicago, Booth School of Business, 5807 S. Woodlawn Avenue, Chicago, IL, 60637, United States, Baris Ata, John J. Friedewald

This paper develops a framework for assessing the impact of changes to the deceased-donor kidney allocation policy on the transplant candidates' organ acceptance behavior, the transplant waitlist, organ availability for different patient groups and organ wastage. It advances a fluid model of the transplant waitlist and a dynamic structural model of the transplant candidates' accept/reject decisions for organ offers. Building on these two models, we also provide an equilibrium framework, enabling counterfactual studies for assessing the (unintended) consequences of policy changes.

#### 4 - Deployment Guidelines for Community Health Workers in Sub-Saharan Africa

Jonas Oddur Jonasson, MIT Sloan School of Management, 30 Memorial Drive, E62-588, Cambridge, MA, 02142, United States, Carri Chan, Sarang Deo, Jeremie Gallien

Community health workers (CHWs) are increasingly important to healthcare delivery in many African countries. Leveraging an extensive dataset featuring time, clinical findings, and GPS information for CHW visits in sub-Saharan Africa, we develop a stochastic model describing the health dynamics of a population served by a time-constrained CHW. We report closed-form solutions quantifying the impact of CHW deployment on public health for a special case and build a heuristic to solve a policy maker's CHW deployment problem.

## ■ SA58

West Bldg 101C

### Joint Session HAS/Practice Curated: Healthcare Analytics I

Sponsored: Health Applications

Sponsored Session

Chair: Ozden Onur Dalgic, Massachusetts General Hospital/ Harvard Medical School, Boston, MA, 02114, United States

#### 1 - Predicting the Risk of Critical Events in ALS Disease Using Data Analytics

Ozden Onur Dalgic, Harvard Medical School, Boston, MA, United States, Osman Ozaltin, F. Safa Erenay, Kalyan Pasupathy, Mustafa Y. Sir, Brian Crum

ALS is a neuro-degenerative disease causing continuous decay of motor neurons and muscle atrophy. Patients suffer from losing their abilities to speak, eat, move and. Due to having no permanent treatment, ALS eventually affects all abilities but disease progression shows a great variability. Using medical records of over 500 patients from Mayo Clinic, we analyse the ALS progression pathways, and estimate risks of losing abilities and needing medical interventions (e.g., feeding/breathing tube). We then develop a natural history model to predict the risk of critical events (e.g., using wheelchair) over the course of the disease.

#### 2 - Using Partially Observable Markov Decision Processes to Improve Alzheimers Disease Screening

Saeideh Mirghorbani, University of Alabama, Tuscaloosa, AL, 35401, United States, Sharif Melouk, John Mittenhalt

Family history, genetics, Down syndrome, head injury, high cholesterol levels, high blood pressure, and diabetes are some of the factors that place individuals at a higher risk of developing Alzheimer's disease (AD). To manage this risk and its complications, persons more susceptible to AD should be regularly screened. To determine an optimal screening plan, we develop a finite horizon, partially observable Markov decision process model for individuals transitioning through different stages of AD. The model aims to maximize the Quality Adjusted Life Years (QALY) for an individual.

#### 3 - The Role of Big Data in System Dynamics Modeling

Hamed Kianmehr, Binghamton University, Binghamton, NY, 13905, United States, Nasim S. Sabounchi, Lina Begdache

Our objective in this research is to use big data techniques to enhance system dynamics (SD) modeling regarding the relationship between diet and mental health. We apply our approach to study the relationship between diet and mental health. We estimate the parameters of the system dynamics model by applying some novel big data techniques on a large data set. Then, we feed the calibration parameters in SD models with the new estimations using big data analytics. Big data techniques and SD models can contribute to investigating the causal relationships between nutrition and mental health. The future achievement will enable big data analytics to assist other modeling techniques in the healthcare domain.

#### 4 - Developing Predictive Models for Parkinson's Disease by Analyzing an Imbalanced Dataset

Saeed Piri, University of Oregon, 434 Lillis Business Complex, Eugene, OR, 97403, United States

Parkinson's disease (PD) is a neurodegenerative disorder that affects about one million Americans. In this study, we develop diagnostic models, which use only demographic, lab, and clinical events data. To develop these models, we analyzed a large size imbalanced data. To enhance our models' accuracy, we applied synthetic informative minority oversampling (SIMO) algorithm and extended it to machine learning techniques such as decision tree, logistic regression, and neural network. Finally, we developed an ensemble model by applying confidence margin ensemble approach.

#### 1 - Workload, Predictive Accuracy, and the Value of Algorithm-enabled Process Innovation: The Case of Sepsis Alerts

Mehmet U. Ayvaci, University of Texas at Dallas, Richardson, TX, United States, Idris Adjerid, Ozalp Ozer

Predictive algorithms have an increasingly important role in supporting the day-to-day operations of businesses. This paper studies how and when algorithm-enabled process innovation (AEPI) creates value, particularly in the

context of changing operational environments and the behavioral responses to algorithmic predictions. We contextualize the broad research problem into the implementation of an alert system in a hospital for early identification and treatment of sepsis. We leverage a rich set of clinical and nonclinical data and econometric approaches to examine the relationship between sepsis AEPI and patient mortality.

#### 2 - Impact of Discharge Policies on Emergency Department Overcrowding

Arshya Feizi, Boston University, 595 Commonwealth Avenue, Boston, MA, 02215, United States, Jillian Berry Jaeker

In a hospital "boarding" occurs when emergency department (ED) patients are stabilized but cannot be admitted to their appropriate wards for further treatment, if required, due to issues such as insufficient capacity in the receiving unit. We investigate how discharge policies may impact ED overcrowding and patient boarding.

#### 3 - How to Improve MRI Hospital Waiting Time – An Empirical Analysis of Geographical Resource Pooling

Yangzi Jiang, Northwestern University, 4174 Kellogg Global Hub, 2211 Campus Drive., Evanston, IL, 60208, United States, Jan A. Van Mieghem, Hossein Abouee Mehrizi

Significant mismatches between demand and capacity in MRI hospitals in Ontario Canada leads to prolonged waiting time which inspired our research of when and to what extent to implement pooling. Using patient-level data gathered from 72 MRI hospitals over 5 years, we conducted an empirical analysis using regional pooling to achieve over 20% wait-time reduction. This research provided the basis for strategic hospital decisions. ?

#### 4 - Do Financial Incentives Change Length-of-stay Performance in Emergency Departments? A Retrospective Study of the Pay-for-performance Program in Metro Vancouver

Yichuan Ding, University of British Columbia, University of British Columbia, 6333 Larkin Drive, Vancouver, BC, V6T 1C3, Canada, Yuren Wang, Eric Park, Garth Hunte

We study whether and how a province-wide P4P program affected ED patient disposition timing. The P4P program provided financial compensation to enrolled hospitals for each ED patient visit that met a certain LOS target. We examined, in 4 EDs, whether the LOS distribution had a discontinuous density near the LOS targets specified by the program, which suggests that patient dispositions may have been completed in order to meet the LOS targets. Our findings provide evidence of organizational responses to P4P incentives and suggest that the P4P program can benefit patients by reducing access blocks, but may also lead to unintended outcomes, such as higher return and admission rates.

### Joint Session HAS/Practice Curated: Data and Models in Healthcare Analytics

Sponsored: Health Applications

Sponsored Session

Chair: Joel Goh, NUS Business School, 119245, Singapore

Co-Chair: Shasha Han, National University of Singapore, National University of Singapore, Singapore, Singapore

#### 1 - The Analytics of Bed Shortages: Coherent Metric, Prediction and Optimization

Jingui Xie, University of Science and Technology of China, School of Management, 96 Jinzhai Road, Hefei, 230026, China, Gar Goei Loke, Melvyn Sim, Shao Wei Lam

In practice, healthcare managers often use bed occupancy rates (BOR) as a metric to understand bed utilization, which is insufficient in capturing the risk of bed shortages. Based on the riskiness index of Aumann and Serrano (2008), we propose the entropic bed shortage metric, which captures more facets of bed shortage risk than traditional metrics such as the occupancy rate, the probability of shortages and expected shortages. We also propose optimization models to control the risk of bed shortages and plan for bed capacity via this metric. These models have linear program re-formulations which can be solved efficiently on a large scale.

## 2 - Cost-effectiveness Analysis of Clinical Management Strategies for Undifferentiated Febrile Illness in the Era of Responsible Antibiotic Use

Zhenhuan Zhang, University of Minnesota, Minneapolis, MN, 55414, United States, Diana Maria Negoescu, Claudia Munoz-Zanzi

Febrile illnesses such as dengue, leptospirosis and scrub typhus have similar symptoms and are often difficult to differentiate without diagnostic tests. If not treated appropriately, patients could experience serious complications. The question of what diagnostic test to use and when to administer antibiotic treatment to avoid misuse of scarce resources and ensure best possible health outcomes remains an open problem. We construct a Markov model of febrile illness progression to assess the cost-effectiveness of fifteen clinical management strategies for diagnosing and treating acute undifferentiated febrile illness in Thailand under different attitudes towards antibiotic use.

## 3 - Data Driven Personalized Treatment Planning for Chronic Diseases

Christof Naumzik, ETH Zurich, Zurich, Switzerland, Stefan Feuerriegel

Medical research has found the progression of chronic diseases to transition between different clinical phases (e.g. acute and stable). These trajectory phases are relevant for clinical practice, since they serve as the basis for providing care and nursing. Yet their correct identification is challenging, as symptoms are only stochastically related to them. We formalize a hidden Markov model with latent states matching the trajectory phases as defined by the Corbin-Strauss trajectory framework. A copula approach is implemented to handle multivariate observations (e.g. pain and disability).

## 4 - A Robust Approach to Study Multiple Treatments: Hierarchical Contrast-specific Propensity Score

Shasha Han, NUS Business School, National University of Singapore, NUS Business School, Biz 2 Building B1, 1 Business Link, Singapore, Singapore, Joel Goh, Fanwen Meng, Donald Rubin

The worldwide rise in number of patients with diabetes and the consequent secondary complications is afflicting human population globally. To study the multiple medications treatment effect for diabetes, we propose a hierarchical contrast-specific propensity score (CSPS) approach. One merit of the approach is that it is robust to misspecification of the functional form of CSPS. The results from diabetes data in Singapore corroborates our theoretical findings. Due to such robustness, the hierarchical CSPS could be influential in causal inference for multiple treatments. Also, the approach charts one of the paths towards personalized medication in healthcare.

## Information Provision in Selling Platforms, Health Care and Public Sectors

Sponsored: Manufacturing & Service Oper Mgmt

Sponsored Session

Chair: Shouqiang Wang, The University of Texas at Dallas, Richardson, TX, 75080, United States

## 1 - Conspicuous by Its Absence: Diagnostic Expert Testing under Uncertainty

Tinglong Dai, Johns Hopkins University, 100 International Dr, Baltimore, MD, 21202, United States, Shubhranshu Singh

In many professional services, diagnostic experts may not be able to immediately reach correct diagnoses for their clients' conditions, and often resort to diagnostic testing with cost implications (e.g., money, time, discomfort, or side effect). In this paper, we formulate a diagnostic expert's pathway-selection problem when the peers observe these decisions and form beliefs about the expert's skill level. We find that the high-type expert's optimal diagnostic pathway may entail not performing the test even when it generates a positive surplus. We also show under-testing is the unique pattern allowing the high-type expert to credibly signal her type.

## 2 - Information Design of Time-locked Sales Campaigns for Online Platforms

Can Kucukgul, The University of Texas at Dallas, Richardson, TX, 75080, United States, Ozalp Ozer, Shouqiang Wang

Many online retailing platforms nowadays offer time-locked sales campaigns as an innovative selling mechanism, whereby third-party sellers sell their products at a typically discounted price for a fixed time horizon of pre-specified length. To incentivize purchases, platforms provide some information on up-to-date sales as campaigns progress, in the hope of influencing an upcoming consumer's valuation of products. We propose an easy-to-implement and near optimal information provision strategy for such a time-locked sales campaign. Our policy has important managerial implications, and yields significant profit improvement upon some na ve policies currently implemented in practice.

## 3 - Fast and Slow Learning from Reviews

Ali Makhdoumi, MIT, 77 Massachusetts Ave., 32D-640, Cambridge, MA, 02139, United States

We study the design of rating systems in online platforms. In particular, we consider a model of Bayesian learning from online reviews and characterize the speed of asymptotic learning of the quality of a product. We then characterize the impact of information provision on the speed of learning and identify situations in which providing more information leads to slower learning.

## 4 - Warning Against Recurring Risks: An Information Design Approach

Shouqiang Wang, The University of Texas at Dallas, Naveen Jindal School of Management, 800 W. Campbell Rd, Richardson, TX, 75080, United States, Saed Alizamir, Francis E. De Vericourt

Organizations or government agencies typically emit warning messages to alert relevant stake-holders about potential disastrous events of repetitive nature. Nonetheless, when the adverse event does not materialize, these false alarms affect the agencies' credibility and hence their ability to mobilize timely responses to future threats. Thus, when sounding an alarm, the agencies need to weigh their current ability to elicit immediate actions against the efficacy of their future warning messages. Our research aims to elucidate how to resolve such trade-offs.

## Data Analytic to Facilitate Better Decision Making

Sponsored: Data Mining

Sponsored Session

Chair: Roy Jafari Marandi, Cal Poly, 1 Grand Avenue, San Luis Obispo, CA, 93407, United States,

## 1 - Decision-driven Data Analytics: Case Study of Breast Cancer Diagnosis

Roy Jafari Marandi, Mississippi State University, 260 McCain Engineering Buildin, Mississippi, Mississippi State, MS, 39762, United States

This talk focuses on presenting the development and adaptation of data analytic tools that are created or adapted to improve decision-making. The emphasis of this talk is to highlight the efforts and existing research gaps that pertain to improving data analytic techniques to better serve decision-making goals. Breast cancer diagnosis, which is an essential medical decision, will be used as an example and case study to further clarify the presented concepts, techniques, and contributions.

## 2 - Predicting Personnel Fraud

Ekrem Duman, Ozyegin University, Istanbul, Turkey

Predictive analytics is an important tool to drive useful business results from data. However, for successful predictive models one should have enough number of examples for the classes to be predicted. When the number of examples is small, building strong predictive models becomes a very challenging task. In this study we pick up one such problem: predicting the bank personnel which might commit fraud. In order to have a strong enough predictive model, we decided to combine the powers of descriptive and predictive modeling techniques where we developed several descriptive models and used them as input of predictive model at the last stage. The results show that our solution approach perform quite well.

### 3 - Survival Rate Prediction in Cardiac Patients with Heart Transplant or Assisted Devices

Maryam Soltanpour Gharibdousti, Binghamton University, 1120 Murray Hill Road, Vestal, NY, 13850, United States

The survival rate prediction for the organ transplant surgery patients can help to classify patients risk levels and potential post-surgical complications. The research used the data for cardiac patients with either medical assist devices such as Impella and Left Ventricular Assist Devices (LAVD) or heart transplant patients. The significant factors such as demographic information, baseline patient characteristics, baseline hemodynamics, laboratory values, and in-hospital complications can predict the survival rate after the transplant surgery. The data from one of the Organ Procurement Organizations (OPO) in New York state is analyzed using several machine learning algorithms.

Sponsored: Data Mining

Sponsored Session

Chair: Xun Zhou, University of Iowa, Iowa City, Iowa

#### 1 - Predicting Urban Dispersal Events: A Two-stage Framework Through Survival Analysis

Amin Vahedian Khezerlou, University of Iowa, IA, United States

In this work, we focus on predicting unexpected dispersal of people in urban setting, based on taxi pick-up records. Unlike regular taxi pick-up patterns, which are highly regular and predictable, the irregular dispersal events do not follow an obvious pattern and are challenging to predict. Such predictions can be used to better plan public safety and traffic management, as well as business profit. We propose a supervised learning framework which takes advantage of survival analysis to infer the event time, and also predict the event volume. We use a public dataset of taxi records for evaluations. We outperform baseline methods by a significant margin.

#### 2 - Multi-Frequency Convolutional LSTM for Crime Prediction

Maryam Rahmani Moghaddam, University of Iowa, Iowa City, IA, United States

The crime prediction problem aims at predicting the location and time of the future crimes. This problem is challenging due to the spatial and temporal sparsity of the crimes. In this work, we propose a Multi-Frequency Convolutional LSTM model, which is an ensemble of multiple convolutional lstm models trained by subsets of historical data with varying sampling intervals to capture the multi-frequency patterns of crimes. The combined output of these models using a convolutional neural network is further combined with the historical map through a spatial regression. We test our model on 5 years (Feb 2015-Feb 2017) of burglaries (23797 reports) in Portland, Oregon provided by the Portland Police Bureau and evaluate the PAI and PEI. We compare the proposed model with baseline methods static-map and Self-Exciting Point Process.

#### 3 - A Holistic Solution for Connected Smart City with Good Environmental Health, Traffic and Energy

Sheela Siddappa, Bosch, Bengaluru, India

Traffic Management is very important aspect towards smart city. As a solution towards smart city, this work concentrates on multiple aspects like 1) IOT based systems adapting Deep Learning and Machine Learning Techniques to accurately identify vehicles that violate traffic rules 2) Estimate the probability of a parking space being available in a locality 45 mins in advance and update with time 3) Estimate the impact of traffic realignment on the environment and iterate accordingly. Overall the solution aims towards a connected city and bring a balance between the environmental health and comfort towards traffic movement and rules in a holistic view.

### Big Data Science

Sponsored: Data Mining

Sponsored Session

Chair: Tae Hun Kim, Michigan State University, Eli Broad College of Business, 632 Bogue Street, East Lansing, MI, 48824, United States

#### 1 - Analysis of the Resilience of Public Transportation System Based on Energy Cost of Passengers

Xiongfei Lai, Dr., Tongji University, No. 4800, Cao'an Road, Shanghai, 201804, China, Jing Teng, Lu Ling

Based on field experiments, this paper proposes a calculation method for public transportation service resilience based on the energy cost of passengers. This

method utilizes the heart rate, acceleration and speed data automatically collected by the experimenters when they are walking in subway transfer stations, fits these data to Physical Activity Intensity and uses it as the index of travel energy cost. Subsequently, the accuracy, theoretical and practical prospect of this method are verified by the transfer passenger data of Beijing Subway Line 1 and Line 2 in May, 2017. The results show that the service resilience calculation method can accurately perceive the change of system service efficiency and its recovery ability according to different travel demands of the passengers. At the same time, the method uses automatic data collection to analyze, improves its accuracy and analysis adaptability compared with the traditional analysis methods.

#### 2 - Does User Contribution Enhance Welfare? The Effectiveness of User-crowdsourced Content in Relieving Urban Traffic Congestion

Tae Hun Kim, Baylor University, Waco, TX, 76798, United States, Chenhui Guo, Anjana Susarla, Vallabh Sambamurthy

In a mobile virtual community, Waze app users generates primary information (via alerts), follow-up feedback (via comments), and collective confirmation (via thumbs-up). We examine whether and how the user-crowdsourced content generates welfare by relieving traffic jams in New York City. Spatial panel data models are applied to estimating welfare value with large-scale data on behaviors and locations of users. Based on the results, user contribution reduces traffic congestion duration. A welfare analysis estimates that user contribution saves 2.28% of annual congestion cost per driver in the city. The welfare value shows that user contribution is effective in saving social and economic costs.

### Artificial Intelligence in Big Data

Sponsored: Artificial Intelligence

Sponsored Session

Chair: Jiaheng Xie, University of Arizona, Tucson, AZ, 85721, United States

#### 1 - Visual Social Media Analytics: Impact of Medical Knowledge on User Engagement

Xiao Liu, University of Utah, UT, United States

Video sharing social media sites, such as YouTube, that host videos providing information on the pathogenesis, diagnosis, treatments, and prevention of various conditions can be an effective way to understand medical knowledge and in managing chronic conditions through patient self-care. However, due to the heterogeneity of the content quality and content helpfulness on visual social media, healthcare providers and government agencies have expressed concerns about the quality and reliability of such information. There have been relatively few studies that have identified interventions to increase the ease with which patients can find helpful health information. We propose an interdisciplinary lens that synthesizes deep learning methods with themes emphasized in Information Systems (IS) research and research on healthcare informatics. Using a bidirectional long short-term memory (BLSTM) method, we extract medical terminology from videos. We annotate videos using inputs from domain experts and build a logistic regression based classifier to categorize videos based on whether they encode a high degree of medical knowledge or not. We identify distinct types of user engagement with videos on YouTube using a principal components analysis (PCA) approach: user dissonance, popularity based engagement, and relevance based engagement. We find that medical knowledge encoded in videos matters to patient engagement; however, popularity-based indicators of engagement indicate that videos that score high on medical knowledge encoded in videos, are actually less popular than those that are not. We conduct robustness checks using a convolutional neural network (CNN) to detect the presence of medical objects in a video. We find that medical terminology embedded in textual data is more salient to an assessment of medical knowledge encoded in a video, rather than image analytics. Our results suggest that healthcare practitioners and policymakers need a nuanced understanding of how users engage with medical knowledge in video format, which has implications for the role of videos and visual social media in bridging the health literacy gap and in enabling self-care of chronic conditions.

#### 2 - Are More Diverse Crowds Smarter?

Jiayu Yao, Georgia Institute of Technology, Atlanta, GA, United States, Qiang Gao, Mingfeng Lin

Does the diversity increase the wisdom of crowds? We examine the value of diversity in crowds within a market setting, specifically, the online financial market, utilizing a natural experiment on Prosper.com.

### 3 - Diversity Based Link Recommendation Algorithm

Kexin Yin, University of Delaware, 1020 Wharton Drive,  
Newark, DE, 19711, United States

By 2018, more than 4 billion people are reported using the internet all over the world, while more than 3 billion people are actively using social media. Social network sites are playing important roles in this information era. Link recommendation, the core technique targeting to help users establish a good friendship network, attracts significant attentions from both industry and academic researchers. However, friends recommended by an existing method are generally homogeneous in terms of their backgrounds, e.g. location or current university, because existing methods recommend friends with similar backgrounds or interests or sharing many common friends with a user. Serving as an important information source for users, social networks can perform better if they can introduce diversity in link recommendation. Improving social network diversity could increase the possibility for users to be connected with different information communities, thus gaining users social capital and competence. Because different users may have different preference of diversity when they make friends, and people can have different diversity preference on different dimensions of user background, link recommendation can be made to have different diversity level according to user's diversity preference on each user background dimension. In this presentation, multi-dimensional diversity preference is introduced as a new factor in link recommendation, and a new link recommendation problem, namely diversity preference-aware link recommendation problem is defined and proved to be a NP-hard problem. An efficient heuristic solution method will be developed based on the heuristic algorithm of binary quadratic programming and empirically tested with a real social network data set from Google+..

### 4 - Using Long Short-Term Memory to Predict Hospital Readmission

Jiaheng Xie, University of Arizona, 1130 E. Helen Street, Tucson,  
AZ, 85721, United States

Hospital readmission refers to the situation where a patient is re-hospitalized with the same primary diagnosis within a specific time interval after discharge. Hospital readmission causes \$26 billion preventable expenses to the U.S. health systems annually and often indicates suboptimal patient care. To alleviate those severe financial and health consequences, it is crucial to proactively predict patients' readmission risk. Such prediction is challenging because the evolution of medical events (illness trajectory) is dynamic and complex. The state-of-the-art studies apply statistical models which assume homogeneity among all patients and use static predictors in a period, failing to consider patients' heterogeneous illness trajectories. Our approach ð TADEL (Trajectory-BASED DEep Learning) ð is motivated to tackle the problems with the existing approaches by capturing various illness trajectories and accounting for patient heterogeneity. We evaluated TADEL on a five-year national Medicare claims dataset including 3.6 million patients per year over all hospitals in the United States, reaching an F1 score of 0.867 and an AUC of 0.884. Our approach significantly outperforms all the state-of-the-art methods. Our findings suggest that health status factors and insurance coverage are important predictors for readmission. This study contributes to IS literature and analytical methodology by formulating the trajectory-based readmission prediction problem and developing a novel deep-learning-based readmission risk prediction framework. From a health IT perspective, this research delivers implementable methods to assess patients' readmission risk and take early interventions to avoid potential negative consequences.

### Joint Session ISS/Smart Cities: Economics of Smart Cities

Sponsored: Information Systems

Sponsored Session

Chair: Beibei Li, Carnegie Mellon University, Pittsburgh, PA, 15213, United States

#### 1 - Learning Individual Behavior Using Sensor Data: The Case of GPS Traces and Taxi Drivers

Beibei Li, Carnegie Mellon University, 5000 Forbes Ave, Hamburg Hall 3026, Pittsburgh, PA, 15213, United States

Abstract not available.

#### 2 - Peer-to-peer Transportation Platforms and Local Consumer Mobility

Zhe Zhang, Carnegie Mellon University, 4800 Forbes Avenue, Pittsburgh, PA, 15213, United States

Abstract not available.

#### 3 - Pricing Efficiently in Designed Markets: Evidence from Ride-Sharing

John Horton, New York University, New York, NY, United States,  
Jonathan V. Hall, Daniel T. Knoepfle

In many designed markets, the platform eliminates price dispersion by setting the product market price, yet still allows supply-side free entry and exit. We explore the equilibrium of such markets, using data from Uber. Following price increases,

drivers make more money per trip and—and initially more per hour-worked—and as a result, work more hours. However, this increase in hours-worked has a business stealing effect, with drivers spending a smaller fraction of hours-worked with paying customers, eventually bringing the hourly earnings rate back close to its previous level. The resulting higher fare/lower productivity equilibrium is generally inefficient.

### 4 - The Value of Time: A High-Frequency Analysis of Ride-Hail Auctions

Nick Buchholz, Princeton University, NJ, United States

We use detailed consumer choice data from a large ride-hailing application to study consumer valuations of time. This application offers a unique mechanism that allows taxi drivers in the Czech Republic to bid on trips, and allows consumers to choose between a set of characteristics of a ride: price, waiting time (based on the distance from consumers to each available taxi), car type and driver ratings. We observe the tradeoffs consumers face between prices and waiting times across 1.9M ride requests and 5M bids, as well as their ultimate selection. We leverage rich variation in bids and customer choices to directly measure consumer willingness-to-pay for time savings and decompose it further by time-of-day and location. Baseline estimates from Prague show the value of waiting to exceed median wages; from \$0.40 per minute in peak weekday morning hours, to \$0.05 per minute in off-peak weekend hours. Waiting times are important to explain customers' choices, on average accounting for 13.7 percent of total valuation. We use our preference estimates to quantify the welfare benefits of offering a menu of time and price options. Our results show that a flexible menu of waiting time and choices improves welfare by up to 48 percent over a more standard dispatch mechanism.

#### 1 - Monitoring for Changes in the Nature of Stochastic Textured Surfaces

Anh Tuan Bui, Northwestern University, Technological Institute 2145 Sheridan Road, Room C210, Evanston, IL, 60208, United States

This work monitored for changes in the nature of stochastic textured surfaces without requiring prior knowledge of the changes. We used supervised learning to characterize the joint distribution of surface image pixels. Our monitoring statistic was based on likelihood-ratio principles. We demonstrated the approach with textile and simulation examples.

#### 2 - Predictive Comparisons for Screening and Interpreting Inputs in Machine Learning

Raquel Ferreira, Purdue University, West Lafayette, IN, 47907, United States

A methodology based on predictive comparisons is specified to identify important inputs and interpret their associations with an outcome that are obtained via a machine learning algorithm. New predictive measures are constructed to perform input screening, and interpret conditional and two-way interactions of inputs.

#### 3 - Scan B-Statistic for Kernel Change-Point Detection

Shuang Li, Georgia Institute of Technology, Atlanta, GA, United States

Detecting the emergence of an abrupt change-point is a classic problem in quality control, statistics and machine learning. In this paper, we propose a computationally efficient kernel-based nonparametric statistic for change-point detection, which enjoys fewer assumptions on the distributions than the parametric approaches and can handle high-dimensional data. A novel theoretical approximation of the tail probability of these statistics is proposed, which provides a convenient way to find the detection thresholds for both offline and online cases. We show that our methods perform well on both synthetic data and real data.

#### 4 - Scalable Robust Monitoring of Large-Scale Data Streams

Ruizhi Zhang, Georgia Institute of Technology, Atlanta, GA, United States

Online monitoring large-scale data streams has many important applications. However, it is non-trivial to develop efficient schemes due to three challenges: robustness, sparsity and computation. To tackle these challenges, we propose an efficient, robust and scalable monitoring scheme. Asymptotic analysis and extensive numerical simulations illustrate the usefulness of our proposed scheme.

### Joint Session QSR/Practice Curated: Data Analytics in Healthcare Applications

Sponsored: Quality, Statistics and Reliability

Sponsored Session

Chair: Dongping Du, Texas Tech University, Lubbock, TX, 79409, United States

#### 1 - Network-based Analysis of Multivariate Sensory Data for Real-time Monitoring of Cardiac Patients

Chen Kan, University of Texas at Arlington, Arlington, TX, United States

In this paper, a new network model is developed to integrate multivariate sensory data for real-time detection of abnormal cardiac patterns. Each cycle of the high-dimensional signal is mapped as a weighted network. Structural variations among networks are characterized by optimal network alignment, which are then incorporated into an exponentially weighted moving average control chart for in-situ monitoring. Experimental results show that the proposed network model effectively and efficiently captures incipient changes of cardiac activity for the early identification of disease patterns.

#### 2 - Atrial Fibrillation Source Identification Using Multinomial Distribution and Maximum Likelihood Estimation

Dongping Du, Texas Tech University, 2500 Broadway, P.O. Box 43061, Lubbock, TX, 79409, United States, Amirhossein Koneshloo

Atrial Fibrillation (AF) is the most common sustained cardiac rhythm disorder. Identifying AF triggers is essential for efficient treatment design. However, due to the uncertainty and randomness associated with electrical wave propagation, determining the trigger locations is challenging. In this study, we develop a robust probabilistic method to track the electrical wave conduction in AF in the presence of uncertainty. The method provides confidence regions that successfully capture AF sources. The confidence bounds can be valuable references for AF ablation design and planning.

#### 3 - A Mixed Effects Multi-task Learning Model for Parkinson's Disease Monitoring Using Smartphones

Hyunsoo Yoon, Arizona State University, 699 S. Mill Ave, Tempe, AZ, United States, Jing Li

Built-in sensors in smartphones can conveniently collect the activities of PD patients. The cost-effectiveness of this method allows patient conditions to be assessed frequently for more effective treatment. However, due to patient heterogeneity, patient-specific models are needed but face the challenge of limited data regarding the Unified PD rating Scale representing disease severity. We propose a multi-task learning approach, MEMTL, which can utilize both general population and patient-specific patterns to improve prediction performance. The unique features of MEMTL include detection of early signs of PD and accurate prediction of PD progression.

#### 4 - Subspace Learning and Representation of Dynamic Coordination Pattern Across Multiple Joints During Movement for Chronic Ankle Instability

Shaodi Qian, Northeastern University, Boston, MA, 02115, United States, Sheng-Che Yen, Eric Folmar, Chun-An Chou

Ankle sprains and instability are major public health concerns. Up to 70% of individuals don't fully recover from a single ankle sprain and develop chronic ankle instability (CAI). The diagnosis of CAI is usually based on self-report rather than objective biomechanical measures. In this study, we propose a new analytics method to identify discriminative patterns in the coordination among bilateral hip, knee, and ankle joints between individuals with CAI and health cohorts. A subspace learning algorithm is developed to estimate the multi-joint coordination patterns. The computational results show >80% classification accuracy with the identified patterns using a SVM classifier.

Chair: Ying Lin

#### 1 - Personalized Treatment Monitoring and Switching Policies for Chronic Depression

Mutita Siriruchatanon, University of Washington, Seattle, WA, United States, Shan Liu

To achieve better health outcomes, early detection of ineffective treatment plays a key role in developing optimal treatment plans. We formulated a personalized treatment monitoring and switching problem for chronic depression as a Markov decision process, and estimated the individual treatment effects on disease transitions. Considering the tradeoff between exploration and exploitation in solving the MDP, optimal treatment policies were obtained and analyzed using simulated data. This work is a starting point to enable optimal depression treatment selection using a decision support system.

#### 2 - Detect Depression from Communication: How Computer Vision, Signal Processing, and Sentiment Analysis Join Forces

Aven Samareh, University of Washington, 4324 8th ave NE, D7, Seattle, WA, 98105, United States, Yan Jin, Zhangyang Wang, Xiangyu Chang, Shuai Huang

Depression will leave recognizable markers in patient's vocal acoustic, linguistic, and facial patterns, all of which have demonstrated increasing promise on evaluating and predicting patient's mental condition in a more objective way. We developed a multi-modality prediction model to combine the audio, video, and text modalities, to identify the biomarkers that are predictive of depression with consideration of gender differences. We identified promising biomarkers from successive search on feature extraction analysis for each modality.

#### 3 - Forecasting the Demand for Mobile Clinic Service Based on Demographic and Clinic Data

Bilal Majeed, University of Houston, Houston, TX, 77054, United States, Jiming Peng, Ying Lin

Demand forecasting plays an important role in the deployment of mobile clinic services as it can help a mobile clinic to maximize its coverage under limited resource. In this talk, we present a new forecasting model to predict the delinquency rate in census tracts based on the clinic and the demographic data. For this, we first develop some associations between the delinquency data in census tracts and school zones. Then we combine semi-supervised learning and convex optimization to build up a forecasting model for the delinquency rates in all the census tracts. A case study in Harris County will be reported to demonstrate the efficacy of the new model and technique.

### Joint Session ICS/IOS-Uncertain: Stochastic and Distributionally Robust Optimization

Sponsored: Computing

Sponsored Session

Chair: Hamed Rahimian, Northwestern University, 2145 Sheridan Rd, Evanston, IL, 6208, United States

#### 1 - Distributionally Robust TSP with Wasserstein Distance

Mehdi Behrooz, Northeastern University, Department of Mech. & Ind. Engineering, 334 Snell Engineering Center, Boston, MA, 02115, United States, John Gunnar Carlsson, Kresimir Mihic

Motivated by a districting problem in multi-vehicle routing, we consider a distributionally robust version of the travelling salesman problem in which we compute the worst-case spatial distribution of demand against all distributions whose Wasserstein distance to an observed demand distribution is bounded from above. This allows us to circumvent common overestimation that arises when other procedures are used, such as fixing the center of mass and the covariance matrix of the distribution. Numerical experiments confirm that our new approach is useful when used in a decision support tool for dividing a territory into service districts for a fleet of vehicles when limited data is available.

#### 2 - Distributionally Robust Optimization with Chance Constraints Using Wasserstein Metric

Ran Ji, George Mason University, 4400 University Dr. MS 4A6, Fairfax, VA, 22030, United States, Miguel Lejeune

We study distributionally robust chance-constrained optimization problems DRCCP with Wasserstein metric under two types of uncertainties (uncertain probabilities and continuum of realizations). For the case of uncertain probabilities (resp. continuum of realizations), we propose a set of deterministic mixed-integer linear programming (resp. second-order cone programming) inequalities to reformulate DRCCP. We transform the chance constraints to the expectation ones via indicator function, then leverage the convex duality to reformulate the expectation constraints under Wasserstein ambiguity set. We derive valid inequalities to enhance the computational efficiency.

#### 3 - Two-stage Distributionally Robust Mixed Integer Program

Manish Bansal, Virginia Tech., 227 Durham Hall, 1145 Perry Street, Blacksburg, VA, 24060, United States

In this talk, we present our recent advances for solving two-stage distributionally robust mixed integer program and its variants.

**Healthcare Delivery Policy and Implementation**

Sponsored: Manufacturing &amp; Service Oper Mgmt/Healthcare Operations

Sponsored Session

Chair: Shima Nassiri, University of Michigan, Ann Arbor, MI, 48109, United States

**1 - Outcomes-based Reimbursement Policies for Chronic Care Pathways**

Sasa Zorc, INSEAD, 1 Ayer Rajah Avenue, PhD Office, Singapore, 138676, Singapore, Stephen E. Chick, Sameer Hasija

We develop an outcomes-based model of contracting in care for chronic patients, using data from United Kingdom's NHS. The government contracts with healthcare providers in effort to maximise population health minus the cost. We consider the decision of whether to contract with individual healthcare providers or groups of such providers, as well as which contract type to use. Individual contracts fail to provide the desired incentives if providers under such contracts cooperate (collusion), however so do group contracts if group members fail to coordinate (free-riding). We demonstrate that individual outcomes-adjusted capitation contracts are the most resistant to these adverse effects.

**2 - Predicting with Proxies: Improving Medical Risk Scores**

Hamsa Sridhar Bastani, Wharton School, Philadelphia, PA, United States

Risk scores are often used by providers to target interventions, and by payers to estimate costs. However, such scores may not transfer well from one healthcare provider to another due to differences in physician behavior, medical coding practices, and patient risk factors. On the other hand, developing a different risk score for each provider may be infeasible due to data scarcity. We present a new technique for adapting an existing risk score to a new provider by learning important biases specific to that provider. We evaluate our technique on a diabetes prediction task and demonstrate both improved predictive performance as well as insights into underlying differences between providers.

**3 - Outcome-based Pricing for Pharmaceuticals**

Elodie Adida, University of California - Riverside, School of Business Administration, 900 University Avenue, Riverside, CA, 92521, United States

We study the effect of outcome-based pricing for pharmaceuticals. Under this payment scheme, the pharmaceutical firm is paid only when the drug treatment achieves a pre-specified goal. We consider heterogeneous, price-sensitive, risk-averse patients, a payer, and a pharmaceutical firm producing a drug with uncertain effectiveness. We find that outcome-based pricing is unlikely to solve the issues of high drug prices and high payer expenditures. However, supplementing outcome-based pricing with a transfer payment between firm and payer can make patients, payer and firm better off than under uniform pricing.

**4 - The Price of Simplicity in Personalized Prostate Cancer Screening Strategies**

John Silberholz, University of Michigan, Ross School of Business

Patient preferences for different health states can significantly impact their best course of action in screening for diseases like prostate cancer. Patients with a relatively small disutility for treatment side effects might benefit from aggressive screening, while others might benefit from less aggressive screening or no screening at all. In this work, we use a mathematical model to quantify the benefit of fully personalized prostate cancer screening versus a one-size-fits-all strategy. Further, we identify simpler, more interpretable personalized screening strategies that could be easier to implement in practice, and we quantify the price of this simplicity in strategies.

**Recent Algorithmic Advances on Multi-objective Integer Programming**

Sponsored: Multiple Criteria Decision Making

Sponsored Session

Chair: Hadi Charkhgard, University of South Florida, Tampa, FL, 33620-5350, United States

**1 - OOES.jl: A Julia Package for Optimizing a Linear Function Over the Set of Efficient Solutions for Bi-objective Mixed Integer Linear Programming**

Alvaro Sierra-Altamiranda, University of South Florida, Tampa, FL, United States, Hadi Charkhgard

We present 'OOES.jl', a flexible package for optimizing a linear function over the set of efficient solutions for bi-objective mixed integer linear programs. The proposed framework extends our recent algorithm, by adding two main characteristics: (1) The package allows using any single-objective mixed integer programming solver supported by 'MathProgBase.jl'; (2) The algorithm works under multiprocessing environments by exploiting parallelization. An extensive computational study evaluates the performance of the package versus previous C++ implementation, the performance of parallelization and provides a comparison between different solvers available in the market.

**2 - A Branch-and-Bound Algorithm for a Class of Mixed Integer Linear Maximum Multiplicative Programs: A Multi-objective Optimization Approach**

Payman Ghasemi Saghand, FL, United States, Hadi Charkhgard, Changhyun Kwon

We present a linear programming based branch-and-bound algorithm for a class of mixed integer optimization problems with a bi-linear objective function and linear constraints. These problems can be viewed as a special case of optimization over the efficient set. It is known that without integer variables, such problems can be transformed into a Second-Order Cone Program (SOCP) and be solved by CPLEX SOCP. Also, such problems can be solved faster by a linear programming based algorithm. In this study, we embed that algorithm in an effective branch-and-bound framework to solve mixed integer instances. An extensive computational study shows that the proposed algorithm outperforms CPLEX SOCP solver.

**3 - MSEA-1.0: A Multi-Stage Exact Algorithm for Bi-objective Pure Integer Linear Programming in Julia**

Hadi Charkhgard, PhD, The University of South Florida, Tampa, FL, United States, Aritra Pal

We present a new exact method for bi-objective pure integer linear programming, the so-called Multi-Stage Exact Algorithm (MSEA). The method combines several existing exact and approximate algorithms in the literature to compute the entire nondominated frontier of any bi-objective pure integer linear program. Each algorithm available in MSEA has multiple versions in the literature. Hence, the main contribution of our research is developing a unified framework for all these versions in MSEA. The package supports execution on multiple processors and users (if interested) can easily customize the package for their specific problems.

**4 - Enabling Energy Storage Sharing among Multiple Independent Users: A Multi-objective Optimization Approach**

Rui Dai, University of South Florida, Tampa, FL, United States, Hadi Charkhgard

Energy storage sharing should be coordinated in a proper way to ensure the fairness and efficiency when allowing users exchange their stored energy. To address this challenge, this work proposes a multi-objective optimization based sharing strategy to operate an energy storage system shared by multiple independent users. In order to guarantee the fairness in the exchange of stored energy, the payoff for the user transferring their stored energy to other users is calculated. This strategy is formulated as a Nash bargaining problem, and solved through a multi-objective optimization approach. In addition, piecewise McCormick relaxation is adopted to linearize the existing bilinear terms.

### Joint Session MAS/Practice Curated: Cybersecurity Analysis and Applications I

Joint Session

Chair: Paul L. Goethals, United States Military Academy, West Point, NY, 10996, United States

#### 1 - Quantum Correlation Sets and the Limits of Quantum Communication

Travis Russell, PhD, Army Cyber Institute, West Point, NY, 10996, United States

A quantum correlation is a kind of probability distribution that can be achieved with quantum technology but cannot be achieved by classical probabilistic means. The study of quantum correlations goes back to debates between Albert Einstein and his contemporaries during the formative years of quantum mechanics, yet there are many questions about quantum correlations that remain unanswered to this day. In this talk, we introduce the idea of quantum correlations and discuss some connections with positive semidefinite programming, operator algebras and cyber security.

#### 2 - Cyber Attacks Models Based on Weighted Rooted Trees

Elie Alhajjar, Army Cyber Institute, West Point, NY, 10996, United States

In recent years, Agnarsson et al. defined a rooted tree model for cyber-security systems based on defense-in-depth and layered-security approaches, as many systems do. In the model, the concepts of penetration cost and acquisition gain are introduced and decision and optimization problems are formulated. In this talk, we look at the problem of storing targets via the intuition that high-value targets should be deeper in the system and outer layers should have higher penetration costs. Moreover, we address the possibility of repositioning targets periodically and how it affects the dynamics of the network.

#### 3 - Locating Arrays: A New Experimental Design for Complex Engineered Systems

Violet Syrotiuk, PhD, Arizona State University, Tempe, AZ, United States

Screening experiments are used to identify significant factors and interactions on a response. Traditional experimental designs for screening in complex engineered systems requires either restricting the factors considered, which automatically restricts the interactions, or restricting interest to main effects, which fails to consider interactions. To address this problem we propose a locating array (LA) as a screening design. LAs exhibit logarithmic growth in the number of factors allowing an order of magnitude more factors in experimentation than traditional approaches. We apply an LA for screening responses in an experiment on w-iLab.t, a wireless network testbed in Belgium.

#### 4 - Modeling in Cyberspace: Accounting for the Human Dimension

Paul L. Goethals, United States Military Academy, 66-B Schofield Place, West Point, NY, 10996, United States, Natalie Scala

It is now widely recognized that a large number of our cybersecurity vulnerabilities are attributed to human error of some kind. The models that account for the human dimension, however, are somewhat sparse in the cyberspace literature. This talk will outline some of the existing research lines of effort and discuss potential opportunities for future research in this area.

## ■ SA76

### Design and Control of Manufacturing Systems

Emerging Topic: Design and Control of Manufacturing Systems

Emerging Topic Session

Chair: Yunyi Kang, Arizona State University, Tempe, AZ, 85281, United States

#### 1 - Real-time Manufacturing System Performance Evaluation using Machine Degradation Signals

Yunyi Kang, Arizona State University, 1850 E. Hayden Lane, Apt 207, Tempe, AZ, 85281, United States, Hao Yan, Feng Ju

Evaluating and predicting real-time system performance is important while challenging for modern manufacturing practitioners. With the help of sensor technology, real-time system conditions can be measured and collected. In this work, we build up a Markovian model to evaluate the instant production performance, given the machine degradation signals, in two-machine-and-one-buffer systems. Phase-type distributions are used to mimic the machine operational time distributions based on signal information. A case study is provided to show that such a model can be applied effectively in practice.

#### 2 - Conic Reformulations of Production Planning Models with Clearing Functions

Karthick Gopalswamy, North Carolina State University, 3000 Kings Court, Unit G, Raleigh, NC, 27606, United States, Reha Uzsoy

We consider the problem of planning the releases into a production system to meet demand in a near-optimal manner. Clearing function models that capture the queuing behavior of production systems under congestion are considered. We provide a conic reformulation of the non-linear constraints in the multi-product problem and provide computational experiments on the solution quality of different model in comparison to traditional LP models and a linear approximation of the non-linear model.

#### 3 - Approximations for Dynamic Multi-class Manufacturing Systems with Priorities and Finite Buffers

Girish Jampani Hanumantha, Arizona State University, Tempe, AZ, 85281, United States, Ronald G. Askin

Steady-state queueing models are commonly used as a performance evaluation component in aggregate planning. However, with shortened product introduction and life cycles and constantly evolving customer preferences the assumption of stationary demand processes is no longer reasonable. Nonstationary demand processes capture the dynamic nature of modern manufacturing systems well. We present computationally efficient numerical approximations for dynamic manufacturing systems with part priorities and finite buffers. The performance of these approximations is tested for practically sized instances.

#### 4 - Q-learning Based Overhead Transport (OHT) Routing Algorithm for Massive Vehicle Control

Young Jae Jang, KAIST, Department of Industrial and Systems Engineer, 291 Daehakro, Yuseong-Gu, Daejeon, 34141, Korea, Republic of, Illhoe Hwang

The Overhead Hoist Transport (OHT) is a class of automated material handling system (AMHS) consisting of automated vehicles operating on a network of guideways or specially designed rails. This OHT is widely used in semiconductor fabs and modern high-tech manufacturing production lines. One of the challenges in operating OHT based AMHS for a large scale production line is the development of a routing algorithm controlling massive number of vehicles. We introduce AI based algorithm, Q-learning routing, which effectively control OHT system which consists of more than 500 vehicles. The performance of the algorithm is compared to conventional optimization algorithms.

### Challenges and Strategies in Humanitarian Operations

Sponsored: Public Sector OR

Sponsored Session

Chair: Seyma Guven-Kocak, Georgia Institute of Technology, Atlanta, GA, 30340, United States

Co-Chair: Pinar Keskinocak, Georgia Institute of Technology, Atlanta, GA, 30332, United States

#### 1 - Nonprofit Operations: Challenges and Strategies

Gemma Berenguer, Purdue University, 1020 Happy Hollow Rd, West Lafayette, IN, 47906, United States

In this talk I will provide a definition of nonprofit operations and I will give an overview of this field of Operations Management (OM). I will examine the objectives, major actors and major activities of nonprofit operations and I will identify the major challenges and strategies to address the challenges. A specific analysis of the most relevant applied areas and their unique challenges will also be provided.

#### 2 - Competition Over Funding Resources in Humanitarian Operations

Arian Aflaki, University of Pittsburgh, Pittsburgh, PA, United States, Alfonso J. Pedraza-Martinez

We study the optimal funding strategy of Humanitarian Organizations (HOs) in the presence of control seeking donors. We find that monopolist HOs can ask for control over donations to improve their operational efficiency; however, competition between HOs limits their ability to collect non-earmarked donations and contributes to lower operational efficiency as well as higher fundraising costs.

### 3 - The Facts on the Ground: Using Simulation to Understand Policies in Humanitarian Fleet Management

Liyi Gu, University of Maryland, Van Munching Hall, College Park, MD, 20742, United States, Ilya O. Ryzhov, Mahyar Eftekhari

Humanitarian field managers are known to lack systematic guidance in decision making and often rely on their intuition. In this work we develop empirical and stochastic models of humanitarian fleet management, on top of which we build a simulator that evaluates intuitive policies that may be used by field managers. We empirically estimate demands (mission distances) and vehicle operational costs using data from a large international humanitarian organization, and evaluate the acquisition, assignment, and disposition of vehicles in field operations. The simulation results provide insight to why managers make decisions the way they do, and could lead to improved policy recommendations.

### 4 - Scale vs. Impact. Resource Allocation Strategies for Family Planning Outreach

Harwin de Vries, INSEAD, Boulevard de Constance, Fontainebleau, 77210, France, Lisanne Van Rijn, Kim Leliveld, Luk N. Van Wassenhove

We study an organization deploying over 500 mobile outreach teams to bring family planning services to hard to reach communities. Major objectives are to maximize utilization (scale) and to reach target populations like young and poor people (impact). We discuss how operations affect scale and impact, trade-offs, models, and implications.

### Joint Session TSL-FAC/SOLA: Random Stow Strategies in Warehousing

Sponsored: Location Analysis

Sponsored Session

Chair: John Gunnar Carlsson, University of Southern California, Los Angeles, 90089, United States

#### 1 - A Velocity-based Stowage Policy for a Semi-automated Fulfillment System

Stephen C. Graves, Massachusetts Institute of Technology, E62-579, 77 Massachusetts Avenue, Cambridge, MA, 02139-4307, United States, Amy Liu

Online retail fulfillment is increasingly performed by semi-automated systems in which inventory is stored in mobile pods that are moved by robotic drives. The stowage decision decides on what pods to store what inventory. We examine the impact of velocity-based stowage policies on the operational performance of the fulfillment system. In particular we model a stowage policy in which received units are categorized as being either fast or slow, and then characterize the impact of velocity-based stowage on the travel distance for the robotic drives. We find that such policies can substantially reduce the travel distance, which reduces the number of drives required for a given system throughput level.

#### 2 - Man vs Machine in Warehouse Picking

Gerard P. Cachon, University of Pennsylvania, 3730 Walnut St, Philadelphia, PA, 19104, United States, Omar Besbes

We compare warehouse pick operations performed the traditional way (with a human) against picking with robots (e.g., Kiva systems). We are interested in how these different systems scale and under what conditions one outperforms the other.

#### 3 - Random Stow and the Generalized Travelling Salesman Problem

John Gunnar Carlsson, University of Southern California, 3750 McClintock Avenue, Los Angeles, CA, 90089, United States

The generalized travelling salesman problem is a variation of the traditional TSP in which one is given a collection of sets of points and one seeks a tour of minimal length that visits one member each set. The GTSP is fundamentally important in studying randomized strategies in warehouses, in which one stores a stock keeping unit (SKU) in any available location (as opposed to designating specific regions of the warehouse for different SKUs). We derive asymptotic bounds for the length of a GTSP tour under various assumptions on the magnitude of demand and its distribution.

#### 4 - Fast Solutions for the Dynamic Item Stocking Problem in Amazon Class Online Order Fulfillment Warehouses

Sanchoy Das, Professor of Industrial Engineering, New Jersey Institute of Technology, University Heights, Newark, NJ, 07102, United States, Jingran Zhang, Sevilya Onal

Amazon class online order fulfillment warehouses use an explosive storage policy, whereby the same item is stocked simultaneously in many bin locations anywhere in the warehouse. The stocking objective is to disperse incoming items through the warehouse to maximize the probability a time-fenced group of future customer orders can be fulfilled from a set of closely located bins (efficient pick list). Demand intelligence described by time-fenced item correlations of incoming orders is a key data input. The problem is dynamic in that both the inventory state and pending order list are temporal.

### Plenary: Riding Technology Waves: Perspectives and Opportunities for Operations Research

Plenary Session

Chair: Young-Jun Son, University of Arizona, Systems and Industrial Engineering, Engineering Building #20 Room 111, Tucson, AZ, 85721-0020, United States

#### 1 - Riding Technology Waves: Perspectives and Opportunities for Operations Research

Brenda Dietrich, Cornell University, Ithaca, NY, United States

This talk begins with a fly-by of almost six decades of information technology beginning with its use to automate business processes and extending to its current role in consumer self-service, the internet of things, and in intermediating social processes. The resulting "data exhaust" together with the availability of low cost computing capacity spawned the age of analytics, the rise of big data, the birth of cognitive computing and the reinvigoration of artificial intelligence. The past, current and potential role of analytic methods in these technology waves will be discussed, with focus on the opportunity to use analytics and automation to create new data. Areas in need of further study by the Operations Research community will be highlighted.

### Methods for Multi-Stage Stochastic Optimization

Sponsored: Optimization/Optimization Under Uncertainty

Sponsored Session

Chair: Selvaprabu Nadarajah, College of Business, University of Illinois at Chicago, Chicago, IL, 60607, United States

#### 1 - Basis Function Selection in Approximate Linear Programming

Parshan Pakiman, University of Illinois at Chicago, Chicago, IL, United States, Selvaprabu Nadarajah, Negar Soheili, Qihan Lin

Approximate linear programs (ALPs) compute a value function approximation (VFA) for Markov decision processes (MDPs) using a linear combination of basis functions. The resulting VFA provides policies and lower and upper bounds on the optimal policy value. Basis functions - typically chosen in a problem-specific manner - affect the quality of these bounds. Constructing VFAs is thus challenging to a non-expert and may not guarantee tight bounds. To ease the use of ALPs, we develop a version using basis functions sampled from a parametric function class, which asymptotically leads to a near-optimal VFA. We establish finite sample guarantees and discuss numerical results on challenging applications.

#### 2 - Computational Experience with Asynchronous Projective Hedging

David L. Woodruff, University of California-Davis, Graduate School of Management, One Shields Avenue, Davis, CA, 95616, United States, Jean-Paul Watson, Jonathan Eckstein

Recent work by Eckstein and Combettes resulted in development of an algorithm for multi-stage, convex optimization problems with uncertain input data expressed as a set of scenarios. The algorithm is called Asynchronous Projective Hedging (APH). In this talk we describe computational experience with this algorithm primarily based on two well-known problems from the stochastic programming literature as well as experience with large mixed-integer problems. We explore various tradeoffs such as computational resources vs. wall-clock vs. solution quality as well as primal versus dual solution quality.

#### 3 - Solving Multi-period Mine Planning Models with Endogenous Uncertainty

Tito Homem-de-Mello, Universidad Adolfo Ibáñez, Santiago, Chile, Denis R. Saure, Tomas Lagos, Guido Lagos, Margaret Armstrong

We study a production scheduling problem in open pit mining under ore-grade uncertainty. We consider a multi-stage version of the problem, where there is a planning horizon of several time periods and where at each period the decision is: which blocks to extract and which to process, while satisfying extraction and processing capacity constraints. We propose an optimization with learning approach intended to tackle two of the main challenges presented by this problem: the scalability of the problem due to its large dimensions, and the robustness to uncertainty due to the inherent volatility of some of the parameters of the problem. We report computational experiments on a real-sized mine.

#### 4 - Revisiting Approximate Linear Programming Using a Saddle Point Approach

Selvaprabu Nadarajah, College of Business, University of Illinois at Chicago, 601 South Morgan Street., UH 2406, Chicago, IL, 60607, United States, Qihang Lin, Negar Soheili

Approximate linear programs (ALPs) are well-known models for approximating high dimensional Markov decision processes (MDPs). Solving ALPs exactly remains challenging, for instance, in applications where (i) the MDP includes nonlinear reward and transition dynamics and/or (ii) rich basis functions are required to obtain a good VFA. We address this tension between ALP theory and solvability by proposing a novel ALP saddle point reformulation and mirror descent solution approach that embeds iterative learning of constraint violation distributions. We present convergence guarantees for our approach and test it on inventory control and energy storage applications.

## ■ SB02

North Bldg 121B

### Joint Session OPT/Practice Curated: Optimization under Uncertainty in Energy and the Environment

Sponsored: Optimization/Optimization Under Uncertainty

Sponsored Session

Chair: Sarah G. Nurre, University of Arkansas, Walnut Creek, CA, 94596, United States

#### 1 - Resilient Transmission Hardening Planning in a High Renewable Penetration Era

Ali Bagheri, Oklahoma State University, Stillwater, OK, 74075, United States, Chaoyue Zhao, Feng Qiu, Jianhui Wang

Transmission system hardening is a practice to improve system resilience against possible disruptions. In a power system with a very high penetration of renewable energy, the system hardening will be further complicated by the uncertainty of renewable energy. We study the transmission line hardening planning problem in the context of probabilistic power flows injected by the high penetration of renewable energy. We assume that the information of renewable energy is incomplete. A data-driven two-stage stochastic model is formulated by considering the joint worst-case wind output distribution and transmission line contingencies.

#### 2 - An Integrated Two-level Inventory Problem: Applications to Battery Management in Electric Vehicle and Drone Swap Stations

Amin Asadi, University of Arkansas, 4207 Bell Engineering Center, 800 W. Dickson Street, Fayetteville, AR, 72701, United States, Sarah G. Nurre

We examine the new class of stochastic two-level integrated inventory problems (TOLIPs) with applications in drone and electric vehicle (EV) battery management. In the TOLIP, we model how first-level battery charge with battery charging, discharging, and replacement actions impact the deterioration and necessary actions for second-level battery capacity. In the context of a battery swap station, we formulate the TOLIP using a Markov Decision Process model with an uncertain demand for swaps. We perform computational experiments to derive optimal policies and deduce insights.

#### 3 - Stochastic Multi-Objective Water Allocation with Hedging Rule

Ming (Arthur) Yang, The Ohio State University, Columbus, OH, United States, Guzin Bayraksan

The problem of water shortage is usually caused by uneven distribution of rainfall, increasing water demand, or other environmental and human factors. In this study, we develop a mathematical model that applies hedging rules under inflow and demand uncertainties to provide an optimal strategy in managing and operating reservoirs. Hedging rules determine different rationing levels between users at certain trigger volumes of reservoirs during droughts. We develop time series models for the uncertain inflows and demands and model the problem as a multistage stochastic mixed integer program with multiple objectives. We present numerical results on a real-world multi-reservoir system.

#### 4 - Industrial Demand Response in Electricity Markets

Golbon Zakeri, University of Auckland, Dept of Eng Science, Private Bag 92019, Auckland, New Zealand

We will present a single stage optimization problem faced by a large industrial consumer of electricity who is capable responding to price, and also capable of offering interruptible load reserves. We will then extend our model to a multistage setting and report some computational results.

Chair: Sinan Erzurumlu, Babson College, Babson Park, MA, 02457, United States

#### 1 - Lean Startup Goal Conflict: Can Startups Manage Survival and Revenue Growth Simultaneously?

Emre Guzelsu, Boston University Questrom School of Business, 595 Commonwealth Ave, Boston, MA, 02215, United States, Nitin Joglekar, Moren Levesque

We examine if survival and revenue growth are separately or jointly determined at different stages of a business startup's life. By examining a startup from the Lean Startup perspective and incorporating dynamic capabilities, and in particular a micro strategy framework, we hypothesize that startups act differently in the early stages versus late stages of development. We test our hypothesis by applying a Hausman simultaneity test to data from the Kauffman Foundation Survey. We find that survival and revenue growth are separately determined in the early stages of a startup's life, but become more jointly determined in later stages.

#### 2 - Evaluating Telemedicine Adoption in Clinics: Accounting for Socioeconomic, Geographical, Organizational and Technological Antecedents

Xiaojin (Jim) Liu, University of Virginia, Darden, 100 Darden Boulevard, Charlottesville, VA, 22903, United States, Susan Goldstein, Kingshuk K. Sinha

This study involves a theoretically grounded empirical analysis on how socioeconomic, geographical, organizational and technological antecedents impact the adoption and use of telemedicine in health care delivery.

#### 3 - Shortages of Resources, Routines, Reputation or Regulations: Can Data and Analytics-driven Capabilities Assist Technology Entrepreneurs' Decisions?

Nitin Joglekar, Boston University Questrom School of Business, 595 Commonwealth Ave, Boston, MA, 02215, United States, Moren Levesque

We describe emerging studies that contribute to theory and create practical insights for managers in the technology arena, noting the dominance of either time or timing as crucial concepts in technology entrepreneurship. We also highlight the importance of information availability, which directs our attention to the timely availability and usage of data, along with computational technologies. We then argue that data-driven and analytics-driven capabilities can shape every aspect of the tradeoffs associated with the shortages of resources, routines, reputation or regulations and call for novel modes of decision-making for technology entrepreneurs.

#### 4 - Managing the Sources of Uncertainty in Entrepreneurial Decision Making: A Data Analysis Approach to Entrepreneurship and Innovation

### Theory of Integer and Nonconvex Optimization

Sponsored: Optimization/Integer and Discrete Optimization

Sponsored Session

Chair: Eli Towle, University of Wisconsin-Madison, Madison, WI, 53705, United States

#### 1 - Mining Expression Trees to Improve Factorable Relaxations

Taotao He, Purdue University, 403 W. State St, West Lafayette, IN, 47906, United States, Mohit Tawarmalani

We introduce new relaxations for composite functions by convexifying the outer-function over a polytope, which models an ordering structure of outer-approximators of inner functions. We devise a fast combinatorial algorithm to separate the hypograph of concave-extendable supermodular outer-functions over the polytope. As a consequence, we obtain large classes of inequalities that tighten prevalent factorable programming. Moreover, these inequalities can be seamlessly embedded into a discretization scheme to approximate nonlinear programs with MIP. Combined with linearization, our techniques provide a framework for deriving cutting planes used in relaxation hierarchies and more.

## 2 - On the Complexity of Testing Attainment of the Optimal Value in Nonlinear Optimization

Jeffrey Zhang, Princeton University, 206 Lakeside Road, Princeton, NJ, 08540, United States, Amir Ali Ahmadi

We prove that it is strongly NP-Hard to test whether the optimal value of a nonlinear optimization problem is attained for certain degrees of the objective and constraints. Our results along with previously-known “Frank-Wolfe type” theorems settle the complexity for any combination of degrees. We also show that testing for some well-known sufficient conditions for attainment of the optimal value, such as coercivity of the objective function, compactness of the feasible set, and the Archimedean property of a related quadratic module is strongly NP-hard. Finally, we give SDP-based sufficient conditions for attainment of the optimal value, such as a new characterization of coercive polynomials.

## 3 - Exact Lexicographic Scheduling and Approximate Rescheduling

Dimitrios Letsios, Imperial College London, London, United Kingdom, Ruth Misener

We consider the fundamental two-stage robust makespan scheduling problem with a planning and a recovery phase. We show that planning using lexicographic optimization imposes optimal substructure that enables more efficient recovery with performance guarantees. We propose a novel lexicographic branch-and-bound method using vectorial bounds to deal with the lack of strong lower bounding techniques in exact lexicographic optimization MILP methods. Numerical analysis using standard commercial approaches substantiates the strength of our methods.

## 4 - Intersection Disjunctions for Reverse Convex Sets

Eli Towle, University of Wisconsin-Madison, Madison, WI, 53705, United States, James Luedtke

We present a framework to obtain valid inequalities for a reverse convex set, defined as the set of points in a polyhedron that lie outside a given open convex set. Our contribution is a disjunctive framework that uses basic solutions that lie outside the convex set to generate valid inequalities. We define a two-term disjunction for a reverse convex set. Next, we generalize this analysis to a multi-term disjunction by considering the convex set's recession directions. We present a polyhedral relaxation for each disjunctive term, allowing the approach to be used to generate disjunctive cuts.

### Semidefinite Optimization I

Sponsored: Optimization/Linear and Conic Optimization

Sponsored Session

Chair: Gary Au, PhD, University of Saskatchewan, SK, Canada

## 1 - Lift-and-project Lower Bounds for Hypermatching Relaxations

Yu Hin (Gary) Au, University of Saskatchewan, 106 Wiggins Road, 239 McLean Hall, Saskatoon, SK, S7N 5E6, Canada, Levent Tuncel, Nathan Lindzey

In 1999, Stephen and Tuncel showed that the Lovasz-Schrijver lift-and-project operator with semidefiniteness requires exponential effort to compute the integer hull of the standard linear relaxation of the matching polytope. Herein, we extend their results to b-matching polytope of complete uniform hypergraphs, utilizing some known results in association schemes.

## 2 - Using Mixed Precision Arithmetic in an Interior Point Method for SDP

Brian Borchers, New Mexico Institute of Mining & Technology, Dept of Mathematics Weir Hall, 801 LeRoy Place, Socorro, NM, 87801-4796, United States

Interior point methods for semidefinite programming are typically implemented in double precision floating point due to the fact that the Schur complement matrix that must be factored in each iteration becomes ill-conditioned as the iterates approach an optimal solution. Since single precision arithmetic is typically twice as fast as double precision, there are potential performance advantages to using single precision arithmetic in those parts of the algorithm and during those phases of the algorithm where single precision is sufficient. We describe an implementation of a mixed-precision primal-dual method for SDP and demonstrate its performance on benchmark problems.

## 3 - Two Dimensional Search Interior Point Algorithms for Linear Programming

Fabio T. Vitor, Kansas State University, 2061 Rathbone Hall, 1701B Platt St., Manhattan, KS, 66506, United States, Todd W. Easton

Interior point methods optimally solve linear programs by moving between feasible interior solutions. The majority of these algorithms move between solutions following a single direction. This talk presents novel primal and dual two dimensional interior point methods derived from affine and logarithmic barrier directions. These techniques use two potential improving directions to create a two dimensional problem. The optimal solution to this problem enables the algorithms to move to a new and improved feasible interior solution. Computational experiments show an improvement in solution time and iterations of approximately 12% when compared to the traditional one dimensional version.

## 1 - A Novel Initialization Procedure for the Simplex Algorithm

Nikolaos Ploskas, Carnegie Mellon University, 5000 Forbes Avenue, Doherty Hall 3110, Pittsburgh, PA, 15213, United States, Nikolaos Sahinidis, Nikolaos Samaras

This paper addresses the computation of a starting basis for the simplex algorithm. We propose six algorithms for constructing an initial basis. We give the initial bases as input to the CPLEX solver and compare the performance of the primal and dual simplex algorithm using the proposed algorithms against CPLEX advanced starting basis and crash procedures. The best algorithm results in 7% and 6% average reduction of the execution time of CPLEX's primal and dual simplex algorithm, respectively. Taking into account only the hard instances, the proposed algorithm results in 23% and 32% average reduction of the execution time of CPLEX's primal and dual simplex algorithm, respectively.

## 2 - Warm-start of Interior Point Methods for Second Order Cone Optimization via Jordan Frames

Tamás Terlaky, Endowed Chair Professor, Lehigh University, 200 West Packer Avenue, Bethlehem, PA, 18015, United States, Imre Polik, Sertalp Bilal Cay

IPMs are the most popular approaches to solve Second Order Cone Optimization (SOCO) problems. We present a warm-start method for primal-dual IPMs to reduce the number of IPM steps needed to solve SOCO problems that appear in a Branch and Conic Cut (BCC) tree when solving Mixed Integer Second Order Cone Optimization (MISOCO) problems. Our method exploits the optimal Jordan frame of a related subproblem and provides a conic feasible primal-dual initial point for the self-dual embedding model by solving two auxiliary linear optimization problems. Numerical results on test problems in the CBLIB library show on average around 61% reduction of the IPM iterations for a variety of MISOCO problems.

## 3 - The Tight-and-cheap Conic Relaxation for the AC Optimal Power Flow Problem

Miguel F. Anjos, Professor, NSERC-Hydro-Quebec-Schneider Electric Industrial Research Chair, Inria International Chair, P.O. Box 6079, Station Centre-Ville, Montreal, QC, H3C 3A7, Canada, Christian Bingane, Sebastien Le Digabel

The classical ACOPF problem is highly non-convex and generally hard to solve. Convex relaxations, in particular, semidefinite, second-order cone, and linear relaxations have recently attracted significant interest. The semidefinite relaxation is the strongest among them and is exact for many cases, but the computational efficiency for solving large-scale semidefinite optimization is limited. We propose a new conic relaxation which is derived by a combination of semidefinite optimization and the reformulation-linearization technique. The proposed relaxation is stronger than the second-order cone relaxation and nearly as tight as the semidefinite relaxation.

## 4 - Valid Conic Inequalities for Hyperboloids and Non-convex Quadratic Cones

Julio C. Góez, Miguel F. Anjos

We use the disjunctive conic cut (DCC) approach to show the existence of valid conic inequalities for hyperboloids and non-convex quadratic cones when the disjunction is defined by parallel hyperplanes. For some of the cases, we show that for each of the branches of those sets, which are convex, the intersections with the DCCs provides the convex hull of the intersection of the branches with a parallel linear disjunction. For other cases, we show that this technique provides a second order cone equivalent reformulation for some non convex sets.

**5 - Advances in the Maximum K-cut Problem**

Vilmar Rodrigues de Sousa, Polytechnique, Montreal, QC, Canada,  
Miguel F. Anjos, Sebastien Le Digabel

We consider the maximum k-cut problem that consists in partitioning the vertex set of a graph into k subsets such that the sum of the weights of edges joining vertices in different subsets is maximized. We present our recent computational advances using associated semidefinite and linear programming relaxations.

**1 - Charm of Consistency - Two-stage Stochastic Team-orienteering Problem with Time Windows and Uncertain Services Requests**

Yongjia Song, Clemson University, 211 Fernow Street, 264  
Freeman Hall, Clemson, SC, 29634, United States,  
Marlin Wolf Ulmer, Barrett Thomas, Stein W. Wallace

We consider a practical problem in transportation, where service providers serve a set of regular customers over a long-term horizon, and also receive requests from additional on-demand customers on a daily basis. We formulate this problem as a two-stage stochastic team orienteering problem, which is challenging for two reasons. First, on the first stage assignment decisions need to be made under incomplete information. Second, decisions on the second stage require to solve a deterministic team-orienteering problem with time windows. We address the two challenges via a progressive hedging framework integrating a runtime efficient heuristic, adapted version of the multiple scenario approach.

**2 - An Integrated Fleet Management Model Introducing Alternative Fuel Trucks into Existing Diesel Fleets**

Ilke Bakir, University of Groningen, Groningen, Netherlands,,  
Alan Erera

We address the challenge of introducing alternative fuel trucks into an existing fleet, while making necessary structural changes and maintaining feasible operations. We develop an integrated fleet management model, which incorporates (i) opening new maintenance facilities, and (ii) fleet deployment, into a fleet replacement framework. We demonstrate that the integrated model makes use of information that is often overlooked by conventional fleet replacement strategies. We propose a Benders' decomposition framework and a Variable Neighborhood Search (VNS) algorithm for the integrated model; and demonstrate the performance of these methods with a comprehensive computational study.

**3 - Service Network Design with Mixed Autonomous Fleets**

Yannick Oskar Scherr, Technische Universität Braunschweig,  
Braunschweig, 38106, Germany, Bruno Albert Neumann-  
Saavedra, Mike Hewitt, Dirk C. Mattfeld

We introduce a service network design problem that integrates automated driving technologies into the tactical planning of parcel delivery. In this problem, autonomous vehicles at SAE level 4 are only permitted to drive in dedicated zones for the sake of traffic safety. Outside of these zones, manually operated vehicles must guide them in platoons, i.e., groups of vehicles following each other closely. Our integer linear program not only decides on vehicle routes and delivery operations but also on the number of autonomous and manually operated vehicles. Results show different solution structures depending on the fleet configuration and increased complexity due to platooning.

**4 - Sequential Optimization of the Intra-link Movement of an Emergency Response Vehicle Along Transportation Segments in the Connected Vehicle Environment**

Gaby Joe Hannoun, Virginia Tech, Blacksburg, VA, United States,  
Pamela Murray-Tuite, Kevin Heaslip, Thidapat Chantem

The ERVs face numerous safety hazards in their attempts to reach their destinations in a timely manner. An integer linear program (ILP) was previously developed to delineate the fastest intra-link ERV path and to determine the optimal assignment location of each downstream vehicle. Since the ILP is not scalable on large links, we present a dynamic approach to sequentially execute the ILP on short transportation segments. Recommendations are made about how to define the size of the transportation segments, based on factors related to downstream traffic conditions to achieve a near global optimal solution.

**1 - Finding the Longest Path in a Structurally Perturbed Directed Acyclic Graph**

Golshan Madraki, Assistant Professor, Clarkson University,  
8 Clarkson Ave, Potsdam, NY, 13699, United States

In a structurally perturbed Directed Acyclic Graph (DAG) multiple edges are added and deleted simultaneously. Finding the longest path in the perturbed DAGs after perturbation without doing the calculation from the scratch is a critical challenge. The solution for this problem can solve and improve different problems in manufacturing system, transportation, telecommunications and etc. All previous researched considered single edge addition/deletion at a time. However, this research proposes an efficient algorithm called SPA to handle multiple edge deletions/additions with a single pass. This solution is more efficient in terms of time complexity than the previous approaches.

**2 - Exact IP-based Approaches for the Longest Induced Path Problem**

Dmytro Matsypura, University of Sydney, Sydney, Australia

Graph diameter, which is defined as the longest shortest path in the graph, is often used to quantify graph communication properties. In particular, it provides a very intuitive measure of the worst-case pairwise distance. However, in many practical settings where vertices can either fail or be overloaded, or destroyed by an adversary and thus, cannot be used in any communication or transportation path, it is natural to consider a more general measure of worst-case distance. One such measure is the longest induced path. The longest induced path problem is defined as the problem of finding a subgraph of largest cardinality such that this subgraph is a simple path. In contrast to the polynomially computable graph diameter, this problem is NP-hard. In this paper, we focus on exact solution approaches for the problem based on integer programming (IP) techniques. We first propose three conceptually different IP models and study their basic properties. To improve the performance of standard IP solvers, we propose an exact iterative algorithm, which solves a sequence of smaller IPs in order to obtain an optimal solution for the original problem. In addition, we develop a heuristic capable of finding induced paths in larger networks. Finally, we conduct an extensive computational study to evaluate the performance of the proposed solution methods.

**3 - Facility Location in Sparse Networks with Application to Aircraft Gate Assignment**

Mohammad Javad Naderi, Oklahoma State University,  
Stillwater, OK, 74075, United States, Austin Buchanan

Airport gate assignment problem is a problem that involves assigning scheduled flights to airport gates during a specific time period. Due to the fact that air traffic has almost doubled during the past three decades, there is a need for assigning flights to gates in an efficient way. Existing mathematical formulation approaches are developed mostly based on either the Quadratic Assignment Problem (QAP) or they include quadratic terms which both approaches can only be used to solve small scale problems. In this research, a novel graph based formulation is developed to exploit the sparsity of such networks. The efficiency of the formulation is examined by running the model for some numerical example.

**4 - Identifying Resilient Clusters in Networks with Randomly Changing Topology**

Maciej Rysz, University of Florida, 1751 Thomas St, Niceville, FL,  
32578, United States

We propose a two-stage stochastic programming framework for designing or identifying "resilient", or "repairable clusters in graphs whose topology may undergo a stochastic transformation. The reparability of a cluster is defined in terms of a budget constraint, which limits the repairs that can be made to the cluster when restoring its original structural properties after observing random changes to the graph's topology. A combinatorial branch-and-bound algorithm is developed, and its effectiveness is illustrated on the example of a two-stage stochastic maximum k-club problem.

**5 - The Most Degree-central Clique Problem**

Haonan Zhong, University of Massachusetts, Boston, MA,  
United States, Foad Mahdavi Pajouh

The most degree-central clique problem is to find a clique of maximum degree centrality in a graph. We addressed the computational complexity of this problem and proposed a series of theoretical foundations to build a combinatorial branch and bound algorithm for its solution. The performance of our proposed algorithm is tested on real life networks and random graphs.

**First Order Methods for Saddle Point Problems**

Sponsored: Optimization/Nonlinear Programming

Sponsored Session

Chair: Necdet Serhat Aybat, University Park, PA, 16802, United States

**1 - Primal-dual Stochastic Gradient Method**

Yangyang Xu, Rensselaer Polytechnic Institute, Department of Mathematical Sciences, 110 8th Street, Troy, NY, 12118, United States

Stochastic gradient (SG) method has been used for problems with objective that is stochastic or an average of many functions. Most works on SG assume that the problem is unconstrained or has an easy-to-project constraint set. In this talk, I consider problems with a stochastic objective and also many functional constraints. For these problems, we propose a novel SG method based on augmented Lagrangian function. Each update, it inquires a stochastic subgradient of the objective, a subgradient and function value of one sampled constraint function, and function value of another sampled constraint function. Its convergence rate is shown. Numerical test on QCQP is conducted to show its efficiency.

**2 - Accelerated Stochastic Algorithms for Nonconvex Finite-sum and Multi-block Optimization**

Yu Yang, ISyE Ga Tech, Atlanta, GA, 30332, United States, Guanghui Lan

We first introduce a randomized accelerated proximal gradient (RapGrad) method for solving a class of nonconvex optimization problems consisting of the sum of  $m$  component functions, and show that it can significantly reduce the number of gradient computations especially when the condition number, i.e., the ratio between the Lipschitz constant and negative curvature, is large. Inspired by RapGrad, we also develop a new randomized accelerated proximal dual (RapDual) method for solving a class of multi-block nonconvex optimization problems coupled with linear constraints. We demonstrate that RapDual can also save up to a factor of  $O(\sqrt{m})$  projection subproblems than its deterministic counterpart, where  $m$  denotes the number of blocks.

**3 - Primal-dual Methods for General Convex-concave Saddle Point Problems**

Erfan Yazdandoost Hamedani, Pennsylvania State University, State College, PA, 16801, United States, Necdet Serhat Aybat

In this research we propose a primal-dual algorithm with a momentum term that can be viewed as a generalization of the method proposed by Chambolle and Pock in 2016 to solve saddle point problems defined by a convex-concave function  $L(x,y)=f(x)+F(x,y)-h(y)$  with a general coupling term  $F(x,y)$  that is not assumed to be bilinear. We derive error bounds in terms of Lagrangian function for the ergodic sequence of iterates; in particular, we show  $O(1/k)$  rate when the problem is merely convex. Furthermore, assuming  $F(x,\cdot)$  is linear in  $y$  for each fixed  $x$  and  $f$  is strongly convex, we can obtain the ergodic convergence rate of  $O(1/k^2)$ .

**4 - Complexity of a Quadratic Penalty Accelerated Inexact Proximal Point Method for Solving Linearly Constrained Nonconvex Composite Programs**

Renato Monteiro, School of ISyE, Georgia Tech, Atlanta, GA, 30332, United States

This talk discusses the complexity of a quadratic penalty accelerated inexact proximal point method for solving a linearly constrained nonconvex composite program. Its objective function is of the form  $f+h$  where  $f$  is a differentiable function whose gradient is Lipschitz continuous and  $h$  is a closed convex function with bounded domain. The method consists of applying an accelerated inexact proximal point method to solve a sequence of quadratic penalized subproblems associated to the linearly constrained problem. Each subproblem is then approximately solved by an accelerated composite gradient method. Numerical results showing the efficiency of the proposed method are given.

**1 - Selected Adventures in Policy Modeling**

Edward H. Kaplan, Yale University, Yale School of Management, Box 208200, New Haven, CT, 06520-8200, United States

Policy Modeling refers to the application of operations research, statistics, and other quantitative methods to model policy problems. Recognizing that analyses of all sorts often exhibit diminishing returns in insight to effort, the hope is to

capture key features of various policy issues with relatively simple “first-strike” models. Problem selection and formulation thus compete with the mathematics of solution methods in determining successful applications. I will review some personal adventures in policy modeling selected from public housing, HIV/AIDS prevention, bioterror preparedness, counterterrorism, and immigration policy.

**1 - Optimal Procurement from Multiple Contracts in Agricultural Processing: Implications for Biomass Commercialization**

Buket Avci, Singapore Management University, 50 Stamford Road, Singapore, 178899, Singapore, Onur Boyabatli, Bin Li

We study the optimal procurement strategy of an agricultural processor that procures a commodity input from multiple contracts to produce a commodity output in the presence of input and output spot price uncertainties. We investigate the impact of spot price correlation on the procurement strategy and profitability. We also examine the impact of commercializing output waste as biomass on the profitability and greenhouse gas emissions. Calibrating our model with data from palm industry, we show that failing to update procurement strategy after commercialization leads to a significant profit loss and commercialization of biomass can increase emissions due to change in the procurement strategy.

**2 - Integrated Optimization of Fertilizer Procurement, Cultivation, and Harvesting**

Yangfang (Helen) Zhou, Assistant Professor, Singapore Management University, Singapore, 178899, Singapore, Onur Boyabatli, Lusheng Shao

We consider the integrated optimization of three key operational decisions in farm planning: fertilizer procurement via both contract and spot markets; cultivation and harvesting with limited respective resources in the presence of uncertain farm yield and labor cost. We model this problem as a three-stage stochastic program and characterize the optimal decisions in each stage. Using a numerical study calibrated to real data, we characterize the value of the integrated optimization and examine how the uncertainties in the farm yield and labor cost affect the farm profitability, cultivation decisions, and two measures of food loss: un-harvested yield and the yield gap.

**3 - Food Safety Control in the Developing Economies. Centralization Versus Decentralization**

Duo Shi, The Chinese University of Hong Kong, Shenzhen, Shenzhen, China, Lingxiu Dong, Iva Petrova Rashkova

We analytically investigate how the food safety outcome is affected by the structure of government auditing agencies in the developing economies. We find that a decentralized control structure may beat a centralized control structure, and higher auditing capabilities from the agencies may lead to a worse food safety outcome. We also propose a responsibility reallocation approach to further improve the current decentralized structure.

**1 - Deep Learning for MIP Branch and Bound**

Bistra Dilkina, University of Southern California, 941 Bloom Walk, Los Angeles, CA, 90089, United States, Aaron Ferber, Elias B. Khalil

Effective branching decisions are one of the key components to designing more scalable MIP branch and bound algorithms. We leverage a deep learning approach to obtain a predictive model that works well over distributions of similar instances. The features used as input to the model are generic so that transfer to new instances is seamless. Experimental results are encouraging.

## 2 - Recent Advances in Algorithm Configuration and Algorithm Tuning

Meinolf Sellmann, General Electric, 82 Diamond Avenue,  
Cortlandt Manor, NY, 10567, United States

We present new results on highly efficient parallel algorithm configuration as well as algorithm portfolios. Our deterministic parallelization of the GGA tuner is shown to achieve near-linear speed-ups up to 96 cores. Moreover, we show that a self-configured CSHC portfolio builder with a new recourse mechanism sets a new state of the art in solver selection.

## 3 - Learning to Search via Retrospective Imitation

Jialin Song, California Institute of Technology, 1200 E. California  
Blvd, MC 305-16, Pasadena, CA, 91125, United States, Ravi Lanka,  
Albert Zhao, Yisong Yue, Masahiro Ono

We study the general problem of learning a good search policy. To do so, we propose the retrospective imitation setting, which builds upon imitation learning in two ways. First, retrospective imitation uses feedback provided by retrospective analysis of search traces. Second, the policy can learn from its own decisions and mistakes without requiring repeated feedback from an external expert. Combined, these two properties allow our approach to iteratively scale up to larger problem sizes than the initial problem size for which expert demonstrations were provided. We showcase the effectiveness of our approach on learning node selection and pruning policies in branch-and-bound.

## 4 - Learning-Theoretic Foundations of Algorithm Configuration for Combinatorial Partitioning Problems

Ellen Vitercik, Carnegie Mellon University, 5000 Forbes Ave,  
Pittsburgh, PA, 15213, United States, Maria-Florina Balcan,  
Vaishnavh Nagarajan, Colin White

Data-driven algorithm design, that is, choosing the best algorithm for a specific application, is a crucial problem in modern data science. Practitioners often optimize over parameterized algorithm families, tuning parameters based on problems from their domain. While effective in practice, these procedures generally have not come with provable guarantees. I will present work that helps put data-driven combinatorial algorithm configuration on firm foundations. We provide strong computational and statistical performance guarantees for several important problems, including clustering algorithm configuration and integer quadratic programming approximation algorithm configuration.

## 5 - Learning to Branch

Tuomas W. Sandholm, Angel Jordan Professor of Computer  
Science, Carnegie Mellon University, Gates Center for Computer  
Science, Pittsburgh, PA, 15213, United States, Maria Florina  
Balcan, Travis Dick, Ellen Vitercik

Tree search algorithms, e.g. branch-and-bound, are the most widely used tools for combinatorial and nonconvex problems (e.g., MIP and CSP). To keep the tree small, it is crucial to decide, when expanding a node, which question (e.g., variable) to branch on to partition the remaining space. Many techniques have been proposed, but theory was lacking. We show how to use machine learning to determine an optimal weighting of any set of partitioning procedures for the instance distribution at hand using samples from the distribution. We provide the first sample complexity guarantees for tree search algorithm configuration. The theory gives rise to a learning algorithm which dramatically reduces tree size.

## 1 - Does Ownership Conversion from Nonprofit to For-profit Benefit the Public? Evidence from U.S. Nursing Homes

Lauren Xiaoyuan Lu, University of North Carolina at Chapel Hill -  
Kenan Flagler, Kenan-Flagler Business School, CB #3490, Mccoll  
Building 4701, Chapel Hill, NC, 27599, United States, Susan F. Lu

In the last few decades, many healthcare institutions converted their ownership from nonprofit to for-profit, contributing to an increased presence of for-profit ownership in the U.S. healthcare sector. There have been contradicting views on whether such ownership conversions benefit the public. Employing a large panel dataset of U.S. nursing homes dated from 2006 to 2015, we conduct a difference-in-differences analysis on converting facilities' financial performance, operating policies, and service quality.

## 2 - Perishable Inventory Sharing in a Two-location System

Can Zhang, Duke University, Durham, NC, United States,  
Turgay Ayer, Chelsea C. White

Motivated by a platelet inventory management problem in a local hospital network, we study an inventory sharing problem for perishable products in a two-location system. We derive structural properties of the optimal policy and present managerial insights that are significantly different from those in existing studies for traditional non-perishable products.

## 3 - Operational Drivers of Stock-outs in Reproductive Health Supply Chains: An Empirical Study

Amir Karimi, University of Minnesota, Minneapolis, MN, 55408,  
United States, Karthik Natarajan, Kingshuk K. Sinha

Despite the widespread prevalence of contraceptive stock-outs in practice, very little is known about the drivers of stock-outs and this forms the motivating context for our study. Utilizing field data collected in developing countries, we investigate how different factors such as a health facility's geographic location and product variety impact the likelihood of stock-outs. In addition, we explore the effect of two commonly used inventory management practices that have the potential to serve as mitigation mechanisms to reduce the risk of stock-outs. Our findings have important implications for resource allocation and supply management of health commodities in developing countries.

## 4 - Optimal Motorcycle Routing in Sample Transportation for Diagnostic Networks

Jonas Oddur Jonasson, MIT Sloan School of Management,  
30 Memorial Drive, E62-588, Cambridge, MA, 02142,  
United States, Sarang Deo, Emma L. Gibson, Mphatso Kachule,  
Kara Palamountain

Due to limited resources, diagnostic and disease monitoring services in sub-Saharan Africa are delivered through a network of clinics and laboratories. An ongoing challenge is to develop cost-effective sample transportation systems to ensure short turnaround times of results. Using data from Riders for Health in Malawi we develop an algorithm for the daily route optimization of couriers in a diagnostic network and evaluate its impact on turnaround times and distance driven. Our method maintains current service levels while requiring approximately 90,000 km less distance travelled per year.

## 1 - Process Flexibility for Multi Period Production Systems

Yuan Zhong, University of Chicago / Booth School of Business,  
5807 S. Woodlawn Avenue, Chicago, IL, 60637, United States,  
Cong Shi, Yehua Wei

We consider process flexibility in a multi-period make-to-order production (MTO) system. First, using a new chaining notion, termed the Generalized Chaining Gap (GCG), we prove that in a general system with high utilization, a sparse flexibility structure with  $m+n$  arcs is needed to achieve similar performance as full flexibility, where  $m$  and  $n$  are the number of plants and of products, respectively. We also provide a simple and efficient algorithm for finding such sparse structures. Moreover, we show that the requirement of  $m+n$  arcs is necessary, as for some systems, even the best flexibility structure with  $m+n-1$  arcs cannot achieve the same asymptotic performance as full flexibility.

## 2 - On the Control of Polling System with Large Switchover Times

Yue Hu, Columbia University, c/o Clara Magram, 4th Floor West,  
New York, NY, 10027, United States, Jing Dong, Ohad Perry

We study the control problem of polling systems with large switchover times. Under the proper scaling and cyclic controls, we show that the exhaustive switching policy is asymptotically optimal in minimizing the long-run average holding cost among all switching policies that achieve certain long-run regularity. To establish the asymptotic optimality, we characterize the fluid scaling limit of the system as a hybrid dynamical system and prove the corresponding interchange-of-limit results. We also study properties of several classes of controls of interests.

**3 - Managing the Callback Option under Arrival Rate Uncertainty**

Xiaoshan Peng, Indiana University, Kelley School, Bloomington, IN, United States, Baris Ata

We study how to manage the callback option effectively to mitigate congestion due to temporary surges in the arrivals to a call center. Initially, we allow complete foresight policies that look into the entire future. We consider the setting where some customers may reject the callback offer. We show that a modified lookahead policy that looks into the future arrivals and service completion times for the next p/h time units and uses the current number of customers in the system who previously rejected a callback offer is pathwise optimal. Building on the insights gleaned from the optimal lookahead policies, we also propose a non-anticipating policy, referred to as the line policy.

**4 - Using Hospital Admission Predictions at Triage for Improving Patient Flow**

Serhan Ziya, University of North Carolina, Department of Stat and OR, 356 Hanes Hall Cb#3260, Chapel Hill, NC, 27599, United States, Sukriye Nilay Argon, Wanyi Chen

We investigate how predictions for hospital admissions at the time of triage can be used to reduce boarding times and overall emergency department length-of-stay. Using simple mathematical models, we develop methods for making early bed reservations for patients at triage depending on the predictions for hospital admissions and also possibly on time-of-day and census levels. We then compare the performances of these methods using a simulation model constructed using data from an emergency department.

**1 - Mobile Technology in Online Retail: Strengths and Limitations**

Jose A. Guajardo, University of California-Berkeley, Haas School of Business, 545 Student Services Bldg, Berkeley, CA, 94720-1900, United States

We empirically analyze central aspects of the role of mobile technology in the overall customer experience in online retailing.

**2 - Impact of After Sales Service on Technology Adoption in Emerging Markets**

Amrita Kundu, London Business School, Regent's Park, PhD Office - MSO, London, NW1 4SA, United Kingdom, Kamalini Ramdas

We aim to empirically assess the impact of after-sales interactions on adoption and continued use of new technology in emerging markets. In particular, we estimate the impact of after-sales service and customer engagement on new customer acquisition and customer retention for a solar distribution company operating in off-grid communities in East Africa. We combine a proprietary dataset obtained from a solar distribution company and secondary data sources to estimate the market impact of after-sales interactions.

**3 - When is the Root of All Evil Not Money? The Impact of Load on Operational Risk at a Commercial Bank**

Yuqian Xu, University of Illinois at Urbana-Champaign, Wohlers Hall 487, 1206 S. 6th St, Champaign, IL, 61820, United States, Fangyun Tan, Serguei Netessine

We use a unique operational risk event data set from a commercial bank in China that contains 1,441 operational risk events in two years. We find that workload has a U-shaped impact on operational risk frequency. In addition, we show that workload has an inverted-U shaped impact on bank profit. We compare our optimal staffing policy with bank's original policy, and estimate that the new staffing policy would reduce the current number of employees by 7.56%, which would further decrease the number of risk events by 4.51%, cut the total losses by 4.58%, and increase profits by 1.24%.

**1 - Encouraging Energy Efficiency Investment in a Supply Chain: A Behavioral Investigation**

Jason Quang Nguyen, University of New South Wales, UNSW Business School, Sydney, 2052, Australia, Karen L. Donohue, Behrooz Pourghannad

Suppliers' propensity to accept external assistance from third-party organizations and buyers and undertake subsequent Energy Efficiency investments is still elusive. Through controlled behavioral experiments, this paper studies how the source of external assistance, contract framing and characteristics of the investment influence the supplier's propensity to undertake the assessments and subsequent investments.

**2 - Predicting Carbon Abatement Disclosures using Text Analysis**

Christian Blanco, Ohio State University, 640 Fisher Hall, 2100 Neil Ave Columbus, Columbus, OH, 43201, United States

Firms may choose not to disclose financial information on carbon abatement opportunities for various reasons. One reason for this is that firms are strategic about what they may disclose. Another reason is that firms may not yet be aware of the precise outcome of these opportunities. We explore conditions when firms may or may not disclose financial information on carbon abatement opportunities. We will explore this question using over 40,000 carbon abatement opportunities reported to CDP from 2011-2016.

**3 - The Impact of Input- vs. Output-based Farm Subsidies on Farmer Welfare and Income Inequality**

Yulan Wang, Hong Kong Polytechnic University, Department of Logistics and Maritime Studies, Faculty of Business, Kowloon, Hong Kong, Christopher S. Tang, Ming Zhao

We examine the implications of two commonly observed farm subsidy schemes in this paper. The first scheme is input-based while the second is output-based. By analyzing a stylized model that captures the yield heterogeneity across farmers who engage in quantity competition, we find that both schemes can improve farmers' income. However, the input-based subsidy scheme narrows the income gap between farmers, but the output-based scheme widens this gap. The output-based subsidy scheme outperforms the input-based subsidy scheme in terms of total farmer income and farmer productivity. We find these results continued to hold when the farmer's yield rate is uncertain.

**4 - How Does Regulation Stimulate the Good and the Bad Innovations?**

Keija Hu, Owen School of Business, Vanderbilt University, Nashville, TN, United States, Mark Cohen

Using data to quantify the technology progress in the auto industry in the past 20 years, we analyze how regulation stimulates both the good and bad innovations.

**Data-Driven Supply Chain Operations**

Sponsored: Manufacturing & Service Oper Mgmt/Supply Chain

Sponsored Session

Chair: Max Shen, JD.com, Santa Clara, CA, 95054, United States

Co-Chair: Sheng Liu, University of California, Berkeley, Berkeley, CA, 94709, United States

**1 - Bayesian Inventory Management: Demand Learning via Exploration Boosts**

Michael Kim, PhD, Sauder School of Business, University of British Columbia, Vancouver, BC, Canada

We investigate inventory management problems where parameters of the demand distribution are not known a priori, but need to be learned using right-censored sales data. The goal of this paper is to characterize the structure of the optimal inventory policy to better understand the basic mechanism by which learning and inventory control are optimally combined. To this end, through an analysis of the Bayesian dynamic programming (BDP) equations, our main result shows that BDP-optimal decisions can be expressed as the sum of a myopic-optimal decision plus an "exploration boost" that is proportional to the posterior variance-to-mean ratio of the demand.

## 2 - Dynamic Procurement of New Products with Covariate Information- The Residual Tree Method

Gah-Yi Ban, London Business School, Regent's Park, London, NW1 4SA, United Kingdom, Jeremie Gallien, Adam J. Mersereau

We study the practice-motivated problem of dynamically procuring a new, short life-cycle product under demand uncertainty. The firm does not know the demand for the new product but has data on similar products sold in the past, including demand histories and covariate information such as product characteristics. We propose a new, combined forecasting and optimization algorithm called the Residual Tree method, and analyze its performance via epidemiological convergence theory and computations using data from Zara. Our method generalizes the classical Scenario Tree method by using covariates to link historical data on similar products to construct demand forecasts for the new product.

## 3 - Designing Response Supply Chain Against Bioattacks

Yun Zhang, MIT, Cambridge, MA, United States, Nikolaos Trichakis, David Simchi-Levi

This work studies the problem of prepositioning medical inventory against bioattacks. We model it as a general two-stage inventory optimization problem on a network, and provide tractable and optimal solution methods. We collect data from publicly available sources and perform a thorough case study against anthrax attacks.

## 4 - Data-driven Order Assignment for Last Mile Delivery

Sheng Liu, University of California, Berkeley, 1731 Spruce St Unit B, Berkeley, CA, 94709, United States, Long He, Zuo-Jun Max Shen

Motivated by a food delivery service provider, we discuss a data-driven framework to model the delivery performance and optimize the order assignment decision using real delivery data. Leveraging on classical results in routing literature and machine learning approaches, we propose a prediction model for the delivery tour distance. We then propose a sample average approximation model and a distributionally robust model for order assignment. A branch-and-price algorithm is developed to solve both models efficiently. In the numerical study, we show the benefits of data-driven order assignment models integrated with delivery tour prediction, compared to classical vehicle routing models.

## New Topics in Supply Chain Management

Sponsored: Manufacturing & Service Oper Mgmt/Supply Chain  
Sponsored Session

Chair: Serguei Netessine, The Wharton School, Philadelphia, PA, 19104, United States

## 1 - Supply Chain and Antitrust Governance: Supply Chain and Antitrust Governance: Can Contractual Agreements Reinforce the "Illinois Brick"?

Nitish Jain, London Business School, Sussex Place, Regent's Park, London, NW1 4SA, United Kingdom, Sameer Hasija, Serguei Netessine, Serguei Netessine

In 1977, the U.S. Supreme Court issued a key ruling in *Illinois Brick Co v Illinois* case that debarred indirect purchasers to sue for recovery of antitrust damages. This ruling, however, can be exploited by firms to form collusion; muting the effectiveness of private enforcers in fighting antitrust violations. In this paper, using a supply chain lens, we characterize the conditions that facilitate or deter collusion formation. Our findings provide actionable insights to public enforcers in active case selection and investigation of antitrust violations.

## 2 - Do Flexibility and Chaining Really Help? An Empirical Analysis of Automotive Plant Networks

Vivek Choudhary, INSEAD Business School, 1 Ayer Rajah Avenue, Singapore, Singapore, Sameer Hasija, Serguei Netessine

We study production networks of automotive assembly plants to shed new light on the impact of flexibility on performance. We reconcile the extant empirical and modeling literature by testing existing flexibility indices. We introduce new flexibility indices to assess the relationship between flexibility and productivity to explain the trend of real-life networks. We empirically show that intermediate levels of flexibility are optimal due to trade-off between better flexibility and productivity, however, chaining may not be the optimal configuration if changeover losses of flexible plants are accounted for.

## 3 - Worker Poaching in a Supply Chain: Enemy from Within?

Gad Allon, University of Pennsylvania, 3730 Walnut Street, Philadelphia, PA, 19104, United States, Evan Barlow, Achal Bassamboo

Poaching workers has become a universal practice. We explore worker poaching between firms linked in a supply chain. We show that the classical intuition from labor economics is insufficient in explaining poaching between supply chain partners. We also show how and under what conditions worker poaching can

actually improve supply chain performance. Finally, we show how the equilibrium identity of the supply chain bottleneck depends on the interaction between hiring, poaching, and productivity.

## 4 - Sustaining Forests and Smallholders by Eliminating Payment Delay in a Commodity Supply Chain

Dan Andrei Iancu, Associate Professor, Stanford University, 655 Knight Way, Stanford, CA, 94107, United States, Joann de Zegher, Erica Plambeck

Motivated by the Indonesian palm oil industry, we propose a profitable way in which large buyers can simultaneously improve farmer livelihoods and halt illegal deforestation in their supply chains. Currently, farmers are paid with delays, and buyers avoid sourcing from illegally-deforested land by monitoring individual farmers. Instead, we propose rewarding all farmers in a village by eliminating payment delay if no production occurs on illegally-deforested land in the village. Using field data, dynamic programming and game theory, we show how this village-level incentive improves productivity and profitability for farmers, processors and buyers, and best halts illegal deforestation.

## Digital Ad Auctions

Sponsored: Revenue Management & Pricing  
Sponsored Session

Chair: Hemant K. Bhargava, University of California, Davis, CA, 95616, United States

Co-Chair: Ramnik Arora, Facebook, Menlo Park, CA, 9, United States

## 1 - No Really, What Does Any of this Mean?: Proxy Metrics in Ad Auctions

Dan Chapsky, Facebook, New York, NY, United States

Digital ad auctions are rife with data available for interpretation by marketers. In general, some combination of data on clicks, views, conversions is used to interpret which strategies are actually delivering value. Much research has been done to show that the only true method of measuring value is through randomized control trials, but the majority of online ads go through no such experimentation. In this talk we will be discussing exploratory research on which non-experimental measurement methods work and when.

## 2 - Pacing Mechanisms for Ad Auctions

Nicolas Stier-Moses, Facebook, 1 Hacker Way, Menlo Park, CA, 94025, United States, Vincent Conitzer, Christian Kroer, Debmalaya Panigrahi, Okke Schrijvers, Eric Sodomka, Chris Wilkens

Online ad auction platforms typically rely on pacing mechanisms to ensure that campaign daily budgets are consistent with maximum bids. The goal is maximizing advertisers' utilities. We model this process and connect it to market equilibria. The goal of this system is being able to forecast market outcomes.

## 3 - Budget-constrained Ad Selection in Large-scale Advertising Systems

Hemant K. Bhargava, University of California, Gh-3108, Graduate School of Management, Davis, CA, 95616, United States, Ramnik Arora

Internet advertising systems operate at large scale with tens of thousands of potential ads mapping to an individual or a keyword. Moreover, search results need to be computed in a fraction of a second to provide seamless user experience. We report results of experiments with a hierarchical decomposition approach where candidate ads are sequentially pruned using a finer and more computationally expensive machine learning model and/or higher number of user / ad features.

## 4 - On Optimal Auctions for Mixing Exclusive and Shared Matching in Platforms

Hemant K. Bhargava, University of California, Gh-3108, Graduate School of Management, Davis, CA, 95616, United States, Gergely Csapo, Rudolf Muller

We study auctions that can produce either exclusive or shared allocations, and involve two dimensions of information, a bidder's valuations for exclusive and shared allocation, respectively. We formulate the revenue-maximizing incentive-compatible auction, and demonstrate that our proposed solution, a two-dimensional reserve-price based mechanism (RM), has excellent revenue performance.

**Revenue Management for Marketplaces**

Sponsored: Revenue Management &amp; Pricing

Sponsored Session

Chair: Omar Besbes, Columbia University, New York, NY, 10027, United States

Co-Chair: Ilan Lobel, New York University, New York University, New York, NY, 10012, United States

**1 - Frustration-based Promotions: Field Experiments in Ride Sharing**

Maxime Cohen, NYU Stern, Baek Jung Kim, Michael-David Fiszer

In this talk, we examine whether a firm should proactively send compensation to users who have experienced a frustration (i.e., a poor service quality). In collaboration with one of the leading ride-sharing platforms, Via, we designed and ran three field experiments to investigate how different compensation types affect the engagement of riders who experienced a frustration.

**2 - Position Ranking and Auctions for Online Marketplaces**

Heng Zhang, USC Marshall School of Business, Bridge Memorial Hall - BRI 401B, 3670 Trousdale Parkway, Los Angeles, CA, 90089, United States, Leon Yang Chu, Hamid Nazerzadeh

We study how online e-commerce platforms should rank products displayed to consumers, and utilize the top slots. We present a model that considers consumers' search costs and the externalities sellers impose on each other, which allows us to study a multi-objective optimization, whose objective includes consumer, seller surplus, and the sales revenue, and derive the optimal ranking decision. In addition, we propose a surplus-ordered ranking mechanism, motivated in part by Amazon's sponsored search program, for selling top slots. We show that our mechanism is near-optimal, performing significantly better than those that do not incentivize the sellers to reveal their private information.

**3 - Surge Pricing and Its Spatial Supply Response**

Francisco Javier Castro, Columbia University, Columbia School of Business, 527 West 121st, New York, NY, 10027, United States, Omar Besbes, Ilan Lobel

We study the pricing problem faced by a platform matching price sensitive customers to flexible supply units in a city. The platform sets prices, and drivers react by choosing where to travel based on prices, travel costs and congestion levels. By uncovering an appropriate knapsack structure to the platform's problem, we first establish a characterization of the optimal solution and its supply response. We then tailor the analysis to a demand shock and derive in quasi-closed form the optimal solution. The platform uses prices to create damaged regions where demand is shut-down or driver congestion is artificially high, incentivizing some drivers to travel both toward the demand shock and away from it.

**4 - Value Loss in Allocation Systems with Provider Guarantees**

Xavier Warnes, Stanford University, Yonatan Gur, Dan Andrei Iancu

Centralized planning systems that allocate tasks to workers or service providers must often restrict their allocations so as to ensure particular (welfare) guarantees to their workers. Such restrictions can generate losses in the total value created or in the system's share of that value. Our work provides a uniform bound for these losses under a very broad class of restrictions due to worker guarantees. The bound only depends on the number and the heterogeneity of the service providers, and allows identifying the guarantees that are most stringent. We also show that such value losses remain small in practical settings of interest calibrated with real data.

**Data Driven Revenue Management**

Sponsored: Revenue Management &amp; Pricing

Sponsored Session

Chair: Jake Feldman, Washington University in St. Louis

**1 - Pricing Discounts in Electric Vehicle Share Systems**

Bobby Nyotta, Fernanda Bravo, Jacob Feldman

We study the use of pricing discounts in an electric vehicle share system with free-floating parking. Specifically, we examine the optimal policy for the operator to offer free rides to the charging stations. Free rides can help to keep vehicles charged and to rebalance the system, however a revenue loss is experienced. Based on the optimal policy structure, we decompose and approximate the problem with an algorithm that performs well on real problem instances.

**2 - A Choice Modeling Framework for Service Time Windows**

Xiao Lei, Columbia University, 500 W. 120th St., New York, NY, 10027, United States, na, Adam Elmachroub

On-demand services have become increasingly common, and typically allow customers to choose a time window to receive the service. As a result, there is a natural trade-off between on-time customer service and operational cost. To address this issue, some service providers offer large time windows with rewards, together with the normal small ones. In this paper, we provide a choice modeling framework to address how customers choose among time windows, and apply this framework to evaluate various strategies for time window design.

**3 - When Behavioral Operations Meets Optimization: Evidence From a Large Field Experiment on Behavioral Bin-packing Algorithms**

Jiankun Sun, Northwestern University, Evanston, IL, United States, Dennis Zhang, Haoyuan Hu, Jan Van Mieghem

In logistics, optimization algorithms are widely deployed to augment and empower human. However, human may not execute the algorithm solutions for various reasons, which might cause efficiency loss and cost increase. We examine how a behavioral optimization algorithm affects human's compliance rate of algorithm solutions, working efficiency and estimate the corresponding economic value by running a field experiment on two bin-packing algorithms. The first algorithm is a conventional heuristic bin-packing algorithm, while the second algorithm extends the first one by considering human behavior in choosing the packing boxes.

**4 - Revenue Management versus Machine Learning:****Finding Optimal Product Displays at Alibaba**

Jacob Feldman, Olin Business School, 6 Portland Court, Saint Louis, MO, 63108-1291, United States, Dennis Zhang

We compare the performance of two state of the art approaches for finding the optimal set of products to display to customers arriving to Alibaba. The first procedure embeds hundreds of product and customer features within a sophisticated machine learning algorithm that is used to estimate the purchase probabilities of each product for the customer at hand. The products with largest expected revenue (revenue\*predicted purchase probability) are then made available for purchase. Our second approach uses a featurized MNL model to predict purchase probabilities for each arriving customer and then solves cardinality constrained assortment optimization problems.

**Joint Session RMP/Practice Curated: Data Science in Online Platforms**

Sponsored: Revenue Management &amp; Pricing

Sponsored Session

Chair: Ruben Lobel, Airbnb, San Francisco, CA, 94103, United States

Co-Chair: Carlos Abad, Airbnb, San Francisco, CA, 94103, United States

**1 - Supply-side Incentives Allocation at Lyft**

Davide Crippis, Lyft, San Francisco, CA, United States

Lyft runs a number of programs to engage drivers when and where supply is most needed. The aim is to align supply and demand, provide better service levels for passengers and increased earnings for drivers. Scientists work on optimizing these programs using machine learning, optimization algorithms, and continuous experimentation. We give an overview of different incentives programs and the technical problems they pose. We then present in more detail some of the techniques used to compute optimal allocations.

**2 - Zillow Instant Offers with Human-in-the-loop Machine-learning**

David E. Fagnan, Senior Manager, Applied Science, Zillow Group, Seattle, WA, United States, Fan Cao, Sebastian Wickenburg, Emily Gill, Krishna Rao

We give an overview of recent data science challenges at Zillow. In particular, we focus on Zillow Instant Offers, a new home-selling option for homeowners who want a certain and predictable sale on their timeline. Our system tries to balance offer quality, offer timeliness, and risk in the presence of potential selection bias. With this focus, we discuss our learnings around making decisions under uncertainty including examples such as how much to pay for a house, predicting housing liquidity through days on market, and how much a pool is worth. We discuss progress on these problems and how we combine the use of human judgement with machine-learning algorithms in a human-in-the-loop system.

### 3 - Marketplace Experimental Design at Airbnb

Ruben Lobel, Airbnb, 888 Brannan St, 3rd Floor - Airbnb,  
San Francisco, CA, 94103, United States, David Holtz, Bar Ifrach,  
Sinan Aral

Online A/B tests rely on the assumption that responses on treatment and control units are independent. However, experiments in online marketplaces such as Airbnb can be biased when listings in the treatment group affect the listings in the control group. We propose a method to reduce this bias by identifying a network of marketplace substitution and applying a clustering algorithm on this network. By delivering the experiment on clusters of listings, we hope to detect the true impact of our models, without sacrificing too much in the experiment's sample size. We demonstrate the use of this method with a pricing experiment, measuring the trade-off between bias reduction and statistical power.

### 4 - An Overview of Uber's Surge Pricing Mechanism

Hamid Nazerzadeh, USC Marshall School of Business, Bridge  
Memorial Hall - BRI 401B, 3670 Trousdale Parkway, Los Angeles,  
CA, 90089, United States

Uber is running one of the largest marketplaces in the world that matches millions of riders and drivers together. One of the key features of Uber's marketplace is dynamic pricing, so called surge pricing, that aims to balance the demand for trips and the supply of available cars. The surge pricing also motivates drivers to relocate to parts of the city with higher demand. In this talk, I'll discuss the design of the new generation of surge mechanisms that aim to increase the marketplace efficiency.

### Systemic Risk

Sponsored: Finance

Sponsored Session

Chair: Daniel Mitchell, University of Minnesota, Minneapolis, MN

Co-Chair: Stathis Tompaidis, University of Texas-Austin, Austin, TX,  
78712-1277, United States

### 1 - Regulation of Financial Networks

Daniel Mitchell, University of Minnesota, Minneapolis, MN,  
United States, Stathis Tompaidis

We investigate the problem faced by a regulator to impose capital constraints on financial institutions in a network. By imposing capital constraints on one bank, the riskiness of others may be affected. We show how the regulator can set cVaR capital requirements for every institution in the network simultaneously. We analyze this regulation and look at its implications in an example calibrated to match publicly available data from bank holding companies in the United States.

### 2 - Bank Risk Culture Identification by Machine Learning

Akena Owusu, Rensselaer Polytechnic Institute, Troy, NY,  
United States, Aparna Gupta

We develop a framework for evaluating the risk culture of banks and how it relates to banks' performance, governance and risk-taking incentives. Textual analytics of banks' annual 10-K reports using Loughran and McDonald's (2011) sentiment dictionary and a risk culture framework develops a two-dimensional features space. Legal expense as a proxy allows a feature reduction, followed by k-means clustering to group banks into three risk culture groups. The good and moderate risk culture groups show better performance, more institutional investors, lower total executive pay and equity fraction of pay. Boards of better risk culture groups have more independent directors.

### 3 - Can Swing Pricing Prevent Mutual Fund Runs and Fire Sales?

Agostino Capponi, Columbia University, 500 W. 120th street,  
New York, NY, 10027, United States

We develop a model of the feedback between mutual fund outflows and asset illiquidity. Alert investors anticipate the impact on the fund's NAV of other investors' redemptions and exit first at favorable prices. Our analysis shows that (i) the first-mover advantage introduces a nonlinear dependence between a market shock and the aggregate impact of redemptions on the fund's NAV; (ii) there exists a critical magnitude of the shock beyond which a run brings down the fund; (iii) properly designed (not swing pricing!) not only transfers liquidation costs from the fund to redeeming investors, but importantly reduces them and prevents fund failure.

### 4 - Managing Default Contagion in Inhomogeneous Financial Networks

Nils Detering, University of California, Santa Barbara, Santa  
Barbara, CA, 93106, United States

The aim of this paper is to quantify and manage systemic risk caused by default contagion in the interbank market. Our results allow us to determine the impact of local shocks to the entire system and the wider economy. As a central application, we characterize resilient and non-resilient cases. In particular, for the prominent case where the network has a degree sequence without second moment, we show that a small number of initially defaulted banks can trigger a

substantial default cascade. Paralleling regulatory discussions, we determine minimal capital requirements for financial institutions sufficient to make the network resilient to small shocks.

### Health IT Innovations: Opportunities and Risks

Sponsored: EBusiness

Sponsored Session

Chair: Idris Adjerid, University of Notre Dame, Notre Dame, IN, 46556,  
United States

### 1 - When IT Creates Legal Vulnerability: Not Just Overutilization but Underprovisioning of Healthcare Could be a Consequence

YeongIn Kim, University of Texas-Dallas, Richardson, TX, 75080,  
United States, Mehmet Ayvaci, Srinivasan Raghunathan,  
Turgay Ayer

There is a growing interest in better understanding the new IT vulnerabilities. We examine one such vulnerability, viz., the heightened litigation risk due to information sharing enabled by IT, in a typical health care context. Using a game-theoretic model, we find that socially optimal policies may require underprovisioning of health care in the presence of health IT. Limits on malpractice damage can alleviate the underprovisioning of health care.

### 2 - Detecting Anomalous Patterns of Care Using Health Insurance Claims

Sriram Somanchi, University of Notre Dame, 344 Mendoza College  
of Business, University of Notre Dame, Notre Dame, IN, 46556,  
United States, Edward McFowland, Daniel Neill

This work provides a novel machine learning methodology to identify subpopulations for whom certain patterns of medical care have led to significantly anomalous health outcomes. We detect interventions in patient care (currently in terms of medications) that have significantly affected health outcomes either negatively (in which case they may represent suboptimal care that should be identified and corrected) or positively (in which case they may represent new, previously undiscovered best care practices).

### 3 - Effect of Gamification on Healthful Activity: The Case of Fitbit Leaderboards

Idris Adjerid, Virginia Tech, Blacksburg, PA, 46556, United States,  
Zia Hydari, Aaron Striegel

Lack of physical activity represents a growing global health crisis. We evaluate whether gamification of health behavior using wearable devices is one intervention that has the potential to increase physical activity. Using a unique data set, our initial analysis suggests that gamification (in the form of leaderboards) leads to a significant increase in steps walked daily.

### 4 - Analyzing Healthcare Information Exchanges' Strategies in a Competitive Environment

Can Sun, University of Alberta, 03A Unit, 8909-112, Edmonton,  
AB, T6G 2C5, Canada, Yonghua Ji, Subodha Kumar

Demand for health information exchange (HIE) among healthcare providers is growing very fast. In this paper, we investigate a setting where heterogeneous healthcare providers can join one of two competing HIEs. The utility for a healthcare provider is determined by the software quality offered by an HIE and also the network effect, i.e., the number of healthcare providers adopting the same HIE. We use a game theoretical model to investigate how HIEs should price the basic and premium services to maximize their profits.

**1 - Influence Maximization for HIV Prevention among Homeless Youth**

Bryan Wilder, University of Southern California, Los Angeles, CA, United States

HIV among homeless youth is a pressing health challenge; hence, local agencies conduct HIV prevention interventions. Selected youth are trained as peer leaders and disseminate prevention-related information through their social network. Choosing influential peer leaders is a difficult optimization problem. Together with local agencies, we developed and deployed novel optimization techniques which reached over twice the youth as previous methods.

**2 - Inconvenience, Liquidity Constraints and the Adoption of Off-Grid Lighting Solutions**

Bhavani Shanker Uppari, INSEAD, 1 Ayer Rajah Avenue, Singapore, 138676, Singapore, Serguie Netessine, Ioana Popescu, Rowan Clarke

One-fifth of humankind living in poverty does not have access to electricity. An off-grid lighting model that is becoming prominent in impoverished countries is rechargeable bulb technology. We examine, both theoretically and empirically, the impact of liquidity constraints and recharge inconvenience on the usage of rechargeable bulbs. Our analysis has implications for both firm-level operational decisions and government-level policy decisions.

**3 - Improving the Chilean College Admissions System**

Ignacio Rios, Stanford University, Stanford, CA, 94305, United States

We designed and implemented a new white-box algorithm that solves the matching of students to universities, unifying the admission tracks and improving the allocation of around 2,500 students each year since it was fully implemented. In addition, our solution reduced dramatically the computational time, allowing the evaluation of other policies and the implementation of new changes to the Chilean college admissions system.

**4 - How and When Should Students Get to School? Equity-Driven Optimization for Boston Public Schools**

Sebastien Martin, Massachusetts Institute of Technology, Cambridge, MA, 02139, United States, Arthur Delarue

We collaborated with Boston Public Schools to develop and apply optimization algorithms for school bus routing and bell time assignment, resulting in a \$4+ million yearly educational reinvestment in a district where 75% of students are economically disadvantaged and the unanimous approval of the first equity-driven start time policy in almost thirty years by the Boston School Committee.

**1 - You Can't Take It with You**

Coleen R. Wilder, Valparaiso University, 353 Sheffield Drive, Valparaiso, IN, 46383, United States, Sailu Li

The theme of this two-part case study is erroneous retirement planning experienced by two protagonists at different stages in their lives. A common retirement goal presented to many financial advisors is that people want to maintain their current lifestyles. For older clients, advisors are typically confronted with the task of explaining why their clients have insufficient funds and for younger clients, they are challenged with the task of convincing them to save more today for tomorrow. This case study provides a concrete example for students to visualize the impact of the time value of money. Students will often

nod their heads to the idea that a dollar today is not worth the same tomorrow. They also will nod to the fact that a loaf of bread costs more today than it did yesterday. It does not actually register, however, until they see it evolve year by year over an extended period of time. Advanced Excel functions that may be used include FV, PV, PMT, NORMINV, VLOOKUP, Scenario Manager, Data Table, and Goal Seek.

**2- Supply Chain Coordination and Contracts in the Sharing Economy: A Case Study at Cargo**

Maxime Cohen, NYU Stern, New York, NY, 10012, United States, Daniel Guetta, Wenqiang Xiao

This case study presents a modern approach to supply chain contracts. Supply chain coordination and supply chain contracts are central parts of almost every operations management (OM) core course. Traditionally, the main motivational example used in this context is video rentals. In the late 1990s, Blockbuster LLC revamped their business model and successfully implemented supply chain contracts. This is indeed an excellent example, but it is becoming increasingly outdated, and the vast majority of millennial students find it difficult to relate to this application. With this motivation in mind, we decided to revisit the topics of supply chain coordination and supply chain contracts in the context of the sharing economy. This case study is written in collaboration with Cargo, an innovative startup that recently raised \$7.3 million in seed funding, and illustrates how supply chain contracts can be applied in two-sided markets. Cargo sources goods from suppliers to provide a platform for gig economy drivers (e.g., Uber and Lyft) to run small convenience stores out of their vehicles. Consequently, Cargo needs to optimize its supply chain with both its drivers and its suppliers. Inspired by Cargo's operations, we generate datasets that illustrate the benefits of supply chain coordination and contracts, and allow students to experience the use of these techniques in a real-world business problem. This case study can be used at the undergraduate, MBA, and graduate levels for 1-3 sessions. In particular, instructors of an OM core or a supply chain elective course could use this case to discuss the following topics: (i) a novel OM application in the sharing economy, (ii) supply chain centralization, (iii) supply chain contracts (wholesale price, revenue sharing, and buyback), and (iv) the benefits of data-driven demand forecasting.

**1 - Optimizing the Relocation Operations of Free-floating Electric-car Sharing Systems**

Zulqarnain Haider, University of South Florida, Tampa, FL, United States, Hadi Charkhgard, Sang Won Kim, Changhyun Kwon

In a free-floating electric-car sharing system, the problems of fleet placement to fulfill demand requirements, fleet recharging using limited infrastructure to fulfill recharging requirements, and driver pick up and delivery using shuttles are of great interest. In this work, we present a combined MILP formulation and a decomposition algorithm, to solve the aforementioned problems simultaneously, rather than sequentially. The relationship between preferred charging levels and geographic location of customer demand is used to determine recharging requirements.

## 2 - A Two-sided Ride-sharing Optimization Problem Considering Electric Vehicle Deployment

Sang Jin Kweon, Carnegie Mellon University, 5000 Forbes Ave, Pittsburgh, PA, 15213, United States

Ride-sharing platforms are online mobile platforms which match riders with drivers. As electric vehicles receive attention, the ride-hailing giant has dabbled in electric vehicle programs. In this talk, we address the ride-sharing problem to analyze the impacts of electric vehicle deployment on ride-sharing systems. A two-sided model for ride-sharing systems is formulated, and the closed-form solution is derived to maximize the ride-sharing platform's operating profitability. The numerical results are further discussed to quantify the impacts of deployment and utilization of electrified fleets in urban transportation systems.

## 3 - Evaluating and Optimizing Charging Strategies for Electrical Busses in Public Transportation Networks

Pieter van den Berg, Rotterdam School of Management, Erasmus University, Burgemeester Oudlaan 50, Rotterdam, 3062 PA, Netherlands, Ayman Abdelwahed, Tobias Brandt, John Collins, Wolfgang Ketter, Wolfgang Ketter

Public transport operators increasingly face a challenging problem in switching from conventional diesel to electrical busses. Cooperating with the public transport operator in the city of Rotterdam, we develop a discrete-event-based simulator to study the scheduling feasibility by applying different charging strategies. Some fundamental strategies are assessed such as "first in first served" and "lowest charge highest priority". A mixed integer linear programming optimization model is then introduced to obtain the optimal charging strategy, which showed better results.

Sponsored Session

Chair: Jennifer A. Pazour, Rensselaer Polytechnic Institute, Troy, NY, 12180, United States

## 1 - Towards a Collaborative Supply Chain: A Quantitative Approach to Shared Facility Design and Operations

Chase Rainwater, University of Arkansas, 4207 Bell Engineering Center, Fayetteville, AR, 72701, United States, Kimberly P. Ellis, William G. Ferrell, Philip Kaminsky

Supply chain experts agree that goods will move more quickly, require more customization, and be shipped to a more urbanized customer base over the next 25 years. The current logistics system makes inefficient use of transportation and storage resources. One answer to this growing problem is the adoption of a collaborative logistics system in which manufacturers, transporters, distributors and retailers make use of shared resources. This talk focuses specifically on how collaborative use of facilities should be approached operationally. A mathematical program is presented with results highlighting the differences in system operations from that seen in current logistics systems.

## 2 - Performance Analysis of Modern Goods-to-person Order Picking Systems

Francisco Jose Aldarondo, University of Michigan, 3512 Green Brier Boulevard, Apartment 497C, Ann Arbor, MI, 48105, United States

For many online retailers, order picking (OP) is a labor-intensive activity, and it typically accounts for over 50% of their operational costs. Although many online retailers use walk-and-pick systems, a stronger alternative is goods-to-person OP, which generally improves the picker efficiency and offers ergonomic advantages. In such systems, automated equipment brings the containers to the pick station(s) where picker(s) perform the picks. In this study, we are concerned with the performance analysis of state of the art good-to-person systems and the operational challenges they present.

## 3 - Flexible Supply Chain Network Design with Different Granularity Options

Kaan Unnu, Rensselaer Polytechnic Institute, Center For Industrial Innovation, 110 8th Street, Troy, NY, 12180-3590, United States, Jennifer A. Pazour

On-demand distribution matches underutilized capacity to entities who need distribution services on-demand. This enables finer commitment and capacity granularities, creates flexibility to address demand variability and volatility, but has higher variable costs. Our multi-period capacitated facility location problem simultaneously decides the best combination of distribution options (construction, long-term lease or on-demand). The proposed heuristic algorithm, combining p-median, decomposition, and column generation, is used to solve different scenarios and provide managerial insights.

## Advances in Routing and Network Algorithms

Sponsored: TSL/Intelligent Transportation Systems (ITS)

Sponsored Session

Chair: Mohamad Kamal El Din Ahmad Hasan, Kuwait University, Department of Quantitative Methods & IS, CBA, Kuwait City, 13055, Kuwait

## 1 - Mean-standard Deviation Model for Capturing Reliability in the Minimum Cost Flow Problem

Can Gokalp, University of Texas, Austin, TX, United States, Stephen D. Boyles

We study the mean-standard deviation network flow problem, where the objective is minimizing a linear combination of the mean and standard deviation of path costs. This optimization problem is non-linear and non-additive. We prove that the efficient frontier of this problem is a subset of the efficient frontier of the mean-variance problem. Leveraging this result we provide an algorithm that solves this problem by solving an easier mean-variance problem.

## 2 - Routing in Time-dependent Networks: A Microstate Interpretation of Dynamic Traffic Assignment

Mohammad Arani, PhD candidate, University of Arkansas, 7005 Archwood Dr., Little Rock, AR, 72204, United States, Yupo Chan

Dynamic traffic assignment suggests that, for the same origin and destination pair, a driver who departs later may reach her destination ahead of those who depart earlier. Although this has been shown, the result may be heavily dependent on the characteristics of a traffic network. Consider a directed graph  $G(N, A)$ , where the travel time and reliability of a commuting path varies over the day. For a risk-averse and a risk-prone driver, we wish to study the driver's behavior regarding different metrics. Included in the study is the ability for a driver to not only defer her departure time but also wait en-route for the traffic to clear. A computational study has been conducted on Central Arkansas network.

## 3 - Steep Roads Impact on Vehicle Routing Decisions

Ricardo Giesen, Associate Professor, Universidad Catolica de Chile, Vicuna Mackenna 4860 Macul, Casilla 306 Cod. 105, Santiago, Chile, Mathias A. Klapp, Carlos Brunner

Most routing decisions assume that the world is flat, however there are many cities in which this assumption does not hold. Thus, we formulated a Vehicle Routing Problem in regions with steep roads (VRP-sr), and implemented a heuristic solution method for this problem. We use this model to study the impacts of not taking into account steep road grades when routing vehicles which are visiting customers located at point with differences in altitude. Our initial results, show that in hilly cities cost reductions between 3% to 6% on average can be obtained when taking into account steep road grades. Moreover, there are instances in which cost reduction greater than 14% can be achieved.

## 4 - Online Routing of Heterogeneous Vehicles on Stochastic Time-Varying Managed Lane Networks

Priyadarshan Patil, University of Texas-Austin, 301 E. Dean Keeton Street, Stop C1761, Austin, TX, 78712, United States, Venktesh Pandey, Stephen D. Boyles

Managed lane (ML) networks have multiple entrances and exits, complicating the route choice decisions of travelers. Current algorithms in the literature either assume that travelers only compare a subset of alternatives or assume a value of time distribution which is difficult to calibrate. This presentation describes efficient algorithms exploiting the acyclic nature of the ML networks for optimal routing of vehicles given stochastic variation of toll and travel time values. We compare the performance of the algorithm against other methods and on larger networks.

## 5 - A Link Node Nonlinear Complementarity Model for a Multiclass Simultaneous Transportation Dynamic User Equilibria

Mohamad Kamal El Din Ahmad Hasan, Professor of Operations and Supply Chain Management, Kuwait University, Department of Quantitative Methods & Information Systems, College of Business Administration, Kuwait City, 13055, Kuwait, Xuegang Ban

In this paper, the authors combine a dynamic link-node based discrete-time Nonlinear Complementarity Problem (NCP) Dynamic Traffic Assignment (DTA) model with a static Multiclass Simultaneous Transportation Equilibrium Model (MSTEM) in a unified dynamic link-node based discrete-time NCP Dynamic Multiclass Simultaneous Transportation Equilibrium Model (DMSTEM) model. The new model improves the prediction process and eliminates inconsistencies that arise when the DTA or Dynamic Traffic Assignment with Departure Time (DTA-DT) is embedded in a more comprehensive transportation planning framework. An iterative solution algorithm for the proposed DMSTEM model is proposed.

**Joint Session TSL/ICS: Approximate Dynamic Programming and Reinforcement Learning for Routing II**

Sponsored: TSL/Freight Transportation &amp; Logistics

Sponsored Session

Chair: Barrett Thomas, University of Iowa, Iowa City, IA, 52242-1000, United States

**1 - Reinforcement Learning for Solving the Vehicle Routing Problem**

Reza Nazari, Lehigh University, Bethlehem, PA, 18015, United States, Afshin Oroojlooy, Lawrence V. Snyder, Martin Takac

We present an end-to-end framework for solving Vehicle Routing Problem using reinforcement learning. In this approach, we train a single model that finds near-optimal solutions, only by observing the reward signals and following feasibility rules. Our model represents a parameterized stochastic policy, and by applying a policy gradient algorithm to optimize its parameters, the trained model produces the solution as a sequence of consecutive actions, without the need to re-train for every new problem instance. On capacitated VRP, our approach outperforms classical heuristics and Google's OR-Tools on medium-sized instances in solution quality with comparable computation time.

**2 - Reinforcement Learning for Same-day Delivery with a Heterogeneous Fleet of Drones and Vehicles**

Xinwei Chen, University of Iowa, Iowa City, IA, 52242, United States, Marlin Wolf Ulmer, Barrett Thomas

With ten cities approved in May to test drones, commercial use of drones is nearly a reality. Previous work shows, compared to a homogeneous fleet of vehicles, using a heterogeneous fleet of drones and vehicles for same-day delivery increases the expected number of served customers. In that work, a travel time-dependent threshold determines whether to dispatch a drone or a vehicle when both are available. In this talk, we introduce a time-dependent threshold to account for changing resource availability and heterogeneous customer requests. We use reinforcement learning to learn policies that are represented by neural networks. Computational results demonstrate improvements in solution quality.

**3 - Multi-Period Dynamic Technician Routing with Experience-based Service Times**

Barrett Thomas, University of Iowa, S210 PBB, Iowa City, IA, 52242-1000, United States, Mike Hewitt, Xi Chen

We study a multi-period technician routing problem in which technicians gain productivity as they gain experience. Tasks to be performed in the current day are known, but the tasks to be performed in subsequent days are uncertain. We develop an Approximate Dynamic Programming-based approach that incorporates into daily assignment decisions estimates of the long-term benefits associated with experience accumulation. Using an extensive computational study, we derive insights into how an organization can schedule their employees in a manner that enables meeting both near and long-term demands.

**4 - Multi-period Workload Balance in Last-mile Urban Delivery**

Yang Wang, Tsinghua University, Beijing, China, Lei Zhao, Martin W. P. Savelsbergh

When dispatching last-mile delivery among couriers, managers need to consider workload (im)balance among couriers besides their total travel cost. We differentiate two types of workload: incentive workload (e.g., number of packages) that affects couriers' income and effort workload (e.g., travel distance or time). We model the multi-period (e.g., a month) workload balance problem in last-mile delivery as a stochastic dynamic program and study the impact of various dispatching policies on the expected total travel cost and workload (im)balance.

**Multimodal Passenger Transportation**

Sponsored: Transportation Science &amp; Logistics

Sponsored Session

Chair: Jan Fabian Ehmke, Otto-von-Guericke University, Magdeburg, 39106, Germany

**1 - Using Analytics to Find Reliable Itineraries for Multimodal Travel**

Michael Redmond, University of Iowa, 820 Spencer Dr, Iowa City, IA, 52246, United States, Ann Melissa Campbell, Jan Fabian Ehmke

Multimodal travel requires the combination of several transport options. In this presentation, we will introduce reliability measures of multimodal travel itineraries. These itineraries may include scheduled travel modes such as flights or buses as well as non-scheduled travel modes such as driving or ride-sharing

services to bridge the last mile. We base our reliability measures on continuous distributions of historical travel data and apply it to search for reliable itineraries. We also investigate the amount of historical travel data required to predict reliable itineraries.

**2 - Intermodal Autonomous Mobility on Demand Systems**

Maximilian Schiffer, Dr., Technical University of Munich, Munich, 52072, Germany, Mauro Salazar, Federico Rossi, Daniele Vigo, Christopher H. Onder, Marco Pavone

Currently, municipalities struggle to implement sustainable modes of transportation that can cope with increasing urban congestion. Against this background, we study the benefits of an autonomous mobility-on-demand system interacting with public transportation. We present a network flow model to jointly optimize the operation of a fleet of self-driving cars providing on-demand mobility and public transit. We design socially optimal control policies, including a pricing and tolling scheme to align the behaviour of selfish agents to the social optimum. Results on a case study of Manhattan show that such an intermodal system can yield significant benefits to an urban transportation network.

**3 - Considering Complex Customer Preferences in Multimodal Travel Itineraries**

Jan Fabian Ehmke, Otto von Guericke University, Universitätsplatz 2, Magdeburg, 39106, Germany, Thomas Horstmannshoff

Digital travel apps allow for easy combination of an ever-increasing number of multimodal travel options. However, underlying optimization approaches focus on simple objectives such as travel time, price or number of transfers, and neglect complex customer preferences that would provide a customer-oriented selection of multimodal travel itineraries. We highlight challenges of considering complex customer preferences in the creation of multimodal itineraries, present an overview of current research in this area, and, based on standard algorithms available in the literature, present a first solution approach that takes more complex preferences into account.

**1 - Data Driven Supply Chain Management Practices at JD.com**

Zuo-Jun Max Shen, University of California Berkeley, 4141 Etcheverry Hall, Mail code 1777, Berkeley, CA, 94720-1777, United States

As China's largest retailer, online or offline, JD leverages advanced technologies such as AI to develop cutting-edge retail solutions that enable more personalized marketing and more efficient supply chain management, all aimed at improving the customer experience. In this tutorial, we will focus on a wide range of scenarios and applications in JD.com's ecosystem, from both JD's own e-commerce platform and its external business partners. We will cover the data-driven approaches used in these business scenarios to help improve supply chain efficiency and customer experience. We will also cover how technologies from fields such as operations research, data analytics, and machine learning are transforming the retail landscape.

**2 - Solving Multi-Objective problems with CPLEX**

Ed Klotz, IBM, P.O. Box 4670, Incline Village, NV, 89450, United States

During this tutorial, you will learn how to use the Multi-Objective feature in the upcoming version of CPLEX Optimizer. With the ability to specify combinations of lexicographic and blended objectives, it allows you to specify your goals very precisely. By using this feature, you can save the trouble of developing your own multi-objective framework, and avoid the numerical difficulties often faced when combining vastly different objectives scales.

**Joint Session AAS/TSL-Air: Airport and Airspace Capacity**

Sponsored: Aviation Applications

Sponsored Session

Chair: Yuan Wang, University of South Florida, 6507 Markstown Dr, Tampa, FL

**1 - Dynamic Prediction of Runway Configuration and Airport Acceptance Rate**

Yuan Wang, University of South Florida, 6507 Markstown Dr, Tampa, FL, 33617, United States, Yu Zhang

Automated prediction of runway configuration and airport capacity is critical for the future generation of air traffic management. Airport Acceptance Rate (AAR) is a key parameter to measure capacity in Ground Delay Program, and runway configuration is prerequisite to determine or adjust AAR. In this study, different weather forecast information was collected, decoded and then integrated. Then we proposed a time-dependent data-driven deep learning mechanism to predict runway configuration and Airport Acceptance Rate (AAR) simultaneously from the multi-source weather forecast, as well as airport condition and air traffic demand.

**2 - En-route Flow Corridor Capacity with a Dynamic Wake Separation Policy**

Azin Zare-Noghabi, George Mason University, Fairfax, VA, United States, John Shortle

To prevent en-route wake encounters, aircraft must maintain adequate separation. Current separation requirements are static. This talk investigates a dynamic wake separation concept where separation requirements are updated using real-time meteorological and aircraft-state data. This allows separation requirements to be specified based on more precise state information, rather than using pessimistic assumptions. A simulation of an en-route flow corridor is presented and capacity benefits are discussed under a variety of traffic scenarios.

**3 - Ground Delay Program Planning with Uncertain Airport Capacity**

Jun Chen, San Diego State University, San Diego, CA, 92182, United States

To efficiently balance traffic demand and capacity, ground delay program (GDP) planning rely on accurate predictions of future airport capacity. However, these predictions are inherently uncertain due to factors such as weather. This work will present a robust method to incorporate probabilistic information of capacity for GDP planning with chance constraints. The idea is to constrain the chance of a capacity constraint violation, based on probabilistic information about future capacity prediction. The major advantage is to provide robust solutions with user-defined service level, which can be adjusted by the air traffic authority or airlines to ensure reliable operations.

**4 - Optimizing Flight Schedules for Minimum Delay**

Rajesh Piplani, Nanyang Technological University, School of MAE, 50 Nanyang Avenue N3-2C-84, Singapore, 639638, Singapore, Wai Lun Cheung

In order to minimize the imbalance between capacity and demand, the airports managers negotiate with the airlines the flight schedules months ahead of time. In this research, we propose an integrated approach to optimize the daily flight schedules in light of the delays likely to be encountered on the day of actual flights; we estimate the delays from sequences of flight movements, optimized dynamically and continuously during the peak period of operations. Our proposed integrated approach would better estimate the delays likely to be encountered, and the resulting schedule interventions by airport managers (developed on the basis of a dynamic programming model) that can reduce those delays.

**Airline Competition and Customer Choice**

Sponsored: Aviation Applications

Sponsored Session

Chair: Susan Hotle, Virginia Tech, Blacksburg, Virginia

**1 - The Evolution of Low-Cost Carrier Operational Strategies Pre- and Post-Recession**

Susan Hotle, Virginia Tech, Blacksburg, VA, 24061, United States, Stephanie Atallah, Stacey Mumbower

This study analyzes LCC competition strategies for CONUS markets. Using OAG schedules, pre- and post-recession trends in LCC flight offerings were compared with their major carrier counterparts in terms of markets served, flight frequency, and competition structures of served markets. Results show that LCCs increased

the number of markets served to/from large airports. The results suggest that LCCs outpaced major carriers in terms of markets entered while major carriers have gained a greater flight frequency share in the markets they already serve. However, evidence suggests that the top four LCCs adopted different operating strategies during the study period.

**2 - Predicting Demand for Intra-urban Air Taxi Service**

Laurie A. Garrow, Georgia Institute of Technology, School of Civil &amp; Environmental Engr, 790 Atlantic Drive, Atlanta, GA, 30332-0355, United States, Robert Binder, Sreekar-Shashank Boddupalli, Thomas Douthat, Brian German

Imagine a world where instead of sitting in traffic on the downtown connector, you could simply drive to a vertiport near your home, enter into a small electric propulsion aircraft, fly over traffic, land on a rooftop near your work, and either walk or have an rideshare vehicle take you to your office. In this presentation, we provide an overview of ongoing research in air taxi flights for cities and present results from a survey we conducted of 2,500 commuters in five cities in the U.S. to estimate commuting demand and willingness to pay for these air taxi flights.

**3 - How Frequent Flyers Choose Airlines Case of Turkey**

Ozay Ozaydin, Dogus University, Zeamet Cad. No:21, Istanbul, 34722, Turkey

Airline industry can easily be considered to have the fiercest competition among businesses, due to the sensitive nature of customer trends. Thus, airline companies do and must dynamically adapt a number of competitive strategies in order to survive in this market and also expand their share. These strategies include these main topics: pricing, on-time performance, passenger satisfaction, luggage handling, flight safety and corporate image. The common dominator for all these topics is customer focus. The airline passengers' selection principles are used for main criteria for a comparison of airlines operating in Turkey.

**Control and Analysis of Queueing Systems**

Sponsored: Applied Probability

Sponsored Session

Chair: Guodong Pang, Penn State University, University Park, PA, 16802, United States

**1 - Stability of a Standard Decentralised Medium Access**

Aleksandr Stolyar, University of Illinois at Urbana-Champaign, 1308 W. Main Street, Office 156CSL, Urbana, IL, 61801, United States, Vsevolod Shneer

A decentralised medium access algorithm is considered. Each node generates packets at the rate  $\lambda$ . Each packet takes one time unit (slot) to transmit. There are no collisions - neighbouring nodes cannot transmit simultaneously. The algorithm we study is standard in that: a node with empty queue does not compete for access; the access procedure by a node does not depend on its queue length, as long as it is non-zero. For two system topologies, with nodes arranged in a circle and in a line, we prove the system stochastic stability under the condition  $\lambda < 2/5$ . This result is intuitive for the circle topology (which, however, does not help to prove it), but not intuitive at all for the line topology.

**2 - Optimal Service Elasticity in Large Scale Distributed Systems**

Debankur Mukherjee, Eindhoven University of Technology, Heeghtakker 78A, Eindhoven, 5625SW, Netherlands, Sem Borst, Souvik Dhara, Johan S. van Leeuwen, Aleksandr Stolyar

A fundamental challenge in large-scale systems is to achieve efficient server utilization and limit energy consumption, while providing excellent performance. We propose a joint auto-scaling and load balancing scheme, which does not require any global queue length information or explicit knowledge of system parameters, and yet provides provably near-optimal service elasticity. Specifically, we prove that both the waiting time of tasks and the relative energy consumed by idle servers vanish in the limit. At the same time, the proposed scheme operates in a distributed fashion and involves only constant communication overhead per task, ensuring scalability in massive data center operations.

### 3 - Analysis of Processor Sharing Queues via Relative Entropy

Amber L. Puha, California State University-San Marcos,  
Department of Mathematics, 333 S. Twin Oaks Valley Road,  
San Marcos, CA, 92096-0001, United States, Ruth J. Williams

In this talk, we discuss a new approach to studying the asymptotic behavior of fluid model solutions (formal functional law of large numbers limits) for critically loaded processor sharing queues. For this, we introduce a notion of relative entropy associated with measure valued fluid model solutions. This approach is developed with idea that similar notions involving relative entropy may be helpful for understanding the asymptotic behavior of critical fluid model solutions for stochastic networks operating under protocols naturally described by measure-valued processes.

### 4 - Ergodicity Properties of Levy-driven SDEs Arising from Multiclass Many-server Queueing Networks

Guodong Pang, Penn State University, 310 Leonhard Bldg.,  
Industrial and Manufacturing Engineering, University Park, PA,  
16802, United States

We study the ergodic properties of multidimensional piecewise Ornstein-Uhlenbeck processes with jumps, arising in multiclass many-server queues with bursty arrivals and/or asymptotically negligible service interruptions in the Halfin-Whitt regime. The SDEs have a piecewise linear drift, and are driven by either (1) a Brownian motion and a pure-jump Levy process, or (2) an anisotropic Levy process with independent one-dimensional symmetric alpha-stable components, or (3) an anisotropic Levy process as in (2) and a pure-jump Levy process. We identify conditions on the parameters in the drift and the Levy measure which result in polynomial and/or exponential ergodicity.

### Recent Developments in Load-balancing Algorithms

Sponsored: Applied Probability

Sponsored Session

Chair: Anton Braverman, Northwestern University, Evanston, IL,  
60208, United States

#### 1 - Asymptotically Optimal Load Balancing Topologies

Debankur Mukherjee, Eindhoven University of Technology,  
Heeghtakker 78A, Eindhoven, 5625SW, Netherlands, Sem Borst,  
Johan S. van Leeuwen

We consider a system of  $N$  servers inter-connected by some graph topology  $GN$ . Tasks with unit-mean exponential service times arrive at the various servers as independent Poisson processes of rate  $\lambda$ . Each incoming task is assigned to whichever server has the smallest number of tasks among the one where it appears and its neighbors in  $GN$ . This model has been extensively investigated via mean-field techniques in the case  $GN$  is a clique. For arbitrary graph, mean-field techniques breakdown, complicating the analysis. In this talk we will investigate how much sparsity in the graph can be allowed maintaining the asymptotic behavior of a clique on a fluid and a diffusion scale.

#### 2 - Stein's Method for Mean-field Approximations

Lei Ying, Arizona State University, Chandler, AZ, United States

Mean-field analysis is an analytical method for understanding large-scale stochastic systems such as large-scale data centers and communication networks. Most existing mean-field models concerned the light-traffic regime where the load of the system is strictly less than one and is independent of the size of the system. To overcome this difficulty of traditional mean-field models, this paper views the equilibrium point of the mean-field model, called a mean-field solution, simply as an approximation of the stationary distribution of the finite-size system, and uses Stein's method to quantifies the approximation errors.

#### 3 - A Simple Steady-State Analysis of Load Balancing Algorithms in the Sub-Halfin-Whitt Regime

Xin Liu, Arizona State University, Tempe, AZ, 85281,  
United States, Lei Ying

This work studies a class of load balancing algorithms for many-server systems assuming finite buffer. We focus on the steady-state performance of load balancing algorithms in the heavy traffic regime (called sub-Halfin-Whitt regime). We establish a sufficient condition under which the probability that an incoming job is routed to an idle server is one asymptotically. The class of load balancing algorithms that satisfy the condition includes join-the-shortest-queue (JSQ), idle-one-first (IIF), join-the-idle-queue (JIQ), and power-of-d-choices (Pod) with certain  $d$ . The proof of the main result is based on the framework of Stein's method. A key contribution is to use a simple generator approximation based on state space collapse.

### 4 - Steady-state Analysis of the Join the Shortest Queue Model in the Halfin-Whitt Regime

Anton Braverman, Northwestern University, Kellogg Global Hub,  
Room 4171, Evanston, IL, 60208, United States

This talk will focus on the generator comparison framework. This framework also goes by the name of the Stein method framework or the drift-based fluid Lyapunov function approach, and has received significant attention over the past few years as a tool for proving rates of convergence to steady-state fluid and diffusion approximations. I focus on the Join the Shortest Queue (JSQ) model in the Halfin-Whitt regime. This is an example of a 'clean' application of the generator comparison framework, which lets one push the boundaries of what the framework can do. Two specific points include a novel 'trick' to deal with state space collapse, and an approach to prove exponential ergodicity for Markov processes.

#### 1 - Adaptive Matching for Expert Systems with Uncertain Task Types

Virag Shah, Stanford University, Stanford, CA, United States,  
Lennart Gulikers, Laurent Massoulié, Milan Vojnovic

Online two-sided matching markets such as Q&A forums (e.g. StackOverflow, Quora) and online labour platforms (e.g. Upwork) rely on the ability to propose adequate matches based on imperfect knowledge of the two parties to be matched. This prompts a question: Which matching algorithms can, in the presence of uncertainty, lead to efficient platform operation? To this end, we develop a model of a task-server matching system. We give a necessary and sufficient condition for an incoming stream of tasks to be manageable by the system. We identify an optimal policy and show that it outperforms a natural greedy policy. We confirm our theoretical findings with experiments based on logs of a StackOverflow forum.

#### 2 - Small-scale Markets for Bilateral Resource Trading in the Sharing Economy

Srinivas Shakkottai, Texas A&M University, Dept. of ECE, College  
Station, TX, United States, Bainan Xia, Vijay Subramanian

We consider a small-scale market for agent-to-agent resource sharing, in which each agent could either be a server (seller) or a client (buyer). In every time period, a server has resources that any client could consume, and randomly gets matched with a client. During each transaction, the server gets money and the client gets resources. We model the system using a Mean Field Game approach and prove the existence of the Mean Field Equilibrium, which can achieve an almost 100% trade ratio. Finally, we carry out a simulation study motivated by an agent-to-agent computing market, and a case study on a proposed photovoltaic market, and show the designed market benefits both individuals and the system as a whole.

#### 3 - Integrating Online Learning and Adaptive Control in Queueing Systems with Uncertain Payoffs

Xiaojun Lin, Professor, Purdue University, 465 Northwestern Ave.,  
EE Building, West Lafayette, IN, 47907, United States,  
Wei-Kang Hsu, Jiaming Xu, Mark R. Bell

Consider a queueing system where un-labeled clients arrive according to a stochastic process and each client brings a random number of tasks. As tasks are assigned to servers, they produce client/server-dependent random payoffs. The goal of the system is to maximize the expected payoff per unit time subject to the servers' capacity constraints. However, both the statistics of the dynamic client population and the client-specific payoff vectors are unknown to the operator. We design task-assignment policies that carefully integrate adaptive control (of the queueing system) with online learning (of the clients' payoff vectors) to achieve low regret in finite time.

#### 4 - Risk-sensitive Optimal Control of Stochastic Networks

Rahul Singh, Intel, Santa Clara, CA, United States

We consider the problem of designing risk sensitive optimal control policies for scheduling in a stochastic network. A single server provides service to  $N$  queues. Processing incurs a cost of  $C$  units, while completion yields a reward of  $R$  units. The queues have a buffer capacity of  $B$  units, and are penalized  $L$  units if a job is lost due to buffer overflow. We show that the risk-sensitive optimal control policy for such a simple set-up is of threshold type.

### Statistical and Optimal Learning

Sponsored: Applied Probability

Sponsored Session

Chair: Ilya O. Ryzhov, University of Maryland, College Park, MD, 20742, United States

#### 1 - The Diverse Cohort Selection Problem

John P. Dickerson, University of Maryland, 3217 A.V. Williams Building, University of Maryland, College Park, MD, 20742, United States

How should a firm allocate its limited interviewing resources to select the optimal cohort of new employees from a large set of job applicants? How should that firm allocate cheap but noisy résumé screenings and expensive but in-depth in-person interviews? We view this problem through the lens of combinatorial pure exploration (CPE) in the multi-armed bandit setting, where a central learning agent performs costly exploration of a set of arms before selecting a final subset with some combinatorial structure. We present new algorithms with theoretical guarantees and provide experimental validation on real data from a hiring process at a large US-based graduate program.

#### 2 - Data-driven Decision-making Using Variational Bayes

Harsha Honnappa, Purdue University, West Lafayette, IN, United States

We consider a canonical problem where an agent uses Bayesian updating to learn to take optimal actions from independent and identically distributed (i.i.d.) observations of the state of a stochastic system. Given these observations, beliefs over unknown state parameters are summarized by a posterior distribution, allowing decision-making which, while Bayes-optimal, is typically computationally intractable. In this talk, we present asymptotic and empirical analyses of two algorithms for learning optimal decision-rules, which we call naive variational Bayes (NV) and loss-calibrated variational Bayes (LC) algorithms for data-driven decision-making.

#### 3 - Index Policies and Performance Bounds for Dynamic Selection Problems

David Brown, Duke University, Fuqua School of Business, 100 Fuqua Drive, Durham, NC, 27708, United States, James E. Smith

In this work, we study heuristics and performance bounds for dynamic selection problems. Examples of dynamic selection problems include assortment planning with demand learning, design of clinical trials, and screening a pool of applicants (e.g., for admission to colleges). We study a number of index-based policies, including one based on a Lagrangian relaxation of the problem. We characterize the performance of this Lagrangian index policy compared to an optimal policy. We also develop performance bounds that combine Lagrangian relaxations with information relaxations and show that these new performance bounds outperform standard Lagrangian relaxation bounds.

#### 4 - A New Rate-balancing Algorithm for Ranking and Selection

Ye Chen, 1305 Mathematics Building, University of Maryland, College Park, MD, United States, Ilya O. Ryzhov

Recent years have seen a surge of interest in the study of optimal convergence rates in ranking and selection, based on the large deviations approach of Glynn & Juneja (2004). We present a new algorithmic and computational approach that adaptively learns the optimal allocations derived by Glynn & Juneja (2004) without any tunable parameters. Our proposed BOLD (Balancing Optimal Large Deviations) method assumes that the samples come from a known distributional family, but is applicable and quite easy to implement for multiple families (in particular, it does not require normality). We report our progress on the theoretical analysis of BOLD and present preliminary numerical results.

### Joint Session DAS/Practice Curated: Decision Analysis Practice Award Competition

Sponsored: Decision Analysis

Sponsored Session

Chair: Saurabh Bansal, Penn State University, State College, PA, 16801, United States

Co-Chair: Michael C. Runge, USGS Patuxent Wildlife Research Center, 12100 Beech Forest Rd, Laurel, MD, 20708, United States

Co-Chair: Michael Fitch, Chevron, San Ramon, CA, 9458, United States

#### 1 - Modeling the Value of Agents in Supply Chains of Malaria Rapid Diagnostic Test Kits with Decision Analysis

Jarrod D. Goentzel, Massachusetts Institute of Technology, 77 Massachusetts Avenue, E38-650, Cambridge, MA, 02139, United States, Gilberto Montibeller, Corinne Carland

Malaria poses one of the greatest challenges to global health. Accurate diagnosis, with rapid diagnostic tests (RDTs), is critical because presumptive treatment of malaria wastes resources and increases the risk of drug resistance. In this project, we developed a value model for the agents along the RDT kit supply chain in Uganda. The model, based on multi-attribute value theory, enables an understanding of the motivations of each agent in the supply chain. The analysis identified a new package of incentives that proved to be robust against the variation of relevance of agents in the chain.

#### 2 - New Methods for Improved Decision Making in Unconventional Field Development

Andrew Beck, University of Texas-Austin, Austin, TX, 78757, United States, J. Eric Bickel

We developed a decision support tool for Statoil's US Onshore portfolio. This tool includes an asset valuation model and price and production uncertainty models. Because of high dimensionality, finding an optimal dynamic development schedule based on learning is difficult. We combined the Least Squares Monte Carlo algorithm with forward simulation to replicate an annual cycle of drilling, learning, and adaptation. By finding the set of alternatives that yields the highest net present value, the user ends up with an expected NPV for the asset, and a recommended year 1 development plan.

#### 3 - Safer Skies in Spain

David Rios Insua, ICMAT-CSIC and Royal Academy of Sciences, Nicolas Cabrera 13, Madrid, 28049, Spain, Javier Gómez, Carlos Alfaro, Verónica Elvira, Pablos Hernández-Coronado, Fran Bernal

As required by the International Civil Aviation Organization, nations must develop a so-called State Safety Program (SSP) to promote a proactive approach to safety oversight and management at country level. SSPs support strategic decision-making and resource allocation to areas with higher aviation safety risks. The Spanish Aviation Safety and Security Agency (AESA) developed a novel methodology with full use of numerous Decision and Data Sciences methods and implemented it in an R-based tool. This has allowed AESA to better support its safety decision making and attain considerable savings.

### Joint Session ISim/APS: Simulation Optimization II

Sponsored: Simulation

Sponsored Session

Chair: David Eckman, Cornell University, Cornell University

Co-Chair: Shane Henderson, Cornell University

#### 1 - Sequential Inferential Optimization via Simulation Under Input Model Risk

Eunhye Song, Penn State University, 310 Leonhard Building, University Park, PA, 16802, United States

Optimization via simulation (OvS) is subject to model risk when the input distributions to the simulator are estimated based on finite real-world data. We sequentially fit a Gaussian process metamodel to the conditional means of solutions as a function of the input model parameters and the design parameters to assist OvS and define a solution to be inseparable from the real-world optimum if the expected improvement (EI) of the solution's conditional mean is less than a threshold specified by a user. At each iteration, we compute EIs of all solutions to form a set of inseparable solutions from the optimum. We simulate a solution that can best reduce the size of the set until a stopping criterion is met.

#### 2 - Simple Top-two Sampling Algorithms for Best-arm Identification

Daniel Russo

This talk considers the optimal adaptive allocation of measurement effort for confidently identifying the best among a finite set of options or designs. I propose top-two sampling, a template for designing algorithms that adaptively allocate measurement effort. Four simple Bayesian algorithms designed via this template are shown to have strong performance in numerical experiments, and a unified analysis establishes each satisfies strong asymptotic optimality properties.

#### 3 - A Knockout-tournament Approach to Large-scale Indifference-zone Ranking and Selection

Ying Zhong, City University of Hong Kong, 22 Cornwall Street, KLN Tong, KLN, Hong Kong, L. Jeff Hong

Ranking and selection is similar to a sport tournament where the goal is to find a champion. Traditional R&S procedures typically compare the best with all competing K-1 alternatives. Motivated by the form of knockout tournaments typically used in tennis grand slams, we propose a R&S procedure where the best only needs to survive log<sub>2</sub> K comparisons. We show that the procedure works well for large-scale problems and is particularly suitable for commercial cloud services.

#### 4 - Comparing Frequentist and Bayesian Fixed-Confidence Guarantees for Selection-of-the-Best Problems

David J. Eckman, Cornell University, 118 Compton Rd, Ithaca, NY, 14850, United States, Shane Henderson

The problem of selecting the best from among a finite number of simulated alternatives has been studied under the contrasting frequentist and Bayesian interpretations of probability. We emphasize the conceptual differences in fixed-confidence guarantees under the two frameworks and examine practical implications of this distinction. We also discuss how frequentist selection procedures are inherently conservative and Bayesian selection procedures are relatively easier to design. Through simulation experiments, we compare the performance of selection procedures designed under each framework with respect to the other type of guarantee.

#### Joint Session Energy/Climate & ENRE/Env: Renewable Energy and Storage Modeling and Policy for the US

Emerging Topic: Energy and Climate

Emerging Topic Session

Chair: Zana Cranmer, Bentley University, Waltham, MA, 02452, United States

##### 1 - Dispatch of Wind, Solar, and Energy Storage in Long-term Planning Models

Cara Marcy, Renewable Electricity Analyst, U.S. Energy Information Administration, 1000 Independence Avenue SW, Washington, DC, 20585, United States

EIA's National Energy Modelling System (NEMS) provides a detailed multi-decadal assessment of the future of U.S. energy sectors. With the recent growth of wind and solar technologies, EIA has been working on capturing the value of these resources given their variable nature. In addition, energy storage is one technology that can take advantage of value streams presented from curtailment of excess renewable energy. This presentation will review the updated mini-dispatch model in NEMS, as well as highlight scenario results that investigate the relationship between renewable energy and storage.

##### 2 - The Potential for Emissions Reductions with Residential Demand Response

Maddie Macmillan, North Carolina State University, Raleigh, NC, United States, Jeremiah Johnson

The primary goal of demand response (DR) is to reduce peak electricity demand. In this study, we examine an alternative goal of using DR to reduce air emissions. For the US, we estimate the diurnal and seasonal demand profiles for suitable residential end uses including air conditioning, electric heating, and water heating. We assume that the DR events are load-neutral and test a range of tolerances for demand deferral. We develop an emissions minimization model that utilizes hourly marginal emissions factors for 20 grid regions to show significant potential to reduce CO2 emissions through DR approaches. The magnitude of the benefits are limited by the length of the demand deferral and DR adoption rate.

##### 3 - Estimating the Value of Offshore Wind Along the United States' Eastern Coast

Andrew Mills, Research Scientist, Lawrence Berkeley National Lab., 1 Cyclotron Rd., Berkeley, CA, 94720, United States

Offshore wind has been concentrated in Europe, and remains limited in other areas of the world. Among the many challenges to deployment is the need to understand the value that offshore wind provides within electricity markets. To explore the drivers of offshore wind value we use historical (2007-2016) weather data at thousands of potential offshore wind sites, combined with historical wholesale electricity market outcomes at hundreds of possible interconnection points. We find that the average historical market value of offshore wind from 2007-2016 varies significantly by project location, from \$40/MWh to more than \$110/MWh, and is highest for sites off of NY, CT, RI, and MA.

##### 4 - The Climate Value of Offshore Wind Energy in the US

Zana Cranmer, Bentley University, 175 Forest Street, Waltham, MA, 02452, United States, Erin Baker

We develop a forward looking method for estimating the value of permitting offshore wind projects in terms of addressing climate change. Offshore wind provides an additional way to reduce emissions as well as potential reductions in the cost of abatement. Our method includes value from both sources using the GCAM-USA model to look at different regions of the world and the US. These values can be compared to the potential costs imposed on local ecosystems.

#### Joint Session ENRE/Practice Curated: Optimization Methods for Power Systems

Sponsored: Energy, Natural Res & the Environment/Electricity

Sponsored Session

Chair: Cedric Josz

Co-Chair: Somayeh Sojoudi, University of California, Berkeley, Berkeley, CA, 94703, United States

##### 1 - Learning Solutions to Optimal Power Flow: An Active Set Approach

Line Roald, University of Wisconsin-Madison, Madison, WI, United States, Sidhant Misra, Yee Sian Ng

Power systems optimization involves solving similar optimization problems over and over and over again, with slightly varying input parameters. We consider the problem of directly learning the optimal solution as a function of the input parameters. Our learning framework is based on identifying the relevant set of active constraints, which we discover using our proposed streaming algorithm with performance guarantees. Applying the algorithm to the optimal power flow problem with renewable energy, we establish that the number of active sets is typically small for OPF problems, and discuss theoretical and practical implications for power systems operation.

##### 2 - Improving Bound Tightening with Quadratic Reformulation Method Applied on Optimal Power Flow

Hadrien Godard, Rte, Paris, France

Optimality-based and reduced-costs bound tightening are classic methods using convex relaxations. For the OPF problem, the Quadratic Reformulation method gives an efficient relaxation, leading to sharp lower bounds, and interior-points methods compute good feasible solutions. We strengthen bound tightening using those sharp bounds, and present computational results on OPF instances up to a thousand nodes.

##### 3 - Tight Piecewise Convex Relaxations for Global Optimization of Optimal Power Flow

Harsha Nagarajan, Los Alamos National Laboratory, NM, United States, Mowen Lu, Russell Bent, Sandra D. Eksiöglu, Kaarthik Sundar

In recent years, there has been an increasing interest in developing convex relaxations for ACOPF, which are often tight in practice. We further improve the quality of these relaxations by employing convex-hull characterizations for multilinear functions and develop tight piecewise convex relaxations. We also provide useful polyhedral results of these relaxations. Using these tight relaxations, we develop an adaptive, multivariate partitioning algorithm with bound tightening that progressively improves these relaxations, thus converging to the global optimal solution. Computational results show that our novel algorithm reduces the best-known optimality gaps of the NESTA ACOPF cases.

##### 4 - Conic Optimization for Robust State Estimation: Deterministic Bounds and Statistical Analysis

Igor Molybog, University of California, Berkeley, Berkeley, CA, United States, Ramtin Madani, Javad Lavaei

This project is concerned with the robust electric power system state estimation problem, where the goal is to find the unknown state of a system modeled by nonconvex quadratic equations based on unreliable data. We propose two techniques based on conic optimization to address this problem. We analyze the techniques in both deterministic and stochastic (Gaussian) settings by deriving bounds on the number of bad measurements the algorithms can tolerate without producing a nonzero estimation error. The efficacy of the developed methods is demonstrated on synthetic data and the European power grid.

### Real-time Optimization in Power Networks

Sponsored: Energy, Natural Res & the Environment/Electricity  
Sponsored Session

Chair: Enrique Mallada, Johns Hopkins University, Baltimore, MD, 21218, United States

Co-Chair: John Simpson-Porco, University of Waterloo-ECE Department, Waterloo, ON, N2L 3G1, Canada

#### 1 - A System Level Approach to Frequency Control

Nikolai Matni, UC Berkeley, Berkeley, CA, United States

We show how the System Level Approach to controller design can be used to explore design tradeoffs in primary and secondary frequency control. In particular, we show that localized distributed optimal controllers can be computed and implemented at scale, and explore tradeoffs in system performance, robustness, actuation density, sampling time, communication speed, and coordination between subcontrollers. We end with a brief discussion of progress made towards co-designing such low-level feedback, or reflex, layers and higher-level planning layers, such as those solving optimal power-flow problems.

#### 2 - Optimal Steady State Control for Frequency Regulation

John Simpson-Porco, University of Waterloo, 200 University Avenue West, Waterloo, ON, N2L 3G1, Canada, Liam S. Lawrence, Zachary Nelson, Enrique Mallada

We consider the problem of designing a feedback controller that guides the input and output of a linear time-invariant system to a minimizer of a convex program in the presence of unknown disturbances. The proposed controller combines proportional-integral control with gradient feedback, and enforces the KKT optimality conditions in steady-state, without incorporating dual variables into the controller. The results are applied to derive different centralized and distributed secondary frequency regulation strategies for power systems.

#### 3 - Online Optimization with Feedback for Power Grids

Emiliano Dall'Anese, University of Colorado Boulder, CO, United States

This talk addresses the design of feedback-based online algorithms for distribution systems. The time-varying optimization formalism is leveraged to model optimal operational trajectories of a distribution system, as well as explicit local and network-level operational constraints. The design of the algorithms capitalizes on an online implementation of primal-dual projected-gradient methods; the gradient steps are modified to accommodate measurements from the system. The algorithms can cope with model mismatches, avoid pervasive measurements, and lend themselves to distributed implementations. Convergence claims are established in terms of dynamic regret and Q-linear convergence.

#### 4 - The Effect of Power System Dynamics on Feedback Steady-state Optimization

Adrian Robert Hauswirth, ETH Zurich, ETL I. 13, Physikstrasse 3, Zurich, 8092, Switzerland

We consider the problem of optimizing the steady-state of a power system in closed loop. While the design of the feedback steady-state optimization law is based on a time-scale separation argument, in reality the dynamics of the (slow) iterative optimization routines can interfere with the (fast) natural system dynamics (e.g. primary frequency control). We provide a study of the stability and convergence of these optimization routines when applied to power systems, and we suggest solutions to maximize the robustness of these methods with respect to the underlying power system dynamics.

### Decisions in Energy Markets using Extended Concepts of Equilibrium

Sponsored: Energy, Natural Res & the Environment/Energy  
Sponsored Session

Chair: Sauleh Ahmad Siddiqui, Johns Hopkins University, Baltimore, MD, 21218, United States

#### 1 - Demand Response by Load and EV Aggregators Linked by an Option Contract for Load Sharing

Kevin Melendez, University of South Florida, Tampa, FL, 33613, United States, Tapas K. Das, Changhyun Kwon

With the increasing penetration of electric vehicles (EVs) on the market, the coordinated control of a large fleet of EVs by an aggregator has obtained special attention in the last decade. The cooperation among the EV aggregators and other demand response agents must be addressed to adequately incorporate this new player into the electricity market. In this work, we proposed an option contract among the EV aggregator and a demand response aggregator to define the

economical agreement between the players. The resulting problem was solved using the Nash bargaining solution.

#### 2 - Multicriteria Decision Analytic Framework for Evaluating Future Power Generation Pathways

Thushara De Silva, PhD Candidate, Vanderbilt University, 105 Jefferson Square, Nashville, TN, 37215, United States, George M. Hornberger, Hiba Baroud

Power generation planning objectives are reliable power system, economic efficiency, environmental sustainability, and social acceptability. Multiple alternatives, consists of different technologies and resources, must be assessed in multiple objectives. The objective of this study is to develop a multicriteria decision analysis model to select a power generation pathway for Sri Lanka by developing different alternative pathways, examining them across multiple objectives, and incorporating preferences of multiple stakeholders. A pathway; mix of renewable and fossil fuel resources aimed at achieving energy security can meet multiple criteria associated with future power generation.

#### 3 - Calibration of Transportation Models with Scarce Cost Data: A Mathematical Program with Equilibrium Constraints

Charalampos Avraam, Johns Hopkins University, 3400 N. Charles Street, Baltimore, MD, 21218, United States, Anastasia Lambrou, Wei Jiang, Sauleh Ahmad Siddiqui, Anthony So

The lack of detailed cost data in critical sectors of the economic system, such as the Livestock production sector, confines the ability of economic modelers to properly account for critical details, limiting the usefulness to policymakers. In order to calibrate for unknown or uncertain parameters, our proposed calibration method is formulated as a Mathematical Program with Equilibrium Constraints, where the lower level is the market equilibrium problem and the upper level minimizes the difference of the uncertain or unknown parameters from trademark values. Furthermore, we systematize the trade-off between accurately calibrating for a set of parameters versus another.

#### 4 - Solving Problems with Equilibrium Constraints with an Application to Energy Markets

Sauleh Ahmad Siddiqui, Johns Hopkins University, 3400 N. Charles Street, Baltimore, MD, 21218, United States

We provide a new set of optimality conditions for solving mathematical programs with equilibrium constraints and extend them to solve equilibrium problems with equilibrium constraints. We develop algorithms based on nonlinear programming to provide insights into energy markets with hierarchical structures. We conclude with policy insights and recommendations on how this approach can be extended.

### Nature-Inspired Heuristics: Overview and Critique

Emerging Topic Session

Chair: Theodore P. Pavlic, Arizona State University, ASU - CIDSE, P.O. Box 878809, Tempe, AZ, 85287-8809, United States

#### 1 - Nature-Inspired Heuristics

Craig Tovey, Nature-Inspired Heuristics, Atlanta, GA, United States

Evolutionary Programming, Genetic Algorithms, Simulated Annealing, Ant Colony Optimization, and Particle Swarm Optimization are among the earliest optimization heuristics inspired by animate and inanimate phenomena in the natural world. Some of the more recently invented methods have exotic names such as Roach Infestation, Shuffled Frog-Leaping, Invasive Weed Optimization, and Cuckoo Search. This tutorial is a guide to the bewildering, burgeoning menagerie of such heuristics, which now comprises more than 100 algorithms, and whose accompanying publications number in the hundreds of thousands. Their underlying principles include populations, recombination, exploration, reinforcement, encoding, selection, randomness and perturbation. They have been successful in many implementations, oftentimes winning out against classical OR/CS methods for implementation or a user's acceptance. They have been less successful, sometimes spectacularly so, in many computational test comparisons with classical methods. I speculate as to why these success levels differ so greatly. On the one hand, I critique the insularity and mathematical naiveté of this heuristic research, particularly its limited nature-versus-nature comparisons and self-contradictory stance on algorithm parameter tuning. On the other hand, I critique the OR community's having implicitly ceded important optimization territory to others, and our failure to face what is now there. In an attempt to spur our community to thoroughly engage with nature-inspired heuristics, I conclude by observing a misalignment between individual and community incentives, identifying a few potentially powerful nature-inspired heuristic ideas for optimization, and proposing some specific research questions that may attract operations researchers.

North Bldg 229B

**Modeling the Energy-Water-Land Nexus Across Scales**Sponsored: Energy, Natural Res & the Environment/Energy  
Sponsored Session

Chair: Mohamad Hejazi, PNNL, College Park, MD, 20740, United States

**1 - Energy-Water-Land Nexus: An Integrated Modeling Perspective using GCAM**Mohamad Hejazi, PNNL, 5825 University Research Ct, Ste. 3500,  
College Park, MD, 20740, United States

Energy, water, and land systems are increasingly interconnected. In this study, we use the Global Change Assessment Model (GCAM), where interactions between population, economic growth, energy, land, and water resources interact simultaneously in a dynamically evolving system to explore the role of groundwater resources in meeting future demands for energy, water, and agricultural demands.

**2 - Integrated Assessment of Water-Energy-Land Nexus Solutions for the Indus River Basin**

Simon Parkinson, Austria

The Indus river basin in South Asia is home to an estimated 300-million people. Its freshwaters are critical for human health and regional food and energy security. The Indus faces sustainable development challenges due to rapid population growth, climate change, and extreme water stress hampered by poverty and transboundary disputes. This presentation overviews a new multi-scalar integrated assessment framework that uncovers future pathways balancing basin-wide water, energy and land system interactions and constraints. Preliminary analysis identifies investments supporting infrastructure aligned with development targets. The new framework is readily transferable to other basins.

**3 - Ending Groundwater Overdraft Globally? An Assessment of Water and Food Security Impacts using Integrated Modeling**Tingju Zhu, International Food Policy Research Institute,  
Washington, DC, United States, Karen G. Villholth,  
Edwin Sutanudjaja

Groundwater plays an indispensable role in agricultural production. Yet, aquifers are being depleted in many arid and semi-arid areas. We modified a global water and food simulation model to assess the impacts of ending groundwater overdraft on water supply and food security. It was found that considerable decline in the production of major staple crops can be caused at the global scale, with immediate more severe regional impacts in heavy groundwater-using areas. International prices of significant groundwater-irrigated crop commodities like wheat were found to increase significantly, which potentially increases the population at risk of hunger in the world.

**4 - The Land and Water Implications of Biomass Cofiring in the MISO Region**Jing Liu, Pennsylvania State University, University Park, PA,  
United States, Shanjia Sun, Thomas W. Hertel, Brayam Valqui

Biomass cofiring is a promising and efficient way to provide clean energy for the states that have created Renewable Portfolio Standards. In the MISO region, many power plants are targeting corn residue — the most available and cost effective biomass resource. Should biomass cofiring be widely adopted, the production of corn is expected to expand significantly. This change will have important implications for land and water quality, as corn production intensively uses nitrogen fertilizer and, in some area, water for irrigation as well. The main objective of this study is to explore the potential of biomass cofiring in the MISO region and the associated impacts on land and water resources.

**5 - Modeling the Water-Energy Nexus at the Community Scale: A Case Study of New York City**Mine Isik, United State Environmental Protection Agency,  
Research Triangle Park, NC, United States, Ozge Kaplan

The sustainable supply and efficient use of energy, and the transformation from fossil fuels to renewable energy sources have become strategically important for cities. Regulatory approaches to achieve clean air goals applied on top-down basis tend to yield a significant amount of noncompliance costs. To address this challenge, a community scale, cost optimization linear programming model that focuses on buildings is developed to assess the energy supply systems and the related challenges toward resilient communities while combating climate change are examined in scenario analysis frame.

North Bldg 230

**Joint Session ENRE/Practice Curated:Data Analytics and Renewables in Oil & Gas Production**Sponsored: Energy, Natural Res & the Environment/Natural  
Resources Petrochemicals  
Sponsored SessionChair: Sam Aminfard, University of Texas at Austin, Austin, TX,  
United States**1 - Electrifying Oil and Gas Wells With Renewable Energy**  
Sam Aminfard, University of Texas at Austin

Renewable sources such as solar energy can be utilized to power remote electrified well site control systems and to minimize emissions of greenhouse gases. To assess the viability of powering well sites with renewable energy, we first developed a tool to calculate time-varying power loads of electrified well site control systems. We then utilized a transient energy flow model to evaluate the solar power generation and energy storage needed to reliably meet the estimated power loads using on local energy resource availability. Finally, we assessed the feasibility of potential renewable energy and storage options with a life-of-operation economic study.

**2 - Modeling Microgrids at Well Fields**Sam Johnson, University of Texas at Austin, Austin, TX, 78756,  
United States, Jon La Follett

High penetrations of renewable energy generation could increase downward pressure on electricity prices, which in turn could drive cogeneration plants to seek out alternative profit schemes. Likewise, regulations restricting emissions could motivate industrial electricity consumers to explore alternative power generation options. To identify an optimal operation strategy for facilities facing this predicament, a modeling framework was developed and applied to an existing microgrid. The reliability and resilience of on-site renewable energy generation and integrated energy storage were explored.

**3 - Toward a Global Assessment Framework for Oil and Gas Sector GHG Emissions**Adam Brandt, Stanford University, Mohammad S. Masnadi,  
Jeffrey Rutherford

As the threat of global climate change increases, regulatory limits on the oil and gas industry is becoming more stringent, and long-term emissions reductions look increasingly likely. A particular challenge to addressing oil and gas emissions using current regulatory mechanisms (standards or taxes) is that the industry is profoundly global in nature and crude oil products can cross multiple jurisdictions before reaching consumers. Also, emissions data availability in the global oil industry is generally poor, with many of the data required to estimate emissions being considered proprietary or strategic in nature by companies and thus held closely to operators. We describe an effort to address these issues by developing a combined open-source GHG modeling platform that is data-rich and based on engineering fundamentals. We also describe recent efforts to compile global data sources into the first comprehensive picture of global oil sector emissions, with an emphasis on data and analytical challenges.

**Advances in Project Management and Scheduling**

Emerging Topic: Project Management and Scheduling,  
in Memory of Joe Leung,  
Emerging Topic Session

Chair: George Vairaktarakis, Case Western Reserve University,  
Cleveland, OH, 44106-7235, United States

**1 - The Inventory vs. Timeliness Tradeoff in Project Delivery**

Arman Jabbari, University of California-Berkeley, 2012 Del Norte,  
Berkeley, CA, 94707, United States, Phil Kaminsky

We explore the tradeoffs between inventory cost and project completion times in  
a variety of settings, across single and multiple projects.

**2 - Managing Clinical Trials in a Drug Development Project**

Theodore D. Klastorin, University of Washington, ISOM  
Department, Box 353226, Seattle, WA, 98195-3226, United States,  
Kamran Moinsadeh, Hamed Mamani

We consider the case when a series of clinical trials are needed to validate a new  
drug under development. The issue we consider is related to the number of  
patients to enroll in each trial and when these patients should be enrolled. We  
show how this problem is related to flexible resource allocation problems in  
project management and develop a model that analyzes static versus dynamic  
scheduling strategies.

**3 - Information Asymmetry in Budget Allocation: An Analysis of a Truth-inducing Incentive Scheme**

Yun Zhou, 1989, NDSU, Fargo, ND, United States,  
Joseph Szmerekovsky

Truth-inducing incentive schemes are used to motivate project managers to  
provide unbiased project information to the portfolio manager to reduce  
information asymmetry between the portfolio manager and the project managers.  
To improve the scheme, we identify the proper value of penalty coefficients in the  
truth-inducing incentive scheme when information asymmetry is present. We  
first describe the allocation method that achieves budget optimization under  
certain assumptions and identify the proper coefficients while accounting for the  
differing perceptions of both the portfolio manager and the project managers. We  
report a bound on the ratio between the two penalty coefficients in the truth-  
inducing incentive scheme. We conclude that the penalty coefficient for being  
over budget should be reduced when the portfolio budget is tight and the penalty  
coefficients should be equivalent to the organizational opportunity costs when the  
portfolio budget is sufficient.

**4 - A Cutting Plane Approach for the Multi-Machine Precedence-Constrained Scheduling Problem**

George Vairaktarakis, Case Western Reserve University, Dept of OR  
and OM, 10900 Euclid Avenue, Cleveland, OH, 44106-7235,  
United States, Prahalad Venkateshan, Joseph Szmerekovsky

A cutting-plane approach is developed for the problem of optimally scheduling  
jobs with arbitrary precedence constraints on unrelated parallel machines. Our  
model utilizes a number of valid inequalities that cut off fractional linear  
programming solutions. This leads to an increase of the linear programming lower  
bound from 89.3% to 94.6% of the corresponding optimal solution, and a  
substantial reduction in the computational time of an optimal branch-and-bound  
algorithm for this problem. We report optimal solutions for problem instances  
with up to 25 jobs and 5 machines; more than twice the size of problems for  
which optimal solutions have been reported so far.

**5 - Project Resource Leveling Under Uncertainty**

Hongbo Li, Shanghai University, Baoshan District, Shangda Road  
99, Shangchuan Road 995, Shanghai, 200444, China

We investigate project resource leveling with stochastic activity durations as well  
as resource availabilities to minimize the fluctuations in resource usage. To obtain  
effective scheduling policies for the stochastic resource leveling problem, we  
model the problem as a Markov decision process model and propose approximate  
dynamic programming algorithms built upon Metaheuristics. To evaluate our  
algorithms, we conduct extensive computational experiments on benchmark  
instances.

**SB52**

North Bldg 231C

**Joint Session Award/Practice Curated: Social Media Analytics Best Student Paper Competition**

Emerging Topic: Social Media Analytics  
Emerging Topic Session

Chair: Julie Zhang, University of Massachusetts, Lowell, Operations and  
Information Systems, Lowell, MA, United States

**1 - Detecting Influence Campaigns in Social Networks Using the Ising Model**

Nicolas Guenon des Mesnards, Massachusetts Institute of  
Technology, Cambridge, MA, USA, .

We consider the problem of identifying coordinated influence campaigns  
conducted by automated agents or bots in a social network. We study several  
different Twitter datasets which contain such campaigns and find that the bots  
exhibit heterophony - they interact more with humans than with each other. We  
use this observation to develop a probability model for the network structure and  
bot labels based on the Ising model from statistical physics. We present a method  
to find the maximum likelihood assignment of bot labels by solving a minimum  
cut problem. Our algorithm allows for the simultaneous detection of multiple bots  
that are potentially engaging in a coordinated influence campaign, in contrast to  
other methods that identify bots one at a time. We find that our algorithm is able  
to more accurately find bots than existing methods when compared to a human  
labeled ground truth. We also look at the content posted by the bots we identify  
and find that they seem to have a coordinated agenda.

**2 - Detecting Changes in Dynamic Events over Networks**

Shuang Li, Georgia Institute of Technology, Atlanta, GA,  
United States

Large volume of networked streaming event data are becoming increasingly  
available in a wide variety of applications, such as social network analysis,  
Internet traffic monitoring and healthcare analytics. How to promptly detect  
changes in these dynamic systems using these streaming event data? In this  
paper, we propose a novel change-point detection framework for multi-  
dimensional event data over networks and cast the problem into sequential  
hypothesis test. We show that our method can achieve weak signal detection by  
aggregating local statistics over time and networks. Finally, we demonstrate the  
good performance of our algorithm on numerical examples and real-world  
datasets from twitter and Memetracker.

**3 - How do Sales Responses to Various User-generated-content?****A Panel VAR Analysis based on Twitch, YouTube and Steam Data**

Shuang Li, Georgia Institute of Technology, Atlanta, GA,  
United States

Twitch.tv (Amazon owned), having over 15 million daily active users, owning  
over 43 percent of game video content market and ranking 4th in in peak US  
internet traffic, is the biggest live stream platform now. The unique features of  
live stream video platforms include timely broadcasting and interpersonal  
interaction, large scale user base and democratized content genre distribution.  
Given these unique features, Twitch has been more and more popular among  
various marketers across different industries as a new form of marketing channel  
which have timely impacts and high efficiency. Meanwhile, pre-recorded video  
platforms like YouTube is also largely used as an effective marketing channel.  
Thus, it is unclear that which platform as better marketing efficiency.  
Additionally, compared with traditional user-generated-content (UGC) like  
reviews, it is unclear that whether user-generated video contents about a product  
on two platforms are associated with the product's reputation in terms of reviews-  
the traditional form of user generated content. To explore these two concerns, we  
merge a unique dataset including game sales and profile data from the largest  
online game distribution platform- Steam, game related data from YouTube and  
Twitch and conduct a comprehensive Panel VAR analysis. We provide both  
empirical and theoretical implications based on summarized finding patterns and  
illustrate contributions of this study.

#### 4 - Opinion Dynamics with Stubborn Agents

David S. Hunter, Massachusetts Institute of Technology,  
Cambridge, MA, United States

We consider the problem of optimizing the placement of stubborn agents in a social network in order to maximally impact population opinions. We assume individuals in a directed social network each have a latent opinion that evolves over time in response to social media posts by their neighbors. The individuals randomly communicate noisy versions of their latent opinion to their neighbors. Each individual updates his opinion using a time-varying update rule that has him become more stubborn with time and be less affected by new posts. The dynamic update rule is a novel component of our model and reflects realistic behaviors observed in many psychological studies. We show that in the presence of stubborn agents with immutable opinions and under fairly general conditions on the stubbornness rate of the individuals, the opinions converge to an equilibrium determined by a linear system. We give an interesting electrical network interpretation of the equilibrium. We also use this equilibrium to present a simple closed form expression for harmonic influence centrality, which is a function that quantifies how much a node can affect the mean opinion in a network. We develop a discrete optimization formulation for the problem of maximally shifting opinions in a network by targeting nodes with stubborn agents. We show that this is an optimization problem with a monotone and submodular objective, allowing us to utilize a greedy algorithm. Finally, we show that a small number of stubborn agents can non-trivially influence a large population using simulated networks.

#### Joint Session AMD/RMP: Machine Learning and Optimization for Automated Mechanism Design

Sponsored: Auction and Marketing Design

Sponsored Session

Chair: Ellen Vitercik, Carnegie Mellon University, Pittsburgh, PA, 15213, United States

#### 1 - Automated Design of High-Revenue Combinatorial Auctions

Tuomas W. Sandholm, Carnegie Mellon University, Gates Center  
for Computer Science, Carnegie Mellon University, Pittsburgh, PA,  
15213, United States, Anton Likhodedov

Designing revenue-maximizing combinatorial auctions is a key problem, unsolved even for two items. Automated mechanism design [Conitzer & Sandholm UAI-02] uses computational techniques to design mechanisms. In this paper [Operations Research 2015; extends our AAAI-04 & 05 papers], we introduced two ideas to (automated) mechanism design: 1) search for a good mechanism in parametric families where all mechanisms in the family satisfy desirable properties (e.g. incentive compatibility), and 2) using samples of valuations as input rather than assuming a prior distribution (which can be doubly exponential, thus unrealistic). This begat deterministic mechanisms with highest known revenues.

#### 2 - Mechanism Design for Correlated Valuations: Efficient Methods for Revenue Maximization

Michael Albert, Duke University, 308 Research Drive, Durham,  
NC, 27708, United States, Peter Stone, Vincent Conitzer,  
Giuseppe Lopomo

In this work, we provide a both computationally and sample efficient method to design mechanisms that can robustly incorporate an imprecise estimate of the distribution over bidder valuations, using samples from the true distribution, in a way that provides strong guarantees that the mechanism will perform at least as well as ex-post mechanisms, while also performing nearly optimally with sufficient information. We also demonstrate through simulation that this new mechanism design paradigm generates mechanisms that perform significantly better than traditional mechanism design techniques.

#### 3 - Optimal Auctions through Deep Learning

Zhe Feng, Harvard University, Cambridge, MA, United States,  
Paul D. Tting, Harikrishna Narasimhan, David C. Parkes

In this work, we initiate the exploration of the use of tools from deep learning for the automated design of optimal auctions. The design objective is revenue optimal, DSIC auctions. We show that multi-layer neural networks can learn almost-optimal auctions for settings for which there are known analytical solutions (including results due to Myerson, Manelli-Vincent, Pavlov, Daskalakis et al., ). Moreover, this can be done without appealing to characterization results. We are also able to design essentially optimal auctions for poorly understood problems, as well as obtain state-of-the-art results for combinatorial settings that have been studied in the framework of automated mechanism design.

#### 4 - A General Theory of Sample Complexity for Multi-item Profit Maximization

Ellen Vitercik, Carnegie Mellon University, Pittsburgh, PA, 15213,  
United States, Maria-Florina Balcan, Tuomas W. Sandholm

The design of profit-maximizing multi-item mechanisms is a notoriously challenging problem. The mechanism designer's goal is to field a mechanism with high expected profit on the distribution over buyers' values. Unfortunately, if the set of mechanisms he optimizes over is complex, a mechanism may have high empirical profit over a small set of samples but low expected profit. How many samples are sufficient to ensure that the empirically optimal mechanism is nearly optimal in expectation? We uncover structure shared by a myriad of auctions that allows us to prove strong sample complexity bounds: for any set of buyers' values, profit is a piecewise linear function of the mechanism's parameters.

North Bldg 232B

#### Interactions in Supply Chains

Sponsored: Behavioral Operations Management

Sponsored Session

Chair: Michael Becker-Peth, Rotterdam School of Management,  
Erasmus University, Rotterdam, 3062 PA, Netherlands

#### 1 - Behavioral Biases in Newsvendor Competition: An Indirect Evolutionary Approach

Ilkka Leppanen, Loughborough University, School of Business and  
Economics, Epinal Way, Loughborough, LE11 4NZ,  
United Kingdom

Recent literature has shown that behavioral biases can explain nonnormative decision making of competing newsvendors. We use an indirect evolutionary approach where players maximize biased utility functions but actual profits determine fitness to study 2 behavioral biases, reference effects based on profit comparisons and overconfidence, in newsvendor competition. We show that both kinds of behavioral biases can be evolutionarily stable and lead to increases in inventory levels from the profit-maximizing equilibrium quantities, in line with experimental findings reported in literature.

#### 2 - How to Improve Forecast Performance - Are Two Humans Better than One?

Michael Becker-Peth, Rotterdam School of Management, Erasmus  
University, Burgemeester Oudlaan 50, Rotterdam, 3062 PA,  
Netherlands

We investigate how Marketing and Supply Chain Department interact in sharing forecasting data in a real world setting. We find that when Marketing is in charge of editing the SAP forecast, they inflate substantially. After inserting Supply Chain Department as middle man, the performance increases because SCM anticipates the forecast inflation and reduces the effect.

#### 3 - Strategic Inventories in Dual Channel

Yan Lang, University of Texas at Arlington, 701 S. Nedderman Dr.,  
Arlington, TX, 76019, United States, Kay-Yut Chen

We study the effect of choosing to strategically withhold inventories in a perfect information dual channel environment, which contains one supplier and one retailer. We design a series of laboratory experiments, which subjects are facing different market power and inventory holding cost issues, to test our hypotheses of equilibrium strategies.

#### 4 - An Empirical Analysis of Buyer Strategic Ordering Decisions through a Behavioral Experiment

Minseok Park, Salisbury University, 1101 Camden Ave. Perdue  
Hall 334, Salisbury, MD, 21801, United States, Pelin Pekgun,  
Sriram Venkataraman, Manoj Malhotra

Theoretical literature shows that certain allocation policies can reduce order inflation behavior of buyers, while empirical evidence is scarce. In this study, through behavioral lab experiments, we analyze the impact of a capacity allocation policy and different information disclosures on the buyer ordering decisions in a single-supplier, two-buyer supply chain.

### Joint Session Sports/Practice Curated Sports Analytics I

Sponsored: SpORts

Sponsored Session

Chair: Walter DeGrange, CANA Advisors, Chapel Hill, NC, 27517, United States

#### 1 - Sports Analytics: Making a Difference or Just a Way to get Free Tickets

Walter DeGrange, CANA Advisors, 6727 Falconbridge Rd, Chapel Hill, NC, 27517, United States

With the recent success of sports teams heavily using analytics (Astros, Eagles, Penguins, Warriors, Leicester City F.C.), does this mean that analytics has gained a foothold in the sports world? And if so, is there a career path that a high school student can use to become a sports analytics professional? This presentation attempts to answer both of these questions and summarizes all the areas of the application of analytics in sports. It also adds another year of professional team results and additional factors.

#### 2 - NHL Expansion Draft Optimization

Timothy Chan, University of Toronto, Mechanical and Industrial Engineering, 5 Kings College Road, Toronto, ON, M5S 3G8, Canada, Kyle Booth, Yusuf Shalaby

Las Vegas became the 31st team in the National Hockey League in 2017. To build an initial roster, an expansion draft was held where Vegas selected one player from each of the existing teams. Existing teams were allowed to protect a subset of their players from being selected. In this talk, we present integer optimization formulations that model the protection and selection decision problems. We use this optimization framework to investigate how existing teams can reduce Vegas' team value by making roster moves to improve protection of their assets. We also illustrate how this model can provide Vegas with insight on which teams it may have leverage to extract additional assets through the draft.

#### 3 - How to Play Fantasy Sports Strategically (and Win)

Raghav Singal, Columbia University, New York, NY, United States, Martin Haugh

Daily Fantasy Sports (DFS) is a multi-billion dollar industry. We provide a coherent framework for constructing DFS portfolios where we explicitly model the behavior of other DFS players. We maximize the expected reward and connect the problem to the mean-variance optimization from finance literature, allowing us to solve our problem using a sequence of binary quadratic programs. We also introduce a Dirichlet-multinomial process for modeling opponents' behavior, enabling us to predict and embed opponents' actions in our decision-making in addition to estimating the value of "insider trading" and "collusion". We demonstrate the value of our framework by participating in DFS contests.

#### 1 - Bayesian Sequential Learning for Clinical Trials of Multiple Correlated Medical Interventions

Ozge Yapar, University of Pennsylvania, Philadelphia, PA, United States, Stephen Chick, Stephen Chick

We propose an approach to clinical trial design that integrates three important, emerging trends: design for cost-effectiveness, which ensures health-economic improvement of new interventions; multi-arm design, which simultaneously compares multiple interventions; and adaptive design, which dynamically adjusts the sample size and allocation of patients to different interventions over the course of the trial. We construct a multi-arm, adaptive sampling policy to maximize the expected population-level benefit and provide numerical results that illustrate the benefits in the context of trials that test multiple combinations of therapies and Phase II/III dose-finding trials.

#### 2 - Maximizing Intervention Effectiveness

Rongqing Han, University of Southern California, 1111 Wilshire Blvd, Room 406, Los Angeles, CA, 90017, United States, Vishal Gupta, Song-Hee Kim, Hyung Paek

Policymakers often seek to roll-out an intervention previously proven effective in a research study, possibly subject to resource constraints. We propose a robust optimization framework to guide this roll-out to maximize intervention effectiveness. Our method uses the types of evidence typically available in a published study to identify a subset of patients for treatment. We prove performance guarantees on the method and present a case study assessing its benefits using data from a large teaching hospital in the context of reducing emergency department visits through case management.

#### 3 - Interpreting Predictive Models for Human-in-the-Loop Analytics

Hamsa Sridhar Bastani, Wharton School, Wharton School, Philadelphia, PA, United States, Osbert Bastani, Carolyn Kim

Interpretability has become an important issue as machine learning is increasingly used to inform consequential decisions. We propose an approach for interpreting complex "blackbox" models by extracting a decision tree that approximates the model. Our algorithm provably avoids overfitting by actively sampling new training points using the blackbox model. We use this technique to interpret a random forest classifier for predicting diabetes risk. Physicians successfully used our interpretation to discover an unexpected causal issue in the diabetes classifier.

#### 4 - Timing it Right: Balancing Inpatient Congestion versus Readmission Risk at Discharge

Pengyi Shi, Purdue University, 403 W. State St, Krannert School of Management, Kran 472, West Lafayette, IN, 47907, United States, Jonathan Helm, Jivan Romain Deglise-Hawkinson, Julian Pan

When to discharge a patient plays an important role in hospital patient flow management as well as quality of care and patient outcomes. In this work, we develop and implement a practical decision support tool to aid hospitals in managing the delicate balance between individual readmission risk and ward congestion. Our framework integrates a new prediction model that updates the readmission risk over a patient's hospital stay with a large-scale Markov Decision Process (MDP) to optimize state-dependent discharge decisions. We overcome both practical challenges in the prediction and the curse of dimensionality in the MDP. Lastly, we discuss the ongoing implementation efforts of this discharge tool.

#### 5 - Flexible FDA Approval Policies

Taylor Corcoran, University of California-Los Angeles, 110 Westwood Plaza, Los Angeles, CA, 90024, United States, Elise Long, Fernanda Brava

The FDA requires clinical trial evidence that is statistically significant at the 2.5% level when approving novel drugs, but the agency often uses regulatory discretion when interpreting these standards. Factors such as target disease severity, prevalence, and availability of existing therapies are qualitatively considered, yet no quantitative framework is used to evaluate how such characteristics impact approval standards. We propose a novel queueing network model to analyze the drug approval process, which explicitly incorporates these factors, as well as obsolescence among drugs.

### Joint Session HAS/Practice Curated: Experiments in Health Care Operations

Sponsored: Health Applications

Sponsored Session

Chair: Hummy Song, Philadelphia, PA, 19104, United States

#### 1 - The Effects of Occupancy Information Hurdles and Physician Admission Decision Noise on Hospital Unit Utilization

Song-Hee Kim, University of Southern California, Los Angeles, CA, United States, Jordan D. Tong, Carol Peden

Hospital units usually have high demand that exceeds their capacity, requiring physicians to make admission decisions. Under reasonable conditions, the optimal admission policy should depend on the arriving patient's severity and the occupancy upon a patient's arrival. In practice, the occupancy is not always readily accessible and there may exist occupancy information hurdles. We recruit physicians and MTurk workers to study how occupancy information hurdles may systematically affect admission decision behavior. We also examine how random error (in the policy selection and policy execution) may drive predictable biases of over- or under-occupied units depending on the system parameters.

## 2 - Priority & Predictability: The Differential Effects of Emergent and Scheduled Hospital Admissions

Jillian Berry Jaeker, Boston University, 595 Commonwealth Avenue, Room 657A, Boston, MA, 02215, United States

Using experimental and patient-level data, this study focuses on the impact of incoming patient admission type (scheduled or emergent) on the probability of admission and LOS, and the moderating effect of high workload. We also provide a counterfactual analysis of the possible savings achieved through higher predictability in demand.

## 3 - Shared Medical Appointments – An Innovative Approach to Healthcare Delivery

Nazli Sonmez, London Business School, Regent's Park, London, NW1SN, United Kingdom, Kamalini Ramdas, Ryan W. Buell

We examine shared medical appointments (SMAs) as a substitute for regular one-on-one appointments. Under this innovative approach, a group of patients with similar chronic conditions meet with a doctor simultaneously. We conduct a randomized controlled trial at the Aravind Eye Hospital's Glaucoma Clinic, in Pondicherry, India to assess the effectiveness of shared medical appointments versus traditional one-on-one appointments for glaucoma. Preliminary results obtained with the data suggest that the knowledge and satisfaction level of patients who attend shared medical appointments is significantly higher than that of patients who attend one-on-one appointments.

## 4 - Optimal Newborn Screening Algorithm for Cystic Fibrosis

Seyedehsaloumeh Sadeghzadeh, Virginia Institute of Technology Blacksburg, VA, 24060, United States, Hussein El Hajj, Ebru Korular Bish, Douglas R. Bish

Cystic fibrosis (CF) is one of the most prevalent genetic disorders in the United States. Newborn screening for CF allows for early diagnosis, and can improve health outcomes, whereas a delayed diagnosis may result in severe symptoms or fatality. All 50 states of the United States perform newborn screening for CF, starting with a bio-marker test, followed by a genetic test for newborns with elevated bio-marker levels. We develop a stochastic optimization model to determine an optimal bio-marker threshold and set of CF mutations to be tested, in order to minimize the expected misclassification cost. Our case study shows that the optimal combination can substantially reduce the misclassification cost.

## 1 - Flexible FDA Approval Policies

Taylor Corcoran, University of California-Los Angeles, 110 Westwood Plaza, Los Angeles, CA, 90024, United States, Elise Long, Fernanda Brava

The FDA requires clinical trial evidence that is statistically significant at the 2.5% level when approving novel drugs, but the agency often uses regulatory discretion when interpreting these standards. Factors such as target disease severity, prevalence, and availability of existing therapies are qualitatively considered, yet no quantitative framework is used to evaluate how such characteristics impact approval standards. We propose a novel queueing network model to analyze the drug approval process, which explicitly incorporates these factors, as well as obsolescence among drugs.

## 2 - A Re-solving Heuristic with Uniformly Bounded Loss for Network Revenue Management

Pornpawee Bumpensanti, Georgia Institute of Technology, 755 Ferst Drive NW, Atlanta, GA, 30332, United States, He Wang

We consider a network revenue management problem. The goal is to find a customer admission policy that maximizes expected revenue over a fixed finite horizon. We study a class of re-solving heuristics. These heuristics periodically re-solve the deterministic linear program (DLP), where random customer arrivals are replaced by their expectations. We find that frequently re-solving the DLP produces the same order of revenue loss as one would get without re-solving. However, by re-solving the DLP at a few selected time points and applying thresholds to the customer acceptance probabilities, we design a new algorithm that has a revenue loss bounded by a constant that is independent of the horizon length.

## 3 - Frustration-based Promotions: Field Experiments in Ride Sharing

Baek Jung Kim, NYU Stern, 40 West 4th Street, Tisch Hall, New York, NY, 10012, United States, Michael-David Fiszer, Maxime Cohen

In this talk, we examine whether a firm should proactively send compensation to users who have experienced a frustration (i.e., a poor service quality). In collaboration with one of the leading ride-sharing platforms, Via, we designed and ran three field experiments to investigate how different compensation types affect the engagement of riders who experienced a frustration.

## 4 - A Dynamic Clustering Approach to Data-Driven Assortment Personalization

Sajad Modaresi, UNC Chapel Hill, Kenan-Flagler Business School, Chapel Hill, NC, 27514, United States, Fernando Bernstein, Denis Sauré

A retailer faces heterogeneous customers with initially unknown preferences. The retailer can personalize assortment offerings based on available profile information; however, users with different profiles may have similar preferences, suggesting that the retailer can benefit from pooling information. We propose a dynamic clustering policy that adaptively adjusts customer segments and personalizes the assortment offerings. We test the policy's performance using a dataset from a Chilean retailer.

## 5 - Shipping Consolidation Across Two Warehouses with Delivery Deadline and Expedited Options for E-commerce and Omni-channel Retailers

Lai Wei, University of Michigan, Ann Arbor, MI, United States, Stefanus Jasin, Roman Kapuscinski

Shipment consolidation is commonly used to avoid some of the shipping costs. However, when pending current orders are consolidated with future orders it may require more expensive expedited shipment to meet shorter deadlines. In this paper, we study the optimal consolidation policy focusing on the trade-off between economies of scale and expedited shipping cost. The optimal policies and their structures are characterized, where the impact of expedited shipment on both shipping policy and order fulfillment policy are explored. Two easily implementable heuristics are proposed, which perform within 1-2% of the optimal in intensive numerical tests.

## 6 - Inconvenience, Liquidity Constraints and the Adoption of Off-Grid Lighting Solutions

Bhavani Shanker Uppari, INSEAD, 1 Ayer Rajah Avenue, Singapore, 138676, Singapore, Serguei Netessine, Ioana Popescu, Rowan Clarke

One-fifth of humankind living in poverty does not have access to electricity. An off-grid lighting model that is becoming prominent in impoverished countries is rechargeable bulb technology. We examine, both theoretically and empirically, the impact of liquidity constraints and recharge inconvenience on the usage of rechargeable bulbs. Our analysis has implications for both firm-level operational decisions and government-level policy decisions.

## Joint Session HAS/Practice Curated: HIV Prevention, Testing, and Treatment

Sponsored: Health Applications

Sponsored Session

Chair: Pooyan Kazemian, Harvard Medical School, Boston, MA, 02114, United States

## 1 - Optimal Scale-up of HIV Treatment Programs in Resource-limited Settings Under Supply Uncertainty

Sameer Mehta, PhD Student, UT Dallas, TX, United States, Sarang Deo, Charles J. Corbett

In this paper, we study the challenge of scaling-up HIV treatment programs faced by clinics in sub-Saharan Africa. The key trade-off underlying this allocation is between the marginal health benefit obtained by initiating an untreated patient on treatment and that obtained by avoiding treatment interruption of a treated patient. We cast the clinic's problem as a stochastic dynamic program and provide a partial characterization of the optimal policy, which consists of dynamic prioritization of patient segments and is characterized by state-dependent thresholds.

## 2 - Treatment Optimization of Using Darunavir Versus Lopinavir in a Resource Limited Setting with an Unknown Price Ceiling

Jennifer Campbell, Clinton Health Access Initiative, P.O. Box 51071 Ridgeway, Lusaka, Zambia, Marta Prescott, Paul Domanico

The analysis quantifies the value of second-line HIV drugs in complex market settings by addressing treatment sequencing, clinical efficiencies, programmatic heterogeneity and nuanced market paradigms in resource limited countries. The model estimates patient outcomes linked to probabilities of transitioning to different HIV treatment and health states in the medium and long term. The model uses country and region-specific data and clinical outcomes from published sources. Costs and impact, including secondary infections, are included. This work is shared with Ministries of Health and helps set treatment policy priorities, clinical trainings, and procurement for second line treatment.

## 3 - The Cost-effectiveness of HIV Pre-exposure Prophylaxis (PrEP) in High-risk Groups in India

Pooyan Kazemian, Harvard Medical School, 100 Cambridge St, 1695, Boston, MA, 02114, United States, Sydney Costantini, A. David Paltiel, Kenneth A. Freedberg

We leveraged a detailed microsimulation model of HIV prevention and treatment to evaluate the cost-effectiveness of HIV pre-exposure prophylaxis (PrEP) and regular HIV testing for two high-risk groups in India: adult men who have sex with men (MSM) and people who inject drugs (PWID). We conducted sensitivity analysis on multiple parameters related to PrEP and assessed different HIV testing frequencies. Results suggest that a PrEP strategy targeted to these high-risk groups can be cost-effective in India.

## 4 - Surveillance and Control in Networked Disease Dynamics with Individual Response

Ceyhan Eksin, Assistant Professor, Texas A&M University, 3131 TAMU, College Station, TX, 77843, United States

Disease spread is a complex system in which the outcome of intervention policies depends on the disease state, network structure and individual behavior. We consider the viewpoint of a policy-maker that aims to minimize the spread of an infectious disease under budget constraints and unknown disease severity. Daily, the policy-maker decides to spend its funds on information collection or on targeted campaigns that change individual behavior. We characterize optimal policies based on the accuracy of the disease estimate and time horizon for simple networks such as a line, star, and ring. Based on these optimal policies, we design an algorithm that approximates the solution in arbitrary networks.

### Personalized Medicine

Sponsored: Health Applications

Sponsored Session

Chair: Dimitris Bertsimas, Massachusetts Institute of Technology, Cambridge, MA, 02139, United States

#### 1 - Personalized Stroke Risk Profiles

Agni Orfanoudaki, MIT, 77 Massachusetts Avenue, Cambridge, MA, United States, Dimitris Bertsimas, Emma Chesley

Established stroke risk calculators from the medical literature utilize traditional linear models to estimate the risk of an adverse event. We present a new interpretable model that captures nonlinearity using data from the Framingham Heart Study. Our machine learning model achieves high performance out of sample, 89% AUC, combining phenotypic, hereditary and genomic information from a longitudinal study. The model has been incorporated in a user-friendly, interpretable application for both physicians and patients to inform their decisions in a clinical setting.

#### 2 - Predicting Cervical Spine Injury in Pediatric Trauma Patients

Holly Mika Wiberg, Massachusetts Institute of Technology, Cambridge, MA, United States, Dimitris Bertsimas

Cervical spine injuries (CSI) are a major concern in pediatric trauma patients. Despite its low incidence, the consequences of missed injuries and challenges in evaluating young non-verbal patients have resulted in high reliance on imaging for injury clearance. Imaging, and particularly CT scans, carries its own set of risks including radiation-induced carcinogenesis. In this work, we leverage optimization and machine learning techniques to predict CSI incidence based on clinical exam findings. We propose an interpretable injury clearance protocol that achieves high identification of injured patients while avoiding a significant proportion of unnecessary imaging.

#### 3 - Prediction and Management of Stroke from Text Data

Rebecca Zhang, Massachusetts Institute of Technology, 70 Pacific Street, Room 362B, Cambridge, MA, 02139, United States, Dimitris Bertsimas, Agni Orfanoudaki

Stroke is the leading cause of preventable disability and the fifth leading cause of death worldwide. A personalization approach can greatly improve the effective management of the risk of stroke and additional complications that arise. While methods utilizing structured clinical data have been popular in the last few years,

the massive amounts of unstructured data available in electronic health records are often neglected. In this work, we develop a natural language processing approach to algorithmically classify patients who have ischemic stroke based on radiology reports and visit notes, and discuss models to predict which go on to develop complications including cerebral edema.

#### 4 - Prescriptive Treatments for Children with Vesicoureteral Reflux

Michael Li, Massachusetts Institute of Technology, Cambridge, MA, United States, Hsin-Hsiao Wang, Dimitris Bertsimas

In current medical practice, every child with Vesico-ureteral reflux (VUR) is treated with antibiotics, in hope to buy time for self-correction. If breakthrough infections occur, then the child is recommended for surgery. We aim to predict VUR and then prescribe personalized treatments. We first predict whether a child has VUR using Optimal Classification Trees, then we prescribe surgery and antibiotics using a two-stage Optimal Classification and Prescription Trees. This, tested against different baseline truths, has AUC of 0.8 in predicting VUR, and achieves 25% reduction in use of antibiotics without affecting the recurrent infection rate in patients.

### Joint Session HAS/DM/Practice Curated: Predictive Analytics in Clinical Settings

Sponsored: Health Applications

Sponsored Session

Chair: M. Samie Tootooni, Mayo Clinic, Rochester, MN, 55906

#### 1 - Outcome-Driven Personalized Treatment Design for Managing Diabetes

Eva Lee, Georgia Tech, Industrial & Systems Engineering, Ctr for Operations Research in Medicine, Atlanta, GA, 30332-0205, United States

This work is joint with Grady Health Systems and Morehouse School of Medicine. Diabetes affects 422 million people globally, costing over \$825 billion per year. In the United States, about 30.3 million live with the illness. Current diabetes management focuses on close monitoring of a patient's blood glucose level, while the clinician experiments with dosing strategy based on clinical guidelines and his (her) own experience. In this work, we describe a model for designing a personalized treatment plan tailored specifically to the patient's unique dose-effect characteristics. Such a plan is more effective and efficient for both treatment outcome and treatment cost than current trial-and-error approaches. Implementation results will be discussed.

#### 2 - A Machine Learning Based Personalized Intervention Model to Reduce COPD Readmissions

Sujee Lee, University of Wisconsin-Madison, 402 N. Eau Claire Avenue, Unit 302, Madison, WI, 53705-2820, United States, Philip A. Bain, Jo Goffinet, Christine Baker, Jingshan Li

In this talk, we introduce a machine learning based personalized intervention model to reduce COPD readmissions. Specifically, a machine learning predictive model is trained to predict the readmission risk of a COPD patient based on his/her status at discharge. Using this model, the impact of potential intervention policies is analyzed. Then, the predictive model re-evaluates the risk based on updated information during interventions, and new intervention strategies will be adjusted dynamically.

#### 3 - Mapping Free Text Chief Complaints using an Adaptive Natural Language Processing Approach

Mohammad Samie Tootooni, PhD, Mayo Clinic, Rochester, MN, 55906, United States, Mustafa Y. Sir, Kalyan Pasupathy, Heather Heaton, Casey Clements

We provide a comprehensive structured list to categorize the [free-text] chief complaints. We also developed a heuristic algorithm, equipped with an iterative enhancement procedure to map the recorded chief complaints into the structured list. The data includes all chief complaints recorded at the emergency department of Mayo Clinic in Rochester, MN in 2016 and 2017. Using a bi-level validation process a total sensitivity of 94.2% with specificity of 99.8% and F-score of 94.7% are obtained. The result is reported individually for each main syndrome group as well. In conclusion, the proposed mapping tool can help the field's researchers to incorporate the chief complaints into their models.

**1 - Information Loss from Parameter Estimation in Discrete Distributions with an Application in Genetics**

Maryam Moghimi, PhD Candidate, The University of Texas at Arlington, Arlington, TX, 76019, United States, Herbert W. Corley

We consider the information loss due to the use of a statistic  $T(X)$  to characterize an  $n$ -dimensional vector  $X$  of random variables representing discrete data. In other words, we compare the probability that a random sample  $X$  of size  $n$  takes on the value  $x$  to the probability that  $X$  is  $x$  given the statistic satisfies  $T(X)$  is  $T(x)$ . We focus on sufficient statistics to develop a general formula for the Shannon information loss due to this data reduction. Applications of this approach will be discussed, including an example on gene sequencing.

**2 - A Chronological Pharmacovigilance Network Analysis Approach for Predicting Adverse Drug Events**

Behrooz Davazdahemami, PhD Candidate, Oklahoma State University, Stillwater, OK, 74075, United States, Dursun Delen

In this study, we extend prior research by proposing a chronological network analysis (NA) approach for predicting adverse drug events (ADEs) before the drugs' approval. Combining known drug-ADE associations from the biomedical literature with information about drugs' target proteins for pre-2001 approved drugs, a drug-ADE network was constructed and used as a basis to train machine-learning (ML) models. The models were validated by predicting drug-ADE associations for post-2001 drugs. The promising results (92.9% accuracy, 72.8% sensitivity) achieved by the ensemble ML models shows the incredible power of such models, in combination with NA, for capturing sophisticated drug-ADE patterns.

**3 - Hemodynamic Pattern Discovery and Classification with Children Who Stutter Using Functional Near-infrared Spectroscopy**

Rahil Hosseini

In this paper, we developed a novel supervised sparse feature learning approach to discover discriminative biomarkers from functional near infrared spectroscopy (fNIRS) brain imaging data recorded during a speech production experiment from 46 children in three groups: children who stutter ( $n = 16$ ); children who do not stutter ( $n = 16$ ); and children who recovered from stuttering ( $n = 14$ ). We made an extensive feature analysis of the cerebral hemodynamics from fNIRS signals and selected a small number of important discriminative features using the proposed sparse feature-learning framework. The discovered set cerebral hemodynamics features are presented as a set of promising biomarkers to elucidate the underlying neurophysiology in children who have recovered or persisted in stuttering and to facilitate future data-driven diagnostics in these children.

**4 - A Statistical Network Modeling Approach for Discriminative Brain Network Connectivity Analysis**

Shouyi Wang

There are many studies focusing on network detection in multivariate (MV) time-series data. A great deal of focus have been on estimation of brain networks using fMRI, fNIRS and EEG. We propose a sparse weighted directed network (SWDN) estimation approach which can detect the underlying minimum spanning network with maximum likelihood and estimated weights based on linear Gaussian conditional relationship in the multivariate time series. Considering the brain neuro-imaging signals as the multivariate data, we evaluated the performance of the proposed approach using the publicly available fMRI data-set and the results of the similar study which had evaluated popular network estimation approaches on the simulated fMRI data. Moreover, we applied the proposed network construction method as a feature extraction technique from fMRI data to classify the patterns of the Parkinson Disease.

**1 - Investor's Opinion Divergence and Stock Return Volatility: Evidence from User-generated Content**

Yang Li, Drexel University LeBow College of Business, PA, United States

This paper examines the relationship between investors' opinion divergence and stock return volatility using daily user-generated content (UGC) data of 66 most discussed stocks from a social media platforms for investors in the U.S. Our research adds to the emerging body of literature on the impact of UGC on the stock market regarding: (1) novel techniques for systematically measuring sentiment divergence in large-scale UGC data; and (2) uncovering the dynamic interdependence of the relationship between investors' opinion divergence and stock volatilities.

**2 - Deep Learning for Predicting Research Topic Trends**

Jiangnan He, Drexel University College of Computing and Informatics, PA, United States

Text data can be useful for predicting topic trends in the future. The prediction can be beneficial for various applications. In this study, we represent the semantic and structural dynamics of research topics by embedding learning and propose a deep learning model that can capture discriminative features for predicting research topic trends (rising or falling trend). We train and test the model by using scientific publications from PubMed. Our experimental results show that both semantic and structural dynamics of a research topic has predictive features for its future trend.

**3 - Breadth, Depth, and Conformity: A Double-Hurdle Model for Review Helpfulness**

Chaojiang Wu, Drexel University, 3141 Chestnut Street, Philadelphia, PA, 19107, United States, Feng Mai, Xiaolin Li

Using multi-attribute attitude model as a framework, we show that the helpfulness of a review not only depends on its internal features, but also hinges on its breadth, depth, and content, in relation to other reviews of the product. We construct two novel measures, content entropy and content deviation, and then propose a double-hurdle model to simultaneously estimate the probability of a review being voted and its helpfulness. We show content entropy positively and content deviation negatively related with the helpfulness of a review. We further illustrate that the content deviation moderates the relationship of the numerical rating deviations and helpfulness.

**4 - Person Name Disambiguation Based on Profession**

Haimonti Dutta, Assistant Professor, University at Buffalo, 325P Jacobs Management Center, Buffalo, NY, 14260, United States

Named Entity Disambiguation (NED) is the task of disambiguating entity mentions in natural language text. In this paper, we present a generative model based on Latent Dirichlet Allocation (LDA) to disambiguate entity mentions occurring in noisy text. Each entity is assumed to have a profession and the representative words are generated from the document in which it is mentioned; words representing a profession are further interpreted for the task of disambiguation. Empirical results presented on a corpus of 14020 historical newspaper articles show that this generative model can obtain reasonable accuracy in the task of person name disambiguation.

**1 - A Simple and Efficient Hybrid Genetic Algorithm for Minimum Sum-of-squares Clustering**

Thibaut Vidal, Professor, PUC-Rio, Departamento de Informatica, Rua Marques de Sao Vicente, 225, Rio de Janeiro, 22453-900, Brazil, Daniel Gribel

Minimum sum-of-squares clustering (MSSC) is a widely used clustering model. We introduce an efficient genetic algorithm that uses K-means as a local search in combination with problem-tailored variation operators. The approach is scalable and accurate, outperforming all recent state-of-the-art algorithms for MSSC in terms of solution quality, measured by the depth of local minima. This enhanced accuracy leads to classification results which are significantly closer to the ground truth for overlapping Gaussian-mixture datasets with a large number of features. Improved global optimization methods therefore appear to be essential to better exploit the MSSC model in high dimension.

**2 - On the Behavior of the Expectation-maximization Algorithm for Mixture Models**

Babak Barazandeh, University of Southern California, Los Angeles, CA, 90007, United States, Meisam Razaviyayn

Finite mixture models are among the most popular statistical models that are widely used in different data science disciplines. Despite their broad applicability, inference under these models typically leads to computationally challenging non-convex problems. While the Expectation-Maximization (EM) is the most popular approach for solving these non-convex problems, the behavior of this algorithm is not well understood for general mixture model inference problems. In this work, we study the equally weighted mixture of two single dimensional Laplacian distributions and show that every local optimum of the population maximum likelihood estimation problem is global optimum.

**3 - Fourier Transform Inverse Regression Estimators of the Central Subspaces**

Jiaying Weng, University of Kentucky, Lexington, KY, 40503, United States, Xiangrong Yin

We introduce an optimal inverse regression estimator, Fourier transform inverse regression estimator, by optimizing the quadratic discrepancy function using Fourier transforms. We further develop degenerated and robust Fourier transform inverse regression estimators for computational efficiency and robustness, as well as partial Fourier transform inverse regression estimator for predictors consisting both categorical and continuous variables. For sufficient variable selection, we propose shrinkage and sparse group LASSO Fourier transform inverse regression estimators. Furthermore, marginal or conditional hypothesis tests for predictors or dimensions are considered.

**1 - Does Image Semantics Impact Demand on Digital Sharing Platforms? An Empirical Study Using Deep Learning**

Vivek Kumar Singh, University of South Florida, Tampa, FL, United States, Utkarsh Shrivastava, Anol Bhattacharjee

The digital sharing platforms such as Airbnb encourage customers to seek cues from textual information and images for making an informed decision. Unlike prior studies that focused on only textual information, we study the impact of semantic scenes (e.g. indoor and outdoor) depicted by the property's images and their position within the listing's webpage on the lodging demand. Our propositions are supported by ideas from theories of signaling and information processing and tested using deep learning and econometric modeling approaches. We found that advances in artificial intelligence can indeed provide insights from images at scale for guiding sellers on the digital platforms.

**2 - Seeing the Forest for the Trees: Generating Instrumental Variables with Random Forest for Bias Correction in Statistical Inferences**

Mochen Yang, University of Minnesota, Carlson School of Management, 321-19th Avenue South, Minneapolis, MN, 55455, United States

The practice of combining machine learning with econometric analysis has become increasingly prevalent in empirical research. In the first stage, machine learning methods are typically used to create new variables (e.g., predict sentiment from textual data), which are then added into second stage econometric models as covariates. Because the predictions from machine learning models are inevitably imperfect, the subsequent econometric estimations suffer from biases due to measurement error in covariates. In this paper, we discuss a novel approach that mitigates biases by leveraging instrumental variables that are generated from an ensemble machine learning model, such as a Random Forest.

**3 - A Graphical Model for Topical Impact Over Time**

Zhiya Zuo, University of Iowa, Iowa City, IA, United States, Kang Zhao

After being published, a document, whether it is a research paper or an online post, can make an impact when readers cite, share, or endorse it. Built on supervised topic models, we propose a graphical model to capture the topical impact over time within a corpus of documents. We conducted experiments on papers published in (i) D-Lib Magazine and (ii) The Library Quarterly from 2007 to 2017. Comparing with ToT, we found that our model produced more robust and interpretable results on topical trends over time and. Enabling better understanding and modeling of topical impact over time, this model can be used for the design of social media platforms, and evaluation of scientific contributions and policies.

**4 - A Modeling Framework for Bike Rebalancing Problem in Bike Sharing System**

Fan Dong, University of Arizona, Tucson, AZ, 85715, United States

Bike sharing systems have been implemented in many major cities to offer a convenient mobility service in which public bicycles are deployed in different stations across the city for shared use. The users can check out a bike from a station nearby, take a short ride, and check in the bike to a station around their destination. As the check in and check out of bikes at different stations are unbalanced during different time periods, the bike imbalance issue constantly occurs. Bike stations tend to be full of bikes or empty because the dynamic and asymmetric spatial and temporal bike usage patterns between stations. To ensure good service quality, bike sharing systems need to make sure all stations have enough available bicycles for check out and empty slots for check in. Therefore, system managers need to make decision in advance to send out trucks to dispatch bikes within different stations to rebalancing the bike stations. There are several key challenges related to the bike rebalancing problem: the determination of stations need to be rebalanced, and the dispatch truck routing optimization. In this paper, we design a general framework for bike sharing systems managers to solve the bike rebalancing problems by following steps. The first step is to design a community detection clustering algorithm to cluster bike stations into different communities based on their bike trip network. The second step is to implement a three layer predicting model to predict the check in and check out of bikes for each station in a future period in order to identify the unbalanced stations in future. The third step is to design rebalancing routing algorithm to rebalancing bike stations within and between communities.

**1 - Using Swarm Optimization Heuristics for Winner Determination in Combinatorial Auctions**Karthik Kannan, Purdue University, 3315 Webster Street,  
West Lafayette, IN, 47906, United States, Abhishek Ray

Combinatorial auctions are increasingly being used to allocate bundles of items among interested bidders. However, as the number of bundles increases, it takes exponentially longer to solve for the winners in the auction. In such situations, regular solvers such as IBM CPLEX or AMPL fail to produce the optimal solution either completely due to computational limitations or in reasonable time. We propose an Ant Colony-based algorithm (TrACA) that produces optimal or near-optimal results within specified time. The best value from TrACA is at least as good as best-in-class heuristics in 100 % of the cases. Additionally, to better understand the why deterministic algorithms fail or take too long for approximating winners in such auctions, we analyze empirical hardness of tested instances and use a standard supervised learning method to build a predictive model of TrACA run-times.

**2 - On the Networks of Executives and Firm Strategic Entry: Evidence from the US Broadband Industry**Tedi Skiti, Temple University, Philadelphia, PA, 19123,  
United States, Paul Pavlou

We examine the role of the social and professional networks of the firm's top executives in the firm's geographic entry to new markets. We define networks as social ties (generated by common education and societal activities) and professional ties (generated by common work experiences). Potential entrant firms may have an information asymmetry about the market conditions which might reduce their entry likelihood. Networks may reduce this information asymmetry providing information about competitors and market demand. We combine and utilize firm-level data on broadband deployment in the United States (US) and board member data about their networks and individual characteristics. We find that professional ties mitigate the competitive effects, making entry significantly more likely. We contribute to the limited literature on the role of the network of executives in a firm's strategic entry (before the firm becomes an actual entrant) and the literature on intraorganizational knowledge transfer as the result of individual executives' ties.

**3 - When Your Problem Becomes My Problem: The Impact of Airline IT Disruptions on On-Time Performance of Competing Airlines**Brad N. Greenwood, University of Minnesota, 4200 32nd St S,  
Arlington, VA, 22206, United States, Jennifer Tae, Min-Seok Pang

We study how firm disruptions affect competitor performance in the presence of shared resources. We propose that the impact of disruption is moderated by the routine complexity of both a disrupted firm and a competitor. Our context is the four large IT outages affecting the U.S. airline industry. Competitor flights which originated from, or were inbound to, a disrupted hub experienced significant changes in on-time performance, depending on the routine complexity of the disrupted airline. Performance deteriorated during the disruption of full-service carriers, but improved during that of a low-cost carrier. We also find that this effect is strongly moderated by competitors' routine complexity.

**4 - Chat More and Contribute Better: An Empirical Study of a Knowledge-based Community**Christopher M. Forman, Cornell University, Dyson School of  
Economics, Warren Hall, Ithaca, NY, 14850, United States,  
Xiaomeng Chen, Michael Kummer

Platform design is important to the success of knowledge-based communities. This paper studies whether a new channel of information exchange can impact the efficiency of users' contributions. To test this hypothesis, we use a policy change implemented on the platform. On 2010 October 15, Stack Overflow launched chat.stackoverflow.com to support real-time communication for users. We leverage the fact that not all users could initiate this communication channel to set up a difference-in-differences (DiD) strategy, that compares the questions of the same users before and after the exogenous change. We find mixed evidence of the efficacy of the chat rooms on improving knowledge-sharing outcomes.

**1 - Prescribing Age Replacement Policies with Minimal Repair in Anticipation of Non-stationary Unpunctual Implementation**Shadi Sanoubar, University of Pittsburgh, Pittsburgh, PA,  
United States, Kai He, Lisa M. Maillart, Oleg A. Prokopyev

We consider the problem faced by a maintenance planner who must prescribe an age-replacement policy in anticipation of the fact that the party implementing the policy may be unpunctual, to a degree that depends on the replacement age itself. Our analytical and numerical results compare the optimal solution and its performance to those when the unpunctual behavior is assumed to be absent or independent of the prescribed replacement time.

**2 - Optimal Maintenance Management of the Deteriorating Water and Transportation Infrastructures with Interdependencies**Hung Nguyen, University of South Florida, Tampa, FL, 33613,  
United States, Noha Abdel-Mottaleb, Shihab Uddin, Qiong Zhang,  
Qing Lu, He Zhang, Mingyang Li

Due to the co-location and spatial proximity, the deteriorating water infrastructure (WI) and transportation infrastructure (TI) are physically and operationally interdependent/dependent. Most of the existing maintenance works mainly consider WI and TI separately, but neglect the complex interdependency/dependency between WI and TI. We will propose an optimal maintenance decision-making framework by jointly prioritizing and maintaining a large number of co-located WI and TI components (e.g., pipes and roads) at the reduced cost. A case study will demonstrate the cost-effectiveness of the proposed work.

**3 - Degradation Modeling and RUL Prediction Using Wiener Process Subject to Multiple Change Points and Unit Heterogeneity**Yuxin Wen, University of Texas-El Paso, 216 W. California Ave,  
El Paso, TX, 79902, United States, Jianguo Wu, Devashish Das,  
Bill Tseng

Degradation modeling is critical for health condition monitoring and remaining useful life prediction (RUL). In the paper, we propose a multiple change-point Wiener process as a degradation model. To take into account the between-unit heterogeneity, a fully Bayesian approach is developed where all model parameters are assumed random. At the offline stage, an empirical two-stage process is proposed for model estimation, and a cross-validation approach is adopted for model selection. At the online stage, an exact recursive model updating algorithm is developed for online individual model estimation, and an effective Monte Carlo simulation approach is proposed for RUL prediction.

#### 4 - Monitoring of User-generated Reviews via a Sequential Reverse Joint Sentiment-topic Model

Qiao Liang, Tsinghua University, Beijing, China, Kaibo Wang

User-generated reviews can serve as an efficient tool for evaluating the customer-perceived quality of online products and services. This article proposes a joint control chart for monitoring the quantitative evolution of topics and sentiments in online customer reviews. A sequential model is constructed to convert the temporally correlated review documents to topic and sentiment distributions, which are subsequently used to monitor the topics and topic-specific opinions in an ongoing product and service process. Simulation studies on various data scenarios demonstrate the superior performance of the proposed control chart in terms of both shift detection and diagnosis.

#### 5 - Optimal Design of Reliability Demonstration Tests with Risk-adjusted Costs

Suiyao Chen, University of South Florida, 5017 Patricia Court, Tampa, FL, United States, Lu Lu, Qiong Zhang, Mingyang Li

Conventional optimal design of reliability demonstration tests (RDTs) mainly minimizes the testing costs within a RDT, but neglects its impacts on subsequent reliability assurance activities, such as reliability growth and warranty. This work investigates the influence of RDT design on its subsequent reliability activities and further proposes an optimal RDT design strategy by jointly considering cost components at both design and operational phases in a more holistic manner. A comprehensive case study is given to demonstrate the benefits of the proposed work under different cost scenarios and prior elicitation settings.

#### 1 - Understanding Wind Turbine Performance for Better Condition Monitoring

Hoon Hwangbo, Texas A&M University, College Station, TX, 77840, United States, Yu Ding

For wind turbines, a direct monitoring of power output data may not be sufficient for tracing the performance change of wind turbines, due to the strong dependency of power output on wind conditions. As such, we model power output as a function of wind variables and provide an approach to monitor the change of the function via a performance metric defined over the function. Since the functional model, albeit data driven, is developed in a way it follows physical restrictions, it is better representative of wind turbine performance and more suitable for the condition monitoring of wind turbines.

#### 2 - Selective Maintenance of Systems with Multiple Dependent Failure Modes

Cesar Ruiz, University of Arkansas, 4183 Bell Engineering Center, Fayetteville, AR, United States, Edward A. Pohl, Haitao Liao

Selective maintenance may be conducted by choosing a subset of possible actions during the downtime of a system. We propose a selective maintenance optimization framework for complex systems with components that have more than one failure mode. In particular, both non-catastrophic and catastrophic failures are considered. The first occurs when the physical characteristic of a component exceeds a predetermined threshold. On the other hand, the time-to-failure of a catastrophic failure is modeled by a Weibull distribution where the scale parameter depends on the state of the non-catastrophic failure process. A genetic algorithm is utilized to determine the optimal maintenance actions.

#### 3 - Dual-stage Attention-based Recurrent Neural Networks for Prognostics and Smart Maintenance

Jos Carlos Hernández Azucena, PhD Student, University of Arkansas, 800 W. Dickson St., Fayetteville, AR, 72701, United States, Haitao Liao

The present work proposes the use of a Dual-Stage Attention-Based Recurrent Neural Network (DA-RNN) for the estimation of remaining useful life of an individual complex system with multivariate measures. Using the C-MAPSS turbine engine run-to-failure datasets (PHM08 data challenge) as a benchmarking setting, an initial implementation is carried out using Python. The potential of the current algorithm and technical modifications that may arise as research progresses are expected to be of great benefit for the advancement of prognostics and smart maintenance.

#### 4 - Joint Optimization of Resource Allocation and Maintenance Planning for a Multi-Facility Infrastructure System

Yue Shi, Yisha Xiang

Maintenance management is intriguing when considering deteriorating facilities at a system level, which represents more challenges on modeling the interdependencies among facilities. Meanwhile, maintenance policies are usually made by agencies responsible for an entire network, leading to an increasing need to optimally allocate the limited budget. This research develops an integrated resource allocation and maintenance planning for a deteriorating transportation infrastructure system that consists of multiple facilities with complex maintenance effects. The proposed method is illustrated using real-world pavement deterioration data from the state of Florida.

#### 5 - Optimizing Condition-based Maintenance for Systems with Degrading Sensors

Anahita Khojandi, University of Tennessee, 521 Tickle Building, Knoxville, TN, 37996, United States, Mahboubeh Madadi

We consider a degrading system with non-silent failures. System failure is costly and it requires an immediate system replacement. The system status can be partially observed using a series of heterogeneous sensors at a given cost. The sensors are not only noisy, but also are prone to degradation themselves, and hence, the sensor noise level is a function of the sensor status. We develop a POMDP model to determine the optimal condition-based maintenance scheme to minimize the total expected discounted cost over an infinite horizon.

We will introduce a new platform named Computational Operations Research Exchange (CORE) with several illustrative examples. The CORE platform allows OE (Operations Engineering) researchers to leverage data, models, and software created by an ecosystem of researchers so that they are able to use the exchange to demonstrate that the value of their research results using the cyber-infrastructure developed, maintained, and updated by this platform.

#### 2 - Solving Structured Nonconvex Problems in Statistical Learning

Rahul Mazumder, Massachusetts Institute of Technology, Sloan School of Management, 100 Main Street, Cambridge, MA, 02139, United States

Nonconvex problems arise frequently in machine learning, posing challenges from a computational and statistical viewpoint. Continuous especially convex optimization, has played a key role in our understanding of these problems. However, some other well-grounded techniques in mathematical optimization (for example, mixed integer optimization) have not been explored to their fullest potential. I will demonstrate how such techniques can be used to address problems in structured sparsity. I will outline instances in robust statistics, nonparametric function estimation and low-rank factor analysis where such techniques seem to be promising.

#### 3 - Online Active Set Algorithm for Generalized Solution Paths in Machine Learning

Ammon Washburn, University of Arizona, 2552 N. Geronimo, Tucson, AZ, 85705, United States, Neng Fan, Hao Helen Zhang

Parameter tuning is computationally difficult in machine learning due to cross-validation on a large search space. Solution path algorithms (or online active set in optimization) alleviate this difficulty by analytically solving each successive optimization program from previous optimal solutions. The current theory for general online active set assumes certain constraint qualifications and a strictly convex objective that are not met in general for machine learning problems. We extend the theory of online active set to deal with parametric convex QPs with no constraint qualifications and show a particular implementation with a new model of Support Vector Machines.

#### 4 - The CCP Selector: Best Subset Selection for Sparse Ridge Regression from Chance-Constrained Programming

Weijun Xie, Virginia Tech, Blacksburg, VA, 24060, United States,  
Xinwei Deng

This paper studies sparse ridge regression problem. This paper first derives a novel mixed integer conic (MISOC) reformulation and proves that its continuous relaxation is equivalent to the convex integer formulation proposed by literature. Based upon these two formulations, we study two approximation algorithms-greedy and randomized rounding. We develop efficient implementable procedures for both algorithms and prove that under mild conditions, these two approaches yield near-optimal solutions. We numerically compare these two algorithms with the others proposed from literature and show that greedy approach consistently outperforms the other by correctly identifying more features.

#### 1 - Learning Optimal Online Advertising Portfolios with Periodic Budgets

Lennart Baardman, MIT, Operations Research Center, 77 Mass Ave, Bldg E40-130, Cambridge, MA, 02139-4307, United States,  
Elaheh Fata, Abhishek Pani, Georgia Perakis

We study a novel multi-armed bandit (MAB) problem with periodic budgets and intermittent feedback on rewards and costs. At the beginning of each time period an agent needs to determine which set of arms to pull to maximize the expected total reward, while maintaining a total cost that is within the budget. As the expected revenues and costs of arms are unknown, the agent has to use each period's budget to both explore the values of arms as well as exploit the most efficient set of arms. This model captures the practical setting where advertisers, in each period, have a periodic advertising budget that is used to bid on a portfolio of targets (e.g., search ads or social ads) to maximize the advertising revenue over that period of time. Over time, the efficiency of the picked targets is revealed and the advertiser revises the portfolio accordingly. This is in contrast to deciding which target to bid on one at a time, which is considered in the budget-limited MAB literature. In this paper, we formulate the MAB problem with periodic budgets, that is a hard to solve problem; therefore, we relax the oracle policy to be able to consider a greedy approximation algorithm for it. We propose an optimistic-robust learning (ORL) algorithm that achieves a bounded total expected regret with respect to this oracle, and show its computational performance.

#### 2 - Sustaining Rainforests and Smallholders by Eliminating Payment-delay in a Commodity Supply Chain – It Takes a Village

Joann de Zegher, Stanford University, Via Ortega 473, Suite 226, Stanford, CA, 94305, United States

Millions of poor smallholder farmers produce global commodities, often through illegal deforestation. Multinational commodity buyers have committed to halt illegal deforestation and improve farmers' livelihoods in their supply chains. We propose a profitable way to do so, motivated by field research in Indonesia's palm oil industry. Currently, farmers suffer from delay in payment by processors, and buyers expensively attempt to avoid sourcing from illegally deforested land by monitoring individual farmers. Instead, we propose that buyers reward all farmers in a village by eliminating payment-delay if no production occurs on illegally-deforested land in the village. Using field data, dynamic programming and game theory, we show how eliminating payment-delay improves productivity and profitability for farmers, processors and buyers, and how village-level incentives best halt illegal deforestation.

#### 3 - Hidden Integrality of SDP Relaxation for Sub-Gaussian Mixture Models

Yingjie Fei, Cornell University, Ithaca, NY, United States,  
Yudong Chen

We consider the problem of estimating the discrete clustering structures under Sub-Gaussian Mixture Models. Our main results establish a hidden integrality property of a semidefinite programming (SDP) relaxation for this problem: while the optimal solutions to the SDP are not integer-valued in general, their estimation error can be upper bounded in terms of the error of an idealized integer program. The error of the integer program, and hence that of the SDP, are further shown to decay exponentially in the signal-to-noise ratio. To the best of our knowledge, this is the first exponentially decaying error bound for convex relaxations of mixture models, and our results reveal the "global-to-local

mechanism that drives the performance of the SDP. A corollary of our results shows that in certain regimes the SDP solutions are in fact integral and exact, improving on existing exact recovery results for convex relaxations. More generally, our results establish sufficient conditions for the SDP to correctly recover the cluster memberships of  $(1-\delta)$  fraction of the points for any  $\delta \in (0,1)$ . As a special case, we show that under the  $d$ -dimensional Stochastic Ball Model, SDP achieves non-trivial (sometimes exact) recovery when the center separation is as small as  $\sqrt{1/d}$ , which complements previous exact recovery results that require constant separation.

#### 4- Implementing the Lexicographic Maxmin Bargaining Solution

Anilesh Krishnaswamy, Stanford University, Stanford, CA, 94305, United States, Ashish Goel

There has been much work on exhibiting mechanisms that implement various bargaining solutions, in particular the Kalai-Smorodinsky solution [Moulin, 1984] and the Nash Bargaining solution. Another well-known and axiomatically well-studied solution is the lexicographic maxmin solution. However, there is no mechanism known for its implementation. To fill this gap, we construct a mechanism that implements the lexicographic maxmin solution as the unique subgame perfect equilibrium outcome in the  $n$ -player setting. As is standard in the literature on implementation of bargaining solutions, we use the assumption that any player can grab the entire surplus. Our mechanism consists of a binary game tree, with each node corresponding to a subgame where the players are allowed to choose between two outcomes. We characterize novel combinatorial properties of the lexicographic maxmin solution which are crucial to the design of our mechanism.

### JFIG Paper Competition I

Sponsored: Junior Faculty JFIG

Sponsored Session

Chair: Oleg Prokopyev, University of Pittsburgh, 1031 Benedum Hall, Pittsburgh, PA, 15261, United States

Co-Chair: Fatma Kilinc Karzan, Carnegie Mellon University, Pittsburgh, PA, 15217, United States

#### 1- JFIG Paper Competition

Oleg Prokopyev, University of Pittsburgh, Pittsburgh, PA, United States

The 2018 JFIG paper competition features paper submissions from a diverse array of talented junior faculty members. The prize committee evaluated submissions based on the importance of the topic, appropriateness of the approach, and significance of the contribution. After careful review, the prize committee selected a group of finalists to present their research in one of the two JFIG sessions. For information on the finalists and their papers, please refer to the online program..

Sponsored: Multiple Criteria Decision Making

Sponsored Session

Chair: Margaret M. Wiecek, Clemson University, Clemson, SC, 29634-1907, United States

#### 1 - From Stakeholder Analysis to Cognitive Mapping and Multi-Attribute Value Theory: An Integrated Approach for Policy Support

Valentina Ferretti, London School of Economics and Political Science, Houghton Street | London | WC2A 2AE, London, United Kingdom

This study proposes and tests a decision support process that integrates three different tools to structure and solve complex decision problems. First, stakeholders' analysis is deployed to identify the key perspectives involved in the decision process. Second, cognitive mapping is used to facilitate participation of the key stakeholders and define a shared set of objectives for the analysis. Finally, Multi Criteria Analysis is employed to identify the best performing alternative among a set of competing projects. Synergies among the three tools and the operability of the proposed framework are discussed.

## 2 - Application of a Novel PROMETHEE-based Method for Construction of a Group Compromise Ranking to Prioritization of Green Suppliers in Food Supply Chain

Milosz Kadzinski, Poznan University of Technology, Piotrowo 2, Poznan, 60-965, Poland

We propose a hybrid outranking-based approach for group decision aiding. It combines novel procedures based on Binary Linear Programming for constructing a compromise ranking with robustness analysis accounting for the decision makers' incomplete preferences. The framework's applicability is endorsed with a study concerning a food processing industry situated in India. The case company has been supported in selecting the most preferred supplier, while considering economic and green criteria and procuring the environmental friendly policy. The study's significance derives from a prodigious focus of the food sector, which is constantly gaining in importance in today's global economy.

## 3 - Bilevel Programming for Generating Discrete Representations in Multiobjective Optimization

Gokhan Kirlik, University of Maryland Medical System, 920 Elkridge Landing Rd, Linthicum Heights, MD, 21090, United States, Serpil Sayin

A bilevel programming formulation is proposed to identify a Decision Maker(DM)'s most preferred solution without generating the entire nondominated set. The bilevel program is capable of delivering an efficient solution that maps into a given set, provided that one exists. If the DM's preferences are known a priori, they can be used to specify the given set. Alternatively, we propose a search method using the bilevel program to obtain a representation of the nondominated set when DM's preferences are not available. The method searches the outcome space using a partitioning scheme. We show that the method finds a representation with a specified coverage error level in a finite number of iterations.

## Joint Session MAS/Practice Curated: Cybersecurity Analytics and Applications II

Joint Session

Chair: Natalie M. Scala, Towson University, Dept. of e-Business and Technology Management

### 1 - A Risk Model for Voting Systems at Local Precincts

Natalie M. Scala, Towson University, Dept. of e-Business and Technology Management, 8000 York Road, Towson, MD, 21252, United States, Paul L. Goethals

Cyber, physical, and insider vulnerabilities are threats to the integrity of elections. Most research has predominantly examined cyber threats at the aggregate state level in U.S. elections. Little attention has been paid to insider or human threats, particularly at polling places. This research examines vulnerabilities at polling precincts and develops a risk model, based on Markov chains, to assess total threat. We then identify best practices to mitigate threat and illustrate the application of the model through a case study of a mid-Atlantic state.

### 2 - Cybersecurity Applications of Blockchain Technology

James Howard, Lead Data Scientist and Service Manager, The Johns Hopkins University, 11100 Johns Hopkins Road, Laurel, MD, 20723, United States

Many are lured to blockchain by the promise of security and privacy in the transaction. However, blockchain security and privacy are mostly a myth. But many applications will still benefit from blockchain technology when reliability and trust are at stake. Cybersecurity is a realm rich with applications as an industry founded on reliability and trust for protecting infrastructure, physical and virtual. This talk will look at the cybersecurity industry and how it can use blockchain to provide better service to clients, public and private.

### 3 - Defending Against Chained Cyber-attacks by Adversarial Agents: An Optimization Approach

Vivin Paliath, Arizona State University, Tempe, AZ, 85281, United States, Paulo Shakarian

Cyber-adversaries employ a variety of malware and exploits to attack computer systems. Existing paradigms that model such cyber-adversarial behavior do not account for sequential or "chaining of attacks. We take the first steps toward addressing this need thru a framework that allows for the modeling of sequential cyber-attacks, taking into account complex interdependencies between vulnerabilities and exploits. The framework identifies the overall set of capabilities gained by an attacker through the convergence of a fixed-point operator. We study the problem of determining an optimal defense strategy to block the attacker from gaining certain capabilities.

## SB76

West Bldg 212C

## Modelling and Control of Production Systems

General Session

Chair: Baris Tan, Koc University, Istanbul, 34450, Turkey

### 1 - Integrated Quality and Production Logistics Analysis of Manufacturing Systems with Lead-time Dependent Product Rework Loops

Marcello Colledani, Poltecnico di Milano, Milano, Italy, Alessio Angius

Products whose quality deteriorates with the time spent within specific portions of a manufacturing system are commonly found in the food, semiconductor, and polymer processing industries. Usually, in these systems, perishable parts must be scrapped if their system sojourn time exceeds a certain threshold. However, there are cases, for example in semiconductor wafer front-end production lines, in which these products can be re-inserted in the system and re-processed to meet the lead-time requirements. This paper presents an analytical method for the exact analysis of the lead-time distribution in these systems, providing the capability to support their design and operation.

### 2 - Dynamic Pricing and Lead Time Quotation in a Make-to-Stock Queue

Baris Balcioglu, Sabanci University, Faculty of Engineering and Applied Sciences, Orhanli Tuzla, Istanbul, 34956, Turkey

We study an environment where customers pay more if their demand is instantaneously satisfied. With dynamic pricing and lead-time quotation policies, the manufacturer aims at preventing loss of demand from those who have to wait. As an extension, customers can form two classes: those who are willing to pay more for instantaneous delivery and those who can opt to wait in return for being charged lower prices. We extend the application of the multilevel inventory rationing policy for the manufacturer to serve these different types of customer classes. Via numerical examples, we assess if elaborate dynamic pricing and lead-time quotation policies increase profit when compared to simpler policies.

### 3 - Data-Driven Control of a Production/Inventory System by Using Marking-Dependent Threshold Policy

Baris Tan, Koc University, Rumeli Feneri Yolu, Sariyer, Istanbul, 34450, Turkey, Siamak Khayyati

We introduce the Marked Markov Arrival Process (MMAP) framework to model a production system that generates different signals (markings) based on the system status. We propose a marking-dependent threshold policy to control the system with partial information. We propose a matrix analytical approach to analyze a production/inventory system with MMAP information and demand arrivals and production times that follow a Markov Arrival Process. We then use a joint simulation and optimization approach to determine the parameters of the threshold policy by using the shop-floor data, the processing time data of the machine and its statistical information, and the inventory position.

### 4 - Continuous Simulation Optimization with Model Mismatch

Giulia Pedrielli, Arizona State University, AZ, United States, Alireza Inanlouganji, Georgios Fainekos, Sebastian Pokutta

Multi-fidelity simulation optimization uses low-cost simulation models to optimize functions that can be only evaluated through an expensive, black-box oracle. Current methods are either applicable to discrete problems or suffer from the curse of dimensionality. We propose a novel multi-fidelity continuous global optimization algorithm that works with general low fidelity models, and we use the state of the art Efficient Global Optimization algorithm as a benchmark. Results show that the proposed algorithm can achieve two orders improved accuracy in optimal location identification.

### 5 - Sales and Operations Planning for Product Rollovers Under Limited Capacity

Justus Arne Schwarz, University of Mannheim, Schloss Schneckenhof Ost, Mannheim, 68131, Germany, Baris Tan

A product rollover takes place if a product generation is replaced by its successor. The key decisions are the offered amount of each product generation and their pricing. If the production of the old generation is stopped prior to its withdrawal from the market, an inventory decision has to be made additionally. In contrast to the existing literature, we consider finite production capacities. We propose a stylized model that captures the firm's decisions and the substitution behavior of the customers. Structural insights with respect to the impact of limited production capacity based on analytical solutions and a numerical study are discussed. Extensions to a stochastic setting are outlined.

**Data Driven Insights for Decision Making**

Sponsored: Public Sector OR

Sponsored Session

Chair: Tina Rezvanian, Northeastern University, Boston, MA, 02115-4420, United States

Co-Chair: Ergun Ozlem, Northeastern University, Boston, MA

**1 - The Foodome: Systematic Longitudinal Evaluation of Dietary Factors Associated with Coronary Heart Disease**

Soodabeh Milanlouei, Northeastern University, Boston, MA, 02130, United States

Coronary Heart Disease is mainly driven by environmental factors among which diet is a key player. Nutritional epidemiology aims to explain the effect of nutrients on the heart by focusing on one nutrient at a time. Limited to a panel of 150 nutrients, epidemiologists are unable to address the role of a wide range of smaller molecules that we consume through diet. We propose a new methodology called Chemical-Wide Association Study (CWAS), which systematically evaluates multiple chemical factors simultaneously in relation to diseases in an agnostic fashion. We show that CWAS is not only capable of reproducing prior knowledge on diet-disease associations but also detecting new associations.

**2 - Demand Forecast of Emergency Response Operations at United Nations High Commissioner for Refugees**

Tina Rezvanian, Northeastern University, Boston, MA, 02115-4420, United States

United Nations High Commissioner for Refugees runs Emergency Response supply chain for unprecedented demand by 65.6 million forcibly displaced people worldwide. Efficient utilization of available funds significantly depends on accurate regional demand estimations. Although complex models incorporate higher degrees of data characteristics, we find that models in humanitarian logistics need to capture the right balance between flexibility and practicality. This paper aims for optimizing the use of techniques and providing a framework that promotes practicality of advanced analytics

**3 - Donations for the Refugee Crisis: Cash Versus In-kind Assistance**

Telesilla Oly Kotsi, PhD Candidate, Indiana University, Bloomington, IN, United States, Owen Wu, Alfonso J. Pedraza-Martinez

Our study is motivated by fieldwork during the response to the Syrian refugee crisis in north-western Greece. We analyze tradeoffs regarding the mix of assistance (cash and in-kind assistance) that a humanitarian organization should offer to refugee populations. We model a humanitarian organization that aims to maximize its benefit to refugees, local retailers, and local residents. We determine the impact that cash assistance has on all above actors. We find that the introduction of cash assistance increases the importance of the allocation decision of the remaining budget of the humanitarian organization among the goods provided as in-kind assistance to refugees.

**4 - Improving Financial Loan Access for Farmers in Uganda**

Erica Gralla, Assistant Professor, George Washington University, Washington, DC, United States, Jillian Miles

Ugandan farmers struggle to access financial loans. We aimed to understand the dynamics driving this problem and identify the most effective interventions to increase access to loans. A system dynamics model was developed to integrate data from diverse sources. The results highlight some of the most significant barriers to loan access — interest rates and geographic access to financial institutions — and identify combinations of interventions that can lead to broader loan access.

## ■ SB78

**Location and Logistics**

Sponsored: Location Analysis

Sponsored Session

Chair: Sibel Alumur Alev, University of Waterloo, Waterloo, ON, N2L 3G1, Canada

**1 - Locating Law-enforcement Facilities to Intercept Evading Vehicle Flows**

Okan Arslan, HEC Montreal, 5308 Ave Decelles, Montreal, QC, H3T1V8, Canada, Ola Jabali, Gilbert Laporte

We consider locating law enforcement facilities in a transportation network to intercept unlawful vehicle flows traveling between origin-destination pairs, who in turn deviate from their routes to avoid any encounter with such facilities. Vehicle deviations are bounded by a given tolerance. We use duality theory and

polyhedral analysis to reformulate a bilevel model as a single stage equivalent with facet defining inequalities. Results show that locating a station can counterintuitively decrease system effectiveness. We find that, even in the worst scenario, optimally locating stations can dramatically increase system performance and provide significant gains.

**2 - Benders Decomposition for Profit Maximizing Hub Location Problems with Capacity Allocation**

Sibel Alumur Alev, University of Waterloo, 200 University Avenue West, Waterloo, ON, N2L 3G1, Canada, Gita Taherkhani, Seyed Mojtaba Hosseini

We model capacity allocation decisions within profit maximizing hub location problems to satisfy demand of commodities from different market segments. We present a deterministic formulation of this problem and further extend this model considering stochastic demands. We describe two exact algorithms based on a Benders reformulation to solve large-size instances of the problem. Stochastic problem is solved using sample average approximation. Computational results show that large-scale instances can be solved to optimality, and that the proposed Benders decomposition algorithms generate cuts that outperform the best known cuts.

**3 - GIS and the Subtle Proliferation of Optimization**

Alan Murray, University of California at Santa Barbara, Department of Geography, Santa Barbara, CA, 93106, United States

This paper discusses optimization and its formalization to support geographic analysis, planning, management and understanding. It is highlighted that GIS often represent a starting (or ending) point for undertaking optimization through location analytics capabilities. This paper provides an overview of representative models that can be found, highlighting both strengths and weaknesses, including issues of critical evaluation in observed performance and behavior of associated spatial optimization approaches in practice.

**4 - Weber: "Should We Forget About Him in Location Science?"**

Richard Church, University of California, Santa Barbara, 1832 Ellison Hall, UCSB, Santa Barbara, CA, 93106-4060, United States

Many now recognize that Launhardt's location triangle has eclipsed that of Weber's. Perreur (1998) actually asked the question in his paper: "should Weber be forgotten"? In this paper, I will demonstrate that Weber actually proposed a family of location problems that has yet to be tackled.

**5 - Integrated Location and Inventory Modeling for Service Systems: Condition-based Replacements with IoT-based Data**

Erhan Kutanoglu, University of Texas-Austin, OR/IE Graduate Program, Dept of Mechanical Engineering, Austin, TX, 78712, United States, Murat Karatas

We analyze a joint location and inventory problem in service parts logistics taking advantage of data on equipment condition via Internet of Things (IoT) technology. Instead of using a traditional replace-upon-failure policy, our model uses a condition-based part replacement (CBR) policy, finding the optimum condition to replace the parts, while designing the network and allocating the base stock levels. Even though CBR generates more frequent demands which put pressure on inventory, we capture the ideal balance between facility, transportation, inventory, and downtime costs, overall leading to significant cost savings in our preliminary results.

**Sunday, 1:30PM - 3:00PM**

## ■ SC01

North Bldg 121A

**Joint Session OPT/Practice Curated: Applications of Stochastic Mixed Integer Programming**

Sponsored: Optimization/Optimization Under Uncertainty

Sponsored Session

Chair: Haoxiang Yang, Northwestern University, Evanston, IL, 60208, United States

**1 - Optimizing Crashing Decisions in a Project Management Problem with Disruptions**

Haoxiang Yang, Northwestern University, 2145 Sheridan Road, Room C151, Evanston, IL, 60208, United States, David Morton

We introduce a general type of sequential decision problem under uncertainty, where the uncertainty consists of a small number of disruptions, both the magnitude and the timing of which can be random. We consider a special case: a project crashing problem under a single disruption. When a disruption occurs, the duration of an activity which has not started could change. The magnitude of the activity duration change and the timing of the disruption can be random. We formulate a stochastic mixed integer programming (SMIP) model with second stage a mixed integer program. We propose a learning-based branch-and-bound algorithm and evaluate the computational performance of our approach.

## 2 - Optimizing Water Network Mitigation Shortage and Distribution Costs Under Node Damage and Demand Uncertainty

Jiangyue Gong, Texas A&M University, College Station, TX, 77840-7140, United States, Lewis Ntamo, Mark Alan Lawley

Planning for water distribution in a network under unforeseen node damage due to natural hazards and demand uncertainty is challenging. We present a two-stage stochastic programming model for minimizing weighted water shortage and water distribution cost. The model identifies sectors to pressurize in the first stage and determines the assignment of unpressurized sectors to pressurized sectors for water delivery to satisfy demand in the second stage when the uncertainty is resolved.

## 3 - Modeling Wildfire Extended Attack Planning using Stochastic Programming

Brittany Segundo, TAMU, 924 Sun Meadows Street, College Station, TX, 77845, United States, Lewis Ntamo

Wildfires that are not contained after an initial response, called escaped fires, challenge decision-makers due to the high degree of temporal and spatial uncertainty surrounding fire behavior and response. We model the extended attack as a stochastic process and employ probabilistic constraints to limit response to scenarios that are feasible given resource and budgetary constraints. We present an accompanying algorithm that identifies optimal solutions while remaining computationally tractable. These solutions will inform when and how to stage and deploy resources to each fire.

## 4 - Data-Driven Generator Maintenance and Operations Scheduling under Endogenous Uncertainty

Beste Basciftci, Georgia Institute of Technology, H. Milton Stewart School, 755 Ferst Drive NW, Atlanta, GA, 30332, United States, Shabbir Ahmed, Nagi Gebraeel

In this study, our aim is to effectively model and solve the integrated condition-based maintenance and operations scheduling problem of a fleet of generators. We develop a data-driven optimization framework that explicitly considers the effect of the operations decisions on the generators' degradation levels. Since this problem involves decision-dependent uncertainties, we propose a stochastic formulation that captures the resulting endogeneity. Finally, we present computational experiments demonstrating the significant cost savings and computational benefits of the proposed approach.

North Bldg 121B

## Joint Session OPT/Practice Curated: Optimization under Uncertainty: Military and Cybersecurity Applications

Sponsored: Optimization/Optimization Under Uncertainty  
Sponsored Session

Chair: Rajesh Ganesan, George Mason University, Fairfax, VA, 22030, United States

## 1 - Critical Node Analysis and System Identification using a Discrete, General Framework for Dependency Mapping

Les Servi, The MITRE Corporation, M/S M230, 202 Burlington Road, Bedford, MA, 01730-1420, United States, Erica Mason, Damon Frezza

A new mission dependency mapping framework is introduced which models the relationship between an overall mission capability and its dependent component's capability. A new genetic algorithm is presented which identifies the framework's parameters using simulated experiments instead of the time-intensive manual alternative. A second new algorithm is presented that uses these parameters to identify the dependent components that have the greatest impact on the mission outcome. Empirical performance is reported both algorithms.

## 2 - Resource-enabled Pathfinding with Mandatory Waypoints and Turn Constraints

Doug Altner, MITRE Corporation, 7515 Colshire Drive, M/S H617, McLean, VA, 22102, United States

This presentation introduces a shortest path problem/robot motion planning problem around obstacles in a continuous space in which 1) new paths through obstacles could be created using a limited number of resources and 2) the path must also come within range of a pre-specified sequence of waypoints and satisfy turn constraints. We develop an A\*-based heuristic for this problem that incorporates elements from constrained shortest path routing, theta\* search, and tour routing. Computational results on over 100 test cases demonstrate our heuristic is a viable solution for this complex problem.

## 3 - An Approximate Dynamic Programming Approach for the Financial Execution of Department of Defense Weapon System Acquisition Programs

Erich D. Morman, Naval Postgraduate School, 298 Watson Street, Apartment A, Monterey, CA, 93940, United States, Rajesh Ganesan, Karla L. Hoffman

Operating in a "use or lose" fiscal environment, weapon system programs return millions-of-dollars each year of unspent funding. These dollars are opportunity costs to program offices representing forgone projects. The inefficiency is due to the institutional use of an inadequate myopic cash allocation policy. Using Q-learning and value function learning, we develop approximate dynamic programming (ADP) approaches to create alternative cash allocation policies. When compared to the myopic policy, our ADP models reveal that between 2% and 7% of funding is at risk of yearly "sweep-up". The research can help program offices interested in improving overall utilization of their annual budget.

## 4 - Dynamic Optimization of the Level of Operational Effectiveness of a Cybersecurity Operations Center under Adverse Conditions

Rajesh Ganesan, George Mason University, 4400 University Drive, Engineering Building MSN 4A6, Fairfax, VA, 22030, United States, Ankit Shah

The analysts at a cybersecurity operations center (CSOC) analyze alerts generated by intrusion detection systems. There are many disruptive factors that affect the alert analysis process and as a result, adversely impact the Level of Operational Effectiveness (LOE) of the CSOC. To improve the LOE, additional resources must be called upon to assist with the alert analysis process. In a resource constrained environment, determining when and how many resources to call upon is non-trivial. In this talk, a reinforcement learning (RL) model for optimizing the LOE of a CSOC is presented. Results indicate that the RL model helps in making better decisions compared to ad-hoc practices employed at the CSOCs.

## Managing Innovation

Sponsored: Technology, Innovation Management & Entrepreneurship

Sponsored Session

Chair: Morvarid Rahmani, Georgia Institute of Technology, Atlanta, GA, 30308-1149, United States

## 1 - Delegated Search Impact on Startup Supply Chain Contracting and Order Allocations

Berke Emre Guzelsu, Boston University, 595 Commonwealth Avenue, Boston, MA, 02215, United States, Nitin Joglekar, Pnina Feldman

We examine the effects of a delegated search on startup supply chain contracting. An entrepreneurial startup partners with a collaborative supplier where the supplier needs to iterate on the product to improve the potential size of the market. At the same time, a large potential supplier may poach business from the collaborative supplier by offering a cheaper product if the order allocation it receives from the entrepreneurial startup is sufficiently large. Given these tradeoffs, we evaluate the order allocation decision an entrepreneurial firm can make to influence the collaborative supplier to invest in experimentation and examine alternative contracts to align incentives.

## 2 - Dynamic Innovation Contests and Information Design

Sina Moghadas Khorasani, University of Utah, Salt Lake City, UT, United States, Luis Rayo, George Georgiadis

We solve for the optimal design of innovation contests with multiple stages of success and an exogenous deadline. The principal selects both the award structure of the contest and its information design.

## 3 - Connecting Restaurants: An Exploratory Study of Customer-based Restaurant Networks

Manuel Emilio Sosa, INSEAD, 1 Ayer Rajah Avenue, Singapore, 138676, Singapore, Victor Martinez-Albeniz, Clara Carrera

Online customer reviews play an increasingly important role in service industries. In restaurants, links created by reviewers who visit several restaurants form a network of unobserved connections which may determine restaurants' fate. We empirically investigate the factors that lead to the choice of visiting a restaurant, the mark given to it, and how the position of a given restaurant in the customer-based restaurant networks influences its survival.

## 4 - Operations in Space: Exploring a New Industry

Joel Wooten, University of South Carolina, 1014 Greene St., Columbia, SC, 29208, United States, Christopher S. Tang

Private, commercial spaceflight is changing the course of space exploration. We often think of innovation in terms of products, services, and (more recently) business models. The new space market presents innovation challenges in all of these areas; our paper analyzes the opportunities for novel contributions from the operations management community.

**5 - A Model of Learning and Doing in Innovation Contests**

Sanjiv Erat, University of California-San Diego, Rady School of Mgmt., Otterson Hall, 9500 Gilman Drive MC 0553, La Jolla, CA, 92093-0553, United States, Lakshminarayana Nittala

In the setting of an innovation contest, we conceptualize solvers who exert effort on two orthogonal dimension - (i) effort geared toward “exploration and learning more about the solution space, and (ii) effort geared toward “exploitation of the newly created knowledge and delivering a tangible and usable solution. Using this richer multidimensional conceptualization of “learning and doing in innovation contests, this talk shall discuss the levers available at the contest organizer firm to influence outcomes, and how the focal firm can optimally manage contests.

**Joint Session Integer Programming/OR Frontiers: Machine Learning and Discrete Optimization II**

Sponsored: Optimization/Integer and Discrete Optimization

Sponsored Session

Chair: Thiago Serra, Carnegie Mellon University, Pittsburgh, PA, 15206, United States

**1 - Mathematics of Neural Networks**

Anirbit Mukherjee

In this talk I will give a brief overview of some of the mathematical questions about neural networks that me and Amitabh Basu (with other collaborators) have been exploring. We will start with the results in our ICLR 2018 paper about neurally representable functions (<https://eccc.weizmann.ac.il/report/2017/098/>). We will particularly focus on our recent works (1) (<https://eccc.weizmann.ac.il/report/2017/190/>) proving lower bounds on the size of neural circuits representing certain Boolean functions and (2) our results in the paper in ISIT 2018 (also NIPS 2017 workshop) trying to formalize the connection between autoencoders and sparse coding (<https://arxiv.org/abs/1708.03735>).

**2 - Combinatorial Attacks Against Binarized Neural Networks**

Elias B. Khalil, Georgia Tech, Atlanta, GA, 30318, United States, Amrita Gupta, Bistra Dilkina

Binarized Neural Networks (BNNs) with weights in  $\{-1, 1\}$  and the sign function non-linearity have recently attracted attention due to their small computational overhead. Concurrently, it has been shown that neural nets may be overly sensitive to tiny adversarial changes in the input, which may be detrimental to their use in safety-critical domains. The non-differentiable nature of BNNs poses a challenge to gradient-based robust training methods. We show how to attack a trained BNN, a task that is crucial to robust learning, by solving a Mixed Integer Program, or with a structured decomposition approach. Our attacks are substantially more effective than standard gradient-based attacks on MNIST.

**3 - A Temporal Architecture for Branch and Bound**

Giulia Zarpellon, Polytechnique Montréal, Montréal, QC, Canada, Jason Jo, Andrea Lodi, Yoshua Bengio

The heuristic character of the Branch and Bound (B&B) framework for Integer Programming (IP) naturally provides an appealing ground for machine learning. At the same time, addressing one of the key heuristic decisions B&B relies on - namely, variable selection - poses many challenges for machine learning models. We propose a novel way to model the temporal complexity of B&B and the role of its diverse though interconnected components. We experiment on a baseline architecture, and highlight its flexibility to accommodate tools and insights from both IP and Deep Learning domains.

**4 - Bounding and Counting Linear Regions of Deep Neural Networks**

Thiago Serra, Carnegie Mellon University, Pittsburgh, PA, United States, Christian Tjandraatmadja, Srikumar Ramalingam

We study the number of linear regions that piecewise linear functions represented by neural networks can attain, both theoretically and empirically. We present (i) tighter bounds for the maximum number of linear regions on rectifier networks, which are exact for inputs of dimension one; (ii) a first upper bound for multi-layer maxout networks; and (iii) a first method to perform exact enumeration of the linear regions by modeling the DNN as a mixed-integer program. These bounds come from leveraging the dimension of the space defining each linear region and they indicate that, for a same number of units, the dimension of the input determines if shallow or deep networks have more linear regions.

Sponsored Session

Chair: Nathan Krislock, Northern Illinois University, DeKalb, IL, 60115-2888, United States

**1 - Low-Rank Matrix Completion (LRMC) using Nuclear Norm (NN) with Facial Reduction (FR); Applications to Robust Principal Component Analysis**

Henry Wolkowicz, University of Waterloo, Combinatorics & Optimization, Waterloo, ON, N2L 3G1, Canada

Minimization of NN is often used as a convex relaxation for solving LRMC problems. This can then be solved using semidefinite programming (SDP). The SDP and its dual are regular. FR has been successful in regularizing degenerate problems. Here we take advantage of the structure at optimality for the NN minimization and show that even though strict feasibility holds, the FR framework can be successfully applied to obtain a proper face that contains the optimal set and even improves on the NN relaxation. We include numerical tests for both exact and noisy cases.

**2 - Finding the Relative Interior of Spectrahedra with Applications to Facial Reduction and Matrix Completion Problems**

Stefan Sremac, University of Waterloo, Waterloo, ON, Canada

A spectrahedron is the intersection of an affine manifold with the cone of positive semidefinite matrices. In this talk we present an approach to finding a matrix in the relative interior of a spectrahedron. We construct a parametric curve terminating at a matrix in the relative interior of the spectrahedron and present sufficient conditions for this limit point to be the analytic centre. We implement a path-following algorithm and discuss numerical performance on test spectrahedra having various singularity degrees. Finally, we conclude the presentation by discussing implications of the approach to positive definite Toeplitz completion problems.

**3 - BiqCrunch: Solving Binary Quadratic Problems Efficiently using Semidefinite Optimization**

Nathan Krislock, Northern Illinois University, Dept. of Mathematical Sciences, DeKalb, IL, 60115-2888, United States, Jérôme Malick, Frederic Roupin

BiqCrunch is a branch-and-bound solver using semidefinite optimization to compute high-quality bounds for binary quadratic problems, such as MaxCut, Max-k-Cluster, Maximum-Independent-Set, Exact Quadratic Knapsack, and the Quadratic Assignment Problem. BiqCrunch does not use an interior-point method for computing its bounds. Instead, an eigenvalue solver and a gradient-based method are used to compute tight bounds. We will discuss our bounding procedure and give an update on the new features and performance enhancements of the latest version of BiqCrunch.

**4 - Solving the Semidefinite Programming (SDP) Relaxation in BiqCrunch using an Augmented Lagrangian Method**

Ahmed Al-Jilawi, Northern Illinois University, DeKalb, IL, United States

We present our recent work in solving semidefinite relaxations of binary quadratic optimization problems in the BiqCrunch solver. The semidefinite relaxation gives us a high-quality bound on the optimal value of the binary quadratic optimization problem. We use an augmented Lagrangian method instead of the penalty method in BiqCrunch, giving us a bounding procedure that converges faster.

**1 - Augmented Lagrangian - Fast Projected Gradient Method for Convex Quadratic Problems**

Igor Griva, George Mason University, Fairfax, VA, United States

We consider an augmented Lagrangian - fast projected gradient method for convex quadratic problems with linear constraints and simple bounds and discuss its convergence properties.

## 2 - Improving Exploration in Population-based Metaheuristics using Fading Consensus: Application to PSO

Xin Su, Arizona State University, Tempe, AZ, United States,  
Theodore P. Pavlic

Simple averaging protocols on fault-prone networks can exhibit long periods of quasi-stability punctuated by large group-level jumps. Although communication theorists view these recently observed jumps as pernicious, we propose using them to augment population-based metaheuristics to improve search ergodicity in multiextremal optimization. We demonstrate this approach with faded consensus particle swarm optimization (FC-PSO), which is a multi-agent optimization algorithm that improves the performance of PSO while potentially decreasing the number of required function evaluations as well.

## 3 - Distributed Non-linear Optimization under Non-separable Constraints: A Low-communication Approach with a Power Systems Example

Theodore P. Pavlic, Assistant Professor, Arizona State University,  
ASU - CIDSE, P.O. Box 878809, Tempe, AZ, 85287-8809,  
United States

Economic dispatch, matching generator operation levels to customer demands over a network, is the optimal diet problem of power systems. Non-linear cost functions and non-separable demand constraints usually require centralized solutions or decentralized approaches with high amounts of communication (e.g., bidding with Lagrange multipliers). In this talk, I introduce a distributed primal-space approach that converges to a bounded set of the optimizer with no direct communication between generators and self adjusts to changes in demands without broadcasting new parameters to every generator.

## 4 - Efficient LP Algorithms for which the Dense Constraint Matrix has a Sparse Factorization

Robert J. Vanderbei, Princeton University, Operations Research &  
Financial Engineering, 209 Sherrerd Hall, Princeton, NJ, 08544,  
United States

In linear programming, it is sometimes the case that the constraint matrix  $A$  is fairly dense but has a known sparse factorization. A few different methods for exploiting this sparsity in the context of interior-point methods will be presented and compared. The same ideas can be extended naturally to interior-point methods for nonlinear programming.

## 5 - Motion Planning for Autonomous Vehicles using MINLP

Hande Benson, Drexel University, Department of Decision  
Sciences, 3141 Chestnut Street, Philadelphia, PA, 19104,  
United States

We will present a mixed-integer nonlinear programming model, its centralized and decentralized solution, for motion planning in fleets of autonomous vehicles under communication constraints.

### Uncertainty and Network Resilience

Sponsored: Optimization/Network Optimization

Sponsored Session

Chair: Zhijie Dong, Texas State University, San Marcos, TX, 78640,  
United States

## 1 - Interdependent Network Functionality and Recovery for Community Resilience

Charles D. Nicholson, University of Oklahoma, 202 West Boyd,  
Room 124, Norman, OK, 73019, United States, Weili Zhang,  
Naiyu Wang, Peihui Lin, Xianwu Xue

A framework is presented to estimate building functionality loss and utility recovery in a community following a hazard. Analysis includes spatial distribution of physical damages to both buildings and utility infrastructure; utility disruptions deriving from the cascading failures; and the recovery of the utility system. The framework couples stochastic functionality analyses of physical systems and hazard response characteristics to provide a rich array of information for hazard mitigation and resilience planning. An earthquake scenario in Shelby Co., TN illustrates the framework.

## 2 - Resilience Quantification in Global Maritime Networks

Elise Miller-Hooks, George Mason University, 208 Rosalie Cove Ct,  
Silver Spring, MD, 20905, United States, Ali Asadabadi

Ports are critical components of the global supply chain, supplying key connections between land- and maritime-based transport modes. They operate in cooperative, but competitive environments wherein individual port throughput is linked through an underlying transshipment network. Building on concepts of stochastic equilibrium problems with equilibrium constraints, this presentation models and analyzes protective investment strategies aimed at enhancing resilience to disruption from a host of potential future damage scenarios while protecting each port's market share.

## 3 - Restoration Crew Routing Problem under Incomplete Information

Kash Barker, University of Oklahoma, 202 W. Boyd St., Room 124,  
Norman, OK, United States, Kash Barker

We consider the problem of restorative capacity enhancement problem in an infrastructure network which is interconnected with a routing network through which restoration crews are dispatched. The output will be a set of synchronized routes formed by planning and scheduling restorative efforts for infrastructure networks. Along with the uncertainty and urgency during post-disruption situations, considering the routing network disrupted may result in the limited information on the requirements for network restoration. To deal with this case, we propose a stochastic restoration crew routing problem to improve the compatibility of the model with the real-time conditions.

## 4 - Uncertainty-aware Routing of Aerial Sensors for Infrastructure Damage Inspection

Andrew Lee, Massachusetts Institute of Technology, Cambridge,  
MA, United States, Mathieu Dahan, Saurabh Amin,  
Cynthia Barnhart

We present an approach to actively inspect urban networks facing risk of disruptions due to natural events using small Unmanned Aerial Systems (sUAS). Information from fixed sensors and environmental features are used to predict the number and type of failures in different spatial regions. These predictions are used to achieve prioritized plans for routing repair vehicles and sUAS. This entails incorporating uncertainties in the distribution of failure events and travel times into a network inspection problem and a vehicle routing problem, and sequentially solving them. We illustrate our approach using data from Houston's drainage network inspection in the aftermath of Hurricane Harvey.

### Joint Session OPT/Practice Curated: Network Optimization Models in Routing and Communications

Sponsored: Optimization/Network Optimization

Sponsored Session

Chair: Tachun Lin, Bradley University, Peoria, IL, 61625, United States

## 1 - Consistent Aircraft Fleeting and Routing among Schedule Periods

Zhili Zhou, United Airlines, 233 S. Wacker Drive, 5th Floor,  
Chicago, IL, 60606, United States

Commercial airlines invest in international markets, which gain revenues compatible with its domestic counterpart. For international services, airlines change flights and markets in different schedule periods. To reduce the operational burdens, we address the fleet assignment and aircraft routing consistency problem between two schedule periods with the objective to minimize the changes of fleets on served markets and routes. We explore the column-and-row algorithm under a cross-layer network setting for this airline scheduling problem. Preliminary experiment results demonstrate the improvement of scheduling consistency between schedule periods.

## 2 - On Routing Unmanned Aerial Vehicles for Surveillance and Reconnaissance Activities

Cai Gao, University at Buffalo, Buffalo, NY, 14260, United States,  
Jose Luis Walteros

We tackle a variation of the Close-enough Traveling Salesman Problem where the salesman is accounted for visiting a node if he traverses a precalculated distance through a circular area surrounding each node. This variation arises in the context of unmanned aerial vehicle (UAV) routing where a UAV collects information from a set of targets, while minimizing detection risks. We provide a mixed-integer formulation and solve it using Benders Decomposition. We enrich our approach by introducing a set of lifting algorithms to strengthen the optimality cuts generated by the proposed decomposition and a k-opt heuristic in the style of the classic Lin-Kernighan algorithm to generate better lower bounds.

## 3 - 5G Hierarchical Network Slicing with Uncertain Demands

Tachun Lin, Bradley University, 1501 W. Bradley Ave,  
Bradley Hall 171, Peoria, IL, 61625, United States

Network slicing, a key enabling technology for 5G development, creates concurrently dedicated and independent virtual networks and virtual network services for tenants on a common physical infrastructure platform. Compared with early works targeting single-domain physical infrastructure and demand-driven virtual network construction, we present in this talk multi-domain network slicing jointly with the construction of network functions' forwarding graph. We discuss random tenant choices and the respective resource allocation based on traffic/demand uncertainty under a cross-layer network topology.

#### 4 - A Real-time Relocation Strategy for Station Based Autonomous Electric Vehicle Sharing System

Li Li, PhD Candidate, New York University, New York, NY,  
United States, Saif Eddin G. Jabari

This paper puts forward a distributed rebalance strategy for station based autonomous electric vehicle sharing system. The max-weight algorithm is adopted and the queue stability of the network is guaranteed. The rebalance decision is made by each station independently, and only local information, e.g. queue length of neighboring stations, is required for decision making. Hence the rebalancing strategy is able to be implemented in real time, regardless of how big the network size is. Another advantage of this algorithm is that it requires no knowledge of the demands, and can achieve the maximum throughput of the whole network.

### First-order Methods in Structured Non-convex Optimization

Sponsored: Optimization/Nonlinear Programming  
Sponsored Session

Chair: Paul Grigas, UC Berkeley, Berkeley, CA, 94720-1777,  
United States

#### 1 - Convergence to Second-Order Stationarity for Constrained Non-Convex Optimization

Meisam Razaviyayn, University of Southern California,  
3715 McClintock Ave, Los Angeles, CA, 90089, United States,  
Maher Nouiehed

We consider the problem of finding a second-order stationary point of a linearly constrained non-convex optimization problem. We show that, unlike the unconstrained scenario, the vanilla projected gradient descent algorithm fails to escape saddle points even in the presence of a single linear constraint. We then propose a trust region algorithm for linearly constrained optimization problem which converges to second order stationary points. Our algorithm is the first optimization procedure which can converge to  $\epsilon$ -first order stationary points of a non-manifold constrained optimization problem in  $\tilde{O}(\epsilon^{-3/2})$  iterations, and at the same time can escape saddle points under strict saddle property.

#### 2 - Gradient Boosting Machine: New Insights, Analysis and Algorithms

Haihao Lu, Mathematics Department and Operations Research Center, MIT Rahul, Sloan School of Management, MIT

Gradient Boosting Machine (GBM) is a powerful supervised learning algorithm, and has routinely featured as a top algorithm in Kaggle competitions and the KDDCup. It constructs additive models by greedily fitting a simple parameterized function (weak learner) to the current “residuals” at each iteration. In spite of the usefulness of GBM in practice, there is a huge gap between its theoretical understanding and the practical implementation. In this work, we propose Randomized Gradient Boosting Machine (RGBM), a new variant of GBM, in which we randomly picks a subset of weak learners and choose the best fit among them. A special case of RGBM corresponds to the column subsampling heuristic implemented in XGBoost. We show in theory that this approach is equivalent to a random-then-greedy coordinate descent in the coefficient space and/or a stochastic mirror descent in the “residuals” space. With such understanding, we derive novel, comprehensive computational guarantees for RGBM by using techniques of first-order methods in convex optimization, which as a special case significantly improve the traditional convergence rate for GBM as well. As a byproduct, such understanding also leads to a natural step-size rule as an efficient replacement of the line-search step-size rule in GBM.

#### 3 - Primal-dual Optimization for Online Advertising

Alfonso Lobos Ruiz, UC Berkeley, IOR, 4141 Etcheverry Hall,  
Berkeley, CA, 94720, United States, Paul Grigas

We propose and study non-convex optimization problems that arise in the context of online advertising, a multi-billion-dollar industry involving multiple ad-exchanges as well as other players. We propose a general primal-dual algorithmic scheme, and we identify a fairly general set of sufficient conditions that hold for several auction types such that our dual formulation obtains the same optimal value as the original non-convex formulation. In the context of the management of a Demand-Side Platform (DSP), we demonstrate how our offline optimization model and algorithm leads to an implementable policy by a DSP which we applied in both artificial and real data showing the value of our approach.

#### 4 - Generalization Error Bounds of SGD with Probabilistic Guarantee for Nonconvex Optimization

Yingbin Liang, The Ohio State University, 606 Dreese Lab,  
2015 Neil Avenue, Columbus, OH, United States, Yi Zhou,  
Huishuai Zhang

The success of deep learning has led to a rising interest in the generalization property of the stochastic gradient descent (SGD) method, and stability is one popular approach to study it. In this work, we characterize the on-average stability of the iterates generated by SGD in terms of the on-average variance of the stochastic gradients, and establish various generalization error bounds with probabilistic guarantee for SGD for nonconvex loss functions. With strongly convex regularizers, we further establish the generalization error bounds for nonconvex loss functions under proximal SGD with exponential concentration in probability.

United Kingdom

#### 1 - Retailer Initiated Inventory-based Financing

Weiming Zhu, IESE Business School, Avenida Pearson 21,  
Barcelona, 08034, Spain, Wei Luo

We study a innovative financing scheme in which a large retailer provides short-term financing to a small retailer using the inventory of the small retailer as collateral. We analyze the effectiveness of such financing scheme and explore their impact on operational decisions and contract design.

#### 2 - Buyer Preferred Commodity Price Risk Allocation: A Theoretical and Empirical Investigation of the BMW Supply Chain

Panos Markou, Cambridge Judge Business School, Cambridge,  
United Kingdom, Daniel S. Corsten, Panos Kouvelis, Danko Turcic

Downstream manufacturers are exposed to volatile commodity prices through their suppliers, and information asymmetry often means that they are disadvantaged in seeing true prices in opaque markets. We formalize a model of BMW's supply chain, generate several predictions of how contracts should be allocated to suppliers under information asymmetry, and test these using a proprietary data set comprising contracting terms from 1,600 suppliers.

#### 3 - Operational Disruptions and the Value of Credible Control Systems

William Schmidt, Cornell University, 314 Sage Hall, Ithaca, NY,  
14850, United States, Ananth Raman

Operational disruptions can impact a firm's risk, which manifests in a host of operational issues, including a higher holding cost for inventory, a higher financing cost for capacity expansion, and a higher perception of the firm's risk among its supply chain partners. We empirically examine whether firms can meaningfully reduce the impact on their risk by implementing and credibly attesting to having effective internal control systems.

#### 4 - Supply Chain Network Structure and Environmental Information Disclosure

Marcus A. Bellamy, Rafik B. Hariri Building, 595 Commonwealth Avenue, Boston, MA, 02215, United States, Suvrat Dhanorkar, Ravi Subramanian

Recognizing that supply network structure has implications for a focal firm's ability to access environmental information embedded in its supply network, this paper draws on structural, environmental, and financial data from Bloomberg to test the relationship between a focal firm's supply network structure and its extent of environmental information disclosure.

#### Joint Session Frontiers/Practice Curated: Statistical Learning and Optimization

Emerging Topic: OR Frontiers

Emerging Topic Session

Chair: Emma Frejinger, Université de Montréal, Montréal, QC, H3C 3J7, Canada

##### 1 - Learning MILP Resolution Outcomes before Reaching Time-limit

Andrea Lodi, École Polytechnique de Montréal, Montréal, QC, Canada, Martina Fischetti, Giulia Zarpellon

The solution of some MILPs still presents challenges for solvers and may require hours of computations, so that a time-limit is often provided by the user. Nevertheless, it could be useful to get a sense of the optimization trends after only a fraction of the time-limit, and ideally be able to tailor the use of the remaining solution time in a more strategic way. Looking at the evolution of a partial branch-and-bound tree for a MILP, up to a certain fraction of the time-limit, we aim to predict whether the problem will be solved to proven optimality before timing out. We exploit Machine Learning tools, and summarize the progress of a MILP solution process to cast a prediction within a classification framework.

##### 2 - Optimizing Decision Diagrams Size and Bound via Reinforcement Learning

Louis-Martin Rousseau, École Polytechnique de Montréal, Cp 6079 Succ Centre-Ville, Montréal, QC, H3C 3A7, Canada, Quentin Cappart, David Bergman

Decision Diagrams are a recent technology enhancing optimization methods. They can be used in Integer Programming for tightening relaxation bounds. Their performances are highly dependent on the variable ordering chosen. Finding an optimal ordering is NP-complete. Recent research in Machine Learning has also shown that reinforcement learning can be used for solving NP-hard problems. Following this trend, we propose to use a similar approach in order to reduce the size of Decision Diagrams.

##### 3 - Learning Heuristics for the TSP by Policy Gradient

Yossiri Adulyasak, HEC Montréal, 3000 Cote-Sainte-Catherine, Montreal, QC, H3T 2A7, Canada, Michel Deudon, Pierre Cournut, Alexandre Lacoste, Louis-Martin Rousseau

We extend the neural combinatorial optimization framework to solve the traveling salesman problem (TSP). The neural network is trained using reinforcement learning to predict a distribution over city permutations. We designed our own critic to compute a baseline for the tour length which results in more efficient learning. We further enhance the solution approach with the well-known local search heuristic and the approach could outperform a high performance heuristic (OR-Tools). Our approach based on machine learning techniques could learn good heuristics which, once being enhanced with a simple local search, yield promising results.

##### 4 - A Machine Learning Algorithm for Fast Prediction of Solution Descriptions to an ILP

Emma Frejinger, Université de Montréal, FAS, Pavillon Andre-Aisenstadt, Montreal, QC, H3C 3J7, Canada, Eric Larsen, Sébastien Lachapelle, Yoshua Bengio, Simon Lacoste-Julien, Andrea Lodi

We propose a methodology to predict descriptions of solutions to discrete stochastic optimization problems in short computing time. We approximate the solutions based on supervised learning and the training dataset consists of a large number of deterministic problems that have been solved independently (offline). Uncertainty regarding a subset of the inputs is addressed through sampling and aggregation methods. Our application concerns booking decisions of containers on double-stack trains. The results show that deep learning algorithms make predictions high accuracy in milliseconds or less.

#### Healthcare Management: Meet the Editors

Sponsored: Manufacturing & Service Oper Mgmt/Healthcare Operations

Sponsored Session

Chair: Nicos Savva, London Business School, London, NW1 4SA, United Kingdom

Co-Chair: Susan F. Lu, Purdue University, Purdue University, West Lafayette, IN, 47907, United States

##### 1 - Healthcare Operations Management at POM

Sergei Savin, The Wharton School, 570 Jon M. Huntsman Hall, 3730 Walnut Street, Philadelphia, PA, 19104, United States

The POM Journal has maintained a strong tradition of publishing high-quality research in healthcare operations. The talk will review the mission of the Healthcare Operations Management Department at POM and the types of papers published in recent years.

##### 2 - Healthcare Operations Management at OR

Ozlem Ergun, Northeastern University, Mechanical and Industrial Engineering, Boston, MA, 02115, United States

The Policy Modeling and Public Sector OR area seeks papers that define important problems and use innovative mathematical models and analytics to solve them for improving outcomes. Especially welcome are manuscripts that utilize data to develop original models linking the design and operations of public programs and systems to recognizable policy outcomes and recommendations. Priority is given to papers that present novel and convincing data-driven model-based analyses of issues likely to generate widespread public interest, awareness, and impact.

##### 3 - Introduction of the New Healthcare Management Department of Management Science

Stefan Scholtes, University of Cambridge

Management Science has recently introduced a new department of Healthcare Management. I will introduce the new department and its editorial statement.

##### 4 - MSOM Submissions Perspective on Health Care Management Research

Morris A. Cohen, Professor, University of Pennsylvania, 546 Huntsman Hall, 3730 Walnut Street, Philadelphia, PA, 19104, United States

This presentation will provide an overview of the historical record of submissions to the Service Operations Department of MSOM that fall in to the area of Healthcare Management. This will include a summary of the volume and outcome of papers submitted to the department during the period 2016 to the present. We will also review the major topic areas, source (authors affiliation), reasons for acceptance or rejection, and the nature of the research (i.e. analytical, empirical, policy, other). The presentation will conclude with observations on trends in healthcare management research as well as challenges, and opportunities for future research directions as suggested by the MSOM experience.

##### 5 - Healthcare Management at the INFORMS Journal on Computing

Paul Brooks, Virginia Commonwealth University, Dept of Stat Sci and OR, P.O. Box 843083, Richmond, VA, 23284, United States

The Applications in Biology, Medicine, & Healthcare area of the INFORMS Journal on Computing publishes articles and welcomes manuscripts in the area of healthcare management. We seek manuscripts that include OR, computing, and a relevant application, and provide a significant contribution in at least one of these or in a combination.

**1 - Component Sharing and Recalls: An Empirical Study in the Auto Industry**

Kamalini Ramdas, London Business School, A215 Sussex Place, Regent's Park, London, NW1 4SA, United Kingdom

Automakers often share components - such as brakes, engines or outer body panels - across models in their product lines, in any year and across years. We examine how such component sharing impacts product recalls, using US government recalls data and detailed data on automakers' component sharing strategies in the US market.

**2 - The Combined Effect of the Information Provision and the Randomized Reward on Patients' Satisfaction**

Danqi Luo, Stanford Graduate School of Business, 655 Knight Way, Stanford, CA, 94305, United States, Mohsen Bayati, Erica Plambeck

This work looks at the problem of information provision on wait time in the emergency department. What kind of information schemes should be provided to the low-acuity patients, considering patients' own satisfaction and the waiting externalities on other patients? The effect of varies delay announcement schemes on patients' satisfaction level and pain level will be looked.

**3 - The Impact of Primary Care Provider Availability on Patient Care**

Hessam Bavafa, Wisconsin School of Business, 4284C Grainger Hall, 975 University Avenue, Madison, WI, 53706, United States, Christian Terwiesch

Emergency room (ER) overcrowding and overuse are significant problems in the United States, and prior studies have shown that a large portion of ER patients could have been treated by a primary care provider. If this is the case, why do patients spend hours waiting in the ER for a problem that their primary care physician could have addressed? One common answer is that primary care providers are too busy to provide timely appointments, making the ER a more attractive alternative for their patients. In this paper, we use a large dataset from the Veterans Health Administration to shed light on this claim.

**4 - Structural Estimation of Intertemporal Externalities on ICU Admission Decisions**

Fanyin Zheng, Columbia University, Columbia Business School, 412 Uris Hall, New York, NY, 10027, United States, Carri Chan

Patient care in capacity-constrained hospital units sometimes results in scenarios where the demanded quantity and level for care exceeds immediate availability, which may impact patient outcomes as well as economic outcomes. In this paper, we study the intertemporal externalities on Emergency Department patients' Intensive Care Unit admission decisions. In particular, we study how admitting a patient in the current period affects the system status, and, in turn, its ability in admitting another patient with possibly more severe conditions in the next period. We take the structural estimation approach which allows us to estimate the intertemporal externalities from data.

**1 - Controlling Congestion when Consumers Choose Their Service Time**

Pnina Feldman, Boston University, 595 Commonwealth Ave, Boston, MA, 02215, United States, Ella Segev

In many service environments consumers have a need for service and choose how long they want to use it. We propose alternative mechanisms, such as imposing a limit for the time spent in service and charging a price per unit of time, for controlling congestion in such settings. We investigate their optimality

for maximizing firm's profits as well as consumer and social welfare.

**2 - Persuading Customers to Buy Early**

Ramandeep Randhawa, University of Southern California, Los Angeles, CA, United States, Shobhit Jain, Kimon Drakopoulos

Retailers tend to have more information than customers on product availability. This leads to the natural question of how can a firm communicate this information in a profitable manner. We use a Bayesian Persuasion framework to model this information provisioning game. We find that public information provisioning has limited value, however, personalized information provisioning has significant value. Somewhat surprisingly, we find that personalized information provisioning has attributes very similar to personalized pricing.

**3 - The Boundaries of Operational Transparency**

Laurens G. Debo, Dartmouth College, 100 Tuck Hall, Hanover, NH, 03755, United States, Cuihong Li, Ryan Buell

Recent research has suggested that providing operational transparency from customers to employees can increase customers' perceptions and appreciation of employee effort, which in turn boosts customer perceived value. In this talk, we discuss mechanisms through which operational transparency might backfire. We test out the strength of these mechanisms in a controlled laboratory setting.

**MSOM Sustainable Operations: Daniel Ying's Session**

Sponsored: Manufacturing &amp; Service Oper Mgmt/Sustainable Operations

Sponsored Session

Chair: Yen-Ting (Daniel) Lin, University of San Diego, San Diego, CA, 92110, United States

**1 - Supplier Development in a Multitier Supply Chain**

Timothy Kraft, MIT Sloan School of Management, Cambridge, MA, United States, Ozgen Karaer, Pinar Yalcin

We study a buyer's strategy to develop the quality capabilities of a tier-1 and a tier-2 supplier. We consider how the buyer's cost-sharing decisions and the suppliers' quality decisions are impacted by the market opportunity for improved quality and the division of the supply chain margin between the three parties. We find if the market opportunity is such that the buyer develops only one supplier, then he should share costs with the supplier that captures the higher portion of the margin. If instead the market opportunity is greater and he invests in both suppliers, then he should instead share a larger fraction of the cost to build quality with the supplier that captures the lower portion of the margin.

**2 - The Danger of Tightening Standards in Driving Carmakers' Non-compliance Behavior**

Kejia Hu, Vanderbilt University, 300 Ashcroft Pl, Nashville, TN, 37215, United States, Sunil Chopra, Yuche Chen

Using a 14-year on-road vehicle emission dataset, we confirm a causal impact from tightening emission standards on carmakers' noncompliance behavior.

**3 - The Environmental Impact of Online Grocery Retailing**

Ekaterina Astashkina, INSEAD, Boulevard de Constance, Fontainebleau, 77305, France, Elena Belavina, Simone Marinesi

We explore the environmental impact of the online grocery retailing. We build a stylized three-echelon model of traditional and online fresh grocery chains. We identify the drivers of grocery retail carbon footprint at the consumer, retail, and supplier tiers, incorporating food waste and transportation emissions. We analytically characterize when online presence is environmentally beneficial or detrimental, and isolate the three drivers by which online presence can hurt the environment: retail inventory decentralization, excessive household food waste, or last-mile travel. Calibration of the model suggests that, in all practical cases, online presence reduces total emissions.

**4 - Supplier Centrality and Auditing Priority in Socially-responsible Supply Chains**

Jiayu Chen, The University of Texas at Dallas, 800 W. Campbell Road, Richardson, TX, 75080, United States, Anyan Qi, Milind Dawande

Most supply networks are characterized by firms sourcing from multiple suppliers and suppliers serving multiple firms, thus resulting in suppliers who differ in their degree centrality, i.e., the number of firms they supply to. In such networks, any negative publicity from suppliers' noncompliance of socially-responsible practices can significantly damage the reputation of the buyers. To mitigate this impact, firms preemptively audit suppliers, although resource and time considerations typically restrict the number of suppliers a firm can audit. We explore how the degree centrality of the suppliers affect the socially-responsible supply chains and offer several novel and useful insights.

**Supply Chain Management at JD.com**Sponsored: Manufacturing & Service Oper Mgmt/Supply Chain  
Sponsored Session

Chair: Zuo-Jun Max Shen, University of California Berkeley, Berkeley, CA, 94720-1777, United States

Co-Chair: Di Wu, JD.com, Mountain View, CA, 94043, United States

**1 - An Approximation Algorithm for Joint Replenishment-and-Allocation Problem**

Meng Qi, University of California, Berkeley, 1911A Berkeley Way, Berkeley, CA, 94704, United States, Rong Yuan, Di Wu, Max Shen

We study the joint replenishment-and-allocation inventory management problem in the context of JD.com's two-echelon inventory network. Different from the traditional two-echelon system, inventories at the upper-level warehouse are used to fulfill customer orders for a major city as well as transshipped to warehouses that used to fulfill orders for small cities and rural area. We formulate the problem as a multiple period decision problem and derived an approximation algorithm with worst-case bound. We demonstrate the effectiveness of the proposed algorithm through an extensive numerical study.

**2 - Matrix Factorization with Missing Data for Improving Accuracy of Probabilistic Demand Forecasting**

Di Wu, JD.com, 675 E. Middlefield Rd, Mountain View, CA, 94043, United States, Xiaoyue Li, Yi Pan

Demand forecast, as a classical time series problem, is crucial for e-commerce supply chain management. The performance of sales forecast has significant impact on revenue and operation cost. At the same time, missing or incomplete sales data commonly exists in the historical data which causes traditional time series models to be less effective. This paper describes an algorithm developed based on matrix factorization that specifically designed to handle missing-value issues and demonstrates its usage for demand forecast for JD.com.

**3 - Understanding the Value of Fulfillment Flexibility in an Online Retailing Environment**

Yehua Wei, Boston College, 140 Commonwealth Avenue, Chestnut Hill, MA, 02467-3809, United States, Levi DeValve, Rong Yuan, Di Wu

We propose a two-echelon inventory fulfillment model for a large online retailer, containing a large central distribution center (DC), and  $N$  smaller local DCs, to study the value of fulfillment flexibilities. Motivated by practical constraints, we propose a class of threshold fulfillment policies to effectively incorporate flexibilities at DCs. Based on our threshold policy, we estimate the savings on shipping costs and lost sales cost for a more flexible fulfillment structure considered by the online retailer.

**4 - Omni-Channel Online Fulfillment Threshold Policies**

Xin Chen, UIUC, 216C Transportation Building, 104 S. Mathews Avenue, Urbana, IL, 61801, United States, Ebrahim Arian, Rong Yuan, Di Wu

We consider inventory models in which online demands are fulfilled by physical stores. We focus on the threshold type of policies to control the amount of online demands to be accepted and compare their performances. The potential impacts of our models/policies are illustrated on JD.com's 7fresh business.

**5 - Product Placement Optimization Using Parametric Cuts**

Titouan Jehl, University of California - Berkeley, Berkeley, CA, United States, Yuhui Shi, Di Wu, Max Shen

E-Commerce companies use forward distribution centers (FDC) that are closer to customers distance-wise to fulfill orders in a timely manner. However, due to the capacity, it is impossible to store every item vended in the FDC. If an customer order contains items not stored as inventory, it comes in several packages (called order split), leading to a worse consumer shopping experience and higher operations costs. The proposed method in this research reduces the number of split orders by building an item-order graph and solving for the optimal assortment problem using parametric cut over the graph, which can reflect consumers' co-purchase behaviors.

**Operations Planning in Supply Chain**Sponsored: Manufacturing & Service Oper Mgmt/Supply Chain  
Sponsored Session

Chair: Sean Zhou, Chinese University of Hong Kong, Shatin N. T, Hong Kong

**1 - Multilocation Newsvendor Problem: Centralization and Inventory Pooling**

Sean Zhou, Chinese University of Hong Kong, 12 Chak Cheung Street, Cheng Yu Tung Building, Shatin N. T, Hong Kong, Chaolin Yang, Zhenyu Hu

We study a multilocation newsvendor model with a retailer owning multiple retailing stores, each of which is managed by a manager who decides its order quantity for filling random customer demand of a product. The store managers and the retailer are all risk-averse while the managers are more risk-averse than the retailer. When there is inventory pooling, if the store managers are sufficiently more risk-averse than the retailer or the demands are very heavy-tailed, we find that inventory pooling brings less benefit than centralization.

**2 - Optimal Inventory Control on a Multi-Item Inventory Model with Partial Pricing Strategies**

Youyi Feng, Zaragoza Logistics Center, C/ Bari 55, Edificio Nayade 5 Plaza, Zaragoza, 50197, Spain

We study an inventory and pricing control on the multi-item inventory system with  $K = K_0 + K_1 + K_2$  products, among which there are  $K_0$  complementary products whose prices are controlled by the firm. Other  $K_1$  products and  $K_2$  products are complement and substitute to either of those  $K_0$  products, respectively. Demand functions for these products are linear with additive independent noises. We characterize optimal joint partial pricing and inventory control on all the products and compute optimal policy with an efficient algorithm. In addition, we demonstrate the firm views the economic relations between the products differently from what the customers do.

**3 - Dynamic Substitution Policy for Selling Multiple Products under Supply Uncertainty**

Chengzhang Li, Purdue University, West Lafayette, IN, United States, Qi Feng, Mengshi Lu, J. George Shanthikumar

We study a firm selling multiple substitutable products over a selling horizon of multiple periods. The firm faces replenishment cycles of fixed lengths with uncertain supply. In each period, when the random demands materialize, the firm may choose one product to meet the demand for another at a cost. Extending the notion of stochastic linearity, we show that the replenishment problem is concave via transformation. We design an efficient algorithm to determine the allocation policy that delivers close-to-optimal performance. We also show that restricting substitutions between products with adjacent characteristics can yield a benefit close to allowing full substitution among all products.

**4 - Effects and Mitigation of Natural Hazards in Retail Networks**

Jorge Garc a Castillo, Massachusetts Institute of Technology, Cambridge, MA, United States, Jarrod D. Goentzel

Knowing the impact of natural hazards is crucial to invest in mitigation. We cross sales and inventory from a retail network with emergency management data to quantify the variability in product and financial flows. We propose a two-stage multi-period inventory flow stochastic program to plan investment in buffer stock or real options contracts with suppliers that execute in declared emergencies. We show that a risk averse approach reduces worst-case cost by 15% while increasing average cost by 2%. We close by showing how various risk profiles shape the nature of investments.

**Joint Session RMP/Practice Curated:  
Empirical Research in Revenue Management**

Sponsored: Revenue Management &amp; Pricing

Sponsored Session

Chair: Dan Zhang, University of Colorado, Leeds School of Business,  
University of Colorado, Boulder, CO

Co-Chair: Xiao Huang, Concordia University, Montreal, Quebec

**1 - How Does Price Volatility Influence Demand of Revenue  
Managed Goods?**Benny Mantin, University of Luxembourg, Luxembourg, L-1511,  
Luxembourg, Chiara Morlotti

We estimate the impact of price fluctuations on demand in the context of revenue-managed goods, first by introducing a new measure of price volatility and second by quantifying the effect on demand elasticity. Using airfare and sales data collected for 21 European route-pairs over five months, we carry out our empirical analyses (IV 2SLS regressions) revealing that as price volatility increases, consumers tend to buy less. We demonstrate how this can be integrated into the classical revenue management model (Expected Marginal Seat Revenue) to yield higher revenues.

**2 - Product Quality, Service and Pricing**Ruxian Wang, Johns Hopkins University, Carey Business School,  
100 International Dr, Baltimore, MD, 21202, United States,  
Shiliang Cui

We develop a unified framework to investigate firms' joint decisions on product quality, price and ancillary service, when they offer a line of products to consumers in a variety of monopolistic and competitive environments.

**3 - Psychological Overage and Underage Costs in Three-part Tariff  
Plans: Evidence from Bike-sharing Economy**Necati Terreyagolu, Georgia Institute of Technology, Scheller  
College of Business, 800 West Peachtree Street NW, Atlanta, GA,  
30308, United States, Brian S. Park, Eunhee Sohn

Three-part tariff plans are often the pricing choice for service providers. These plans involve a fixed subscription fee, which provides an allowance of free units, and a penalty fee for each unit above the allowance. We hypothesize that consumers' usage is determined not only by a psychological cost for passing the allowance (overage), but also by a psychological cost from ending the usage earlier than what is allowed after the paid penalty (underage). We test both costs using individual-level riding data from a bike-sharing company in New York City, and show that riding decisions are driven by the two psychological costs. We also show that the revenue effects of the psychological costs are significant.

**4 - Price to Gain or Price to Retain? An Empirical Study of Hotel  
Pricing and Customer Cancellation Behavior**Dan Zhang, University of Colorado, Leeds School of Business,  
University of Colorado, Boulder, CO, 80309, United States, Xiao  
Huang, Jian Wang

We use hotel transaction data to investigate the customer cancellation behavior. We show that cancellation rates are highly correlated with booking rates and the posted rates at the time of cancellation. We discuss the implications of this finding on hotel overbooking. Our results complement the empirical research on strategic customer behavior in revenue management and highlight the importance of accounting for the behavioral impact of pricing.

**5 - Payment Modes and Order Cancellation: Empirical Evidence from  
an Online Travel Agent in China**Huan Zheng, Shanghai Jiao Tong University, Management Science  
Department, 535 Fa Hua Zhen Rd, Shanghai, China, Zilin Hao,  
Junxiong Yin

Dynamic pricing is a widely adopted tool for Online Traveling Agencies. Consumers strategically respond to price fluctuations in various ways to maximize their utilities. In this study, we empirically explore how consumers choose different payment modes when booking hotel rooms, and strategically cancel their bookings from transaction data of a large Online Traveling Agency in China. Based on our two-period econometric model, we find that strategic consumers will keep monitoring price fluctuations and then decide whether they should cancel existing orders.

North Bldg 129A

**Design and Operations of Marketplaces**

Sponsored: Revenue Management &amp; Pricing

Sponsored Session

Chair: Yash Kanoria

Co-Chair: Abhinav Sinha, Columbia Business School, 3022 Broadway,  
New York, NY, 10027, United StatesCo-Chair: Fanyin Zheng, Columbia University, New York, NY, 10027,  
United States**1 - Engineering a Separating Equilibrium**John Joseph Horton, New York University-Stern, New York, NY,  
10012, United States, Ramesh Johari

This paper explores whether platform-created signaling opportunities can move designed markets to more desirable equilibria. In a large online labor market, buyers were given the opportunity to signal their relative preferences over price and quality. The intervention caused substantial sorting by sellers to buyers of the right "type." However, sellers clearly tailored their bids to the type of buyer they faced, bidding up against buyers with a high revealed willingness to pay. Despite this "markup," a separating equilibrium was sustained over time, suggesting buyers found revelation incentive compatible. We find evidence that informative signaling improved both matching efficiency and match quality.

**2 - Dog Eat Dog: Measuring Returns to Scale using a Digital  
Platform Merger**Andrey Fradkin, Massachusetts Institute of Technology,  
179 Prospect Street, Cambridge, MA, 02139, United States,  
Chiara Farronato

We study returns to scale in digital marketplaces by using proprietary data from the merger of the two largest peer-to-peer platforms for pet sitting services. The merger offers a unique opportunity to study this question because it is one of the few cases where platform size changes in a sudden and exogenous way, not caused by incremental adoption. In addition, the local nature of the services exchanged provide us with multiple city-level markets that are differentially affected by the merger. We quantify changes in the aggregate number of matches and their quality after the platform merger, and how efficiency gains are differentially distributed across platform users.

**3 - Optimal Growth in Two-sided Markets**Garrett Van Ryzin, Cornell University, Ithaca, NY, United States,  
Zhen Lian

We consider the problem of optimal growth in a two-sided market with both increasing and decreasing returns to scale. We show that in both cases faster growth is better and optimal policies involve large "subsidy shocks". Our results also show the optimal balance between supply and demand as markets grow.

**4 - Match Efficiency in Two-sided Platforms**Abhinav Sinha, Columbia Business School, New York, NY,  
United States, Yash Kanoria, Fanyin Zheng

We study the design of two-sided online marketplaces using recent transaction data from a large online platform. We are interested in estimating (i) the unobservable demand and (ii) the dependence of aggregate number of matches on macro-level market characteristics such as the total number of sellers and buyers in the market. Further, our aim is to run counterfactual analysis on platform design and recommend the best ways to improve matching efficiency and/or net profit. We introduce a matching function approach to capture search frictions in the market.

## ■ SC21

North Bldg 129B

**Machine Learning in Demand Modeling**

Sponsored: Revenue Management &amp; Pricing

Sponsored Session

Chair: Andrew Vakhutinsky, Oracle

**1 - Using Monte Carlo Simulations to Balance Supply and Demand in  
an On-demand Grocery Delivery Marketplace**Jagannath Putrevu, Instacart, 50 Beale St, 11th Floor, Instacart,  
San Francisco, CA, 94105, United States

Instacart uses a network of personal shoppers and drivers to shop for groceries and deliver them to our customers. For Instacart to continue growing rapidly, we want to capture as much demand as possible while keeping our costs low and our personal shoppers and drivers engaged on the marketplace. But this is easier said than done. On any given day, there are multiple factors that contribute to a large amount of variance, which makes this an extremely hard problem. This talk explores a simulation-based optimization methodology that we employed to

maximize delivery efficiency, minimize idle shopper hours and minimize orders lost due to lack of supply, all while managing the uncertainty.

## 2 - Dynamic Pricing with Sales- and Inventory-dependent Demand: The Effectiveness of Certainty-equivalent Approximation

Mengzhenyu Zhang, University of Michigan, Ann Arbor, MI, United States, Hyun-Soo Ahn, Christopher Ryan, Joline Uichanco

We study a pricing problem where future demand is influenced by past sales and/or product availability as well as price. Under this setting, the price of a product not only determines the revenue and demand in that period but also influences future demands. Hence, the role that a price decision plays is more complicated than most revenue management models where price only affects the sales in that period. We provide asymptotic results that illustrate the effectiveness of certainty-equivalent policies in these settings. We also analytically demonstrate the benefits of dynamic versus static pricing and characterize when it is revenue-optimal to underserve the market by restricting total supply.

## 3 - Joint Clustering of Retail Products and Customers

Andrew Vakhutinsky, Oracle Labs, 35 Network Drive, Sharon, MA, 02067, United States, Daniel Peterson

Cluster analysis of products and customers is useful for marketing and product targeting. Using a large dataset of retail transactions for millions of households across one year, we develop a probabilistic clustering of households and products that captures typical purchase behavior. Latent Dirichlet Allocation (LDA) is attractive for this application, because it allows a soft clustering. In this work demonstrate the shortcomings of naive application of LDA, present a few simple solutions that improve the product clusters dramatically, and discuss how metadata about the products and households can be used to further improve the clustering. We also compare results from other approaches.

## 4 - Score a Retail Store Location

Yihui Huang, Tsinghua University, Beijing, China, Chen Wang, Lei Zhao

Expected customer visits and sales are two important measures for a retail to decide whether to open a new store at a candidate location. Noticing different shopping behaviors of customers from different types of locations, e.g., shopping malls (S), crowd points (C), offices (O) and resident communities (R), we propose time-domain and frequency-domain models to predict these measures. We develop an expectation-maximization (EM) algorithm to learn the model parameters based on the data of existing stores and public data.

## SC22

## Mechanism Design, Networks, and New Markets

Sponsored: Revenue Management & Pricing

Sponsored Session

Chair: Ozan Candogan, University of Chicago, Chicago, IL, 27708, United States

## 1 - Optimal Commissions & Subscriptions in Networked Markets

Hongfan Chen, University of Chicago, 5050 S. Lake Shore Drive, S3417, Chicago, IL, 60615, United States, Ozan Candogan, Daniela Saban, John R. Birge

We consider a platform providing a marketplace to sellers and buyers of different types, whose compatibility is encoded in a bipartite network. With the platform only controlling commissions/subscriptions, we establish that, the platform may need to differentiate the charges to maximize revenues. We show that charging homogeneous commissions/subscriptions or charging to only one side of the market leads to heavy revenue loss in general. Under homogeneous value distributions, we provide a bound on the revenue loss in terms of the network structure. Finally, under some convexity assumptions, we show the revenue-maximizing equilibrium induces at least 2/3 of the maximum social welfare.

## 2 - Optimal Dynamic Matching under Lost Sales

Yun Zhou, McMaster University, 1280 Main Street West, Hamilton, ON, L8S 4M4, Canada, Zhiyuan Chen, Ming Hu

We consider a dynamic matching problem where the agents on one side, say supply side, are long-lived, and those on the other, say demand side, are impatient and will be lost if unmatched upon arrival. The matching reward is the multiplication of quality levels of agents in a match. In a centralized setting, we show that the optimal matching priority is different from assortative mating: it is optimal to prioritize high-quality supply over low-quality one to satisfy high-quality demand; however, for the low-quality demand, low-quality supply has a priority. We show how the decentralized matching process can be perfectly coordinated as the centralized one.

## 3 - Peer-to-Peer Trading of Usage Quotas

Behrooz Pourghannad, University of Minnesota, Minneapolis, MN, United States, Saif Benjaafar, Jian-Ya Ding

A growing number of businesses are being built around a model that provides customers access to a product or a service up to a specified amount or allowance. We study the impact of allowing customers to trade among themselves unused portions of their allowances and examine conditions under which peer to peer trading is beneficial to both the firms and consumers.

## 4 - Customer Learning and Competition for Online Sales of Durable Goods

Clark C. Pixton, Massachusetts Institute of Technology, Cambridge, MA, 02139, United States, Clark C. Pixton, Brigham Young University, Provo, UT, United States

Motivated by data from a large online retailer, we study online sales of durable goods, focusing on the effects of uncertainty about product quality and learning from customer reviews. We describe the nature of the tradeoff between learning product quality over time and substitution effects between products offered in the same category on the same website. We offer an alternate explanation for market dominance based on transient effects of a learning process which involves decisions under risk, and show that the learning is slower and market dominance more likely in higher price markets. We discuss implications of our model for games between platforms and sellers.

## Stochastic Control Problems in Finance

Sponsored: Finance

Sponsored Session

Chair: Tim Siu-Tang Leung, University of Washington, Seattle, WA, 98195-3925, United States

## 1 - Energy Storage and Trading

Daniel Mitchell, PhD, University of Minnesota, Kumar Muthuraman, Stathis Tompaidis, Long Zhao

We examine the problem of trading in a commodity that requires storage with transaction costs. We present an algorithm to find the optimal buying, selling and holding regions and consider extensions where prices exhibit seasonality, and when the inventory level can fluctuate randomly, such as a water reservoir that can be filled by rain and depleted through evaporation.

## 2 - Optimal Dynamic Basis Trading

Bahman Angoshtari, PhD, University of Washington, Seattle, WA, United States, Tim Siu-Tang Leung

We study the problem of dynamically trading a futures contract and its underlying asset assuming a stochastic basis model. We describe the basis evolution by a scaled Brownian bridge, but also incorporate the possibility of non-convergence at maturity. The optimal trading strategies are determined from a utility maximization problem under hyperbolic absolute risk aversion (HARA) risk preferences. By analyzing the associated Hamilton-Jacobi-Bellman equation, we derive the exact conditions under which the equation admits a solution and solve the utility maximization explicitly. A series of numerical examples are provided to illustrate the optimal strategies and examine the effects of model parameters.

## 3 - American Options under Periodic Exercise Opportunities

Kazutoshi Yamazaki, PhD, Kansai University, Kansai, Japan

We study a version of the perpetual American call/put option where exercise opportunities arrive only periodically. Focusing on the exponential Levy models with i.i.d. exponentially-distributed exercise intervals, we show the optimality of a barrier strategy that exercises at the first exercise opportunity at which the asset price is above/below a given barrier. Explicit solutions are obtained for the cases the underlying Levy process has only one-sided jumps.

## 4 - Dynamic Index Tracking and Exposure Control using Derivatives

Tim Siu-Tang Leung, University of Washington, Dept of Applied Mathematics, University of Wa, Lewis Hall #202, Seattle, WA, 98195-3925, United States

We develop a methodology for index tracking and risk exposure control using financial derivatives. Under a continuous-time diffusion framework for price evolution, we present a pathwise approach to construct dynamic portfolios of derivatives in order to gain exposure to an index and/or market factors that may be not directly tradable. Among our results, we establish a general tracking condition that relates the portfolio drift to the desired exposure coefficients under any given model. We also derive a slippage process that reveals how the portfolio return deviates from the targeted return.

**1 - Micro-giving: On the Use of Mobile Devices and Monetary Subsidies in Charitable Giving**

Dokyun Lee, Carnegie Mellon University, Tepper School of Business, 5000 Forbes Avenue, Pittsburgh, PA, 15213, United States, Dongwon Lee, Anandasivam Gopal

This study examines the effects of push notifications, monetary subsidies, and intertemporal choices of rewards on donation outcomes by individual users. Our experiments provide three main findings. First, push notifications have a remarkably high effect on donation behavior in terms of the decision to donate as well as donation amounts, especially for idle users. Second, offering rebates as economic incentives are more effective than offering matching grants, in particular for male consumers. Finally, while users are indifferent between receiving their rewards now versus later, users that are offered a rebate respond with greater alacrity when rewarded immediately rather than later.

**2 - Fundraising Patterns and Entrepreneurial Strategies in Crowdfunding**

Lusi Yang, National University of Singapore, 15 Computing Drive, COM2-01-02, Singapore, 117418, Singapore, Jungpil Hahn, David Lehman

This study aims to uncover the dynamics of crowdfunding by examining how fundraising patterns affect subsequent entrepreneurial strategies in managing the project during the funding process. Toward this goal, drawing insights from the behavioral theory of the firm, we identify two types of entrepreneurial strategies from potential courses of actions, i.e., exploitation and exploration, and examine the influence of concurrent fundraising performance on the two types of strategic actions.

**3 - You Run, I Donate: The Impact of Corporate Sponsorship in a Three-sided Charitable Platform**

Xue Tan, Indiana University, Kelley School of Business, 1309 E. 10th St, HH 4131, Bloomington, IN, 47405, United States, Lu Yan, Alfonso J. Pedraza-Martinez

This paper seeks to understand a three-sided marketplace where corporate sponsors individuals' charitable efforts by donating to charities based on the individuals' running miles captured by an mobile application. Using social media data that captured a natural experiment, we reveal the impact of announcing and showing gratitude to corporate sponsors.

**4 - Influence of Peer Based Monetary Incentive on Content Generation**

Zixuan Meng, University of Washington, Seattle, WA, 98115, United States, Yi-Chun Ho, Junjie Wu, Yong Tan

User-generated content has been widely studied in the past couple of years. Platforms have tried multiple methods to encourage the content generating behavior, and some have started motivating through monetary incentives. Using a unique setting where content consumers can voluntarily support writers through direct money transaction, we analyze how monetary incentive influences writers behavior. Our findings show that the availability of the monetary incentive encourages writers to increase both the quality and the quantity of writing. However, if the monetary incentive is below writers' expectation, writers can be demotivated.

**Analytic Support for SMART Service Systems**

Sponsored: Service Science

Sponsored Session

Chair: Ralph D. Badinelli, Virginia Polytechnic Institute, Blacksburg, VA, 24061, United States

**1 - On Bias in AI Systems**

Rama Akkiraju, IBM, San Jose, CA, United States

Some argue that one must strive to build unbiased AI models by training AI models with comprehensive training datasets. In this talk, I'd argue that there is no such a thing as an 'unbiased' Machine Learning model. Instead of striving for unbiased machine learning models, a machine learning model must state its biases openly. Minimizing biases has to start with creating test datasets rather than with training datasets. I will provide a practitioner's point-of-view on mitigating biases in AI models.

**2 - Adaptive Decision Models for Smart Service Systems**

Ralph D. Badinelli, Virginia Polytechnic Institute, Dept of Business Information Tech (0235), Blacksburg, VA, 24061, United States

We describe an adaptive decision-modeling framework for integrating IoT and BDA into decision support for smart service systems. The sensing capabilities of IoT and the predictive capabilities of BDA are often mistaken for smartness. However, the integration of these analytic technologies into adaptive decision models is necessary to create a smart DSS. In particular, the engagement decisions of actors in a service ecosystem are the locus of smartness in a service. These decisions are dynamic, stochastic and of high dimensionality. Approximate dynamic programming and heuristics are necessary.

**1 - Numerical Analysis of the Knowledge Gradient for Locally Quadratic Functions in Multidimensional Learning Settings**

Michael Li, Princeton University, Princeton, NJ, United States, Warren Powell

This paper studies the knowledge gradient for locally quadratic functions (KGLQ), a new policy for optimizing smooth, expensive functions. By capturing structural bias through a tunable parameter, KGLQ encourages more strategic behavior than previous policies. KGLQ is applied to parametric functions, newsvendor functions, and energy arbitrage. Numerical results show KGLQ outperforms its predecessors. However, the optimal tunable parameter values are problem dependent and vary across dimensions.

**2 - Centers for Disease Control and Prevention as a Strategic Agent in the Pediatric Vaccine Market: An Analytical Approach**

Kayla Cummings, Massachusetts Institute of Technology, Cambridge, MA, United States, Banafsheh Behzad, Susan Martonosi

The CDC's significant patronage of pediatric vaccines affords them leverage in preventing monopolies via public sector price negotiation. Our optimization model ensures adequate vaccination levels and manufacturers' success at minimum government cost. We find that dissimilar products advantageously segment markets with asymmetric manufacturers. Furthermore, markets are at lower risk when high-capacity manufacturers have low R&D costs, especially in cases of high demand and asymmetry. A shift from annual contracts to ongoing negotiations would give the CDC more control over market viability.

**3 - Multi-Period Lot Sizing with Supplier Selection: Structural Results, Complexity and Algorithms**

Meichun Lin, Shanghai Jiao Tong University, Shanghai, China, Woonghee Tim Huh, Meichun Lin

We consider a multi-period lot-sizing problem with multiple products and suppliers. We aim to determine the order quantity to minimize the total cost of product purchase and inventory holding under deterministic time-varying demand. We show the intractability of the general problem, analyze structural properties for three polynomial-time solvable cases and propose dynamic programming algorithms. We also develop a heuristic for the general problem and computationally show that it works well.

#### **1 - Nash Equilibrium with User-Focused Incentives for Envy-minimized**

Daisik Nam, University of California, 2132 Verano Place, Irvine, CA, 92617, United States

This research models an incentivized and interconnected smart route guidance system. The system provides the users with system optimum routes, which distributes travel demands over space and time but induces travel time imbalances and user envy. To compensate for this, optimum incentives are allocated, that attempt to minimize the envy of participants.

#### **2 - Economic Mechanisms for Cooperative Vehicle Platooning**

Xiaotong Sun, University of Michigan, Department of Civil and Environmental Engineering, Ann Arbor, MI, 48109, United States, Yafeng Yin

A vehicle platoon is a set of vehicles driving together with minimum headways, enabled by, e.g., cooperative adaptive cruise control. Benefits of vehicle platooning include energy cost savings, reduced emissions, and others. Since these benefits are not distributed evenly among vehicles in a platoon, some drivers or owners will not be willing to join or stay in a platoon even if they are advised to do so. This study investigates economic mechanisms that fairly allocate the platoon benefits to facilitate vehicles from different owners to form and maintain desired platoons.

#### **3 - Decentralized Cooperative Control for a Mixed Flow Traffic Platoon**

Yujie Li, Purdue University, West Lafayette, IN, United States

This study develops a cooperative control strategy for a platoon with human-driven vehicles (HDVs) and connected and autonomous vehicles (CAVs) on a straight highway to improve the stability of the whole platoon. Specifically, a novel car-following model for HDVs is established to describe the interactions when a HDV follows a CAV. A cooperative decentralized controller is proposed to generate the control inputs of CAVs by considering the interactions between HDVs and CAVs and the performance of the mixed flow platoon. Numerical simulations are used to investigate the performance of the proposed methodology.

#### **4 - Cooperative Adaptive Cruise Control for a Platoon of Connected and Autonomous Vehicles (CAVs) Considering Dynamic Information Flow Topology**

Anye Zhou, Purdue University, West Lafayette, IN, United States

This study seeks to establish a cooperative adaptive cruise control design that considers a dynamic information flow topology for CAV platoons. This mechanism aims to improve the control performance considerably under an unreliable vehicle-to-vehicle communication network. An adaptive Proportional-Derivative (PD) controller under a two-predecessor-following information flow topology is proposed to reduce the negative effects when communication failures occur. The PD controller parameters are determined to ensure the head-to-tail string stability of the CAV platoon.

Chair: Debjit Roy, Indian Institute of Management, Ahmedabad, 560078, India

#### **1 - Dynamic Batch Picking for Order Picking in Warehouses**

Jelmer Pier van der Gaast, University of Groningen, Nettelbosje 2, Groningen, 9747 AE, Netherlands, Bolor Jargalsaikhan, K.J. Roodbergen

Dynamic batch picking is characterized by combining product demand from multiple customer orders into one pick tour where new orders arrive continuously. Using modern order picking aids, updated pick instructions can be included in the current pick tours which allows pickers to be re-routed to pick for new orders even when they already started a pick tour. We develop a mathematical model for dynamic batch picking that minimizes the order throughput time of an incoming order. The model can be quickly re-optimized in case of a new order arrival and used to determine new updated pick tours. This allows for short order throughput times and ensures that companies can set their cut-off times as late as possible.

#### **2 - The Effects of Hurricanes on Port Operations**

Amir Gharehgozli, David Nazarian College of Business and Economics, Northridge, CA, United States, Dylan Folkman

This paper studies the long-lasting effects of hurricanes on port operations. It focuses on the recent effect of hurricane Harvey on the Port of Houston. Hurricane Harvey pushed a large amount of sediment into the Houston Ship Channel, decreasing the depth of the port. As a result, larger vessels need to de-ballast the water from the ballast tanks in order to reduce their draft and enter the port. Arena simulation software is used to simulate the operations at the two main container terminals in the port. Two simulations are created to model the port and its efficiency before Harvey versus after Harvey. The results show a decrease of total revenue and an increase in average waiting time.

#### **3 - Manual Order Picking in a Warehouse**

Ivo Adan, Eindhoven University of Technology, Den Dolech 2, Eindhoven, 5600 MB, Netherlands, Lacy Greening, Rob Broekmeulen, Stijn De Vuyst

We consider manual order-picking in a rectangular warehouse consisting of multiple parallel aisles. The routing heuristic of the picker is the mid-point strategy. We determine mean and variance of the travel time and also evaluate the performance of batching strategies.

#### **4 - Stochastic Models for Comparing Technology Alternatives at Automated Container Terminals**

Govind Lal Kumawat, Indian Institute of Management Ahmedabad, New Campus, Dorm 29 Room 12, Ahmedabad, 380015, India, Debjit Roy

We address a technology selection problem that arises in the development phase of automated container terminals. We compare various technology alternatives for quay cranes and transport vehicles based on the throughput time using semi-open queueing networks. Moreover, we propose a solution method for semi-open queueing networks with two-phase servers and blocking.

#### **5 - Workforce Scheduling with Order Picking Assignments in Distribution Facilities**

Arpan Rijal, Erasmus University, Postbus 1738, Rotterdam, 3062PA, Netherlands, Marco Bijvank, Asvin Goel, René de Koster

Manual order picking operations at several distribution centers operate with temporal restrictions on the completion times of orders in the form of hard earliness or lateness constraints. The problem is further complicated by multiple shift start and end times, mandatory breaks, and flexible workforce. As a result, the sequence of assignment of orders to order pickers is non-trivial. In this work, we present several formulations of the problem and exact and matheuristic solution approaches for it. Preliminary results show that definition of shifts and break requirements have significant impact on operational costs.

**1 - A Scalable and Real-time Approach for Optimal Signal Control in a Semi-connected Vehicle Environment**

Ali Hajbabaie, Washington State University, 405 Spokane St, Pullman, WA, 99164, United States, S. M. A. Bin Al Islam, Husain Aziz

This research presents an algorithm to incorporate point detector data with shared information of connected vehicles (CV) for real-time optimal signal control with various CV market penetration rates. Besides, a transit signal priority (TSP) based mixed-integer linear program (MILP) is formulated to accommodate multiple modes of vehicles while considering effective coordination between neighboring intersections. The results indicated significant improvement in network performance under various CV penetrations rates compared to the state-of-practice TSP using microscopic traffic simulation.

**2 - Performance Evaluation of Connected and Cooperative Driving: Queueing Theoretic Approach and Case Study**

Mohammad Motie, University of Southern California, Los Angeles, CA, 90089, United States, Ketan Savla

We develop a queueing theoretic framework for performance analysis, in terms of throughput and travel time, for freeway systems under connected vehicles and cooperative driving. In particular, we derive theoretical bounds under well-studied car-following models, and compare with microscopic simulations and the NGSIM dataset.

**3 - A Machine Learning Based Signal Control Algorithm with Energy Minimization Objective**

S. M. A. Bin Al Islam, Graduate Research Assistant, Washington State University, 242, Sloan Hall, NE Spokane St, Pullman, WA, 37830, United States, Husain Aziz, Ali Hajbabaie

This paper presents a distributed agent-based reinforcement learning (RL) technique to minimize energy consumption from signalized intersections while considering effective coordination in decision making processes among adjacent intersections. Besides, we propose a mobility-energy objective to provide a balanced reward function in RL based signal control algorithm. The algorithm is implemented in a calibrated NG-SIM network within a traffic microsimulator-PTV VISSIM and compared with current signal settings of the network and hypothetical optimal solutions.

**4 - Network Traffic Control for Autonomous and Legacy Vehicles**

Michael W. Levin, University of Minnesota, 500 Pillsbury Dr. SE, Minneapolis, MN, United States, David Rey

Autonomous vehicles are expected to help in improving network capacity and mitigate congestion episodes. Yet, there is a lack of traffic control models capable of managing both legacy and autonomous vehicles. We address this gap by optimizing traffic signal control at the intersection level considering mixed traffic flow. We then embed this formulation into a network-level traffic control model wherein link queue evolution dynamics are stochastic. We propose a distributed network traffic control policy inspired by back-pressure algorithms to maximize network throughput and we prove stability.

**Joint Session TSL/ICS: Approximate Dynamic Programming and Reinforcement Learning for Routing III**

Sponsored: TSL/Freight Transportation &amp; Logistics

Sponsored Session

Chair: Justin Goodson, Saint Louis University, St. Louis, MO, 63108, United States

**1 - Dynamic Time Window Allocation and Sizing for Service Routing**

Justin Goodson, Saint Louis University, John Cook School of Business, Davis-Shaughnessy Hall, St. Louis, MO, 63108, United States, Marlin Wolf Ulmer, Barrett Thomas

Firms serving customers at their homes face the challenge of assigning time windows small enough to respect busy schedules, but large enough to provide adequate service. At the time of a request, the firm must provide a window within which service will begin. Accurately estimating arrival times to customers is difficult because requests arrive randomly and must be assigned to employees

in real time without knowing when and where future requests will occur. We show dynamic strategies to set time windows as a function of arrival time variance perform significantly better than static policies.

**2 - Ship Routing Problems: Closing the Optimality Gap**

Thibaut Vidal, PUC-Rio, Departamento de Informatica, Rua Marques de Sao Vicente, 225, Rio de Janeiro, 22453-900, Brazil, Gabriel Homs, Rafael Martinelli, Kjetil Fagerholt

Hemmati et al. (2014) recently introduced real ship routing instances which pose considerable challenges for solution methods. To face this situation, we introduce a hybrid GA and a branch-price-and-cut-based algorithm. Our GA combines a set-partitioning with problem-tailored variation operators to optimize all decision subsets. Our BCP generates elementary routes and relies on strong branching, sophisticated preprocessing and correction techniques for the delivery triangle inequality, route enumeration and subset-row cuts. As visible in our experiment, the BCP solves to optimality all of the 240 available instances, and the GA finds solutions which are near optimal in a few minutes.

**3 - Dynamic Car-passenger Matching for on Demand Mobility Services**

Marvin Erdmann, University of the German Federal Armed Forces, Munich, Werner-Heisenberg-Weg 39, Neubiberg, 85577, Germany Marvin Erdmann, BMW, Parkring 19, Garching, 85748, Germany

Today's challenges of urban traffic - congestion, lack of space, air pollution, etc. - can be met by On Demand Mobility, a concept that would lead to an enhanced use of shared mobility services to utilize the vehicles more efficiently. This trend becomes even more obvious with the future development of autonomous driving vehicles. To avoid a decline of flexibility and convenience for the customers the fleet management function will match the requests and the vehicles in order to quickly find a reliable and time efficient solution for the whole system. My work's focus is the realization of a Tabu Search Metaheuristic to compute near-to-optimal solutions for this NP hard problem.

**Strategic Decision Making for Emergency Medical Services**

Sponsored: Transportation Science &amp; Logistics

Sponsored Session

Chair: Lavanya Marla, U. of Illinois at Urbana-Champaign, Urbana, IL, 61801, United States

**1 - Competitive Coverage with Two EMSs**

Peter McGlaughlin, University of Illinois-Urbana Champaign, Urbana, IL, United States

We study a stochastic game in which two service providers (the players) compete for customers. Player maintain a base at one end point of the service area, a line of length 1, and selects a coverage range  $0 < x < 1$ . Customers arrive by the Poisson process at a random position, and request service from all providers whose range overlaps their position. If a player has an available server, it is dispatched to the customer's location. Only the first player to arrive receives a reward. Players aim to maximize utility, the time average number of customers served, by adjusting coverage range  $x$ . When the players have one server, we show that there always exists a symmetric pure strategy Nash equilibrium.

**2 - Evaluating Capacity Planning Methods for Erlang-B Systems: Application to Emergency Medical Services**

Mohammad Delasay, Stony Brook University, Stony Brook, NY, United States, Armann Ingolfsson, Amir Rastpour

We evaluate capacity planning methods in Erlang-B service systems with continuous random cyclic demands. Emergency medical services is an example of such systems. We use numerical techniques to evaluate the accuracy of methods that rely on independent period-by-period steady state distributions. We investigate how the accuracy of such approximations depends multiple factors, including the average service rate and the shape of the service time distribution.

**3 - Capacity Rationing and Ambulance Diversion in Emergency Departments**

Tianshu Lu, University of Toronto-Rotman School of Management, 105 St George Street, Toronto, ON, M5S 3E6, Canada, Jianfu Wang, Opher Baron

Capacity rationing and ambulance diversion are two important practices in emergency department (ED) management. We model these practices as a two classes non-preemptive priority  $M/M/c+M$  queue where high- and low-priority customers correspond to acute and non-acute patients, respectively. We model capacity rationing by reserving  $k$  servers to high priority customers, and ambulance diversion by blocking high priority customers from entering the system when the total number of patients is high. We give the first exact results for a multi-server queue with non-preemptive priorities. Numerical results provide insights on the control of capacity rationing and ambulance diversion in EDs.

#### 4 - Emergency Response After Disaster Strikes: Agent-based Transportation Simulation of Ambulances in New Windsor, NY

Matthew Yuan, United States Military Academy, West Point, NY, 10996, United States, Zade J. Koch, Elizabeth Bristow

Ambulance travel time in New Windsor, NY is modeled using the agent-based transportation microsimulation software MATSim. MATSim was used to compare ambulance travel time before and after disruption of critical roadways, simulating the effects of a natural disaster. When 0.6% of network links in New Windsor were restricted to 50% of their maximum speed, ambulance travel time increased by 6.05%. Applying agent-based techniques to emergency response planning is a novel approach which offers network analysts and city planners advantages over traditional transportation modeling approaches.

### 1:30 - 2:15 Modular Mining Systems/ 2:15 - 3:00 GAMS

Vendor Demo Session

#### 1 - Modular Mining Systems

Abstract not available.

#### 2 - GAMS - An Introduction

Steven P. Dirkse, GAMS Development Corporation, Washington, DC, United States, Lutz Westermann

Get ready to learn the basics of GAMS, i.e. how to develop algebraic models and solve them using state-of-the-art algorithms. In this workshop, the key concepts of GAMS and the fundamentals of the language (e.g. sets, data, variables, equations) will be introduced. The main part will consist of a demonstration, where we build a simple optimization-based decision support application from scratch. We show how GAMS supports an easy growth path to larger and more sophisticated models, promotes speed and reliability during the development phase of optimization models, and provides access to all of the most powerful solver packages. Along the way we will look at some of the data management tools included in the GAMS system and show how to analyze and debug large problems using the various tools available within GAMS. This introduction assumes no familiarity with GAMS. There will be time for questions both during and at the end of this workshop.

### Joint Session AAS/TSL-Air: Flight Schedule Optimization under Demand-capacity Imbalances

Sponsored: Aviation Applications

Sponsored Session

Chair: Konstantinos G. Zografos, Lancaster University, Lancaster, LA1 4YX, United Kingdom

Co-Chair: Alexandre Jacquillat, Carnegie Mellon University, Carnegie Mellon University, Pittsburgh, PA, 15213, United States

#### 1 - A Large-scale Neighborhood Search Approach to Airport Slot Allocation

Alexandre Jacquillat, Carnegie Mellon University, Heinz College, 5000 Forbes Avenue, Pittsburgh, PA, 15213, United States, Nuno Ribeiro, Antonio Antunes, Amedeo R. Odoni

The airport slot allocation problem has been the focus of extensive research in recent years; yet, exact methods only yield optimal solutions at airports of up to 100,000 aircraft movements per year. We provide here a novel approach that leverages a recent Priority-based Slot Allocation Model (PSAM), and develops heuristic based on large-scale neighborhood search to solve it at the largest schedule-coordinated airports. Specifically, we propose a constructive heuristic that is shown to provide good solutions in short computational times and an improvement heuristic that converges to the optimal, or near-optimal solution in a few hours. Case study results are shown at Lisbon's airport.

#### 2 - An Integrated Scheduling and Flow Management Approach in Air Transportation Networks

Kai Wang, The Hong Kong Polytechnic University, Hong Kong, Alexandre Jacquillat

Two central air traffic management (ATM) problems are demand management, i.e., strategic scheduling interventions, and air traffic flow management (ATFM), i.e., tactical balancing of aircraft flows. This paper provides an original integrated approach that optimizes network-wide scheduling interventions, while accounting for ATFM dynamics and operating uncertainty. This is formulated as a two-stage stochastic integer program. We develop new exact solution algorithms based on dual integer cuts and neighborhood search, which are shown to provide optimal, or near-optimal solutions in reasonable computational times. Case study results identify opportunities in network demand management.

#### 3 - Decomposition Methods for Solving the Slot Allocation Problem with Flexible Scheduling of Series of Slots

Jamie Fairbrother, Lancaster University, Department of Management Science, Management School, Lancaster, LA1 4YW, United Kingdom, Stephen John Maher, Konstantinos G. Zografos, Kevin D. Glazebrook

We formulate the airport slot scheduling problem as a bi-objective integer linear problem which considers efficiency and fairness objectives and satisfies turn-around and airport capacity constraints. This model allows flexibility for the scheduling of series of slots during the scheduling season. We develop and test Benders' decomposition and column generation algorithms for solving the proposed formulation and report results regarding the computational performance of these.

#### 4 - Accommodating New Flights into the Existing Airline Flight Schedule

Ozge Safak, Department of Industrial Engineering, Ankara, 06800, Turkey, Alper Atamturk, Selim Akturk

We present two novel approaches to alter the flight network to accommodate new flights while maximizing airline's profit. The key feature is to adjust the aircraft cruise speed to compensate for the block times of new flights, trading off flying time and fuel burn. We introduce an additional mechanism, namely aircraft swapping, which provides a greater flexibility in reducing the fuel cost. We propose strong mixed integer conic quadratic (MICQ) formulations to handle the nonlinear fuel burn function. This MICQ formulation together with the McCormick inequalities enables the solution of large-scale instances from a major U.S. airline within reasonable compute times. TUBITAK Grant 116M542, 2214

### Aviation: A Whole New World?

Sponsored: Aviation Applications

Sponsored Session

Chair: Arnold I. Barnett, Massachusetts Institute of Technology, Cambridge, MA, 02139-9910, United States

#### 1 - Aviation Safety: A Solved Problem?

Arnold I. Barnett, Massachusetts Institute of Technology, 100 Main Street, E62-568, Mit, Cambridge, MA, 02139-9910, United States

In 2017, roughly four billion passengers worldwide embarked on air journeys on scheduled flights, only ten of whom were killed. Viewed in isolation, this outcome suggests that events that produce aviation deaths are on the verge of extinction. But is 2017 a temporary fluctuation around a general trend that has persisted for the last fifty years? We explore the issue with aviation-fatality data.

#### 2 - A Recheck on TSA PreCheck: Aviation Security in 2040

Sheldon H. Jacobson, University of Illinois, Dept of Computer Science, 201 N. Goodwin Avenue MC258, Urbana, IL, 61801-2302, United States

TSA Precheck is the poster child for risk-based security, the strategy that aligns security resources with risk. This presentation discusses how risk-based security in general, and TSA PreCheck in particular, can be enhanced to make the air system for secure for all travelers over the next two decades.

#### 3 - Smart Markets for Smart Aircraft

Raja Sengupta, University of California-Berkeley, Berkeley, CA, United States, Mark Hansen

Advances in materials, cyber- intelligence, and manufacturing have spawned a renaissance in Aerospace Engineering. Civil Aviation now faces unprecedented growth opportunities, if a vastly richer mix of aircraft, products of the aerospace renaissance, can be admitted into the airspace in sufficient numbers. Our research is about realizing this opportunity. The key is to bring new aircraft to market in times that fit venture investment cycles. Our research targets a permissive airspace system in both tropo- and stratosphere, which is safe and efficient for the incumbent aircraft, but yet fast-to-market for the innovations to come.

#### 4 - Competition and Collaboration for Airport Capacity Allocation: Review and Recent Findings

Vikrant Vaze, Dartmouth College, 14 Engineering Drive, Murdough Center, Hanover, NH, 03755, United States

Commercial airlines, which are the main users of airport capacity, share a complicated relationship with each other. On one hand, they compete with each other for passenger share and fare revenues. On the other hand, effective coordination, communication and collaboration between them are essential for efficient utilization of airport resources. This talk focuses on developing, optimizing and evaluating mechanisms for airport capacity allocation while incorporating airline preferences. We address challenges associated with long-term strategic planning as well as short-term tactical decision-making. We briefly mention a broader set of applications of the ideas developed in this research.

**Data, Services, and Queues**

Sponsored: Applied Probability

Sponsored Session

Chair: Rouba Ibrahim, University College London, London, WC1E 6BT, United Kingdom

**1 - Linking Delay Announcements, Loss Aversion, and Abandonment: A Behavioral Perspective**Eric M. Webb, Assistant Professor, Lindner College of Business,  
University of Cincinnati, Cincinnati, OH, United States,  
Qiuping Yu, Kurt M. Bretthauer

Using field data from a call center, we study the behavioral determinants of customers' queue abandonment decisions in the presence of delay announcements. Customers exhibit loss aversion with respect to time losses in queue, becoming much more likely to abandon if forced to wait longer than expected. We test the robustness of loss aversion across multiple announcements, customer class types, and functional forms of loss aversion. In addition, we study the effect of the queue experience on the time in service for those customers who do not abandon.

**2 - The Impact of Economic Drivers on Gig Economy Workers: Structural Estimation Approach**Gad Allon, University of Pennsylvania, 3730 Walnut Street,  
Philadelphia, PA, 19104, United States, Park Sinchaisri,  
Maxime Cohen

While gig economy firms benefit from increased labor flexibility, ensuring that their services appeal to independent providers poses a great challenge in planning and committing to a service capacity. We study how on-demand workers make labor decisions: when to work and for how long? Our project is in collaboration with a ride-hailing company with the goal to not only improve the way of predicting the number of active drivers, but also understand how to better recruit them, as a way to match supply and demand. We use a structural estimation approach to study how drivers respond to different incentives.

**3 - Last Place Aversion in Queues**Ryan Buell, Harvard Business School, Morgan Hall 429, Boston,  
MA, 02163, United States

This paper investigates whether people exhibit last place aversion in queues and its implications for their experiences and behaviors in service environments. A combination of field and lab evidence reveals that waiting in last place diminishes wait satisfaction while doubling the probability of switching and quadrupling the probability of abandoning queues. This behavior is partially explained by the inability to make a downward social comparison; namely, when no one is behind a queuing individual, that person is less certain that continuing to wait is worthwhile. The results also demonstrate how queue transparency is an effective design lever for reducing last place aversion in queues.

**4 - History Based Priority Policies**Brett Hathaway, UNC Chapel Hill, 1800 Baity Hill Drive #310,  
Chapel Hill, NC, 27514, United States, Seyed Morteza Emadi,  
Vinayak V. Deshpande

We study the behavior of callers in a banking call center. Using a latent class decision model, we estimate that callers differ in their abandonment and redialing behavior based on intrinsic heterogeneity in their behavior and their unique histories of waiting times and decisions with the call center. We introduce a class of policies where callers are prioritized based on our model's predictions of their behavior, which depend on their history. We find that under history-based policies this call center could reduce average waiting times by 10 percent while increasing sales opportunities by 3 percent.

**APS Session Reed**

Sponsored: Applied Probability

Sponsored Session

Chair: Joshua Reed, New York University, New York, NY, 10012, United States

**1 - A Dirichlet Process Characterization of RBM in a Wedge**Josh Reed, NYU, New York, NY, United States, Peter Lakner,  
Bert Zwart

We prove that in the case of  $1 < \alpha < 2$ , RBM in a wedge is a Dirichlet process. Specifically, its unique Doob-Meyer type decomposition is given by  $Z = X + Y$ , where  $X$  is a two-dimensional Brownian motion and  $Y$  is a continuous process of zero energy. Furthermore, we show that for  $p > \alpha$ , the strong  $p$ -variation of the sample paths of  $Y$  is finite on compact intervals, and, for  $0 < p \leq \alpha$ , the strong  $p$ -variation of  $Y$  is infinite on  $[0, T]$  whenever  $Z$  has been started from the origin. We also show that  $(Z, Y)$  satisfies the extended Skorokhod problem for  $X$ .

**2 - Asymptotic Analysis of Multiclass Queues with Random Order of Service**Mohammadreza Aghajani, University of California San Diego,  
9500 Gilman Drive # 0112, La Jolla, CA, 92093, United States

Queueing models under Random order of Service (ROS) policy have been used to study molecular interactions of intracellular components in biology. However, these models often assume exponential distributions for processing and patience times, which is not realistic. We study a multiclass queueing model under ROS with reneging and generally distributed processing and patience times. We use measure-valued processes to describe the dynamic evolution of the network, and establish a fluid and diffusion approximations for this representation. These limits are characterized by deterministic and stochastic non-linear Partial Differential Equations, whose analysis requires new techniques.

**3 - Ergodic Control of a Class of Jump Diffusions with Finite Levy Measures and Rough Kernels**Yi Zheng, The Pennsylvania State University, State College, PA,  
United States, Ari Arapostathis, Luis Caffarelli, Guodong Pang

We study the ergodic control problem for a class of jump diffusions in  $\mathbb{R}^d$ , which are controlled through the drift with bounded controls. The Levy measure is finite, but has no particular structure. Unstable behavior is 'discouraged' by the running cost which satisfies a mild coercive hypothesis. We first study the problem as an optimization problem on the space of infinitesimal ergodic occupation measures, and derive the Hamilton-Jacobi-Bellman equation, including verification of optimality results, using only analytical arguments. We also examine the regularity of invariant measures. Then, we address the jump diffusion model, and obtain a complete characterization of optimality.

**4 - Existence and Uniqueness of Obliquely Reflecting Diffusions in Cusps**Cristina Costantini, University of Chieti-Pescara, Pescara, Italy,  
Thomas G. Kurtz

In a 2009 paper, Kang, Kelly, Lee and Williams proposed a diffusion approximation for the workload process in a model for a network operating under a weighted a-fair bandwidth sharing policy. For  $\alpha < 1$  the diffusion approximation cannot be proved because the diffusion state space presents cusp-like singularities and suitable uniqueness results are not available. We prove weak existence and uniqueness for a semimartingale reflecting diffusion in a 2-dimensional cusp, with a varying oblique direction of reflection on each side, under the only assumption that there exists a vector that has positive scalar product with the common tangent to the two sides and with the two directions of reflection at the tip.

**Machine Learning and Applied Probability**

Sponsored: Applied Probability

Sponsored Session

Chair: Daniel Russo, Columbia University, New York, NY,

**1 - Optimal Hardness of Questions in Static and Interactive Exams**Sandeep Juneja, Tata Institute of Fundamental Research,  
Homi Bhabha Road, Mumbai, Maharashtra, 400005, India,  
Achal Bassamboo, Assaf Zeevi

We consider the problem of designing a perfect exam, one that minimizes the mis-classification or mis-grading probability. We consider both static as well as interactive exams. Student's probability of success in a question is modelled as an increasing function of her ability and decreasing function of question hardness. Ability itself may be a random variable. We use pure exploration Bandit framework to develop sample complexity lower bounds. We also develop algorithms whose computational effort matches the dominant term in the lower bounds.

**2 - Distributional Robustness in Machine Learning: Statistical and Computational Guarantees**Hongseok Namkoong, Stanford University, Stanford, CA,  
United States

We study distributionally robust approaches to statistical learning, and provide finite-sample and asymptotic results characterizing the theoretical performance of the estimator. We also develop efficient solution methods for such approaches, and empirically verify that distributional robustness is a valuable approach in a number of machine learning applications where reliability is a key concern. Our approach learns the tails of the distribution, hedges against potential covariate shifts, promotes fairness across demographics, and provides robustness against adversarial attacks.

**3 - Distributionally Robust Optimal Bidding in First-Price Auctions**

Jose Blanchet, Stanford University, Stanford, CA, United States

Until recently, second price auctions overwhelmingly dominated the market making mechanics in online advertising, but there is a clear trend in which online advertising exchanges are using first-price auctions (and other types of mechanisms) for market making. Optimal bidding in these types of auctions requires highly detailed knowledge on the bidder's competitive landscape, making it extremely challenging for Demand Side Platforms (or DSPs) to manage strong campaigns on behalf of the advertisers. So, distributionally robust optimization (DRO) is particularly well-suited in this setting. We introduce a framework based on DRO which is simple, interpretable and provides reasonable bidding policies which are well-suited for DSP use.

**4 - Sample-based Optimal Pricing**

Amine Allouah, Columbia University, New York, NY, 10027, United States, Omar Besbes

We study the problem of optimal pricing to sell one indivisible good to a buyer, when facing limited information about the willingness-to-pay distribution. In particular, we characterize optimal performance based on a single sample.

**SC40**

**Stochastic Models and Control**

Sponsored: Applied Probability

Sponsored Session

Chair: Rami Atar, Technion, Technion, Haifa, 32000, Israel

**1 - Some Notions of Minimality for Resource Sharing Networks and their Fluid Models**

Lukasz Kruk, Maria Curie-Skłodowska University, Lublin, Poland

We consider real-time stochastic resource sharing networks with soft customer deadlines and arbitrary topology. For such systems, we introduce several notions of pathwise minimality and we discuss their relations to the Earliest-Deadline-First service discipline. We also mention some counterparts of these minimality concepts for fluid models of resource sharing networks.

**2 - Large Deviations for M/M/1 Queue with Abandonment and Long-time Analysis**

Ruoyu Wu, University of Michigan, Ann Arbor, MI, United States, Rami Atar, Amarjit Budhiraja, Paul Dupuis

We consider M/M/1 queue with abandonment according to exponential clocks. A large deviation principle is established for the queue length and total abandonment processes. We study the exponential decaying rate, and its long-time asymptotics, of the probability that there are more abandonment than the law of large numbers limit. Discussions on analyzing related risk sensitive control problems and large deviation bounds of G/G/1 queue with abandonment, using variational formula of the Renyi divergence, are also provided.

**3 - A Fluid Limit for an Overloaded Multi-class Many-server Queue with General Reneging Distribution**

Amy R. Ward, University of Southern California, Marshall School of Business, Bridge Hall BRI 401H, Los Angeles, CA, 90089-0809, United States, Amber L. Puha

We study scheduling in a many server queue with general reneging distribution ( $G/G/N+G$ ) and multiple customer classes. Motivated by the goal to formulate and analyze a fluid control problem, we specify a class of admissible control policies (rules for determining when to serve a given customer class), formulate a fluid model, and characterize the invariant states. Static priority policies do not capture the entire spectrum of invariant states, and so we introduce a set of control policies, called Random Buffer Selection (RBS) that do. We prove that a suitably rescaled state descriptor for the queue operating under specified RBS policy converges to the unique fluid model solution for that RBS policy.

**4 - Subgeometric Ergodicity of Levy Driven SDEs Arising from Multiclass Many Server Queues**

Ari Arapostathis, University of Texas at Austin, Austin, TX, USA, Guodong Pang, Nikola Sandric

We study a class of multidimensional piecewise Ornstein-Uhlenbeck processes with jumps, which contains limiting diffusions arising in multiclass many-server queues subject to heavy-tailed arrivals and/or asymptotically negligible service interruptions in the Halfin-Whitt regime as special cases. We identify conditions on the parameters in the drift, the Levy measure and/or covariance function which result in subexponential and/or exponential ergodicity. We show that these assumptions are sharp, and we identify some key necessary conditions for the process to be ergodic. In addition, we show that for the queueing models described above with no abandonment, the rate of convergence is polynomial, and we provide a sharp quantitative characterization of this rate via matching upper and lower bounds.

North Bldg 226C

**Preferences in Project Evaluation and Selection**

Sponsored: Decision Analysis

Sponsored Session

Chair: Enrico Diecidue, INSEAD, Fontainebleau Cedex, 77305, France

**1 - Net Present Value Analysis of Projects under Expected Utility**

Manel Baucells, University of Virginia, Darden School of Business, 100 Darden Boulevard, Charlottesville, VA, 22903, United States, Samuel Bodily

The traditional decision-analytic approach to evaluate projects is to calculate the expected utility of initial capital plus net present value. The choice of discount rate, and the convergence with the traditional finance approach, have always been a question. Our goal is to fill this gap. Under assumptions compatible with the CAPM model, we find a convenient rate to discount portfolio capital (treasuries, stocks, and the project). We also cater to practitioners, who discount the cash flows of the project, and ignore the market uncertainty. For them, we propose an adjusted discount rate that correctly compensate for the omission.

**2 - Probability Dominance**

Enrico Diecidue, INSEAD, Boulevard De Constance, Fontainebleau Cedex, 77305, France

We test whether a simple heuristic of maximizing the probability of being ahead, probability dominance (PD), affects decisions under risk. We set up head-to-head situations where all preferences of a given class (expected utility, prospect theory, or regret theory) are for one alternative yet PD favors the other. Our experiments reveal that: the majority of choices are aligned with PD in contradiction to any form of expected utility maximization, prospect theory preferences, and regret theory. We conclude that probability dominance affects choices, and should therefore be incorporated into decision making models. We quantify a lower bound on its weight in the decision-making process.

**3 - Optimal Switching Between Projects with Different Profitability and Uncertainty Characteristics**

Tord Olsen, PhD Student, Norwegian University of Science and Technology, Alfred getz vei 3, Trondheim, 7491, Norway, Verena Hagspiel

We consider a firm with an investment opportunity to introduce a new product, where the profit is modelled as a geometric Brownian motion, and the drift and volatility of the underlying process changes after investment. We find that under the assumption of a concave profit function, the conventional insight of investment under uncertainty, that an increase in uncertainty delays investments, might not hold if the characteristics of the stochastic process changes after the investment. Further, we show that a case with a boost in the profit function under constant parameters of the stochastic process can be transformed to a case of constant profit function with changes to the underlying process.

**4 - Decomposition of Sensitivity Analysis for Problems with Correlated Inputs**

Warren Joseph Hahn, The University of Texas at Austin, McCombs School of Business, 217 Grant Cannon Lane, Austin, TX, 78738, United States, Tianyang Wang, James Dyer

The state of the art for sensitivity analysis of decision making problems with dependencies between input variables are fully probabilistic techniques which simultaneously vary all input variables. However, much of the intuition desired from sensitivity analysis is not provided with these methods because they do not isolate the marginal effects of the individual variables. In this paper, we present an approach that provides results that are identical to those from a fully-probabilistic sensitivity analysis, but which also decomposes the sensitivity to each individual input variable into its marginal dependence-constrained sensitivity and its sensitivity due to dependence with other inputs.

### Agent Based Simulation in Healthcare

Sponsored: Simulation

Sponsored Session

Chair: Chao Meng, Valdosta State University

#### 1 - Data Analytics Integrated Simulation for Older Adults Healthcare Utilization Modeling and Evaluation under Multi-type Settings

Xuxue Sun, University of South Florida, 4202 E. Fowler Ave., ENB 118, Tampa, FL, 33620, United States, Chao Meng, Nan Kong, Hongdao Meng, Kathryn Hyer, Mingyang Li

To meet the ever-increasing healthcare demand of America's older adults with the limited and costly healthcare resources, there is a pressing need to investigate how a heterogeneous population of older adults will influence the utilization of different healthcare settings, such as acute care and long-term care facilities. In this work, advanced Bayesian data analytics is integrated with the simulation techniques to jointly model and evaluate both hospital and nursing home healthcare utilization. Real case studies based on Florida's Medicare and Medicaid claims data are studied to demonstrate the effectiveness of the proposed framework.

#### 2 - Multi-agent Based Hybrid Adaptive Training System for Functional Endoscopic Sinus Surgery (FESS)

Saurabh Jain, University of Arizona, Tucson, AZ, 85719, United States, Seunghan Lee, Samuel Barber, Eugene Chang, Young-Jun Son

Multi-Agent Simulation has been widely adopted for training programs. In Otolaryngology, FESS benefits from simulation due to steep learning curves to decrease operative risks and time. We propose a multi-agent task planning framework with adaptive feedback based on real-time evaluation of trainee's surgical proficiency in a virtual environment. This system encapsulates cost-effectiveness, high-fidelity and optimal computation guided by real-time responses.

#### 3 - Hospital Supply Chain Network Design using Agent Based Simulation

Sojung Kim, Texas A&M University-Commerce, P.O. Box 3011, Engineering & Technology, Commerce, TX, 75429-3011, United States, Karli Thornton

This study aims at developing a hospital supply chain using agent-based simulation (ABS) to minimize the total operational cost. Since ABS includes multiple agents making decisions based on their perception processes, it can accurately model a realistic healthcare supply chain environment. Three agents such as consumers, distribution centers, and hospitals are developed under AnyLogic® ABS software with a healthcare supply chain data in Montana, USA. In addition, OptQuest® in AnyLogic is used as an optimization engine to find the appropriate locations of distribution centers in a hospital supply chain network.

### Advances in Integrated Assessment Modeling

Emerging Topic: Energy and Climate

Emerging Topic Session

Chair: Yongyang Cai, Ohio State University, OH, United States

#### 1 - Using Integrated Models to Value the Use of Bulk Energy Storage for Reducing CO2 Emissions from Regional Electricity Systems

Jeffrey M. Bielicki, Ohio State University, Hitchcock Hall, 2070 Neil Avenue, Columbus, OH, 43210, United States, Jonathan D. Ogland-Hand, Yaoping Wang, Benjamin M. Adams, Thomas A. Buscheck, Martin O. Saar

Bulk energy storage (BES) can reduce CO2 emissions by increasing the utilization of variable wind and solar electricity capacity. BES could thus have value to reducing system-wide CO2 emissions. We integrated process-level modeling with a systems-level optimization model to estimate this value for CO2-Geothermal Bulk Energy Storage, Compressed Air Energy Storage, and Pumped Hydro Energy Storage. Our results suggest that the value of BES to reducing CO2 emissions can exceed the operating costs of BES, but BES deployment does not always reduce CO2 emissions: the dispatch order, the net load, and the BES technology all influence how BES changes system-wide CO2 emissions.

#### 2 - DRFEWS: A Dynamic Regional Integrated Framework of Food, Energy and Water Systems

Shaohui Tang, The Ohio State University, 2120 Fyffe Rd., Columbus, OH, 43210, United States, Yongyang Cai, Brian Cultice, Yaoping Wang, Jeffrey Bielicki, Randall Alan, Ian Sheldon, Elena Irwin

We build a new integrated Dynamic Regional Food, Energy, Water Systems (DRFEWS) modeling framework that incorporates key economic elements and environmental linkages. The framework represents the regional production of food and energy services that use land, water, energy resources and that depend on farmer behavior and watershed dynamics. It accounts for environmental impacts from regional production and the effects of exogenous changes in uncertain national and global conditions (e.g., trade war, climate change) on the regional FEWS. We apply the model to the Great Lakes region to simulate its regional FEWS dynamics over time.

#### 3 - Climate Policy under Cooperation and Competition between Regions with Spatial Heat Transport

Yongyang Cai, Ohio State University, Columbus, OH, United States, William Brock, Anastasios Xepapadeas, Kenneth Judd

We build a novel stochastic dynamic regional integrated assessment model (IAM) of the climate and economic system including a number of important climate science elements that are missing in most IAMs. These elements are spatial heat transport from the Equator to the Poles, sea level rise, permafrost thaw and tipping points. We study optimal policies under cooperation and various degrees of competition between regions. Our results suggest that when the elements of climate science which are accounted for in this paper are ignored, important policy variables such as the social cost of carbon and adaptation could be seriously biased.

### Algorithms for Power Systems

Sponsored: Energy, Natural Res & the Environment/Electricity

Sponsored Session

Chair: Richard Zhang, UC Berkeley, Berkeley, CA, 94709, United States

Co-Chair: Somayeh Sojoudi, University of California, Berkeley, Berkeley, CA, 94703, United States

#### 1 - ARPA-E Grid Optimization Competition

Kory W. Hedman, Program Director, Advanced Research Projects Agency-Energy, Washington, DC, United States

This talk will give background information regarding the Advanced Research Projects Agency-Energy (ARPA-E) and related efforts in the areas of energy systems and operations research. The goal of ARPA-E's Grid Optimization (GO) Competition is to challenge the research and industrial communities to develop transformational and disruptive methods for solving power system optimization problems, including the security-constrained AC optimal power flow (SCOPF), a non-convex optimization problem. More information can be found at: <https://gocompetition.energy.gov/>.

#### 2 - Efficient Computational Methods for Optimal Power Flow, State Estimation and Topology Error Detection

Javad Lavaei, University of California, Berkeley, 4141 Etcheverry Hall, Berkeley, CA, 94720, United States

Power optimization problems are nonlinear and subject to modeling errors. In this talk, we develop efficient mathematical techniques based on both conic optimization and local search algorithms to solve fundamental power operational problems with guarantees. We test our techniques on various real-world systems.

#### 3 - Sparse Semidefinite Programs with Near-linear Time Complexity

Richard Zhang, UC Berkeley, 621 Sutardja Dai Hall, University of California, Berkeley, CA, 94709, United States

Some of the strongest polynomial-time relaxations to NP-hard problems are semidefinite programs (SDPs), but their high solution complexities limits their use. Given that SDP relaxations are often sparse, a technique known as chordal conversion can sometimes reduce complexity substantially. In this paper, we describe a modification of chordal conversion that allows any general-purpose interior-point method to solve a certain class of sparse SDPs with a guaranteed complexity of  $O(n^{1.5})$  time and  $O(n)$  memory. To illustrate the use of this technique, we solve the AC optimal power flow relaxation (ACOPF) on power system models with up to  $n = 13659$  nodes in 5 minutes, using SeDuMi on a standard laptop.

#### 4 - Statistical Analysis of PMU Data

Daniel Bienstock, Columbia University, Dept of IEOR, 342 Mudd, New York, NY, 10027, United States

We describe ongoing work using PMU data obtained through an industrial collaboration, focusing on structural analysis. Another facet of the research involves fast estimation of principal components of covariance matrices (i.e., streaming PCA). This is joint work with Mauro Escobar and Apurv Shukla (Columbia) and Michael Chertkov (LANL).

**Environmental and Social Impacts of Power System Expansion Investments**Sponsored: Energy, Natural Res & the Environment/Electricity  
Sponsored Session

Chair: Enzo E. Sauma, Pontificia Universidad Catolica de Chile, Santiago, Chile

**1 - A Mechanism for Allocating Benefits and Costs from Transmission Interconnections under Cooperation: A Case Study of the North Sea Offshore Grid**

Francisco Munoz, PhD, Universidad Adolfo Ibañez, Santiago, Chile, Martin Kristiansen, Shmuel S. Oren, Magnus Korpas

We propose a generic mechanism to allocate these benefits among neighboring countries that are willing to reach a cooperative agreement to support a set of cost-efficient projects. Our mechanism is based on a planning model that considers generation investments as a response to transmission developments and the Shapley Value from cooperative game theory. Conveniently, this method provides a unique allocation that a) satisfies an axiomatic definition of fairness and b) considers each country's expected marginal contribution to the cooperative agreement. We demonstrate our results for three planned cross-border transmission projects in the North Sea. <!--EndFragment-->

**2 - Graphical Models for Transmission Expansion Planning**

David Pozo, PhD, Skolkovo Institute of Science and Technology, Moscow, Russian Federation, Ivan Zorin

Transmission Expansion Planning (TEP) should account for the possible futures foresight of parameters such as demand's growth, level of renewables' penetration or cost of primary energy resources. Although the TEP solution should accommodate to any possible realization of uncertainties, the decision has to be made beforehand. Therefore, TEP problem should thoughtfully recognize all potential uncertainties, via experts' knowledge and forecasting tools. However, finding distributions for uncertain parameters is a hard problem too. Our proposed approach to addresses the TEP problem as a combination of graphical models and mathematical optimization techniques.

**3 - Environmental Impact on the Development of the Expansion of Power Transmission**

Enzo E. Sauma, Pontificia Universidad Catolica de Chile, Ave. Vicuna Mackenna 4860, Santiago, Chile, Carlos Matamala, Rodrigo Moreno

We develop a model for expanding the capacity of the electrical system that co-optimizes the expansion planning of generation and transmission and considers different levels of coordination among market agents. Using this model, we study the influence of environmental and social externalities in the planning of the expansion of power transmission. We show there may be significant interactions between the environmental and social externalities and the development of the power transmission expansion.

**4 - Economic Externalities in Transmission Network Expansion Planning**

Javier Contreras, Univ de Castilla-La Mancha, E. T. S. de Ingenieros Industriales, Campus Universitario, Ciudad Real, 13071, Spain, Hans Alayo, Marcos J. Rider

Since opportunity costs in transmission and generation capacity are dependent, externalities arise when investment decisions are decentralized. When generation and transmission investment decisions are made separately, generation investment introduces negative externalities to transmission planning. A centralized multistage stochastic model is formulated for finding the Pareto optimal solution of investments in transmission and generation capacity. Using the model, we show some examples of externalities in transmission planning for the IEEE 24-bus test system and the Peruvian system.

## ■ SC46

North Bldg 228B

**Distributed Energy Resources**Sponsored: Energy, Natural Res & the Environment/Energy  
Sponsored Session

Chair: Andrea Staid, Sandia National Labs, Albuquerque, NM, 87108, United States

**1 - Practical Challenges in Real-time Optimization of Distributed Energy Resources**

Cesar A. Silva-Monroy, Senior Scientist, EnerNOC, 24001 East Mission Ave. Suite 102, Liberty Lake, WA, 99019, United States

Distributed Energy Resources (DERs) offer tremendous potential for increasing the flexibility and resilience of the grid. DERs can help utilities and grid operators to cost-effectively manage electricity demand growth, congestion, power quality, and reserve allocation. DERs can also increase reliability while reducing electricity costs for end consumers. In this presentation we will review typical Behind-The-Meter (BTM) value streams found in DER optimization applications from an aggregator or energy manager perspective. We'll then discuss practical challenges that arise when deploying real-time optimization in BTM applications and offer insights on how to address some of them.

**2 - Resources in the MIP Gap of Near-optimal RTO-scale Unit Commitment Solutions**

Brent Eldridge, Johns Hopkins University, 811 Park Ave. #5, Baltimore, MD, 21201, United States

Electricity markets schedule resources by solving a large-scale mixed integer program called the unit commitment (UC) problem. Due to the size of the market, UC is almost never solved to a provably optimal solution. It is instead solved to satisfy an optimality gap that may be larger than small distributed resources which are expected to be more prevalent in the coming decades. This presentation discusses arbitrariness and consistency of resource profitability in near-optimal integer solutions and how these issues are affected by new pricing methods. Preliminary results for a large-scale unit commitment problem are presented.

**3 - Distributed Resources and Complications for System Planning**

Andrea Staid, Sandia National Laboratories, Albuquerque, NM, 87108, United States, Anya Castillo, Jean-Paul Watson

Distributed energy resources, such as rooftop solar, are growing quickly. Utility companies and grid operators often have limited visibility into these resources, and obtaining accurate energy production forecasts for uncertain resources is challenging. Here, we evaluate the impact of the quality of information available to operators in terms of capacity and forecast quality on overall grid operations. We also study the differences in forecast error by resource type to determine the impacts of growing distributed capacities in system planning.

**4 - Stochastic Optimization with Risk Aversion for Virtual Power Plant Operations**

Anya Castillo, Sandia National Laboratories, MS 1027, P.O. Box 5800, Albuquerque, NM, 87185-1027, United States

Sandia National Laboratories undertook a three-year research program to create the components of a real-world secure, virtual power plant (VPP) that could simultaneously participate in multiple markets. We determine optimal offers using a rolling horizon control that solves a two-stage stochastic program (SP) with risk aversion for each day-ahead and real-time problems. Real clear sky and cloudy sky results indicate that the overall risk exposure for each offer strategy can enable the VPP operator to hedge against the volatility introduced by aggregating renewable DERs.

North Bldg 229A

**Behavioral Challenges in Policy Analysis with Conflicting Objectives**

Emerging Topic Session

Chair: Margaret M. Wiecek, Clemson University, Mathematical Sciences Dept, Clemson, SC, 29634-1907, United States

**1 - Behavioral Challenges in Policy Analysis with Conflicting Objectives**

Gilberto Montibeller, Loughborough University, School of Business & Economics, Loughborough, LE11 3TU, United Kingdom

Public policy problems are rife with conflicting objectives: efficiency versus fairness, technical criteria versus political goals, costs versus multiple benefits. Multi-Criteria Decision Analysis provides robust methodologies to support policy makers in making tough choices and in designing better policy alternatives when considering these conflicting objectives. However, there are important behavioral challenges in developing these models. Policy analysis works with groups of policy makers, modeling their decision, facilitating their discussions, and representing preferences and priorities. The overarching goal is to improve decision processes and provide support to evidence-based decision making, taking into account public priorities and the inherent uncertainties that long term horizons and complex systems present. Key challenges in those interventions are the use of expert judgments, whenever evidence is not available, the elicitation of preference and priorities from policy makers and communities, and the effective management of group decision processes. Human behavior has a major influence on each of these challenges: experts might be biased in their estimates, individuals may be unable to express clearly their preferences, and groups may present dysfunctional dynamics. Extensive developments in behavioral decision research, social psychology, facilitated decision modeling, and incomplete preference models shed light on how decision analysts should address these issues to provide better decision support and develop high quality decision models. This tutorial discusses the main findings of these extensive, but rather fragmented, literatures. These guidelines are illustrated using policy analysis interventions conducted over the last decade for several organizations, such as the evaluation of capabilities of health systems against rabies for the World Health Organization (WHO), the prioritization of low moisture foods for the Food and Agriculture Organization of the United Nations (FAO), the assessment of bio-security threats for the UK Department of Environment Food and Rural Affairs (DEFRA), the evaluation of malaria treatment kits for the Malaria Consortium/USAID, and the prioritization of value-for-money studies for the UK National Audit Office.

**Forest Management and Conservation**

Sponsored: Energy, Natural Res &amp; the Environment Forestry

Sponsored Session

Chair: Jordi Garcia-Gonzalo, Forest Sciences Centre of Catalonia (CTFC), Ctra St Lloren de Morunys km2, Solsona, 25280, Spain

**1 - PRISM - Harvest Scheduling using the 2012 Planning Rule**

David Anderson, USDA Forest Service, Albuquerque, NM, United States, Dung Nguyen, Eric Henderson, Yu Wei

The US Forest Service developed the Spectrum software in the mid 1990's to help determine estimates of sustainable timber harvest volume as required by the 1976 National Forest Management Act. In the ensuing years the computing environment has changed. Additionally the 2012 Planning Rule updated the US Forest Service's interpretation of the Act. The Northern Region in collaboration with Colorado State University developed a new linear programming model generator called PRISM to address these changes. PRISM uses a hybrid Model I and Model II formulation with a goal programming objective. The software uses an open source philosophy. Interface design and results from two Forest Plans are shown.

**2 - Prioritizing Restoration of Fragmented Landscapes for Wildlife Protection: A Graph-theoretic Approach**

Denys Yemshanov, Natural Resources Canada, 1219 Queen Street East, Sault Ste. Marie, ON, P6A2E5, Canada, Robert G. Haight, Frank Koch, Mark-Andre Parisien, Tom Swystun, Barber Quinn, Cole Burton, Ning Liu, Salimur Choudhury

Restoring habitat connectivity is critical for wildlife conservation in fragmented landscapes. We propose a network-based habitat restoration model with connected area requirements and a budget constraint. The MIP formulation shares some similarities with a budget-constrained Generalized Steiner Network problem. The objective is to determine restoration strategies that maximize the connected habitat capacity accessible to a wildlife species in a fragmented landscape. We apply the model to habitat restoration for woodland caribou in boreal forest in Cold Lake area, Alberta, Canada.

**3 - Acceptance Sampling for Surveillance of Forest Pests**

Robert G. Haight, US Forest Service, 1992 Folwell Ave, Saint Paul, MN, 55108, United States, Denys Yemshanov, Robert Venette, Cuicui Chen, Ning Liu, Frank H. Koch, Christian MacQuarrie, Krista Ryall

Surveillance of forest pests helps foresters plan for pest control. We use acceptance sampling to delimit the extent of an infestation. The forester identifies potential survey sites and chooses the number of trees to inspect in each site given its tree density, infestation rate, and detection rate. If one or more trees in the sample is infested, the site is subject to pest control. The objective is to allocate a fixed survey capacity to sites to maximize the number of detected infested sites subject to an upper bound on the expected number of undetected infested trees. We formulate this objective as a MIP problem and apply it to surveillance of emerald ash borer, a destructive forest pest in Winnipeg, Canada.

**4 - Modelling and Solving Biodiversity Conservation Plans under Uncertainty**

Jordi Garcia-Gonzalo, Forest Sciences Centre of Catalonia (CTFC), Solsona, 25280, Spain, Eduardo Ivarez-Miranda, Andres P. Weintraub, Virgilio Hermoso, Jose Salgado-Rojas

Limited conservation budgets require prioritizing which management actions to implement and where to maximize the long-term persistence of biodiversity. Modelling this problem considering multiple species and actions is not an easy task. In addition, there is uncertainty in the data use for modelling and solving this problem (e.g. presence of the species, response to the action...). We propose a MIP-based framework for modeling and solving this problem. We seek for plans that maximize expected ecological benefit while minimizing spatial fragmentation and considering budget restrictions.

**Supply Chain Planning in the Petrochemicals Sector**

Sponsored: Energy, Natural Res &amp; the Environment/Natural Resources Petrochemicals

Sponsored Session

Chair: Ethan Malinowski, SUNY-Buffalo, Buffalo, NY, 14216, United States

**1 - Dynamic Programming Approach for Maintenance Operations Budgeting**

Alcides Santander-Mercado, Associate Professor, Universidad del Norte, km 5 v a Puerto Colombia, Barraquilla, Colombia, Catalina Torres-Diaz

Budgeting in industrial maintenance operations has been approached using forecasting methods and machine live cycle techniques. However, it is commonly ignored how the cost change overtime due technology upgrades, labor or availability of replacement parts. The comprehensive analysis of the maintenance cost and the new technology offered by their suppliers will help managers to decide whether continue with the original maintenance plan, draw by the manufacturer, or replace the machine. This research presents a Dynamic Programming approach to address the budgeting of maintenance operations, including a case study related to an application of this approach in a chemical company.

**2 - Supply Chain Planning for Production Networks with Highly Flexible Modular Plants**

Tristan Becker, Ruhr University Bochum, Bochum, Germany, Stefan Lier, Brigitte Werners

Modular production concepts are investigated to meet increased variability of product demands in process industries. Modular plants consist of standardized process modules, installed in containers, which allow for quick assembly, disassembly and relocation of production plants. Depending on the combination of process modules, different production capabilities are associated with a production plant. We apply new mixed integer programming formulations for production network planning under consideration of the new flexibility options to a real-world case study from the chemical industry.

**3 - A Practical Approach to the Vehicle Routing Problem in Cylinder Gas Distribution**

Soma Toki, Tokyo Gas Co., Ltd., 1-5-20 Kaigan, Minato-ku, Tokyo, 105-8527, Japan, Naoshi Shiono, Eiji Murakami

Recently, companies can remotely monitor the quantity of daily propane usage and plan their daily distribution operations with communication devices. In the liquefied petroleum gas (LPG) logistics industry, it is desirable that delivery plans for a week or more are always prepared. Companies can prospect a quantity of the jobs in the future with this plan. But when a LPG company has much of the distribute destinations, it is unrealistic to calculate the plan in one time. The company is required to disperse or reduce the calculation load for making the plans. In this work, we introduce some approaches to install the software for one LPG distributor.

#### 4 - Packaged Gas Supply Chain Planning with SKU Rationalization: Customer-selection and Incentivization-based Methodologies

Ethan Malinowski, University at Buffalo (SUNY) Buffalo, NY, 14216, United States, Mark Henry Karwan, Lei Sun

We present a multi-component project, applying SKU rationalization (in the form of a variant of product substitution) towards a traditional supply chain planning problem including production, allocation, and distribution decisions. A customer-selection heuristic is developed and shown to perform very well compared to a full MILP formulation, which includes customer selection for substitution as an explicit decision. Lastly, incentivization strategies are studied in an effort to reduce lost demand via product substitution, while simultaneously ensuring adequate business profit.

Co-Chair: Carrie Beam, University of Arkansas, Walnut Creek, CA, 94596, United States

#### 1 - China National Petroleum

Zuo-Jun Max Shen, University of California Berkeley, 4141 Etcheverry Hall, Mail code 1777, Berkeley, CA, 94720-1777, United States

Abstract not available.

#### 2 - Turner Blazes a Trail for Audience Targeting on Television with Operations Research and Advanced Analytics

J. Antonio Carbajal, Turner Broadcasting System, Inc., Atlanta, GA, USA

Turner has designed and implemented innovative and integrated forecasting and optimization models that power audience targeting solutions disrupting decades-old paradigms and business processes in the media industry, and producing significant sales and advertisement efficiencies for Turner and its clients. Turner is on track to sell 50 percent of its inventory through audience targeting by 2020, representing billions in ad revenue.

#### 3 - Europcar Integrates Forecast, Simulation and Optimization Techniques in a Capacity and Revenue Management System

Europcar, Y, Aruba.

Europcar, the leading European car rental company, partnered with ACT Operations Research to create Opticar, a complex decision support system. Opticar features forecasts, discrete event simulations and optimization techniques providing an integrated approach to revenue and capacity management. Opticar anticipates future demand for Europcar's vehicles fleet, up to six months in advance, improving capacity management. In addition, Opticar enables Europcar to optimize its approach to revenue management and rental pricing, taking into account competitors information, the currently available fleet and expected demand for vehicles. Opticar provides a shared mathematical approach used as a starting point for all daily operations to nine Europcar's corporate countries.

North Bldg 231B

### Joint Session OMS/Practice Curated: Applications in Scheduling

Emerging Topic: Project Management and Scheduling,  
in Memory of Joe Leung,  
Emerging Topic Session

Chair: Rodrigo A. Carrasco, Ph.D., Universidad Adolfo Ibáñez, Santiago, Chile

#### 1 - A Scheduling Problem Motivated by Cybersecurity and Adaptive Machine Learning

Nourhan Sakr, Columbia University, New York, NY, 10027, United States, Clifford Stein, Ojas Parekh, Cynthia Phillips, Vladlena Powers

We consider a multiple-machine problem where each machine is associated with its predetermined sequence of jobs. A machine may start a new job if it is given a signal (a "take") to do so. A take is global across all machines. Given a fixed budget of takes, we schedule takes to minimize total idle time. This problem comes from a stochastic-programming exploration of a cybersecurity game. We

also find another interpretation that applies this problem to adaptive machine learning. We motivate and define the problem, give some preliminary complexity results, and discuss practical (in)tractability.

#### 2 - The Value of Flexibility in Bottling Operations in the Wine Industry under Sequence Dependent Setup Times

Alejandro Francisco Mac Cawley, Pontificia Universidad Católica de Chile, Vicuna Mackenna 4860, Santiago, 7820436, Chile, Sergio Maturana, Mauricio Varas

Wineries must optimize their bottling process and deal with many products to be processed, high-demand variability and sequence dependent setup times. Under these conditions, managers must generate scheduling plans. We look at flexible strategies such as the postponement of the labeling of bottled wines; to gain productivity in the process. We study the performance impact of implementing flexible strategies by developing a multi-stage mixed-integer stochastic programming model with full recourse for demand scenarios. Results show benefits of implementing flexible strategies under given capacity of the system, demand variability and setup times.

#### 3 - Scheduling Surgeries with Variable Times: The Value of More Data

Rodrigo A. Carrasco, Diagonal Las Torres 2640, Of. 532, Edificio C, Santiago, 7941169, Chile

Although operating room scheduling has been studied since the early 60's, dealing with surgery variability has been one of the main difficulties when implementing scheduling tools. In this work we present a way of incorporating such variability by using chance constraints to improve schedule performance. We develop specific constraints, through data analysis of real instances, which improve the schedule, reducing the need for overtime but without affecting the utilization significantly..

#### 4 - Bicriteria Job Scheduling with Split Lots

Rasaratnam Logendran, Professor, Oregon State University, School of Mech Industrial & Mfg Engr, Rogers Hall Rm 204, Corvallis, OR, 97331-6001, United States, Ayush R. Aryal

An algorithm, which incorporates tabu search into the framework of path relinking, is presented to solve a job shop scheduling problem, consisting of  $M = \{1, 2, \dots, m\}$  machines. Each job  $j \in J = \{1, 2, \dots, n\}$  consists of  $i(j)$  ordered operations. During an operation, a job is split or merged into  $k_i(j)$  split-lots. Each split-lot operation can be performed by a subset of machines in  $M$ . The production is discontinuous within a two-week planning horizon. The objective function focuses on minimizing a linear combination of weighted flowtime and weighted tardiness. Three initial solution finding mechanisms are used and their comparative performance in the algorithm is evaluated using various problem instances.

### Section Leaders & Research on Opinions and Facts

Emerging Topic: Social Media Analytics

Emerging Topic Session

Chair: Theodore T. Allen, Ohio State University, Columbus, OH, 43210-1271, United States

#### 1 - Determining Twitter Users Opinions using Research

Evan Munson, Air Force Institute of Technology, Wright Patterson AFB, OH, 45385, United States, Christopher M. Smith

The rise in popularity of social media has changed the World Wide Web from a static repository to a dynamic forum for anyone to voice their opinion across the globe. People have become increasingly used to sharing their opinions on social media platforms. Harvested data, analyzed for opinions and sentiment can provide insight into a population. This research utilizes Twitter data to examine the sentiment associated with tweets. An approach utilizing Latent Dirichlet Allocation topic modeling was utilized to differentiate between tweet topics. A lexicographical dictionary was then utilized to classify sentiment. This method provides insight into the sentiment contained within the Twitter data.

#### 2 - Comparative Analysis of Information Flow and Rumor Debunking and Spreading through Twitter During Hurricanes Harvey and Irma

Kyle Hunt, University at Buffalo, SUNY, 317 Bell Hall, Buffalo, NY, 14260, United States, Jun Zhuang

The topic of the comparative analysis of information flow and rumor debunking is studied both empirically and theoretically.

### 3 - Impact of Fake News and Ambiguity on the Equity Value of Social Media Platforms - Evidence from Twitter

Srikar Velichety, University of Memphis, Memphis, TN, 38111, United States, Utkarsh Shrivastava

We investigate the impact of Fake News and the ambiguity in its detection on the equity value of Social Media platforms. Using prior research, we develop hypotheses about the negative impact of fake news and ambiguity on the medium where it is incubated and propagated. We test these hypotheses using a large scale annotated dataset of real-world events posted to Twitter over a 140-day period. Using extended vector auto-regression, we estimate the impact of the presence of fake news and the ambiguity it causes on the short and long-term equity value of social media. Our results show that the presence of tweets about a single fake event is linked to a decrease in market return of the social media platform by 0.035% and increase the risk by 0.005%.

### 4 - Using DOE and Social Media to Spread Policy Information

Theodore T. Allen, Ohio State University, 210 Baker Systems, 1971 Neil Ave, Columbus, OH, 43210-1271, United States

We illustrate how experimental design can aid in directing social media campaigns to target voter types most receptive to policy information attitudinally and informationally. Both voter survey and google analytics experiments are studied together with resolution V designs and optimal alternatives. Issues relate to the environment, taxes, marijuana, and guns.

### Pricing and Equilibrium Finding in Combinatorial Markets

Sponsored: Auction and Marketing Design

Sponsored Session

Chair: Benjamin Lubin, Boston University, Boston, MA, 02215, United States

Co-Chair: Sven Seuken, University of Zurich, Zurich, 8050, Switzerland

#### 1 - Revealed Preference and Activity Rules in Dynamic Auctions

Oleg V. Baranov, University of Colorado-Boulder, 256 UCB, Boulder, CO, 80309, United States, Lawrence M. Ausubel

We provide a general treatment of activity rules in auctions: constraints that limit bidding in future rounds based on past bids. Traditional point-based activity rules are effective for homogeneous goods, but are simultaneously too strong and too weak for general environments. Rules operationalizing the generalized axiom of revealed preference (GARP) enable straightforward bidding. We prove they are the weakest rules that prevent weak axiom (WARP) violations while never producing “dead ends”. In addition, GARP rules are robust to limited amounts of learning. We also provide empirical examples where bidders generally comply with GARP and violations suggest strategic manipulation.

#### 2 - Adaptive Price Combinatorial Auctions

Benjamin Lubin, Boston University, School of Management, 595 Commonwealth Avenue, Boston, MA, 02215, United States, Sebastien Lahaie

We introduce a novel iterative combinatorial auction based on adaptive polynomial pricing. The mechanism starts with linear prices; then upon provably detecting that the current price structure cannot clear the market, expands the structure to guarantee progress. We provide theoretical and experimental evidence for the effectiveness of the design.

#### 3 - Spectrum Repacking in the Incentive Auction

Neil Newman, University of British Columbia, 1590 West 15th Avenue, Unit 5, Vancouver, BC, V6J 2K6, Canada, Kevin Leyton-Brown, Paul Milgrom, Ilya Segal

In 2016-17 the FCC conducted an “incentive auction” to repurpose radio spectrum from broadcast television to wireless internet. The auction yielded \$19.8 billion, \$10 billion of which was paid to broadcasters for voluntarily relinquishing their licenses. A crucial element of the auction design was the construction of a solver, dubbed SATFC, that determined whether sets of stations could be “repacked” in this way; it needed to run every time a station was given a price quote. To evaluate the impact of our solver, we built an open-source reverse auction simulator. We found that SATFC substantially outperformed other alternatives at national scale.

### 4 - Computing Bayes Nash Equilibria in Combinatorial Auctions

Sven Seuken, University of Zurich, Binzmuhlestrasse 14, Zurich, 8050, Switzerland, Vitor Bosshard, Benedikt Buenz, Benjamin Lubin

We present two new algorithms for computing symmetric pure epsilon-BNEs in CAs with continuous values and actions. We evaluate our algorithms in the well-studied LLG domain, against a benchmark of 16 CAs for which analytical BNEs are known. Furthermore, for CAs with quasi-linear utility functions and independently distributed valuations, we derive a theoretical bound on epsilon. Finally, we introduce the new Multi-Minded LLLGG domain with eight goods and six bidders and apply our algorithms to finding an equilibrium in this domain. Our algorithms are the first to find an accurate BNE in a CA of this size.

## ■ SC54

North Bldg 232B

### BOM Best Working Paper Competition

Sponsored: Behavioral Operations Management

Sponsored Session

Chair: Julie Niederhoff, Syracuse University, Syracuse University, Syracuse, NY, 13244, United States

#### 1 - Increased Transparency in Procurement: The Role of Peer-Effects

Ruth Beer, Indiana University, Bloomington, IN, USA, Ignacio Rios, Ruth Beer.

We study the effects of increased transparency in a setting where purchasing decisions are delegated to individual employees as opposed to being centrally managed by an organization. We develop a theoretical model which incorporates peer effects resulting from transparency and we show that there exists a spillover region where an employee is more likely to choose the expensive supplier when he observes that his peer did so. We confirm this finding with a laboratory experiment. We also find that employees whose decisions are observed are less likely to choose the expensive supplier, in line with what the social norm of appropriate behavior prescribes.

#### 2 - Private Information and Endogenous Matching in Supply Chains

Kyle Hyndman, University Texas-Dallas, Richardson, TX, USA, Andrew M. Davis

We investigate a supply chain setting where a supplier's cost may be private information (but they may disclose it) and buyers and suppliers may endogenously match into pairs. After forming pairs, the two parties engage in a dynamic bargaining setting. Suppliers always make less than theory predicts, whether their cost is known or private information. This effect is especially pronounced under private information for high cost suppliers, because buyers make more aggressive bargaining offers in such a setting. Thus, contrary to theory, a second result is that higher cost suppliers actually benefit from disclosing their private costs, in an effort to achieve a more favorable outcome while bargaining.

#### 3 - From Noise to Bias in Linked Supply Chain Decisions

Daniel Feller, Dartmouth College, Hanover, NH, USA, Jordan D. Tong

Researchers in Behavioral Operations Management have made considerable progress on documenting the random error inherent to human decision behavior and incorporating it into Operations Management models. However, the field is also fundamentally interested in managing processes, and comparably little work has studied how noisy behavior plays out in sequences of unique linked decisions. In this paper, we study the fundamental choose-forecast-invest task combination: a decision maker must (a) choose which product to sell, (b) make a demand forecast for the chosen product, and (c) make an investment decision for the chosen product. Through behavioral models and laboratory experiments, we show how adding unbiased random noise to the process leads to a downstream systematic bias of overinvestment. This bias arises due to the way that random noise is filtered through the sequence of linked decisions and statistical naivety on the part of the decision-maker. Random noise in the demand forecast increases the overinvestment bias, but random noise in the product choice actually decreases the bias. Consequently, under certain parameters, being less rational (i.e., more random) in product choice can actually yield higher profits. Tasks in which information requires greater human interpretation are shown to increase the bias. Finally, employing a task-decomposition approach, we examine when separating product choice and investment decision-making across different people can reduce the bias and improve performance.

#### 1 - NFL versus NCAA Football Decision Making Analysis

Stephen Hill, UNC Wilmington, United States

In this work in game win probability models are developed for NFL and NCAA football. These models are compared and then used to evaluate decision making approaches. Additionally, consideration is given to measuring in game win probability volatility.

#### 2 - Real-Time NBA Playoff Elimination

Mark Husted, Colorado School of Mines, 816 20th Street, Golden, CO, 80401, United States, Alexandra M. Newman, Eli Olinick

The NBA is divided into two conferences, each of which is comprised of fifteen teams, and the top eight teams from each conference compete in the playoffs. An integer-programming model determines when a team has been eliminated from the playoffs before the completion of the regular season. There are instances in which teams' winning percentages are tied. Ties are broken using seven independent criteria based on the number of teams tied. The results are published on the RIOT website so fans can follow their favorite teams' playoff standings. We compare the time at which (and day on which) these results are published to the NBA official standings; in many cases, RIOT notifies the public prior to the NBA.

#### 3 - Learning from Success and Failure at the Speed of Formula One

Michael A. Lapré, Vanderbilt University, 401 21st Avenue South, Nashville, TN, 37203, United States, Candace Cravey

KC, Staats and Gino (2013) found that surgeons learn from their own success and from others' failure. Unlike surgery, in Formula One racing, success is rare and competitive. Using data since Formula One started in 1950, we investigate driver learning from own experience and teammates' experience with both success and failure. We find that drivers learn from own success, teammates' success, as well as own car failures. We use characteristics of success to explain observed learning effects.

#### 4 - Maximizing National Hockey League Goal Differential through the Examination of Line Orders and Lengths

William Davis, Student, Slippery Rock University, Slippery Rock, PA, 16057, United States, Jacob Lindey

While graph theory and mathematical predictive measures rarely enter into dialogue with hockey, these are the very concepts that would provide National Hockey League managers with better chances of winning through more efficient ice time. We examine and implement these concepts to manipulate line orders and lengths to maximize goal differential for any given team. In addition, we break down our easy-to-use interface designed for managers.

#### 5 - A Classification and XML Framework for Round Robin Sports Timetabling Problems

Dries Goossens, Ghent University, Tweekerkenstraat 2, Gent, 9000, Belgium, David Van Bulck, Jorn Schonberger, Mario Guajardo

In the sports timetabling literature, most problems assume different constraints and objectives. Often, one specific case study is discussed, with an accompanying solution method. This lack of structure makes it hard to compare problem instances and to assess algorithmic performance. We present a 3-field classification scheme for round-robin sports timetabling problems. For the instance definition and its solution(s), we propose two XML-file-based templates and a C++-library (RobinX) to evaluate both files. We present a web application that should encourage exchanging instances and solutions, and eventually lead to more general insights.

#### 1 - The US Deceased-donor Organ Procurement and Utilization System

Diwakar Gupta, Professor, University of Texas, 2110 Speedway

Stop B6000, Austin, TX, 78712, United States

The annual supply of human organs in the US has been more or less stable in recent years. The demand has outstripped supply and the national waitlist continues to increase every year. This supply-demand imbalance leads to human suffering, failure to access transplantation, and waitlist deaths. Many Operations Researchers have focused attention on the national system of matching and prioritizing potential transplant recipients, which affects organ utilization. Some other works have focused on geographic disparities between supply and demand and suggested improvements via redesign. These efforts focus only on a subset of practices at both procurement and utilization ends of organ supply that result in reduced supply. This talk will describe current practices across the organ procurement and transplantation system that may benefit from OR models, present preliminary models, and suggest research opportunities.

#### 1 - Financial Incentives Under CPC+

Elodie Adida, University of California at Riverside, CA, United States, Fernanda Bravo

The Centers for Medicare and Medicaid Services have recently launched the Comprehensive Primary Care Plus (CPC+) initiative, aiming at improving primary care delivery by changing the way providers are paid for their services. CPC+ includes a capitation payment, a reduced fee per visit, as well as a performance-based payment incentive. Under this program, physicians are encouraged to use alternative care delivery methods (phone calls, e-visit, in-home nurse visits, etc.). We study how this payment system impacts providers' care delivery decisions, patient welfare and payer cost.

#### 2 - Sustainability Planning for Healthcare Information Exchanges

Tharanga Rajapakshe, Chelliah Sriskandarajah, Subodha Kumar, Arun Sen

We investigate a multi-period two-service model where a HIE offers (i) the healthcare information sharing service, and (ii) the supplier rebate program. Our proposed model is primarily based on our interactions with a number of HIE providers in Texas. First, we present structural properties and equilibrium solution for our model. Then, based on extensive computational experiments, we present several useful managerial insights for the HIE provider as well as the policy-makers.

#### 3 - Coordinated Care for Mental and Physical Health

Sandeep Rath, University of North Carolina at Chapel Hill - Kenan Flagler, CB #3490, McColl Building, McColl 4705, Chapel Hill, NC, 27599, United State, Jayashankar M. Swaminathan

Multiple clinical trials have demonstrated the benefits of coordinating treatment of mental health conditions like depression and chronic physical conditions like diabetes. However, sustainability of coordinated care outside trial settings has not been fully demonstrated. A sustainable coordinated care will be revenue neutral for the providers and improve patient outcomes. Towards this, we propose a mathematical optimization model which would optimize care management plans to improve patient outcome while balancing revenue and resource usage costs.

#### 4 - Estimating Patient Flow Models via Robust Queueing Theory

Chaithanya Bandi, Kellogg School of Management, Northwestern University, 2211 Campus Dr, room 4169, Evanston, IL, 60208, United States

In this paper, we consider the statistical study of partially observed queueing systems arising in application areas such as Hospital networks, data centers, and cloud computing systems. Because these services operate under strict performance requirements, a statistical understanding of their performance is of great practical interest. A key challenge in these settings is that the data are incomplete, because recording detailed information about every request to a heavily used system can require unacceptable overhead. We propose an analytically tractable approach for studying inference problems in these queueing systems. Our approach is based on the Robust Queueing framework.

**Healthcare Operations: Improving Access to Care and Patient-Welfare**

Sponsored: Health Applications

Sponsored Session

Chair: Sila Cetinkaya, Southern Methodist University, Dallas, TX, 75205, United States

Co-Chair: Olga Bountali, Southern Methodist University, Dallas, TX, 75219, United States

**1 - Analysis of Primary Care Delivery with E-Visits: Improving Access to Care and Profitability**

Xiang Zhong, University of Florida, Aditya Mahadev Prakash

We consider a medical institution who offers both office and e-visit to their panel patients. A key planning problem is to determine the medical resource capacity that improves access to care for patients and ensures profitability of the medical institution. A novel analytical framework for modeling a care delivery system with two horizontally substitutable channels and a heterogeneous patient population is proposed. We identify that when the service system is of high traffic intensity, based on patient segmentation, medical institutions can equip their e-visit services with an optimal amount of resources to ensure an economical outcome while providing care to more patients.

**2 - Modelling Enrollment in Clinical Trials**

Erinc Albey, Ozyegin University, Istanbul, 34794, Turkey

Clinical trial planning and execution depends on enrollment, yet few tools exist that allow prediction of subject accrual to inform study design and conduct. We sought to develop a model to estimate the probability that a site will enroll a specified number of subjects in a trial within a given time interval, allowing for better clinical trial planning and execution. We hypothesized that the enrollment process is a finite, first-order, discrete time, homogeneous Markov chain. We based our analyses on data from two large multicenter, completed clinical trials. We modeled the enrollment performance of sites as a discrete set of states (zero/low/medium/high enrollments) over a given time interval and assessed whether the model accurately reflected trial enrollment. We also performed a set of Monte-Carlo simulations based on this Markov model to estimate the time required for the trial to enroll a predetermined number of patients. The enrollment prediction performance of the proposed Markov model is superior to linear and polynomial regression models, especially in the early phases of the trial. These estimates may be used in predicting the overall duration and in managing future similar trials in real-time.

**3 - The Impact of Information Sharing on Organ Transplantation: A Simulation Model**

Michael Hahsler, Southern Methodist University, Bobby B. Lyle School of Engineering, P.O. Box 750123, Dallas, TX, 75275, United States, Zahra Gharibi

Recently, several changes to the kidney allocation rules were approved, and modern IT solutions are developed to improve kidney assignment. We present a flexible simulation framework that considers the effect of several important factors for organ transplantation. We use the model to investigate how the optimal individual-level center listing and kidney acceptance decisions are affected by differences in supply due to different allocation rules. At the macro-level, we evaluate the potential effect of information sharing on the social welfare and organ discard rates.

**4 - Improving the Uninsured Patients' Experience: Practice vs. Theory**

Olga Bountali, Southern Methodist University, 4210 Fairmount Street, Apartment 3063, Dallas, TX, 75219, United States, Sila Cetinkaya, Farnaz Nourbakhsh

Under EMTALA, the current practice of care delivery for the uninsured prescribes that patients receive treatment only after being evaluated as in 'emergent, life-threatening condition'. This practice often leads to excessive overhead cost, severe treatment delays, and congestion at publicly funded hospitals with a hefty impact on the cost and quality of healthcare for the uninsured. Existing literature in service operations offers abundant ideas for improving both cost and quality of care including but not limited to congestion mitigation strategies via alternative service protocols. We explore and compare the value of patient-centric service protocols relative to the current practice.

**Joint Session HAS/Practice Curated: Stochastic models of Hospital Admission and Discharge Services**

Sponsored: Health Applications

Sponsored Session

Chair: Nan Kong, Purdue University, West Lafayette, IN, 47906-2032, United States

Co-Chair: Michelle M. Alvarado, University of Florida, Gainesville, FL, 32611-6595, United States

**1 - Stochastic Models for Inpatient Discharge Planning**

Maryam Khatami, Texas A&amp;M University, College Station, TX, USA; Michelle M. Alvarado, Nan Kong, Pratik J. Parikh, Mark Lawley.

The inpatient discharge planning problem requires the efficient assignment and sequencing of ready-for-discharge patients to resources. Delay in discharge processes deteriorates patient satisfaction and increases hospital costs. We model and solve the inpatient discharge planning problem as a two-stage stochastic program with uncertain inpatient discharge processing time and bed request times. The objective is to minimize patient dissatisfaction, discharge lateness, and patient boarding. We derive managerial insights by comparing the results of a two-stage stochastic program, the mean value problem, and two heuristics from current practice using simulation modeling.

**2 - Missed Opportunities in Preventing Hospital Readmissions: Redesigning Post-discharge Checkup Policies**

Xiang Liu, University of Michigan, Ann Arbor, MI, United States, Mariel Lavieri, Jonathan Helm, Ted Skolarus

Hospital readmissions affect hundreds of thousands of patients, placing a tremendous burden on the healthcare system. Post-discharge checkup can reduce readmissions through early detection of conditions. Our work develops optimal checkup plans to monitor patients following hospital discharge using methods including phone calls and office visits. By analyzing the structure of optimal policies, we develop checkup schedules that mitigate 32% more readmissions.

**3 - Improving Discharge Process at a University Hospital: A System-theoretic Method**

Xiaolei Xie, Tsinghua University, 614 Shunde Building, Beijing, 100084, China, Nan Chen, Zexian Zeng, Xiang Zhong, Maria Brenny-Fitzpatrick, Barbara A. Liegel, Li Zheng, Jingshan Li

This paper introduces a system-theoretic approach to improve inpatient discharge process at a university hospital. The complex hospital discharge process is modeled by a stochastic process with parallel sub-processes, splits, and merges. A system analysis method is introduced to approximate the discharge time and evaluate the mean, variability, and discharge-time performance. It is shown such a method results in a high accuracy in performance evaluation. To improve the discharge process at the university hospital, bottleneck and what-if analyses are carried out and improvement recommendations are discussed.

**4 - Admission Planning Problem with Stochastic Length of Stay**

Jorge Vera, Universidad Catolica de Chile, Dept. Industrial and System Engineering, Santiago, 7820436, Chile, Ana Celeste Batista, David Pozo

Effective admission planning process can improve inpatient throughput and waiting times. The uncertain in the patient's length of stay complex the admission and may cause bottlenecks and long waiting times in the patient's flow. We study the admission planning problem considering uncertain in the length of stay. Classically length-of-stay is modeled as a sum over a time windows constraint. This makes it very complex to consider uncertainty on this variable. In this work, we developed a new formulation in which the length of stay is on the right hand of the constraint by employing a single binary variable.

#### 1 - Optimizing Kidney Sharing to Reduce Geographic Disparity

Sommer Gentry, US Naval Academy, Mathematics Department, 572-C Holloway Road, Annapolis, MD, 21402, United States, Jack Robinson

We use parametric linear programming to investigate tradeoffs in decreasing geographic disparity in kidney transplants. We optimize the sharing of kidney supply between neighboring Donation Service Areas (DSAs) to make the number of kidneys transplanted per incident waitlist candidate similar among DSAs. We adjust the percentage of kidneys recovered in a particular DSA that must be transplanted in that same DSA, to reduce geographic disparity while limiting disruption to existing transplant programs which might otherwise oppose the plan. Surprisingly, even if DSAs retain 90% of their original supply, we can significantly improve the kidney transplant rates in the most underserved areas.

#### 2 - Achieving Fairness in Allocating Uncertain Resources with Applications to Kidney Transplantation

Sanjay Mehrotra, Northwestern University, Chaithanya Bandi

A novel model for fair allocation of uncertain resources becoming available over time is presented. Demand exceeds supply. Supply distribution is constrained by certain logistical requirements. Our goal is to achieve a fair distribution of supply. Fairness objective is stochastic and fractional. We show that a parametric convex optimization problem can be used to identify an optimal solution. We give parametric tractable re-formulations of our model using polyhedral and conic ambiguity sets, motivated from the concepts of robust queues. Numerical results on the performance of the model using data from the US kidney allocation system, which motivated the problem, will be presented.

#### 3 - Cherry-picking Kidneys and Patients: Incentives in Transplant Centers

Mazhar Arikian, Associate Professor, University of Kansas, Lawrence, KS, United States, Baris Ata, Rodney P. Parker

In 2007 the Centers for Medicare and Medicaid Services implemented a set of regulations for transplant centers called conditions of participation (COP). These rules evaluate transplant centers based on one-year patient and organ survival rates post transplantation. According to the COP, centers performing worse than the COP expectation face losing their certification to transplant. Using actual offer and transplant data, we empirically analyze some potential unintended consequences of these regulations such that more risk averse centers choose healthier patients and higher quality organs to transplant. We also discuss some recommendations to policymakers for improving the COP.

#### 4 - The Health and Economic Impact of Presumed Consent Organ Donation on Patients with End-stage Renal Disease

David W. Hutton, University of Michigan, 1015 Fairmount Drive, Ann Arbor, MI, 48105, United States, Huey-Fen Chen, Hayatt Ali, Wesley Javier Marrero Colon, Neehar Parikh, Mariel Sofia Lavieri

We evaluated the impact of opt-out organ donation policies using a Markov model of end-stage renal disease patients in the US. We evaluated policy increasing donation rates by 5%, 25%, or 50% versus the status quo. An opt-out, presumed consent policy would save \$18.3 billion, and gain 137,029 Quality-Adjusted Life-Years over the lifetime of an open cohort of patients on dialysis and on the waitlist for kidney transplantation. When the presumed consent policy only increased donation by 5%, the cost saved was \$4.0 billion, and 29,478 Quality-Adjusted Life-Years were gained. The cost savings were \$32.8 billion and 254,515 Quality-Adjusted Life-Years were saved if the policy increased rates by 50%.

### Recent Advancement on Computational Methods in Energy

Emerging Topic: Energy and Climate

Emerging Topic Session

Chair: Feng Qiu, Argonne National Laboratory, Lemont, IL, 60439, United States

#### 1 - Node-based Valid Inequalities for Optimal Transmission

#### Switching Problems

Burak Kocuk, Sabanci University, Istanbul, Turkey, Santanu Subhas Dey, Andy Sun

Although the benefits of line switching are evident in terms of reducing operational cost and improving system reliability, finding the optimal power network configuration is a challenging task due to the combinatorial nature of the underlying optimization problem. In this work, we carry out a polyhedral study related to a certain "node-based relaxation of the Optimal Transmission Switching Problem. We construct an integral extended formulation of this substructure and propose a practical approach to obtain valid inequalities. Finally, we present the results of our computational experiments on difficult test cases from the literature.

#### 2 - Alternative Formulation of Transmission Constraints for Unit Commitment Problems

Alinson S. Xavier, Argonne National Laboratory, Lemont, IL, United States, Feng Qiu, Santanu Subhas Dey

When solving the Security-Constrained Unit Commitment Problem on large-scale transmission networks, one of the most complicating factors is handling transmission and security constraints. The most common formulation used in the industry, based on Injection Shift Factors (ISF), yields very dense constraints, which can cause significant performance issues. In this work, we propose an alternative formulation for transmission constraints, based on network decomposition. Experiments on realistic instances show that this formulation is considerably sparser and can lead to improved running times.

#### 3 - Enumerating Multiple Local Optima for the Optimal Power Flow Problem

Bernard Lesieutre, University of Wisconsin Madison, WI, United States, Daniel K. Molzahn, Dan Wu

The non-convex AC optimal power flow problem generally admits multiple local minima and it can be beneficial to examine the differences between these solutions. We present a deterministic method to trace between optimal solutions. The method relies on recasting the original equations in quadratic form to a more specific geometrically elliptical form, and then applying the Fritz John conditions for optimality. A path tracing algorithm is recursively applied to locate new critical points from previously known solutions. We present results for several challenging test systems.

#### 4 - Machine Learning for Expediting Security Constraint Unit Commitment Solution

Feng Qiu, Argonne National Laboratory, 9700 S. Cass Ave, Building 202, Room C205B, Lemont, IL, 60439, United States, Alinson Xavier, Shabbir Ahmed

Security constrained unit commitment (SCUC) is one of the fundamental optimization problems in power system operations and market clearing. The computational performance of SCUC is crucial for system reliability and market efficiency. We propose to use machine learning to expedite the solution process of SCUC using mixed-integer programming solvers.

### Joint Session DM/Practice Curated: Data Analytics of Complex Data and its Applications

Sponsored: Data Mining

Sponsored Session

Chair: Wanlu Gu, University of Arizona, Tucson, AZ, United States

Co-Chair: Neng Fan, University of Arizona, Tucson, AZ, United States

#### 1 - Parametric Approach for Developing Quick Quotes in Fabrication

Ravi Suman, University of Wisconsin-Madison, Madison, WI, 53726, United States, Omar Habib, Ananth Krishnamurthy, Sushanta Sahu

We describe a methodology to develop rapid and accurate quotes for fabrication jobs. First, fabrication hours are estimated using parametric equations and part drawings. Next, multistep regression model is used to minimize the input features, speed up the estimation process, and derive accurate estimates of pre-weld and post-weld operations. Finally, model coefficients, exponents, and hyperparameters are set using training data. Validation studies using industry data shows that the methodology reduces quoting times by 50% while providing estimates that are within acceptable industry range.

## 2 - A Markov Decision Process to Identify Optimal Policies for Stopping a Trial of Labor

Karen T. Hicklin, University of North Carolina at Chapel Hill, B-24 Hanes Hall, Chapel Hill, NC, 27599-3260, United States, Julie Simmons Ivy

For first time moms the decision to have a cesarean delivery (C-section) can lead to future complications in subsequent pregnancies such as uterine rupture or repeat C-sections. In addition to the health risk associated with C-sections, there is general consensus that the C-section rate in the United States is too high and not associated with a decrease in maternal and neonatal morbidity or mortality. We model the mode of delivery decision using a Markov decision process (MDP). This MDP evaluates when a C-section is optimal as a function of total time spent in labor and the associated rate of complications.

## 3 - Analysis of Aggregate Data using Phase-type Distribution for Reliability Estimation

Samira Karimi, University of Arkansas, Fayetteville, AR, United States, Haitao Liao

One of the most accessible component reliability data in industry is aggregate lifetime data from fielded systems. While Gamma and Inverse Gaussian have been used in reliability estimation using aggregate data, Phase-type (PH) distribution has not been studied in the related literature. In this work, an expectation-maximization (EM) algorithm is proposed to estimate the parameters of PH distribution based on aggregate data. In addition, a Bayesian alternative is also studied and confidence region for model parameters are provided. A numerical study shows the strength of using PH distribution as an alternative for handling aggregate lifetime data.

## 4 - Modeling Patient Flow Information with Covariates using Phase-type Distributions

Wanlu Gu, University of Arizona, Tucson, AZ, 85719, United States, Neng Fan

The hospital length-of-stay (LOS) measures the time from admission to discharge. It demonstrates patient flow and plays an important role in health care quality improvement. In this paper, we fit the Coxian phase-type (PH) distributions to the patient flow information collected in Banner University Medical Center Tucson and assess the effects of covariates, including age, gender, admission type etc. The resulting estimated PH distributions can classify patients into different LOS groups and the pattern under each group is identified. The estimated coefficients and the statistical significance of covariate effects will help decision making in healthcare service and sources assignment.

## 1 - Neural Fuzzy-based Unscented Kalman Filter Model for Atrial Fibrillation Onset Prediction

Trung Le, North Dakota State University, Fargo, ND, 58102, United States

Atrial fibrillation is the most common arrhythmia, which increases the risk of stroke by 5 times and potentially leads to embolism. Assessing the risk of developing PAF is important to avoid the risk of death; previous work has only focused on addressing the challenge for predicting the onset of paroxysmal atrial fibrillation (PAF) from the morphological-temporal features of surface electrocardiogram by utilizing machine learning-based techniques. In this paper, we propose a method based on a combination of Kalman filter algorithm and a Neural Fuzzy network to predict PAF onset for 70 patients suffering from PAF.

## 2 - Quantification of Stroke Risk in Patients with Atrial Fibrillation and Obstructive Sleep Apnea

Rupesh Kumar Agrawal, Research Assistant, Oklahoma State University, Tulsa, OK, 74106, United States, Daniel Tran, Matt Wilkett, Dursun Delen, Bruce Benjamin

Extant research work has established strong correlation in patients with Atrial Fibrillation (A-Fib), the Obstructive Sleep Apnea (OSA) and the increased risk of stroke. CHADS2 and CHA2DS2-VASc scores are used to calculate the risk of stroke based on circulatory and respiratory mechanism. This is a pilot study to quantify stroke risk in patients with A-Fib, OSA, to show that the stroke risk is higher in patients, independent of treatment with anticoagulants used to treat patients with A-Fib. Furthermore, our goal is also to develop human subject clinical trial, based on the knowledge gained from the analytics study to develop a score for OSA as part of the criteria for calculating a risk of stroke

## 3 - Quantifying the Motivation of Physicians' Continuous Charitable Clinics Choice Online

Han Yang, Beijing Institute of Technology, No.5 Zhongguancun South Street, Haidian Dist, Beijing, 100081, China, Zhijun Yan, Lun Li

Online healthcare communities is a novel channel for physicians to share healthcare knowledge with patients. The services that physicians provide in OHCs consist of paid health services and charitable clinics services, and we have limited knowledge on the motivation of physicians' continuous charitable clinics choice online. We develop a logistic model to examine three types of motivation of physicians' continuous charitable clinics choice, including economic, social image and altruistic motivation. Based on the data from Guahao.com, we find that different types of motivation has different effects on physicians' continuous charitable clinic behavior based on different situations.

## 1 - Influencing Donation Choice in Social Networks after Disasters

Trilce Encarnacion, Rensselaer Polytechnic Institute, 110 8th Street, Jonsson Engineering Center # 4049, Troy, NY, 12180, United States

The goal of this research is to develop analytical methods to effectively influence donation choice in a social network setting. To do so, several objectives need to be accomplished: a) Develop a network influence model formulation to represent the social network interactions b) Incorporate behavior research regarding individuals attitudes and socio-economic characteristics in relationship to donation behavior; c) Develop a diffusion model to characterize influence propagation through the social network after a disaster occurs; and, d) Select an appropriate influencing strategy to effect change in donation choice.

## 2 - Predicting Major Stock Indices using Macroeconomic Indicators

Lin Lu, Auburn University, Auburn, AL, 36830, United States, Waldyn Martinez, Bin Weng, Fadel Mounir Megahed

This paper proposes a two-stage approach to investigate whether macroeconomics variables alone can be used to accurately predict the one-month ahead price for major U.S. stock and sector indices. Stage 1 evaluates the hypothesis that the price for different indices is driven by different economic indicators. Stage 2 uses a hybrid approach of the recurring neural network and the ensembles models to examine the secondary hypothesis that residuals from the time-series model are not random and can be explained by incorporating macroeconomic indicators through the ensemble approach. Results showed that the macroeconomic indicators are leading predictors of the price of 13 U.S. sector indices.

## 3 - Reliability Estimation for Balanced Systems with Multi-dimensional Distributed Units

Elsayed A. Elsayed, Distinguished Professor, Rutgers University, Department of Industrial and Systems Eng, 96 Frelinghuysen Road, Piscataway, NJ, 08854, United States, Jingbo Guo

Balanced systems with multi-dimensional distributed units are emerging in a diverse range of industries. For example, Unmanned Aerial Vehicle (UAV) with multi-layer of rotary wings and spherical UAVs are used in many applications due to their stability and flexibility. A minimum number of units is required to function properly in a balanced arrangement for the system to operate properly. Reliability estimation for such complex systems is studied under different conditions.

## 4 - A Note on Pricing Model of ESG Investing

Hiroshi Ishijima, Chuo University, 42-8 Ichigaya-honmura-cho, Shinjuku, Tokyo, 1628473, Japan, Akira Maeda

Modern investors have been paying more attention to ESG investing than ever which is defined as the consideration of environmental, social and governance factors as well as the conventional finance factor regarded as the discounted sum of future cash flows. Along these lines, we would like to develop a rational pricing model of ESG investing. We then conduct a preliminary empirical analysis in the Japanese stock market to show whether ESG investing is profitable enough to compensate for fiduciary duties as stated in the Principles for Responsible Investment.

## 5 - Modelling Human Trafficking

Kezban Yagci Sokat, Northwestern University, IEMS, 2145 Sheridan Rd, Evanston, IL, 60208, United States, Nezh Altay

Human trafficking has become a serious concern for society and the global economy. While there has been a lot of attention in this topic in the social contexts, there is little in the humanitarian operations community. We develop a model for human trafficking and study the impact of relevant law.

### Business Value of Artificial Intelligence

Sponsored: Artificial Intelligence

Sponsored Session

Chair: Zhongju Zhang, Arizona State University, Tempe, AZ, 85287, United States

#### 1 - Social Learning in Prosumption: Evidence from a Randomized Field Experiment

Tianshu Sun, University of Southern California, 3670 Trousdale Parkway, Bridge Hall, BRI 310B, Los Angeles, CA, 90089, United States, JaeHwuen Jung, Ravi Bapna, Joseph Golden

A customer can now actively participate in the design for a wide range of products, as a 'prosumer'. However, a major challenge in prosumption is the effort involved and ideas required. We combine a randomized experiment with machine learning to examine whether social learning, the act of showing the focal user creations made by other users, can improve users' project creation and purchase decision. We find that under certain conditions, showing other users' design can be highly effective. We further explore heterogeneity in treatment effect across image and user characteristics and find that three types of social learning mechanisms - idea learning, product learning, and self-efficacy - are at play.

#### 2 - High-order Proximity Preserving Information Network Hashing

Yong Ge, University of Arizona, 5776 S.Tiger Lily PL, Tucson, AZ, 85747, United States

Information network embedding is an effective way for efficient graph analytics. We propose a MF-based Information Network Hashing (INH-MF) algorithm, to learn binary codes which can preserve high-order proximity. We also suggest Hamming subspace learning, which only updates partial binary codes each time, to scale up INH-MF. We finally evaluate INH-MF on four real-world information network datasets with respect to the tasks of node classification and node recommendation. The results demonstrate that INH-MF can perform significantly better than competing learning to hash methods in both tasks, and surprisingly outperforms network embedding methods

#### 3 - Crowdboosting: A Boosting-based Model for Crowd Opinions Aggregation

Qianzhou Du, Virginia Tech, Blacksburg, VA, 24060, United States, Alan Gang Wang, Weiguo Fan

Most existing crowd opinion aggregation studies employ rules to determine a weighting scheme for judges based on their past prediction performance. However, those rule-based methods often fail to determine the optimal weights and achieve the optimal prediction performance. We propose a new crowd opinion aggregation model, namely CrowdBoosting, which has a combining procedure for converting weak learners to strong ones and a mechanism of estimating the probabilities of event outcomes based on statistical learning. We empirically evaluate CrowdBoosting in comparison to four baseline methods. The results show that CrowdBoosting significantly outperforms all the baseline methods.

#### 4 - Towards Better Learning from Crowd Labeling

Junming Yin, University of Arizona, Management Information Systems Department, McClelland Hall, Room 430BB, Tucson, AZ, 85721, United States

Microtask crowdsourcing has emerged as a cost-effective approach to obtaining large-scale labeled data in a wide range of applications. Crowdsourcing platforms such as MTurk and CrowdFlower provide an online marketplace where task requesters can submit a batch of microtasks, which a crowd of workers can then complete for a small monetary compensation. However, as the information provided by crowd workers can be prone to errors, significant effort is required to infer the true labels from such noisy labels supplied by a set of heterogeneous workers. Moreover, it would be very beneficial to identify (and then possibly filter out) those crowd workers with low reliabilities so as to foster the creation of a healthy and sustainable crowdsourcing ecosystem. Existing literature on learning from crowds has mainly focused on the single-label (i.e., binary and multi-class) setting, which prevents the application of microtask crowdsourcing to a wide range of business applications in which each item can be associated with multiple labels simultaneously. In this work, we consider the problem of learning from crowd labeling in the general multi-label setting, which includes previously studied single-label crowdsourcing problems as special cases. We propose a new Bayesian hierarchical model for the underlying annotation process of crowd workers, and introduce a mixture of Bernoulli distribution to capture the unknown label dependency. An efficient variational inference procedure is then developed to jointly infer ground truth labels, worker reliability in terms of sensitivity and specificity, and label dependency. Results based on extensive simulation experiments and a real-world MTurk experiment indeed confirm that the proposed approach outperforms other competing methods, highlighting the necessity to model both worker quality and label dependency when learning from crowdsourced multi-label annotations.

#### 1 - An Empirical Evidence of Price Dispersion in Electronic Markets

Jin Sik Kim, University of California-Irvine, 5102 Palo Verde Road, Irvine, CA, 92617, United States, Vijay C. Gurbaxani

Theory predicts that the price of comparable product at online retailers would exhibit low price dispersion; yet, there is empirical evidence to the contrary. This paper investigates online price dispersion in two product types. We hypothesize that product types may influence price dispersion differently because of uncertainty to customers. Seller information may play a vital role in forming dispersed price. Lastly, we assume that search costs may lead to price dispersion. Our logistic regression results show the product with high uncertainty lead to higher price dispersion, some of the seller information increases price dispersion, and search costs are positively related to price dispersion.

#### 2 - Are More Diverse Crowds Smarter?

Jiayu Yao, Georgia Institute of Technology, Atlanta, GA, United States, Qiang Gao, Mingfeng Lin

Does the diversity increase the wisdom of crowds? We examine the value of diversity in crowds within a market setting, specifically, the online financial market, utilizing a natural experiment on Prosper.com.

#### 3 - Personalized Recommendations and Platform Monetization: Theory and Evidence from an App Portal

Shengjun Mao, University of California-Irvine, Paul Merage School of Business SB1 3300, University of California, Irvine, Irvine, CA, 92697, United States, Sanjeev Dewan, Yi-Jen (Ian) Ho

We examine app monetization on a mobile portal. Specifically, we study the click and conversion performance as a function of screen rank, app popularity, and app quality. We also apply natural language processing to investigate the app titles and descriptions in terms of the ambiguity, informativeness, and sentiment. We develop a bivariate probit model to jointly analyze click and conversion choices using a hierarchical Bayesian approach. Our results not only confirm the effects of ranking, popularity and quality but show the subjective text information matters. More importantly, our analyses help optimize the app placements to maximize the profits of the portal through personalization.

#### 1 - Bayesian Model Building from Small Samples of Disparate Data for Capturing In-plane Deviation in Additive Manufacturing

Arman Sabbaghi, Purdue University, 150 N. University Street, West Lafayette, IN, 47907, United States, Qiang Huang, Tirthankar Dasgupta

Quality control of shape deviation in additive manufacturing relies on statistical deviation models. However, resource constraints limit the manufacture of test shapes, and consequently impede the specification of models for new shapes. We present an adaptive Bayesian methodology that effectively combines in-plane deviation data and models for a small sample of previously manufactured, disparate shapes to aid in the model specification of in-plane deviation for new shapes. The power and simplicity of this method is demonstrated with case studies on in-plane deviation modeling for polygons and straight edges in free-form shapes using only data and models for cylinders and a single pentagon.

**2 - Degradation in Common Dynamic Environments**

Zhi-Sheng Ye, National University of Singapore, E1-07-26  
Computing lab, 10 Kent Ridge Road, Singapore, 119260,  
Singapore, Qingqing Zhai

Degradation studies are useful for reliability evaluation. Because of limited test resources, several test subjects may have to share a test rig. The common environments experienced by subjects in the same group introduce significant inter-individual correlations in their degradation. In the study, the Wiener process is used to model product degradation, and the group-specific random environments are captured using a stochastic time scale. Both semiparametric and parametric estimation procedures are developed for the model. Performance of the maximum likelihood estimators is validated theoretically and by simulation. The proposed models are illustrated by an application to LED data.

**3 - A Nonparametric Adaptive Sampling Strategy for Online Monitoring of Big Data Streams**

Xiaochen Xian, Madison, WI, 53705, United States, Andi Wang,  
Kaibo Liu

With the rapid advancement of sensor technology, a huge amount of data is generated in various applications, which poses new and unique challenges for Statistical Process Control (SPC). In this paper, we propose a Nonparametric Adaptive Sampling (NAS) strategy to online monitor non-normal big data streams in the context of limited resources, where only a subset of observations are available at each acquisition time. In particular, the proposed method integrates a rank-based CUSUM scheme and an innovative idea that corrects the anti-rank statistics with partial observations, which can effectively detect a wide range of possible mean shifts when data streams follow arbitrary distributions.

**1 - Online Monitoring for Metal Based Additive Manufacturing Processes using a Dual Control Charting System Based Thermal Image Tensor Decomposition**

Mojtaba Khanzadeh, Mississippi State University, Starkville, MS,  
39759, United States, Linkan Bian, Wenmeng Tian

Real-time thermal image streams captured from AM processes are regarded as most informative signatures of the process stability. The objective of this paper is to develop a statistical process control to detect process changes based on predefined distribution of the monitoring statistics. There are two major challenges: Complex spatial interdependence exists in the thermal images; the thermal images suffer from a large data volume and low signal-to-noise ratio. Multilinear principal component analysis approach is used to extract low dimensional features and residuals. Subsequently, an online dual control charting system is proposed by leveraging multivariate  $T^2$  and Q control charts.

**2 - Lifetime Prediction of Condition Monitoring Signals using Monotonic B-splines with Infinite Support**

Salman Jahani, University of Wisconsin-Madison, Department of Industrial/Systems Engineering, 1513 University Avenue,  
Madison, WI, 53706, United States, Raed Kontar, Shiyu Zhou,  
Dharmaraj Veeramani

Most sensor-based condition monitoring signals in practice are not observed after the failure threshold which results in truncated signals and are subject to high level of noise. This study claims a mixed effects model based on B-splines of infinite support procedure to account for truncation and noise using extrapolation feature and monotonicity conditions of B-splines with infinite support. The performance of the proposed procedure is further investigated through analysis based on the numerical studies and case study with real world data from automotive lead acid batteries.

**3 - Time-warped Sparse Representation for Nonnegative Functional Data Analysis**

Chen Zhang, Tsinghua University, Beijing, 100084, China

This paper proposes a novel framework for learning time-warped sparse non-negative factorization of functional data. The proposed method not only can guarantee the extracted bases and their coefficients to be positive and interpretable, but also can handle weakly correlated functions with different features. Furthermore, the proposed method incorporates time warping into feature learning, and allows the bases of different samples to have temporal deformations. To solve the learning task, we propose an efficient framework of estimation algorithms based on a greedy variable selection approach.

**4 - Machine Annotation of Post-hurricane Satellite Imagery for Identifying Damages**

Quoc Dung Cao, University of Washington, Seattle, WA,  
United States

After a hurricane makes a landfall, emergency managers and first responders commonly assess the damage by driving around the impacted area (also known as a windshield survey). Recently, post-event images captured by satellites started to facilitate the damage assessment, but the process still largely relies on human visual inspection. To improve the efficiency and accuracy of damage assessment, we propose to automatically label damages using image classification techniques. The method is applied to the case study of 2017 Hurricane Harvey.

**Joint Session ICS/Practice Curated: Decomposition Algorithms for Power Grid Optimization**

Sponsored: Computing

Sponsored Session

Chair: Deepak Rajan, Lawrence Livermore National Laboratory,  
Livermore, CA, 94551, United States

**1 - Optimizing Power System Restoration using Mixed Integer Linear Programming**

Ignacio Aravena, Universite Catholique de Louvain, Voie du Roman Pays 34, Center for Operations Research and Econometrie,  
Louvain-la-Neuve, B-1348, Belgium, Deepak Rajan,  
Georgios Patsakis, Jennifer Rios, Shmuel S. Oren

We present a novel framework for optimizing power system restoration and black-start allocation as MILPs. First, we build piece-wise linear approximations of power flow equations that account for the regime of excess of reactive power typical during restoration. Then, we propose a specialized integer L-shaped algorithm that decouples the power flow equations from the combinatorial dynamics of the restoration process. The method allows sharing cuts between time periods and formulating feasibility cuts over electrical islands. We present numerical results for modified IEEE test systems and models of the WECC and the Chilean power grids demonstrating the effectiveness of the proposed approach.

**2 - Scalable Decomposition for Stochastic Unit Commitment**

Jean-Paul Watson, Sandia National Laboratories, 7305 Blue  
Cypress Avenue NE, Albuquerque, NM, 87113-2065,  
United States, David L. Woodruff, Bernard Kneuev

We discuss recent advances in scenario-based decomposition algorithms for solving realistic, large-scale stochastic unit commitment problems. We focus on mitigating the difficulty of instances with diverse renewables production patterns, which can cause serious degeneration in practical convergence behaviors. Mitigation proceeds through the use of cross-scenario cuts. We will discuss experimental results and newly created openly available benchmarks.

### 3 - Parallel Temporal Decomposition Method for Long-term Unit Commitment Problems

Kibaek Kim, Argonne National Laboratory, 9700 South Cass Avenue, Building 240, Lemont, IL, 60439, United States, Audun Botterud, Feng Qiu

We consider a long-term unit commitment (UC) for power system production cost modeling. The UC problem is formulated as a large-scale mixed-binary linear programming problem. We present the Lagrangian dual decomposition method that solves the long-term UC by decoupling the long-term horizon into several sub-horizons. We also develop the branch-and-bound method on top of the dual decomposition, which enables to find a global optimal solution. The method has been implemented in an open-source optimization framework DSP that can run in parallel on high-performance computing clusters. In our computational experiments, we show significant reductions in solution time as compared with CPLEX.

### 4 - ADMM for SCUC: Effects of Market Characteristics and Subproblem Design on Algorithm Performance

Jesse Holzer, Pacific Northwest National Laboratory, 902 Battelle Blvd, Richland, WA, 99354, United States, Feng Pan, Yonghong Chen, Stephen Elbert

Security constrained unit commitment (SCUC) is the computational engine for day ahead wholesale electricity markets. As markets evolve, larger networks and numerous smaller energy resources pose increasing computational challenges for mixed integer programming (MIP) solvers. The alternating direction method of multipliers (ADMM) has been applied to SCUC as a scalable alternative to MIP. ADMM has guaranteed convergence in convex problems, but SCUC is nonconvex. We compare ADMM and MIP on large scale instances, observing that smaller and more numerous resources and larger subsystems tend to improve ADMM convergence but make the subproblems more expensive.

### Nicholson Student Paper Competition II

Emerging Topic: Nicholson Student Paper Prize

Emerging Topic Session

Chair: John Hasenbein, University of Texas-Austin, 1 University Station Stop C2200, Department of Mechanical Engineering, Austin, TX, 78712-0292, United States

Chair: Phebe Vayanos, University of Southern California, OHE 310L, University Park Campus, USC, Viterbi School of Engineering, Los Angeles, CA, 90089, United States

### 1 - Synthesis and Generalization of Structural Results in Inventory Management: A Generalized Convexity Property

Zhe Liu, Columbia University, New York, NY, USA, Awi Federgruen

We address a general periodic review inventory control model with the simultaneous presence of the following complications: (a) bilateral inventory adjustment options, via procurement orders and salvage sales or returns to the supplier; (b) fixed costs associated with procurement orders and downward inventory adjustments (via salvage sales or returns); and (c) capacity limits associated with upward or downward inventory adjustments. We provide a full characterization of the optimal procurement strategy, both for finite and infinite horizon periodic review models, by showing that in each period the inventory position line is to be partitioned into (maximally) five regions. Our results are obtained by identifying a novel generalized convexity property for the value functions, which we refer to as strong (C1K1, C2K2)-convexity. To our knowledge, we recover almost all existing structural results for models with exogenous demands as special cases of a unified analysis.

### 2 - Small-loss Bounds for Online Learning with Partial Information

Thodoris Lykouris, Cornell University, Ithaca, NY, USA.

We consider the problem of adversarial (non-stochastic) online learning with partial information feedback, where at each round, a decision maker selects an action from a finite set of alternatives. We develop a black-box approach for such problems where the learner observes as feedback only losses of a subset of the actions that includes the selected action. When losses of actions are non-negative, under the graph-based feedback model introduced by Mannor and Shamir, we offer algorithms that attain the so called “small-loss”  $\alpha(L?)$  regret bounds with high probability, where  $\alpha$  is the independence number of the graph, and  $L?$  is the loss of the best action. Prior to our work, there was no data-dependent guarantee for general feedback graphs even for pseudo-regret (without dependence on the number of actions, i.e. utilizing the increased information feedback). Taking advantage of the black-box nature of our technique, we extend our results to many other applications such as semi-bandits (including routing in networks),

contextual bandits (even with an infinite comparator class), as well as learning with slowly changing comparators. In the special case of classical bandit and semi-bandit problems, we provide optimal small-loss, high-probability guarantees of  $e O(\sqrt{dL?})$  for actual regret, where  $d$  is the number of actions, answering open questions of Neu. Previous bounds for bandits and semi-bandits were known only for pseudo-regret and only in expectation. We also offer an optimal  $e O(\sqrt{L?})$  regret guarantee for fixed feedback graphs with clique-partition number at most  $\alpha$ .

### 3 - Distributionally Robust Inverse Covariance Estimation: The Wasserstein Shrinkage Estimator

Daniel Kuhn, Ecole Polytechnique Federale de Lausanne (EPFL), Lausanne, Switzerland, Viet Anh Nguyen.

We introduce a distributionally robust maximum likelihood estimation model with a Wasserstein ambiguity set to infer the inverse covariance matrix of a  $p$ -dimensional Gaussian random vector from  $n$  independent samples. The proposed model minimizes the worst case (maximum) of Stein's loss across all normal reference distributions within a prescribed Wasserstein distance from the normal distribution characterized by the sample mean and the sample covariance matrix. We prove that this estimation problem is equivalent to a semidefinite program that is tractable in theory but beyond the reach of general purpose solvers for practically relevant problem dimensions  $p$ . In the absence of any prior structural information, the estimation problem has an analytical solution that is naturally interpreted as a nonlinear shrinkage estimator. Besides being invertible and well conditioned even for  $p > n$ , the new shrinkage estimator is rotation-equivariant and preserves the order of the eigenvalues of the sample covariance matrix. These desirable properties are not imposed ad hoc but emerge naturally from the underlying distributionally robust optimization model.

### 4 - Data-Driven Personalized Decision Making: Algorithm, Theory and Application

Zhengyuan Zhou, Stanford University, Stanford, CA, USA.

In this paper, we study the general online policy learning problem where we aim to learn an effective policy from observational datasets. We propose a novel learning algorithm and establish that it achieves the (asymptotically) optimal regret guarantee, thereby settling the open problem of which learning algorithm to choose in this context. To the best of our knowledge, this is the first provably optimal learning algorithm in the general online policy learning problem and provides a substantial performance improvement over all the existing learning algorithms. We also additionally investigate the application aspects of policy learning by working with finite-depth trees, a specific policy class that is widely used as decision rules in practice. We formulate a key step of the learning algorithm as a mixed integer program, which enables us to solve it to exact optimality. Together, these results contribute to the broad landscape of data science by providing a state-of-the-art personalized decision making framework that is optimal in both generalization and optimization.

**Joint Session MCDM/Practice Curated: MCDM in Practice**

Sponsored: Multiple Criteria Decision Making

Sponsored Session

Chair: Lorraine Gardiner, Dalton State College

**1 - Multi-Objective Delivery Allocation**

Jonathon Leverenz, Systems Planning and Analysis, Inc,  
Alexandria, VA, 22302, United States, Stephanie Diane Brown,  
Chris Grubb

The Multi-Objective Delivery Allocation problem assigns delivery vehicles to jobs delivering equipment to a set of locations. Each vehicle is assigned a job and each job contains multiple locations. Locations can be assigned to multiple jobs and grouped together in various ways resulting in multiple options for each vehicle. Vehicle-location pairs are assigned a probability representing the chance of a successful delivery. Assignments are made under competing objectives that include cost, location coverage, probability of success, and expected number of completed deliveries. A network-with-gains model is used to make assignments and investigate tradeoffs between the various objectives.

**2 - Blockchain's Impact on Digital Supply Chain: Contributions from MCDM**

Birsen Karpak, Distinguished Professor, Youngstown State  
University, One University Plaza, WCBA 3303, Youngstown, OH,  
44555, United States, Valerio A. Salomon

Digital Supply Chain (DSC) is about the way how supply chain processes are managed with a wide variety of innovative technologies, e.g. internet of things, big data, cloud computing, among others. Blockchain is the new-comer not explored even in the frameworks offered very recently. This study explores the impact of blockchain on digital supply chain and reports the findings of the implementation of a proposed DSC framework into an industrial real-case. Authors see a potential contribution from multiple criteria decision approaches.

**3 - Weighting Criteria for Agriculture Planning: An Application of the Analytical Hierarchy Process**

Jay Parsons, University of Nebraska-Lincoln, 103B Filley Hall,  
P.O. Box 830922, Lincoln, NE, 68583-0922, United States,  
Kathleen Brooks

A statewide farm financial health survey of Nebraska farmers and ranchers was conducted in 2016 to assess farm and ranch financial stress as a result of low commodity prices. In the survey, producers were asked a series of questions to assess the importance of different factors in their planning process. The analytical hierarchy process is used to identify the importance of the factor criteria for all respondents as a whole and for various segments of the sample population.

**4 - Survey on the Practice and Implementation of MCDM**

Lorraine R. Gardiner, Dalton State College, Wright School of  
Business, 650 College Drive, Dalton, GA, 30720, United States

The purpose of the research survey is to document and classify published accounts describing the practice of MCDM. The survey includes peer-reviewed articles that describe the actual use of one or more MCDM methods by decision makers in an organization. The author summarizes results by general problem area, organizational type, decision level, degree of organizational involvement and MCDM method category.

**Service-oriented Enterprise Analysis**

Sponsored: Military and Security

Sponsored Session

Chair: Mark Gallagher, US Air Force, Arlington, VA, United States,

**1 - Strategy-to-Task Hierarchy for a Strategy through System Requirements Framework**

Mark Gallagher, US Air Force, Arlington, VA, United States,  
Michael Moss, Doug Fullingim

The Air Force Warfighting Center (AFWIC) is developing a functional linkage that maps strategy themes through our concept documents to our capabilities and systems. This framework enables us to justify requirements in terms of achieving the strategy and concepts that are driving them. We present the current version of this strategy-to-task framework.

**2 - Air Force Warfighting Integration Center (AFWIC) Analyses**

Mark Gallagher, US Air Force, Arlington, VA, United States,  
Doug Fullingim

The Air Force has established an Air Force Warfighting Integration Center (AFWIC) to "drive innovation and transformation to ensure the AF provides the world's most ready, lethal, and dominant air force to the joint fight. We discuss the steps between strategy and budget, and how we are using wargaming, analyses, and assessments to support the decisions at each of those steps. Much of our analytical challenges are modeling the concepts and ideas impact on future warfare integrated view.

**3 - A New Framework for Naval Inventory Models**

Javier Salmeron, Naval Postgraduate School, 1411 Cunningham  
Road, Monterey, CA, 93943, United States, Duncan Ellis

Naval Supply Systems Command, Weapons Systems Support sets inventory policy across all echelons of supply. In 2014, it partnered with the Naval Postgraduate School to develop an in-house suite of inventory models: Wholesale Inventory Optimization Model, currently in production; Site Level Inventory Optimization Model, sets reorder points and quantities at Naval Air Stations and Distribution Depots; Naval Aviation Readiness Based Sparing Model, sets inventory levels for aviation weapon systems to achieve operational availability. The models introduce novel features, provide defensible, auditable, and transparent policy, and help to maintain critical skills within the civil service.

**4 - A Comparative Assessment of Network Solution Methodologies for the Comprehensive Core Capability Risk Assessment Framework**

Alex M. Marshall, Analyst, The Perduco Group, 3610 Pentagon  
Blvd, Suite 110, Beavercreek, OH, 45431, United States,  
Paul F. Auclair

Given an enterprise-level risk model consisting of a weighted, directed, cyclic network, we describe an experimental approach to examining the suitability of four network solution methods for estimating the effect of risk propagating across the network. We also compare results obtained from detailed activity-level networks to those obtained from aggregated capability-level networks and suggest adjustments to eliminate observed aggregation bias and divergence from notional composite truth solutions.

West Bldg 212C

**Performance Modeling and Optimization in Manufacturing Systems**

General Session

Chair: James M. Smith, University of Massachusetts-Amherst, Amherst, MA, 01002, United States

**1 - Scheduling Policies in Flexible Bernoulli Lines with Dedicated Finite Buffers**

Jingshan Li, University of Wisconsin-Madison, 1513 University  
Avenue, 3222 Mechanical Engineering Building, Madison, WI,  
53706, United States, Kyungsu Park, Shaw Feng

This presentation is devoted to studying scheduling policies in flexible serial lines with two Bernoulli machines and dedicated finite buffers. Priority, cyclic and work-in-process (WIP)-based scheduling policies are investigated.

**2 - Stochastic Models for Multi-resource Allocation in Biomanufacturing**

Yasemin Limon, University of Wisconsin-Madison, Madison, WI,  
53705, United States, Ananth Krishnamurthy

We analyze multi-resource allocation decisions for protein purification projects that need to meet strict yield and purity requirements. The purification project can involve multiple steps, each step improving the purity of the sample, although resulting in some yield loss in the process. These purification projects are completed by scientists with different capabilities and capacities. We analyze allocation strategies of projects to scientists using queueing models. Exact solutions are obtained by applying Matrix-Geometric solution algorithms and numerical examples are presented to explore the impact of different strategies on the system performance.

**3 - A Branch and Bound Procedure for Chance Constrained Stochastic Assembly Line Balancing**

Raik Stolletz, PhD, University of Mannheim, Mannheim,  
Germany, Johannes Schnitzler

We analyze the assembly line balancing problem where tasks have to be assigned to stations with the goal of minimizing the number of stations used. Task times are stochastic, leading to the possibility of incomplete work pieces. Therefore, we consider a constraint on the probability of finishing a work piece within the given cycle time. A sampling model is developed to account for generally distributed task times. We present a bidirectional branch and bound procedure in order to solve the model. A numerical study compares the performance of the algorithm to the solution with standard solvers.

**4 - Multifidelity Models for Buffer Allocation Problems**

Andrea Matta, Politecnico di Milano, Via La Masa 1, Milan, 20156, Italy, Ziwei Lin, Nicla Frigerio

Buffer allocation problems in flow line require the estimation of the expected throughput of the system. Literature reports a rich set of optimization methods using either analytical methods or discrete event simulation as performance evaluation models. The two kinds of models are usually used sequentially at different levels of the optimization phase. This work explores the advantages and drawbacks of combining them into the buffer allocation problem. Different multifidelity regression models are used as surrogate models for estimating the expected system throughput in the buffer allocation problem. Results show that using low fidelity models helps to reduce the total computational effort.

**5 - Simultaneous Optimization of Buffer Allocation, Routing, & Population in Closed Finite Queueing Networks**

James Smith, University of Massachusetts at Amherst, MA, United States, Sencer Yeralan

Optimal routing in closed finite queueing networks is a challenging problem all by itself. When it is combined with optimal buffer allocation and the population of the closed network, we achieve a mixed integer nonlinear programming problem. A queueing performance decomposition approach combined with a sequential quadratic programming algorithm is the main vehicle for the analysis and synthesis of the problem. Various closed network topologies are utilized to demonstrate the efficacy of the methodology.

Sponsored: Public Sector OR

Sponsored Session

Chair: Chaitra Gopalappa, University of Massachusetts, Amherst, MA, 01003, United States

Co-Chair: Seyedeh Khatami

**1 - Estimating HIV Transmission Rates Along the HIV Care Continuum in the United States**

Zihao Li, Centers for Disease Control and Prevention, Atlanta, GA, United States, Yao-Hsuan Chen, Chaitra Gopalappa, Paul Farnham, Stephanie Sansom

Estimating HIV transmission rates is critical to understanding how to reduce disease spread. We used the Progression and Transmission of HIV (PATH), an agent-based model that replicates HIV transmission in the United States, to estimate 2015 transmission rates among persons at various stages of HIV care. The overall transmission rate in 2015 was 3.51 per 100 person-years. The rate was 0.07 per 100 person-years for persons in care and virally suppressed compared with 15.64 per 100 person-years for persons newly infected and undiagnosed. Viral suppression is associated with greatly reduced transmission. Thus, strategies to promote viral suppression may be very effective.

**2 - Marginal Cost-effectiveness of Pre-exposure Prophylaxis Compared with Improving HIV Care and Treatment in the United States**

Nidhi Khurana, CDC, 1600 Clifton Road MS E-48, Atlanta, GA, 30333, United States, Paul G. Farnham, Katherine A. Hicks, Justin Carrico, Stephanie L. Sansom

We used a dynamic, compartmental model of the sexually active U.S. population to estimate the marginal cost-effectiveness of preventing HIV infection with pre-exposure prophylaxis (PrEP) compared with preventing HIV transmission through enhanced care and treatment of persons with HIV. We modeled the application of PrEP to persons at high risk of acquiring HIV and investigated its marginal cost-effectiveness for the entire population as well as for individual transmission groups (men who have sex with men, persons who inject drugs, and heterosexuals). We assessed cumulative costs, new infections, and quality-adjusted life-years from 2016 through 2020.

**3 - Using System Dynamics to Investigate HIV Positive Testing Yield in Malawi**

Roma Bhatkoti, CDC, Atlanta, GA, United States, Andrew Auld, Mtemwa K. Nyangulu, George Bicego

With the goal of ending the AIDS epidemic by 2030, UNAIDS set an ambitious target of diagnosing 90% of people living with HIV by 2020 as part of their 90-90-90 framework. As HIV testing programs have expanded over the past few years to meet this target, it has been observed that HIV positive diagnostic yield (a critical factor for determining HIV testing targets) has decreased over time. In order to investigate this declining HIV diagnostic yield and to identify ways to potentially optimize HIV testing strategies, a simulation model was constructed using system dynamics depicting different population stocks. Publicly available data from UNAIDS and the Malawi HIV testing program were used to model yield.

**4 - How to Reach Zero HIV Incidence in the US? A Reinforcement Learning Approach to Optimizing HIV Intervention Decisions**

Seyedeh Khatami, University of Massachusetts Amherst, Amherst, MA, United States

HIV has been a persistent issue in the US. The National HIV/AIDS Strategy (NHAS) for the United States aims to reduce HIV incidence by 25%, by 2020, by increasing coverage on all key interventions that are independently evaluated to be cost-effective. Due to interactions between interventions and the dynamic changes in the epidemic over time, we propose to identify combinations of interventions that can optimally lead to zero incidence, formulated as a sequential decision-making problem. We formulate the problem as a Markov decision process (MDP) with multiple decision stages over a finite time horizon and solve using reinforcement learning, a simulation-based control optimization algorithm.

**Location Models**

Sponsored: Location Analysis

Sponsored Session

Chair: Oded Berman, University of Toronto, Toronto, ON, M5S 3E6, Canada

Co-Chair: Dmitry Krass, University of Toronto, Toronto, ON, M5S 3E6, Canada

**1 - Benefit Maximizing Network Design in the Public Sector**

Robert Aboulian, California State University-San Marcos, 2771 Palmetto Drive, Carlsbad, CA, 92009, United States, Oded Berman

Governments are involved in providing essential services, such as healthcare, transportation, education and utilities. Their mandate is to maximize the societal benefit by acting as agents of the public in contrast with the private firms' mission to maximize profit. Many models in this area try to (re-)design the public service so as to maximize the number of people who will benefit from the program given a limited budget. These models do not consider the marginal benefit (savings in costs to tax payers by adding an extra unit of service capacity) provided. In this work, we determine the optimal number, locations and capacities of a network of facilities so as to maximize the overall benefit to the public.

**2 - Uniform Price Approximation in Elastic Demand Location Models**

Dmitry Krass, University of Toronto, Rotman School of Management, 105 St George Street, Toronto, ON, M5S 3E6, Canada, Oded Berman

We consider a location model with stochastic customer demand where demand rate is affected by service quality (waiting) and price. We show that under certain assumptions, the optimal pricing policy is uniform, with identical price charged at every facility. We then apply this policy as a heuristic for the general case, deriving both theoretical and computational performance bounds.

**3 - Locating Time-knapsacks for Optimising Operational Performance**

Mozart Batista de Castro Menezes, Kedge Business School - Bordeaux, Office: 1449, Talence, 33405, France, Diego Ruiz-Hernandez

In this work we analyse the way a manufacturer's fixed-costs should be allocated to each production order rather than the way they are currently allocated. Using that information, we introduce a facility location model where fixed-costs are incurred when opening a facility; time-knapsacks representing production lines are assigned to the facility, adding another layer of fixed-costs; and finally, production orders are allocated to knapsacks with corresponding variable costs. Using a real situation, resulting solutions have higher capacity utilisation, smaller and fewer facilities than current network design. Serving demand from closest facility is also less frequent.

**4 - Multi-period Home Healthcare Provider Facility Location-allocation Problem**

Vahid Roshanaei, University of Toronto, 1706 35 Charles Street West, Toronto, ON, M4Y 1R6, Canada, Oded Berman, Opher Baron

We study the facility location-allocation problem of a multi-period home healthcare provider in Toronto, Canada. We develop a mixed-integer programming model that considers (i) nurses' flexibility where nurses of higher skills can perform the tasks of nurses with lower skills, (ii) patients' continuity of care, and (iii) inter-facility resource-sharing. We demonstrate how inclusion of the above impact cost-savings.

**1 - Leveraging Decomposition Methods to Design Robust Policies for Markov Decision Processes**

Lauren N. Steimle, University of Michigan, 3261 Bolgos Circle, Ann Arbor, MI, 48105, United States, Brian T. Denton

Markov decision processes (MDPs) are commonly used to derive optimal sequential decision-making policies. However, these policies can underperform if the true model parameters differ from the estimates used in the optimization process. To address this issue, the Multi-model MDP has been proposed as a way to find a policy that performs well with respect to multiple models of the MDP parameters. Finding a policy that maximizes a weighted value across the models can be viewed as a two-stage stochastic program, and leveraging this connection, we develop exact and approximate solution methods that can be used to generate MDP policies that are robust to deviations in model parameters.

**2 - Designing Resilient Distribution Systems Under Natural Disasters**

Sadra Babaei, Oklahoma State University, 322 Engineering North, Industrial Engineering & Mgmt, Stillwater, OK, 74078, United States

This talk proposes a distributionally robust model for designing a distribution power system to withstand the risk of disruptions imposed by natural disasters. Using the moment information of asset failures, we build an ambiguity set of probability distributions of system contingencies. On the one hand, we consider the stochasticity of natural disasters and provide a less conservative configuration than that by a robust optimization approach. On the other hand, our model considers distributional ambiguity and so is more reliable than stochastic programming. We recast the model as a two-stage robust optimization formulation and solve it using the Column-and-Constraint Generation framework.

**3 - Optimizing Flux Bound Change Decisions In Metabolic Engineering**

Amanda Smith, University of Wisconsin-Madison, Fitchburg, WI, 53711, United States, James Luedtke

Bilevel mixed-integer programming models are frequently used to solve metabolic engineering problems. However, these models tend to push cells close to infeasibility, and solutions may yield non-viable organisms. To overcome this drawback, we investigate three new bilevel MIP models that attempt to offer a compromise between desired output and organism viability. First, we introduce a bi-objective top-level problem. We then augment this model by incorporating enzyme kinetics and conclude with a stochastic extension that accounts for uncertainty in cellular behavior.

**4 - Distributionally Robust Dual Dynamic Programming**

Daniel Duque, Northwestern University, 2145 Sheridan Rd, Evanston, IL, 60208, United States, David Morton

We consider a multi-stage stochastic linear program that lends itself to solution by stochastic dual dynamic programming (SDDP). In this context, we consider a distributionally robust variant of the model with a finite number of realizations in each stage, and distributional robustness is with respect to the probability mass function governing candidate realizations. We describe a computationally tractable variant of SDDP to handle this model using the Wasserstein distance to characterize distributional uncertainty.

**1 - Performance Bounds for Multistage Distributionally Robust Optimization**

Eojin Han, Northwestern University, 2145 Sheridan Road, Tech C210, Evanston, IL, 60208, United States, Chaithanya Bandi, Omid Nohadani

Distributionally robust optimization for multistage problems are known to be computationally challenging. Several approximative policies have been proposed, however, without bounds on their performance. For these problems, we study finitely adaptable policies and provide performance guarantees along with tractable implementation. The proposed bounds are established only based on the geometry of the underlying ambiguity set. Therefore, these bounds are general and independent of other problem parameters. We examine their performance on a newsvendor problem, allowing further insights.

**2 - Sustainable Inventory with Robust Periodic-affine Policies and Application to Medical Supply Chains**

Omid Nohadani, Northwestern University, 2145 Sheridan Road, Technological Institute M233, Evanston, IL, 60208-3119, United States, Eojin Han, Chaithanya Bandi

We introduce a new class of adaptive policies called periodic-affine policies, that allow to optimally manage large-scale newsvendor networks under demand uncertainty. These policies are data-driven and can model, e.g., correlation. We then generalize the model to multi-product settings and multi-period problems. We show that these policies are sustainable, i.e. time consistent. This approach is tractable and free of distributional assumptions, hence, suited for real-world applications. We provide efficient algorithms and demonstrate them on one of India's largest pharmacy retailers.

**3 - Distributionally Robust Newsvendor with Variation Distance: Calibration under Limited Information and Application to Reserving Operating Room Time**

Hamed Rahimian, Northwestern University, 1971 Neil Avenue, 210 Baker Systems Building, Evanston, IL, 60208, United States, Guzin Bayraksan, Tito Homem-de-Mello

We use distributionally robust stochastic optimization to model a general class of newsvendor problems. We form the ambiguity set by all demand distributions whose total variation distances from a nominal distribution are bounded by a level of robustness. For this problem, we characterize the optimal solution and the regions of demand that are critical to the optimal cost. We also establish quantitative relationships between the distributionally robust model and the corresponding risk-neutral and classical robust optimization models. We use our analyses to recommend an appropriate level of robustness for an operating room time reservation problem.

**4 - Data-Driven Distributionally Robust Stochastic Programming for Correlated Data**

Mihai Anitescu, Argonne National Laboratory, Argonne, IL, United States, Xialiang Dou

We present a distributionally robust formulation of a stochastic optimization problem for non-i.i.d vector autoregressive data. We use the Wasserstein distance to define robustness in the space of distributions and we show, using duality theory, that the problem is equivalent to a tractable, finite concave-convex saddle point problem. The performance of the method is demonstrated on both synthetic and real data

### Incentive Conflicts in New Product Development: Theory and Data

Sponsored: Technology, Innovation Management & Entrepreneurship

Sponsored Session

Chair: Jochen Schlapp, University of Mannheim, Mannheim, 68163, Germany

#### 1 - Turning the Tables: Licensing Contracts with Reciprocal Options

Pascale Crama, Singapore Management University, 50 Stamford Road, Singapore, 178899, Singapore, Niyazi Taneri

R&D collaborations between an innovator and a partner are often undertaken when neither can bring the product to market individually making joint effort necessary. Either party can avoid moral hazard by acquiring their missing capability and taking sole ownership of the project. The extent of two risks about whether the other party's capability will be acquired and about how well it will be implemented determine the optimality of not signing an up-front contract, signing buyout contracts, buyback contracts, dual buyout-buyback contracts, and an underutilized novel reciprocal option contract.

#### 2 - Project Selection and Success in Pharmaceutical R&D

Panos Markou, Cambridge Judge Business School, Calle Maria de Molina 12, Bajo, Cambridge, United Kingdom, Nektarios Oraopoulos, Stylianos Kavadias

We analyze the R&D pipelines of the fifteen largest pharmaceutical companies and examine how firms select which projects to pursue, and which ones eventually succeed, i.e., receive FDA approval. We find that firms select projects where they have prior experience, but that selection also depends on technological signals from rivals. Additionally, we find that in-licensed projects are less likely to be selected for development than in-house projects; but, conditional on selection, they have higher likelihood of success.

#### 3 - The Role of Participation in Innovation Contests

Jeremy Hutchison-Krupat, University of Cambridge, Cambridge, 22901, United Kingdom, Konstantinos Stouras, Raul Chao

We study a firm that chooses to employ an innovation contest only when the contest is expected to generate more value than alternative options. The population of solvers differ in their ability to generate value and they incur an opportunity cost to participate. Thus, some solvers may not find it beneficial to participate. Critically, when the firm designs the contest, and when the solvers choose to enter, the number of participants remains uncertain. Within this setting, we find that firms with sufficiently high opportunity cost maximize expected profit through the provision of multiple awards; otherwise, firms maximize their profit through a winner-take-all award structure.

#### 4 - Search Under Constraints

Sezer Ulku, Georgetown University, 594 Rafik B. Hariri Building, Washington, DC, 20057, United States

In innovation contexts, slack resources are required to allow experimentation in the face of uncertainty. At the same time, it is also suggested that "necessity is the mother of invention", and that constraints result in superior innovation performance. We conduct several experiments to investigate how constraints influence search behavior and the performance achieved in problem solving tasks. We find that solution quality attained under a moderate constraint is superior to that attained when no such constraint is present. As expected, when the resource constraint becomes very tight, performance suffers.

### Joint Session: Integer Programming/Opt under Uncertainty: Stochastic Mixed-Integer Programming

Sponsored: Optimization/Integer and Discrete Optimization

Sponsored Session

Chair: Amy Burton, Clemson University, Clemson, SC, United States

#### 1 - An Affine Bounding Method for Two-stage Stochastic Integer Programs

Gustavo Angulo, Macul, Santiago, 7820436, Chile, Merve Bodur, Diego A. Moran

For two-stage stochastic programs with mixed-integer recourse, we propose a decomposition method akin to Benders' decomposition. To approximate the second-stage value function, we iteratively partition the first-stage feasible set with affine lower-bounding functions derived from a Lagrangian relaxation, which is shown to be exact at the vertices of each element of the partition. Preliminary computational results are also presented.

#### 2 - Mixed-integer Nonlinear Programming Method for Chance-constrained Models with Endogenous and Exogenous Uncertainty

Alan Delgado de Oliveira, The George Washington University, Washington, DC, United States, Miguel Lejeune, Francois Margot

We propose a chance-constrained stochastic programming model with endogenous and exogenous uncertainty and develop an MILP solution method. This study is motivated by the need to quickly evacuate severe casualties from the battlefield. Computational results will be presented.

#### 3 - On Distributionally Robust Chance Constrained Program with Wasserstein Distance

Weijun Xie, Virginia Tech, Blacksburg, VA, 24060, United States

In a distributionally robust chance constrained optimization problem (DRCCP), the chance constraint is required to hold for all probability distributions of the uncertain parameters within a chosen Wasserstein distance from an empirical distribution. In this work, we investigate equivalent reformulations and approximations of such problems. We first show that a DRCCP can be reformulated as a conditional-value-at-risk constrained optimization problem, and thus admits tight inner and outer approximations. Next, we show that a DRCCP is mixed integer representable. We further identify submodular substructure in DRCCP and hence are able to derive valid inequalities.

#### 4 - Applying Stochastic Mixed-integer Programming to the Resiliency of Transportation Networks

Amy Burton, PhD Student, Clemson University, Clemson, SC, United States, Akshay Gupta

The decisions that dictate how funds are used to protect and increase the resilience of transportation networks should be made in a methodical, studied, and well-attested way. Focusing on bridges as critical links in transportation networks, we propose a stochastic mixed-integer program to minimize: (1) the investment costs of repairing and improving bridges and (2) time and travel costs incurred by motorists when old and damaged structures fail. Bender's Decomposition is used to solve a convex formulation of the nonconvex mixed-integer nonlinear program. Computational results are presented for an example nine-node network as well as the benchmark Sioux Falls network.

Sponsored Session

Chair: Negar Soheili Azad, University of Illinois-Chicago, Chicago, IL, 60607, United States

#### 1 - In-face Frank-wolfe for Non-convex Optimization

Paul Grigas, UC Berkeley, 4177 Etcheverry Hall, University of California, Berkeley, CA, 94720-1777, United States, Nathan Vermeersch

The Frank-Wolfe method and its extensions are well-suited for delivering solutions with desirable structural properties, such as sparsity or low-rank structure. We adapt the methodology of in-face directions within the Frank-Wolfe method to the setting of non-convex optimization. We are particularly motivated by the application of this methodology to the training of neural networks with sparse and/or low-rank properties. We develop theoretical computational guarantees, and we complement these results with extensive numerical experiments.

#### 2 - New Advances in Block Coordinate Descent Methods with Convergence to Second Order Stationary Solutions

Songtao Lu, University of Minnesota Twin Cities, Room 4-174 200 Union St SE, Minneapolis, MN, United States

The alternating gradient descent (AGD) is a simple but popular algorithm which has been applied to problems in optimization, machine learning, etc. In this talk, we show that a variant of AGD-type algorithms will not be trapped by "bad" stationary solutions such as local maximum points. In particular, we consider a smooth unconstrained optimization problem, and propose a perturbed AGD (PA-GD) which converges (with high probability) to the set of second-order stationary solutions (SS2) with a global sublinear rate. To the best of our knowledge, this is the first alternating type algorithm which takes  $O(\text{polylog}(d)/\epsilon^{7/3})$  iterations to achieve SS2 with high probability.

### 3 - First-order Methods for Non-convex Non-smooth minimax optimization

Qihang Lin, The University of Iowa, 21 East Market Street, S380, Pappajohn Business Building, Iowa City, IA, 52245, United States

In this paper, we consider the minimization of the maximum of finitely many weakly convex functions. Such a formulation has applications in machine learning and robust optimization. We model this problem equivalently as a min-max saddle-point problem. Due to the non-convexity, it is challenging to find a global saddle-point in general. We propose a primal-dual first-order method for this saddle-point problem and analyze the total iteration complexity of our method for finding an epsilon-nearly stationary point. Our method is developed for both stochastic and finite-sum problems.

### 4 - A Level Set Method for Constrained Stochastic Optimization

Negar Soheili, University of Illinois-Chicago, 601 S. Morgan Street, University Hall 2416, Chicago, IL, 60607, United States,  
Qihang Lin, Selvaprabu Nadarajah

Stochastic optimization problems with expectation constraints (SOEC) arise in several operations research and financial engineering applications. Only recently has an efficient stochastic subgradient method been developed for solving a SOEC defined by an objective and a single inequality constraint, where both are defined by expectations of stochastic convex functions. We develop a level-set method to compute near-optimal solutions to a generalization of this SOEC containing multiple inequality constraints, each involving an expectation of a stochastic convex function. We establish convergence guarantees for this method under different convexity assumptions.

North Bldg 122C

### Computational Stochastic Programming

Sponsored: Optimization/Computational Optimization and Software  
Sponsored Session

Chair: Rohit Kannan, PhD, University of Wisconsin, Madison, WI, United States

#### 1 - Recent Computational Advances in Multistage Stochastic Programs

Yongjia Song, Clemson University, 211 Fernow Street, 264 Freeman Hall, Clemson, SC, 29634, United States,  
Wim van Ackooij, Welington de Oliveira, Murwan Siddig

We consider decomposition techniques for multistage stochastic programming. The proposed algorithms combine ideas from finite perturbation of convex programs and level bundle methods to regularize the so-called forward step of these decomposition methods. On the other hand, the backward step of the decomposition methods is accelerated via recent developments in cutting plane approaches. Numerical experiments on a hydrothermal scheduling problem indicate that our algorithms are competitive with the state-of-the-art, e.g., the multistage regularized decomposition and the stochastic dual dynamic programming methods in the literature.

#### 2 - An Improved Branching Approach for Branch-and-bound Applied to Stochastic Mixed-integer Programs

Brian Christopher Dandurand, Argonne National Laboratory,  
Kibaek Kim

We present a new branch-and-bound approach for the extended split-variable form of stochastic mixed-integer programs. During the bounding of each node, we assume the generation of: 1) a set of "column" solutions satisfying integrality; and 2) a "consensus" solution satisfying non-anticipativity. Branching is informed by an interweaving of 1) the violations of consensus integrality, and 2) a suitable measure of dispersions of the column solutions around the consensus solution. The measure of dispersion adapts to the changing profile of integrality violation, and the branching scheme only requires branching on first-stage variables. We discuss computational tests on SIPLIB test problems.

#### 3 - A Scalable Global Optimization Algorithm for Stochastic Nonlinear Programs

Yankai Cao, University of Wisconsin-Madison, 2009 Engineering Hall, 1415 Engineering Drive, Madison, WI, United States,  
Victor Zavala

We present a reduced-space spatial branch and bound (BB) strategy for two-stage stochastic nonlinear programs. At each node, a lower bound is constructed by relaxing the non-anticipativity constraints and an upper bound is constructed by fixing the first-stage variables. Both lower and upper bounds can be computed by solving individual scenario subproblems. Another key property is that we only need to perform branching on the first-stage variables to guarantee convergence. We present an implementation of the algorithm called SNGO. We perform numerical experiments and compare the computational results against SCIP and demonstrate that the proposed approach achieves significant speedups.

#### 4 - GOSSIP: Decomposition Software for the Global Optimization of Nonconvex Two-Stage Stochastic Mixed-Integer Nonlinear Programs

Rohit Kannan, University of Wisconsin-Madison, Paul I. Barton

Despite rapid advances in decomposition techniques for solving two-stage stochastic MINLPs, there is, to the best of our knowledge, no publicly available software framework that implements these techniques. Motivated by the increasing interest in solving this rich class of problems, we present our decomposition framework named GOSSIP. GOSSIP includes implementations of nonconvex generalized Benders decomposition, Lagrangian relaxation, and a modified Lagrangian relaxation algorithm along with subroutines for detecting special structure and bounds tightening. The capabilities of GOSSIP are demonstrated on a library of diverse test instances composed from the literature.

Sponsored Session

Chair: Jose Luis Walteros, University at Buffalo, SUNY, Buffalo, NY, 14260, United States

#### 1 - An Integer Programming Approach for Vertex Connectivity Interdiction Problems

Demetrios Papazaharias, University at Buffalo, Buffalo, NY, 14260, United States, Jose Luis Walteros

The vertex connectivity interdiction problem entails finding the minimum subset of vertices in an undirected graph whose deletion achieves a desired reduction in the graph's connectivity. In particular, we aim to reduce the size of the largest component to at most  $k$ . In this paper, we introduce a 0-1 linear programming model with an extended formulation and cutting planes to strengthen its LP relaxation. We present computational experiments to compare our results to competing formulations as well as highlight interesting results for graphs containing a special structure.

#### 2 - Distance Between Two Random Events in a Network

Ningji Wei, University at Buffalo, SUNY, Buffalo, NY, United States,  
Jose Luis Walteros, Rajan Batta

We are interested in the shortest distance  $D$  of two random events in any given connected network where the lengths of edges are not negligible. We found the closed form formula for its expectation, and any order higher moments. Also found its PDF in closed form. In application, we may encounter the situation that one distribution is under our control, so we also found those statistics for the shortest distance conditioning on one of the events. Further, we analyzed the property of these statistics, and also their computational complexity with respect to the size of the network. Finally, we applied our results on some special type networks.

#### 3 - Optimal Corridor Design in Fragmented Landscapes

Chao Wang, Arizona State University, Tempe, AZ, United States,  
Jorge A. Sefair

Corridor design is fundamental in conservation planning to mitigate the adverse effects of habitat fragmentation. Current approaches focus on network analysis and landscape features but ignore the likelihood of movement and species mortality. To overcome these challenges, we present a discrete time Markov chain approach that allows us to predict transient and long-term connectivity measures. We also discuss a MIP formulation to find corridors with the highest expected usage to connect a network of fragmented landscapes. We discuss our models using a real case study of human-wildlife conflict.

#### 4 - Studying the Trade-off Between Police Presence and Patrolling in a Road Network

Fatemeh Mousapour, University at Buffalo, Buffalo, NY, 14260, United States, Jose Luis Walteros, Rajan Batta

Patrolling and adequate coverage are two key factors in police patrol problems respectively to stop, deter and prevent crimes. Our approach integrates some aspects of the traditional orienteering problem within a patrolling model to examine the trade-off between police presence in specific spots and patrolling through a road network.

Sponsored: Optimization/Network Optimization

Sponsored Session

Chair: Navid Matin Moghaddam, Arizona State University, AZ

**1 - Large-scale Network Design with Application to Carbon Capture and Storage**Navid Matin Moghaddam, Tempe, AZ, 85281, United States,  
Jorge A. Sefair

Motivated by the emerging need of climate stabilization, CCS seeks to prevent carbon emissions from entering the atmosphere by capturing, compressing, and transporting CO<sub>2</sub> from sources (e.g., oil refineries) to geologic reservoirs (e.g., depleted oil wells) for its long-term storage. To find the least-cost network of pipelines able to transport a target amount of CO<sub>2</sub>, we propose an optimization model and an exact decomposition algorithm that takes advantage of the optimal solution sparsity and the problem's cost structure. We illustrate the performance of our methods on a set of real instances.

**2 - Profit Oriented Fixed-charge Network Design with Elastic Demand**Carlos Armando Zetina, Concordia University, 1455 de  
Maisonneuve Boulevard West, Montreal, QC, H3G 1M8, Canada,  
Ivan Contreras, Jean-Francois Cordeau

Networks require significant investments and their infrastructure is built to last over an extended period of time. It is unrealistic to believe that the demand patterns will remain the same during its lifetime. Moreover, demand patterns depend on the resulting network's topology, leading to sub-optimal designs if static estimations are used. We attempt to circumvent this by incorporating elastic demand into a fundamental network design problem. We replace static origin-destination demand estimations with functions of the network characteristics often used to estimate demand. This provides the decision-maker with insights on the effect the design has on demand patterns.

**3 - Using Network Optimization to Extend the Transit Opportunity Index for Large-scale Transit Systems**Andres L. Medaglia, Professor, Universiad de los Andes, Cr 1 este  
Bogota, 111711, Colombia, Claudia D. Bedoya, Olga L. Sarmiento,  
Daniel A. Rodriguez, Jessica Camacho

The Transit Opportunity Index (TOI) quantifies accessibility and connectivity of a public mass transit system by combining spatial, temporal, and trip coverage metrics. We extended the TOI to allow for connectivity in large-scale transit systems where more than one transfer may be required. In this extended TOI we build a time-space network from the public transit supply and find shortest paths allowing multiple transfers. With the extended TOI, transit planners could adjust transit service to include opportunities and accessibility as design goals and address equity by identifying underserved areas. We illustrate the extended TOI with the public transit network of Bogotá, Colombia.

**4 - The Wireless Network Design Problem Subject to Radio Interference**Hugh Medal, Mississippi State University, P.O. Box 9542, Msu, MS,  
39762, United States, Will Leonard, Randy K. Buchanan

This paper studies the wireless network design problem, which considers how best to place a set of antennas so that the antennas can send and receive data in a way that maximizes total network throughput. A mixed-integer program was implemented to solve this problem using a Benders-decomposition approach. Maximal independent sets representing antennas' connections to one another were produced dynamically. The goal of this paper is to demonstrate whether utilizing directional antennas instead of omnidirectional antennas affects maximum throughput, as well as what changes occur to maximum throughput based on imposing constraints related to power and channel availability.

**Intersection between Optimization and Statistical Learning**

Sponsored: Optimization/Nonlinear Programming

Sponsored Session

Chair: Hongcheng Liu, University of Florida, Gainesville, FL,

**1 - Global Optimization of High-dimensional Generalized Linear Models with Nonconvex Regularization in Polynomial-time with High Probability**Charles Hernandez, University of Florida, Gainesville, FL, 32606,  
United States

In this presentation we investigate a local optimization scheme for a class of nonconvex learning problems known to be NP-Hard to solve. This optimization scheme can be shown to find a global optimum in polynomial time with high probability. The approach uses LLA in combination with a Folded Concave Penalty function and can be applied to the training of many high-dimensional generalized linear models.

**2 - Second-order Condition in Nonsmooth High-dimensional Learning**Hongcheng Liu, University of Florida, Weil Hall 478, Gainesville,  
FL, 32611, United States

This research concerns the high-dimensional learning with non-smooth empirical loss functions. Through the use of a folded concave penalty (FCP), we show that the excess risk of the M-estimation problem can be well contained even if the loss function is not necessarily differentiable and the number of dimensions cannot be bounded by any polynomial function of the sample size. Such a desirable sample complexity is provably achieved at a second-order stationary point of the FCP-based nonconvex formulation.

**3 - Linearly-constrained High Dimensional Learning**Hung Yi Lee, University of Florida, 303 Weil Hall, Gainesville, FL,  
32603, United States

This presentation is mainly concerned with the computational and statistical complexities involved in the folded concave penalized high-dimensional M-estimation problems with linear constraints. We have shown that by using some local solutions which satisfy certain second-order necessary optimality conditions, the required sample size grows in poly-logarithmic of the number of dimensions, hence, improving the statistical performance.

**4 - Complexity for Training ReLU Neural Network**Digvijay Boob, Georgia Institute of Technology, Atlanta, GA,  
United States, Santanu Subhas Dey, Guanghui Lan

A neural network is a function computed on a graph parameterized by edge weights. Problem of training neural network can be thought of as searching for edge weights such that output of neural network exactly matches with output according to data. It is known that training binary neural network is NP-complete whereas ReLU neural network is employed extensively in practice. Training algorithm involves heuristic methods such as stochastic gradient descent. There is a no complexity based hardness results for fully connected ReLU network. We show that training a simple fully connected ReLU neural network is NP-hard. On the other hand, applying over-parametrization to these networks render the problem in P.

Sponsored: Manufacturing &amp; Service Oper Mgmt

Sponsored Session

Chair: Norbert Trautmann, University of Bern, FM Quantitative  
Methoden, Schuetzenmattstrasse 14, Bern, 3012, Switzerland**1 - The RCPSP: New Benchmark Results**Stefan Creemers, KU Leuven, Naamsestraat 69, Leuven, 3000,  
Belgium, Stefan Creemers, IESEG School of Management, Lille,  
France

We present a new state-of-the-art procedure for solving the resource-constrained project scheduling problem. We present new benchmark results, and are able to solve several problem instances that were previously unsolved.

## 2 - Mixed Integer Linear Programming Formulations for Resource Constrained Truck Scheduling in Cross Docks

Pascal Wolff, Tongji University, Shanghai, China, Yongrui Duan, Hans-Christian Pfohl, Jiazhen Huo

The number of articles on truck scheduling in cross-docks has been growing very fast in the last decades. However, many models are detached from industry practice since they do not explicitly consider resource constraints (e.g. available manpower, material handling equipment etc.). In this paper, we address this research gap and propose MILP formulations for truck scheduling in cross-docks that incorporate resource availability. Considering scarce resources that are required for cross-dock operations, these scheduling models meet industrial needs. Furthermore, we develop heuristic algorithms to tackle the problems.

## 3 - Capacity Planning and Production Scheduling for a Multi-facility Production System

Nourah Almatooq, Arizona State University, Tempe, AZ, United States, Ronald G. Askin, Greg Gruber

We investigate the integrated medium-range capacity planning and production scheduling problem for a multi-facility system producing multiple products with significant capacity change, semi-fixed and variable labor, shortage and logistics costs. We find the optimal production quantities, shift schedules, processing rates, overtime, inventory policy and shipments to demand markets to minimize system costs over the multiperiod planning horizon. Strategies for capacity modification to match dynamic demand are determined.

## 4 - A Novel Continuous-time Model for the Resource-constrained Project Scheduling Problem RCPSP

Norbert Trautmann, University of Bern, FM Quantitative Methoden, Schuetzenmattstrasse 14, Bern, 3012, Switzerland, Adrian Zimmermann

The widely studied resource-constrained project-scheduling problem RCPSP consists of determining the start times for a set of precedence-related project activities requiring time and scarce resources during execution such that the total project duration is minimized. We present a novel continuous-time MILP model which outperforms various state-of-the-art models in particular when the resource capacities are very scarce.

## Socially Responsible and Demand-driven Operations Management

Sponsored: Manufacturing & Service Oper Mgmt

Sponsored Session

Chair: Muge Yayla Kullu, University of Central Florida, Orlando, FL, 32816, United States

### 1 - Nowcasting Restaurant Hygiene using Online Reviews

Shawn Mankad, Cornell University

We provide evidence for how information from online reviews of restaurants can be effectively used to identify cases of hygiene violations in restaurants, even after the restaurant has been inspected and certified. We use data from restaurant hygiene inspections in New York City from the launch of an inspection program from 2010 to 2016, and combine this data with online reviews for the same set of restaurants. Using machine learning techniques, we identify systematic instances of moral hazard, wherein restaurants with positive hygiene inspection scores are seen to regress in their hygiene maintenance within 90 days of receiving the inspection scores.

### 2 - Product Design and Pricing in Integrated Repair Supply Chain

Honggang Hu, University of Florida, Gainesville, FL, 32611, United States, Avinash Geda, Vashkar Ghosh, Asoo J. Vakharia

Firms are producing highly integrated products which are less repairable by third party repair firms. While firms lose out on consumers who value repairable products, they offer the firms a source of repair service revenue downstream. We address the issue where the firms faces trade-off between product design and potential revenue from repair services.

### 3 - Sustainable Management with a Triangle Sustainable Framework: Cases of Sustainable Manufacturing

Yong Yin, Doshisha University, Karasuma-Imadegawa, Kamigyo-ku., Kyoto, 602-8580, Japan, Kathryn E. Steckle, Dongni Li

Triple bottom line is extended to a triangle sustainable framework that consists of categories of primary performance measures and drivers that address the relationships among the economic, environmental, and societal sustainable dimensions. Manufacturing cases of seru production are used to show that following particular practices and performance goals (e.g., pursuing responsiveness) naturally lead to sustainable outcomes. Our results are counter to the literature that claims that giving highest priority to the economic dimension makes it difficult to realize sustainability. A causal loop is used to identify sustainable drivers that induce a seru system to deliver sustainable goals.

## 4 - Recyclability of Post-disaster Debris

Andriy Shapoval, Georgia Institute of Technology, Atlanta, GA, United States, Pinar Keskinocak, Beril Toktay

This work investigates trade-offs in efforts to recycle debris after natural disasters. Various policies and interests of involved stakeholders may impact the possibility of creating efficient recycling programs. We evaluate the conditions under which recycling is viable across three dimensions: economic, environmental, and social.

## 5 - Reining in Onion Prices by Introducing a Vertically Differentiated Substitute

Muge Yayla Kullu, University of Central Florida, 4000 Central Florida Blvd., Orlando, FL, 32816, United States, Omkar D. Palsule-Desai, Srinagesh Gavirneni

Onion is an indispensable ingredient of the Indian diet and plays a vital role in the Indian economy, society, and politics. In this paper, we are interested in examining underlying causes of the onion price volatility that leads to significant social unrest in the country. We identify conditions under which (i) it is optimal to introduce the processed produce as a vertically differentiated substitute to the fresh produce; and (ii) the processed produce should be managed by cooperatives instead of private firms. Our model captures (i) competition between non-profit and for-profit organizations, (ii) consumers' valuation discount for processed produce, and (iii) perishability of the fresh produce.

## Using Estimated Data in Optimization

Emerging Topic: OR Frontiers

Emerging Topic Session

Chair: Meinolf Sellmann, Cortlandt Manor, NY, 10567, United States

### 1 - A Hybrid Decision Diagram and Mixed-integer Programming Approach for Optimization

Jaime E. Gonzalez, Polytechnique Montreal, Montreal, QC, Canada, Andre Augusto Cire, Andrea Lodi, Louis-Martin Rousseau

We present an optimization framework which integrates binary decision diagrams (BDDs) and mixed-integer programming (MIP) technology. In the proposed framework, a relaxed BDD plays the role of a search tree by identifying parts of the search space that can be efficiently explored by solving MIP models associated with the nodes of the BDD. Conversely, the MIP model results are iteratively employed to further refine the BDD and find primal bounds. Selecting the BDD nodes to explore by MIP highly impacts the approach's performance and then, the integration of supervised learning can be critical for this purpose. We present computational experiments on the maximum stable set problem.

### 2 - Maximizing the Expected Value of Order Statistics, with an Application to Sports Betting Pools

David Bergman, University of Connecticut, Storrs, CT, United States, Carlos H. Cardonha, Jason P. Imbrogno, Leonardo Lozano

Real-world optimization problem often require maximizing the expected value of order statistics. We discuss algorithms for solving this general and complex class of optimization problems, and describe how they can be applied to optimally selecting entries in sports betting pools.

### 3 - Predictive and Prescriptive Analytics for Location Selection of Add-on Retail Products

Teng Huang, University of Connecticut, Storrs, CT, 06268, United States, David Bergman, Ram Gopal

In this paper we study a predictive-and-prescriptive analytics framework for optimizing expansion decisions for retailers selling add-on products. We build predictive models for understanding the derived demand of the add-on product and establish an optimization framework for automating expansion decisions to maximize expected sales.

**Navigating the Publication Process: Recently Published Papers in Empirical Healthcare OM**

Sponsored: Manufacturing &amp; Service Oper Mgmt/Healthcare Operations

Sponsored Session

Chair: Song-Hee Kim, University of Southern California, Los Angeles, CA, 90089, United States

**1 - When Waiting to See a Doctor is Less Irritating:****Understanding Patient Preferences and Choice Behavior in Appointment Scheduling**Nan Liu, Boston College, 140 Commonwealth Avenue,  
Fulton Hall, Room 340, Chestnut Hill, MA, 02467, United States,  
Stacey Finkelstein, Margaret Kruk, David Rosenthal

In this talk, we share the journey of our recent research and its publication process. This study concerns patient preferences and choice behavior in scheduling medical appointments. We conduct four discrete choice experiments on two distinct populations and identify several “operational attributes (e.g., delay to care and choice of doctor) that affect patient choice. We observe an interesting gender effect with respect to how patients tradeoff speed (delay to care) vs. quality (doctor of choice), and demonstrate that risk-attitude is a mediator variable. Our results have important implications for improving patient experience in a medical practice based on patient mix and current delay level.

**2 - Variety and Experience: Learning and Forgetting in the Use of Surgical Devices**Kamalini Ramdas, London Business School, A215 Sussex Place,  
Regent's Park, London, NW1 4SA, United Kingdom

We examine learning and forgetting in hip surgery as a function of surgeons' experience with specific device versions. We develop a generalizable method to correct for left censoring of granular experience data, using maximum simulated likelihood estimation. With steep learning and rapid forgetting, device variety hurts surgeons' productivity and quality.

**3 - Team Familiarity and Productivity in Cardiac Surgery Operations: The Effect of Dispersion, Bottlenecks, and Task Complexity**Bilal Gokpinar, UCL School of Management, 1 Canada Square  
(38th floor), Canary Wharf, London, E14 5AA, United Kingdom,  
Emmanouil Avgerinos

Fluid teams are commonly used by a variety of organizations to perform similar and repetitive yet highly critical and knowledge-intensive tasks. Using a granular data set of 6,206 cardiac surgeries from a private hospital in Europe over seven years, our study offers a new and detailed account of how shared work experience influences team productivity. We highlight the role of nuanced team composition dynamics beyond average team familiarity. We observe that teams with high dispersion of pairwise familiarity exhibit lower team productivity, and the existence of a “bottleneck-pair may significantly hinder overall knowledge transfer capability, thus, productivity of fluid teams.

**4 - The Impact of E-Visits on Visit Frequencies and Patient Health: Evidence from Primary Care**Hessam Bavafa, Assistant Professor, Wisconsin School of Business,  
975 University Avenue, Madison, WI, 53706, United States,  
Lorin Hitt, Christian Terwiesch

Secure messaging, or “e-visits,” between patients and providers has increased sharply in recent years, and many hope they will help improve healthcare quality while increasing provider capacity. Using a panel dataset from a large healthcare system in the United States, we find that e-visits trigger about 6% additional office visits, with mixed results on phone visits and patient health. These additional visits come at the sacrifice of new patients: physicians accept 15% fewer new patients each month following e-visit adoption. Our dataset on nearly 100,000 patients spans from 2008 to 2013, which includes the rollout and diffusion of e-visits in the health system we study.

**Data and Platforms**

Sponsored: Manufacturing &amp; Service Oper Mgmt/Service Operations

Sponsored Session

Chair: Hamsa Sridhar Bastani, Wharton School, Philadelphia, PA, United States

Co-Chair: Kenneth Moon, University of Pennsylvania, Philadelphia, PA, 19104, United States

**1 - Network Effects in Contagion Processes Identification and Control**Fanyin Zheng, Columbia University, Columbia Business School,  
412 Uris Hall, New York, NY, 10027, United States,  
Kimon Drakopoulos

In this paper, we study the problem of identifying network effects in contagion processes and present an application to the propagation of influenza in the United States. In particular, using data on the evolution of infections over time, the travel intensity between states as well as environmental conditions we first provide a framework to identify the true network effect of traveling between states. We use our estimates to propose and evaluate the performance of intervention and control policies, illustrating the benefits of network-based interventions.

**2 - The Value of Pop-up Stores in Driving Online Engagement in Platform Retailing: Evidence from a Large-scale Field Experiment with Alibaba**Dennis Zhang, University City, MO, 63124, United States,  
Hengchen Dai, Lingxiu Dong

Short-lived and experiential-oriented pop-up stores have become a mainstream retail strategy. We provide the first causal evidence on how pop-up stores affect consumers' subsequent behaviors. In a randomized field experiment involving approximately 800,000 consumers with Alibaba Group's China's largest e-commerce company we randomly assigned consumers to either receive a message about an upcoming pop-up store event or not receive any message. Our results show that visiting a pop-up store not only increases customers' engagement with participating brands, but also improve customers' long-term engagement with the platform.

**3 - Optimal Recommendations and Preference Learning with Customer Disengagement**Divya Singhvi, MIT, Hamsa Sridhar Bastani, Pavithra Harsha,  
Georgia Perakis

We consider the problem of sequential product recommendations when customer preferences are unknown and customers are restless (i.e., customers decide to stay on the platform based on the quality of recommendations). In particular, we model customers who may abandon a content recommender (e.g., Pandora, Netflix) for an outside option (e.g., Apple Music or Hulu) based on the quality of recommendations they have received so far. We prove that bandit learning algorithms over-explore and the greedy policy under-explores in this regime. We propose a new learning algorithm that carefully balances the exploration-exploitation tradeoff in this setting.

**4 - Flexibility and Relationships in Online Marketplaces**Jiding Zhang, The Wharton School, 3730 Walnut St, 500 Jon M.  
Huntsman Hall, Philadelphia, PA, 19104, United States,  
Elena Belavina, Karan Girotra, Kenneth Moon

Online marketplaces have grown and diversified as intermediaries for services, extending from the flexible (Uber and Airbnb) to those in which trust and relationships are valued (\$800B home services market). Using data from a leading online labor marketplace, we empirically relate the operational performance of the platform's pricing and matching regimes to a simple market characteristic: how clients derive comparative value from flexibility and/or relationships with service providers. Extending recent theoretical modeling in dynamic mechanism design, our structural empirical methods use large-scale market data to prescribe pricing and matching policies.

**5 - Adaptive Learning with Unknown Information Flows**

Ahmadreza Momeni, Stanford University, Yonatan Gur

We introduce a generalized multi-armed bandit formulation in which additional information on each arm may appear arbitrarily throughout the decision horizon, and study the impact of such information flows on the achievable performance and the design of efficient decision-making policies. We characterize the regret complexity of this family of problems and introduce a general and practical adaptive exploration approach for designing policies that, without any prior knowledge on the information arrival process, attain the best performance that is achievable when the information arrival process is a priori known.

## ■ SD15

**Joint Session MSOM/Practice Curated: Managing Customer in Service Systems: Emergency Department and Call Center Applications**

Sponsored: Manufacturing &amp; Service Oper Mgmt/Service Operations

Sponsored Session

Chair: Laurens G. Debo, Dartmouth College, Hanover, NH, 03755, United States

**1 - Modeling and Improving Emergency Department Operations**  
Tava Olsen, University of Auckland, ISOM, Business School,  
University of Auckland, Auckland, 1142, New Zealand

This talk presents a number of different streams of my research on modeling and improving ED operations. I consider issues of modeling patients leaving without being seen (with Bolandifar, DeHoratius, and Wiler), key drivers of ED performance (with Shaw, Parsons, and Walker), and issues in patient prioritization (with O'Sullivan, Walker, and Ziedins).

**2 - Dynamic Resource Allocation in an Emergency Department: A Tandem Queueing Model with Time-varying Arrivals**Ling Zhang, North Carolina State, Raleigh, NC, United States,  
Serhan Ziya, Sukriye Nilay Argon, Yunan Liu

Motivated by daily operations in an emergency department of a hospital, we study a multi-server tandem queueing system with a time-varying arrival rate. We are particularly interested in the optimal allocation of resources (such as nurses, doctors, and beds) among patients at different stages of service within a given cycle (e.g., a day). We solve an optimal control problem with an objective of minimizing the overall operational costs (including holding and staffing costs). Asymptotic analysis and numerical experiments are conducted to provide useful insights.

**3 - The Reference Effect of Delay Announcements: A Field Experiment Presenter**Qiuping Yu, Kelley School of Business, Indiana University, 1309 E.  
Tenth Street, Bloomington, IN, 47405-1701, United States,  
Gad Allon, Achal Bassamboo

We explore whether customers are loss averse in time and how delay information may impact such reference-dependent behavior via a field experiment at a call center. Customers are provided with delay announcements or no announcements in a quasi-randomized manner in our field experiment. We show that customers are loss averse regardless of the announcements. While delay announcements do not alter the nature that customers are loss averse, they do facilitate more granular learning of the offered waiting time and thus impact the reference point customers use. Through counterfactual studies, we demonstrate how customers' loss aversion behavior impacts the value of providing delay information.

**4 - Patients Waiting Experience in an Urban Emergency Department**  
Sina Ansari, Northwestern University, McCormick School of  
Engineering, 2145 Sheridan Road, Evanston, IL, 60208,  
United States, Laurens G. Debo, Seyed Iravani

Excessive wait time is the most common reason patients become unsatisfied and leave the emergency department before being treated. In this study, we determine the impact of announcing patient's waiting times on patients satisfaction.

**Topics in Sustainable Operations**

Sponsored: Manufacturing &amp; Service Oper Mgmt/Sustainable Operations

Sponsored Session

Chair: Ximin Huang, University of Minnesota, Minneapolis, MN,  
55455, United States**1 - Network Architecture in Joint Liability Contracts**Bahar Rezaei, UCLA Anderson School of Management, CA,  
United States, Sriram Dasu, Reza Ahmadi

Joint liability contracts depend on the structure of the borrower network. We develop a model, in which connections between borrowers serve as monitoring tools, and examine the effect of various network structures on the performance of a jointly liable group. Our results show that a higher degree of connectivity has two counteracting effects on the group performance and consequently on the contract they are offered. Although, strong links between borrowers improve the group repayment insurance, it increases the repayment obligation of individual borrowers. We argue that for handling projects with average risk of failure, network structures with average connectedness are the best.

**2 - The Impact of Animal Welfare Regulation on Firms' Product Offerings: Humane or Organic Product**Wenli Xiao, University of San Diego, 5998 Alcala Park, Olin Hall  
335, San Diego, CA, 92110, United States, Yen-Ting Lin,  
Yinping Mu

We consider two competing supply chains with a supplier and a retailer. We examine the retailers' choice between offering an organic product and a humane product, when an animal welfare regulation is introduced. By offering an organic product, the retailer improves both animals' living conditions and the product's nutritional benefits, while offering a humane product only improves animals' living conditions. We provide the conditions under which the retailer would choose to offer the organic versus humane product. In addition, we show that subsidies offered by regulators to encourage the consumption of humane product in general hurts social welfare.

**3 - Impact of Carbon Pricing on Supply Chain Energy Efficiency and Social Welfare**Jason Quang Nguyen, University of New South Wales,  
Kensington, Sydney, 2052, Australia, Karen L. Donohue,  
Mili Mehrotra

This paper analyzes the trade-off between the intended benefit of carbon pricing in making emitters internalize the negative externality of emissions and its adverse effect on business competitiveness against external jurisdictions with a laxer policy. We study the policy decisions of a regulator who wishes to use carbon pricing to regulate emissions and encourage supply chain energy efficiency investments. Through a series of game theoretic models, we show that when it is important to maintain domestic business, social welfare could be reduced by the recommended practice of setting the carbon price equal to the negative externality from energy as well as by external jurisdiction competition.

**4 - Fair Labor Practices in a Sustainable Supply Chain: Buyers and Suppliers Managing Risk**Susan A. Slotnick, Cleveland State University, OSM Department,  
BU 542, Cleveland, OH, 44115, United States, Matthew J. Sobel

This paper investigates the collaborative decision making of a buyer and supplier, when the buyer's reputation in the market affects retail demand. Both buyer and supplier make decisions about managing the risk of an adverse event. The buyer maximizes profit by choosing among financial incentives to induce fair labor practices at the supplier, and the supplier manages its workforce and other resources to maximize its profit, considering the incentives and the risk.

**Economic Models in Supply Chain Management**

Sponsored: Manufacturing &amp; Service Oper Mgmt/Supply Chain

Sponsored Session

Chair: Abhishek Roy, Temple University, Fox School of Business,  
Philadelphia, PA, United States

Co-Chair: Guoming Lai, Austin, TX, 78712, United States

**1 - Price Distributions, Store Sequencing, and Opportunistic Shopping Behavior**Sreekumar R. Bhaskaran, Southern Methodist University, Cox  
School of Business, P.O. Box 750333, Dallas, TX, 75275, United  
States, John H. Semple

This paper investigates the optimal sequence of store visits for items whose prices are unknown. We find that the shape of the price distribution plays an influential but sometimes non-intuitive role in lowering expected costs for the buyer.

**2 - Supplier Audit Information Sharing and Responsible Sourcing**Yunjie Wang, Renmin University of China, Beijing, China,  
Albert Y. Ha, Weixin Shang

We develop a game-theoretic model to study the incentive for competing manufacturers to share supplier audit information in a market with some consumers who boycott a manufacturer if supplier responsibility violations occur. Based on the audit information, each manufacturer either continues to source from an existing common supplier who has uncertain responsibility risk, or switches to a new supplier who has no responsibility risk but charges a higher price. We characterize the manufacturers' equilibrium audit information sharing decisions and sourcing strategies, and show how they depend on the model parameters.

**3 - Strategic Inventory under Supply Chain Competition**

Yanzhi David Li, City University of Hong Kong, Hong Kong, Li Xi, Ying-Ju Chen

We examine the effect of strategic inventory in the presence of chain-to-chain competition. We show that as the competition between two supply chains becomes fiercer, retailers will carry more inventory, which intensifies the supply chain competition. Consequently, this competition intensification effect can overshadow the effect of double marginalization alleviation.

**4 - Strategic Inventory in Non-exclusive Reselling Environments**

Abhishek Roy, Temple University, Fox School of Business, Philadelphia, PA, United States, Stephen M. Gilbert, Guoming Lai

Although the effects of strategic inventory in dynamic contracts on supply chain agents in bilateral monopolies are well known, we find that those effects are altered when competing manufacturers sell partially substitutable products through a common retailer. We examine the manufacturers' choices between a dynamic contract and a commitment contract that includes both price and quantity commitments. In contrast to what occurs in a bilateral monopoly, we find that manufacturers may prefer to use commitment contracts and that such contracts may arise in equilibrium.

**SD18**

North Bldg 128A

**Social Learning in Operations**

General Session

Chair: Gad Allon, The Wharton School of University of Pennsylvania, Philadelphia, Pennsylvania

**1 - Pricing and Prioritizing Differentiated Services when Customers Learn Socially**

Koushiki Sarkar, Kellogg School of Management, Northwestern University, Evanston, Saint Barth lemy, Gad Allon, Achal Bassamboo

Dissemination of information via social networks play a critical role in modern decision-making. We model the effects of social information in service differentiation under a queuing setting. We consider a profit-maximizing firm serving two groups of customers in an M/M/1 queue with two priority classes, where the customers observe service reviews at random from each period and use that information to decide their action for the coming period. We study the steady-state behavior of this system and obtain the firm's profit function and the optimal prices to be set.

**2 - Learning, Welfare, and Profits in Two-sided Service Platforms**

Kostas Bimpikis, Stanford University, Stanford, CA, United States, Yiangos Papanastasiou, Wenchang Zhang

Platforms such as Airbnb and Upwork have reduced search and information frictions in the service industry. The efficient gathering of information about the quality of providers in such a setting is of first-order importance. Our goal is to provide design guidelines taking into account that the quality of new providers is unknown and information about them can only be generated via transactions. The main design levers we explore are commission rates and information disclosure policy. We show that the optimal design features disclosing quality information with a delay and can result in significantly higher revenues than in the case that the platform does not optimize over information provision.

**3 - Which Locations are the Most Valuable in a Network of Service Outlets?**

Masha Shunko, University of Washington, Foster School of Business, PACCAR Hall, Seattle, WA, 98195, United States, Qiuping Yu, Shawn Mankad

Using a comprehensive dataset from a major restaurant network, we evaluate the impact of a restaurant's quality as measured by customer satisfaction and the impact of supply chain quality measured by quality complaints between supply chain members on the total sales at all locations within the network. As a result we identify the most valuable locations in terms of their impact on the total sales in the network, providing guidance on which service outlets should be prioritized for investment and development.

**4 - Value of Traceability in Supply Chains**

Yao Cui, Cornell University, Ithaca, NY, United States, Ming Hu, JingChen Liu

We consider supply chains where the buyer cannot identify which supplier is at fault when quality defect occurs (e.g., agricultural supply chains). We study how new technologies that enable traceability (e.g., blockchain) can create value under different supply chain structures.

**SD19**

North Bldg 128B

**Innovations in Pricing**

Sponsored: Revenue Management & Pricing

Sponsored Session

Chair: Adam Elmachet, Columbia University, New York, NY, 10027, United States

Co-Chair: Michael Hamilton, Columbia University, New York, NY

**1 - Network Revenue Management under Strategic Behavior and Customer Choice**

Nikolaos Trichakis, MIT, 100 Main Street, E62-576, Cambridge, MA, 02143, United States, Yiwei Chen

We consider a canonical network revenue management model in which a seller offers multiple products, which consume capacitated resources, for sale to utility-maximizing customers who choose both (1) when to buy, and (2) which product to buy. We use a novel decomposition approach for a suitable dynamic mechanism design problem to derive for all non-anticipating dynamic pricing policies an upper bound to expected revenues. We employ the bound to obtain a constant-factor guarantee for the performance of static pricing in a fluid-type regime.

**2 - The Impact of IPO on Peer-to-Peer Lending Platforms**

Kevin Jiao, NYU Stern, New York, NY, 10012, United States, Maxime Cohen

In this talk, we investigate the event of initial public offering and its impact on the peer-to-peer lending U.S. market. Focusing on the two leading U.S. platforms, we exploit a research setting which compares the difference between the private platform (Prosper) and the public platform (Lending Club) from both operational and investment perspectives. Using econometrics tools, we carefully examine if the event of IPO causes the firm to manipulate some of its operational decisions.

**3 - Price Optimization for Rotable Spare Parts**

Yunjie Sun, Columbia University, 500 West 120th Street, 535 S. W. Mudd Building, New York, NY, 10027, United States, Omar Besbes, Adam Elmachet

Working in collaboration with Dassault Falcon Jet (DFJ), we address the problem of pricing for rotatable parts, one special type of spare part that can be repaired and reused. We develop a model to maximize the expected profit rate through selling rotatable parts. This model captures the special dynamics of rotatable parts yet still easy to implement. We also discuss the on-going large scale implementation of the pricing model at DFJ. We leverage data in estimating the inputs for the optimization model. We build a user interface which takes the estimated inputs and returns a suggested price that is robust to uncertainties of inputs. We provide initial results of implementation for over 500 parts since May 2018.

**4 - The Power of Opaque Products in Pricing**

Michael Hamilton, Columbia University, New York, NY, 10027, United States, Adam Elmachet

We study the power of selling opaque products, i.e., products where a feature is hidden from the customer until after purchase. We consider models where traditional items are sold at a single price alongside opaque products corresponding to subsets of items and benchmark our opaque selling strategies against two common selling strategies: one which charges different prices for the items (discriminatory pricing), and one which charges a single price (single pricing). When customers are unit-demand and draw valuations exchangeably, we give a sharp characterization for when opaque selling outperforms discriminatory pricing, and characterize the maximal revenue lift opaque products can provide.

### Revenue Management for Online Ad Markets

Sponsored: Revenue Management & Pricing

Sponsored Session

Chair: Negin Golrezaei, Massachusetts Institute of Technology, 30 Memorial Dr, Cambridge, MA, 02142, United States

Co-Chair: Antoine Desir, Google Inc, New York, NY, United States

#### 1 - Using Bundle Sales to Speculate on Price Elasticities for an Online Retailer

Will Ma, Massachusetts Institute of Technology, 71 School Street, Cambridge, MA, 02139, United States, David Simchi-Levi

This work is motivated by the observation that bundle sales numbers generally contain richer information about demand, and specifically, contain information about price elasticities that individual sales numbers do not. We propose a basic rule for using bundle sales to speculate on price elasticities. We test the validity of this simple rule on a data from a large online retailer and show that our speculations are correct with statistical significance.

#### 2 - Planning Online Advertising using Lorenz Curves

John G. Turner, University of California - Irvine, The Paul Merage School of Business, Room SB2 338, Irvine, CA, 92697-3125, United States, Miguel Lejeune

Lorenz curves are commonly-used to depict dispersion; e.g., income inequality. Motivated by online advertising campaigns that desire impressions spread over targeted audience segments and time, we formulate a problem that minimizes Gini Coefficients (area under the Lorenz curve), and develop a specialized decomposition technique to solve instances quickly.

#### 3 - Auction Design for ROI-constrained Buyers

Ilan Lobel, New York University, New York, NY, United States, Negin Golrezaei, Renato Paes Leme

We combine theory and empirics to (i) show that some buyers in online advertising markets are financially constrained and (ii) demonstrate how to design auctions that take consider such financial constraints. Using a field experiment on Google's advertising exchange, we find that a significant set of buyers lowers their bids when reserve prices go up. We show that this behavior can be explained if we assume buyers have constraints on their minimum return on investment (ROI). We proceed to design auctions for ROI-constrained buyers. We show that optimal auctions for symmetric ROI-constrained buyers are either second-price auctions with reduced reserve prices or subsidized second-price auctions.

### Learning and Optimization in Revenue Management Problems

Sponsored: Revenue Management & Pricing

Sponsored Session

Chair: Huanan Zhang, Penn State University, 310 Leonhard Building, University Park, PA, 16801, United States

#### 1 - Nonparametric Learning with Covariates

Ningyuan Chen, Hong Kong University of Science and Technology, Clear Water Bay, Kowloon, Hong Kong, Guillermo Gallego

Decision makers usually need to optimize an initially unknown objective function with observed covariates. When the form of the objective function is unknown, postulating a parametric model of the function may lead to misspecification. We consider a nonparametric policy, which achieves a regret of order  $O((\log(T)^{2T}((2+d)/(4+d)))^{\frac{1}{2}})$ , where  $T$  is the length of the horizon and  $d$  is the dimension of the covariate. The algorithm is shown to be near-optimal. The role played by  $d$  highlights the complex interaction between the nonparametric formulation and the covariate dimension; It also suggests the decision maker incorporate contextual information selectively when possible.

#### 2 - Size Matters, so does Duration: The Interplay between Offer Size and Offer Deadline

Zhenyu Hu, National University of Singapore, 15 Kent Ridge Drive, Mochtar Riady Building, BIZ1 8-69, Singapore, 119245, Singapore, Wenjie Tang

We study a Stackelberg game involving a proposer and responder. The proposer acts first by making an offer to the responder with a deadline, and the responder, following a continuous finite-horizon search for alternative offers, has to respond to the offer by the deadline. We find that the proposer should offer a non-

exploding offer when the alternative offer market is favorable to the responder. When the alternative offer market is unfavorable to the responder, the proposer can profit from making an exploding offer with a smaller size in a harsher market. Finally, when the proposer is only allowed to manipulate offer size, the optimal offer size first decreases then increases in the given offer duration.

#### 3 - Dynamic Segmentation to Explore Markets with Unknown and Time-varying Customer Heterogeneity

N. Bora Keskin, Duke University, Fuqua School of Business, 100 Fuqua Drive, Durham, NC, 27708-0120, United States, Meng Li

Consumers are often heterogeneous in their preferences for product quality, and firms usually face uncertainty about consumer preferences when they sell vertically differentiated products to such heterogeneous consumers. We study this problem in a setting where a firm can dynamically optimize its prices. We construct and analyze near-optimal dynamic pricing policies in this context.

#### 4 - Online Learning and Optimization of (some) Cyclic Pricing Policies for Revenue Management with Patient Customers

Huanan Zhang, Penn State University, 903B West Aaron Dr., State College, PA, 16803, United States, Stefanus Jasin

We consider the joint learning and optimization problem of cyclic pricing policies in the presence of patient customers. We first introduce a learning algorithm that can converge to an optimal decreasing cyclic policy with a logarithmic regret, by only using the total sales information. Then, we introduce a larger family of policies, called threshold-regulated policies, which contains both the decreasing cyclic policies and the nested decreasing cyclic policies. For this broader set of policies, we introduce our second learning algorithm that can converge to an optimal threshold-regulated policy with logarithmic regret.

Sponsored Session

Chair: Dan Zhang

Co-Chair: Saied Samiedaluie, University of Alberta, Alberta School of Business, Edmonton, AB

#### 1 - Exact First-choice Product Line Optimization

Velibor Misis, UCLA Anderson School of Management, Los Angeles, CA, 90095, United States, Dimitris Bertsimas

The first-choice product line design problem is to select a set of candidate products to offer to a set of customers that choose according to a first-choice rule. We present a new MIO formulation of the problem, prove that this formulation is stronger than alternative models and develop a large-scale solution approach based on Benders decomposition. Using real data, we consider a product line problem involving over 3000 candidate products and over 300 respondents and show that our approach can solve this problem to provable optimality in 10 minutes (compared to 1 week in prior work).

#### 2 - Optimizing the Anheuser Busch Trailer Selection and Matching Problem

Jacob Feldman, Olin Business School, United States, Panos Kouvelis, Xingxing Chen, Seung-Hwan Jung

AB delivers its beer to vendors via third party trucks. For each third party truck that arrives to the warehouse, AB must match this truck with a preloaded trailer of beer. The gross weight of the trailer and truck cannot exceed 80K lbs, which is set forth by federal and state law enforcement. The revenue for any matching is proportional to the actual weight of trailer loaded on the truck. We study the problems of choosing weights/inventory levels for the trailers and the problem of developing a policy to optimally match these trailers to arriving trucks. We show that revenue management approximate DP techniques can be employed to solve all three of the previously mentioned problems.

#### 3 - An Approximate Dynamic Programming Approach to Queueing Admission Control Problems

Saied Samiedaluie, University of Alberta, 3-40C Business Building, Alberta School of Business, Edmonton, AB, T6G 2R6, Canada, Dan Zhang

We study a classical queueing control problem with multiple classes of customers. The queue is a loss system; i.e., arriving customers are rejected if all servers are busy. When a server is available, the decision is whether to admit an arriving customer and collect a lump-sum revenue. We model this problem as a continuous-time infinite-horizon dynamic program and solve it using approximate linear programming (ALP). We study several alternative approximation architectures and numerically investigate their policy performance. Our approach is potentially useful for a wide variety of queueing control problems.

#### 4 - An Approximate Dynamic Programming Approach to Dynamic Pricing for Network Revenue Management

Jiannan Ke, Shanghai Jiao Tong University, 1954 Huashan Road, Zhongyuan 111, Shanghai, 200030, China, Dan Zhang, Huan Zheng

We propose an approximate dynamic programming approach to the dynamic pricing problem for network revenue management. The approximate linear program (ALP) are semi-infinite linear programs and can be solved to any desired accuracy with a column generation algorithm. For the affine approximation under a linear independent demand model, we show that the ALP can be reformulated as a compact second order cone program (SOCP). The size of the SOCP formulation is linear in the number of resources, products, and periods. Numerical experiments show that solving the SOCP formulation is orders of magnitude faster and the ensuing pricing policies perform well.

#### Statistical Methods in Finance

Sponsored: Finance

Sponsored Session

Chair: Markus Pelger, Stanford University, Stanford, CA, 94305, United States

##### 1 - Efficient Computational Methods for Distributionally Robust Optimization with Martingale Constraints

Jose Blanchet, Columbia University, 500 West 120th Street, 340 Mudd Building, New York, NY, 10027, United States

We study efficient distributionally robust optimization methods under martingale constraints. These problems arise in several OR applications, including.

##### 2 - Deep Learning Models of High Frequency Financial Data

Justin Sirignano, University of Illinois at Urbana-Champaign, 3 Gibbs Court, Irvine, CA, 92617, United States

Using a Deep Learning approach applied to a large dataset of high frequency financial data, we find evidence for a universal and stationary price formation mechanism relating the supply and demand for a stock, as revealed through the order book, to price dynamics. We build a 'universal price formation model' which demonstrates stable accuracy across a wide range of stocks from different sectors and for long time periods. The universal model, trained on data from all stocks, outperforms asset-specific linear and nonlinear models trained on time series of any given stock. This shows that the universal nature of price formation weighs in favor of pooling together financial data from various stocks, rather than designing asset- or sector-specific models as commonly done. We also find that price formation has path-dependence over long periods of time ('long memory'). Joint work with Rama Cont.

##### 3 - Statistical Inference using Neural-Networks

Enguerrand Horel, PhD Student, Stanford University, Stanford, CA, 94305, United States, Kay Giesecke

Although neural networks can provide highly accurate predictions, they are often considered as opaque "black boxes". The difficulty of interpreting the predictions of a neural network often prevents their use in financial practice, where regulators and auditors often insist on model explainability. In this project, we formulate the objectives of interpretability and define interpretability for neural networks. Then, by considering neural networks as nonparametric models, we show how to use nonparametric variable significance tests to assess the importance of covariates. Tests using mortgage data illustrate our results.

##### 4 - Interpretable Proximate Factors for Large Dimensions

Ruoxuan Xiong, Stanford University, 312 Huang Engineering Center, Stanford, CA, 94305, United States, Markus Pelger

This paper approximates latent statistical factors with sparse and easy-to-interpret proximate factors. Latent factors in a large-dimensional factor model can be estimated by principal component analysis, but are usually hard to interpret. By shrinking factor weights, we obtain proximate factors that are easier to interpret. We show that proximate factors consisting of 5-10% of the observations with the largest absolute loadings are usually sufficient to almost perfectly replicate the population factors without assuming a sparse structure. We derive lower bounds for the generalized correlation between proximate and population factors based on extreme value theory.

Chair: Jinyang Zheng, Purdue University, West Lafayette, IN, 47906, United States

##### 1 - What Goes Around Comes Around: A Structural Matching Model of Peer-to-Peer Lending

Jinyang Zheng, Purdue University, West Lafayette, IN, 47906, United States, Yang Jiang, Xiangbin Yan, Yong Tan

Our work is the first empirical study that investigates the matching mechanism of online P2P lending. In this paper, we use data on transaction records from a large lending site, and apply a structural matching model to examine the determinants of a lender-borrower match formation. Our results show that the matching criteria differ across heterogeneous lenders and borrowers, depending on the interaction characteristics between the two sides. We provide evidence that a larger match value is associated with a better loan performance, which validates the effectiveness of the estimated matching pattern. Our findings shed lights on how to improve the matching efficiency of online two-sided markets.

##### 2 - Does Size Matter? The Effect of Sampling Size in Online Physical Good Sampling

Zibo Liu, University of Washington, Seattle, WA, 98195-5832, United States, Zhijie Lin, Ying Zhang, Yong Tan

Despite the popular use of product sampling as a promotional strategy by retailers, existing research has only studied offline sampling of physical goods and online sampling of information goods, but overlooked online sampling of physical goods. We argue that, in the context of online sampling of physical goods, sampling size serves as a signal of product quality to positively influence product sales, and this effect would vary across product type. We collected a panel-level data set from Taobao.com for empirical analysis. We find evidence for the existence of the effect of sampling size in online sampling of physical goods, and find that the effect indeed vary across products.

##### 3 - Consumer Decisions in Payment-based Knowledge Sharing Communities: The Analysis of Zhihu Live

Zhen Fang, University of Washington, Seattle, WA, 98195-5832, United States, Guannan Liu, Junjie Wu, Yong Tan

Knowledge monetization is becoming a new trend in knowledge sharing communities. Experts on platforms as Zhihu Live give payment-based lectures to audience in the community. This research empirically investigates the impact of different factors on the consumer decisions, including the price, communications, online reviews and the reputation of speakers in Q&A community, Zhihu. We conclude that lower price, more communication and higher reputation of the speaker improve the popularity of Lives.

#### Service Science Topics in the IT Industry

Sponsored: Service Science

Sponsored Session

Chair: Aly Megahed, IBM Research - Almaden, San Jose, CA, 95123, United States

##### 1 - Will they Sign? Predicting the Contract Pipeline with Structured and Unstructured Data

Aly Megahed, IBM Research - Almaden, San Jose, CA, 95123, United States, Hamid Reza Motahari Nezhad, Paul R. Messinger

Suppliers of products and services often compete for highly-valued contracts in lengthy tender processes. Prediction of success for the various prospects in the pipeline is vital to managing a company's work flow. Toward this end, we develop a contract prediction model based on two kinds of data: structured deal attributes and unstructured text of seller comments. We show real-world numerical results that illustrate the effectiveness of our models. We also present managerial implications and insights of implementing this work for a real IT firm.

##### 2 - Analytics Driven Business Travel Management Solution

Pawan Chowdhary, IBM Research, 650 Harry Road, E3-238, San Jose, CA, 95120, United States, Raphael Arar, Guangjie Ren, Sunhwan Lee

Business travel is essential to meet customers and for the company to grow. Mid to large enterprise has business travel as one of the largest spend items but still not managed efficiently. IBM Travel Manager is a solution that is catered for the Travel Program Manager to effectively manage travel spend and leverage analytics to get spend insights and savings opportunities. In the presentation we will go few such analytics and touch over cognitive aspect that will drive the travel manager to act upon opportunities pro-actively.

**3 - Dynamic Cloud Capacity Planning**

Jon M. Stauffer, Texas A&M University, 4217 TAMU, College Station, TX, 77843, United States, Aly Megahed, Chelliah Srisankarajah, Ahmed Nazeem

Many companies are shifting from on-premise IT environments to cloud computing. The computing application resources (instances) need to be adjusted according to the demand (queries) over time. Determining the optimal number of instances needed in a given planning horizon is challenging due to the combinatorial nature of the optimization problem involved. Deploying too many instances results in unnecessary deployment/capacity costs, while deploying too few instances results in penalties for not being able to process all incoming queries on-time. We propose heuristics to solve the offline scheduling problem and illustrate their effectiveness in a real-world case study.

**1 - Evolving Contact Network Algorithm: A New Simulation Method for Modeling HIV, a Disease with Low Prevalence but a Critical Public Health Issue in the US**

Matthew Eden, University of Massachusetts-Amherst, Amherst, MA, United States, Buyannemekh Munkhbat, Chaitra Gopalappa, Hari Balasubramanian

Agent-based network modeling (ABNM) is suitable for simulating multiple interacting events, related to contact network structures, behavior, and care access, for predicting epidemic trajectories. However, ABNM is infeasible to use for HIV due to disproportionate HIV prevalence across population groups in the US. We present a new modeling technique, evolving contact network algorithm (ECNA). Numerical results comparing ECNA with ABNM disease predictions are promising for low prevalence diseases.

**2- Limited-memory Kelley's Method Converges for Composite Convex and Submodular Objectives**

Swati Gupta, Georgia Institute of Technology, Atlanta, GA, United States

Original simplicial method (OSM) has been shown to converge to the minimizer of composite convex and submodular objectives, though no rate of convergence was known. Moreover, OSM is required to solve subproblems in each iteration whose size grows linearly in the number of iterations. We propose L-KM, a novel limited memory version of OSM that maintains convergence to the optimum. We show that the dual method of L-KM is a special case of the Fully-Corrective Frank-Wolfe (FCFW) method with approximate correction, thereby deriving a limited memory version of FCFW (holds for general polytopes) and proving a rate of convergence L-KM.

**3 - Assortment Optimization for a Multi-Stage Choice Model**

Yunzong Xu, Tsinghua University, Beijing, China, Zizhuo Wang

Motivated by several practical selling scenarios that require previous purchases to unlock future options, we consider a multi-stage assortment optimization problem, where the seller makes sequential assortment decisions with commitment, and the customer makes sequential choices to maximize her expected utility. We show that this problem is polynomial-time solvable when the customer is fully myopic or fully forward-looking. The optimal policy entails that the assortment in each stage is revenue-ordered and a product with higher revenue always leads to a wider range of future options. We also show that the problem is NP-hard in general and give efficient algorithms for various scenarios.

Co-Chair: Shantih Marie Spanton, CSX, CSX, Jacksonville, FL, 32204, United States

**1 - Roundtable: Horsepower-hour in Today's Railway**

Shantih Marie Spanton, CSX, Jacksonville, FL, 32204, United States

Railroads may define locomotive work performed over time in terms of horsepower-hours. This term is primarily used in the context of the work of locomotives shared between railroads, wherein the horsepower-hours of a locomotive used by another railroad must be reimbursed to the owner. The balancing the horsepower-hours owed to a foreign carrier with usage of a railroad's own locomotive power is an interesting problem that raises both tactical and strategic questions. In this panel experts from several leading US rail carriers will discuss the impact of balancing horsepower-hours in today's cost sensitive environment, including issues of fleet sizing, fleet mix (foreign or system), tactical/seasonal balancing strategies, rules and regulations around horsepower balancing in the US system, and more.

**1 - Management of Shuttle Systems with Modular Vehicles under Oversaturated Demand**

Xiaopeng Li, University of South Florida, Eng 207, Tampa, FL, 33620, United States, Zhiwei Chen, Xuesong Zhou

In this paper, we investigate the joint design problem of dispatch headway and vehicle capacity for one to one shuttle systems considering oversaturated demand. The first model we proposed is a mixed integer linear programming model that

can yield exact solutions to the optimal design with a customized dynamic programming algorithm, where a series of valid inequalities based on the relationship between passenger demand and vehicle capacity are applied to expedite the solution speed. The second model is a continuum approximation (CA) model that presents a macroscopic view of the system and yields simple analytical rules into the optimal design.

## 2 - Optimal Rebalancing for Bike Sharing Systems with Information Assisted Riders

Mohammad Javad Feizollahi, Assistant Professor, Georgia State University, 35 Broad St., Room 408, Atlanta, GA, 30303, United States, Xinchang Wang

We consider a bike sharing system with riders who are well informed of the number of available bikes and dockers at each docking station. Meanwhile, this information affects the likelihood of riders choosing a station to pick up or drop off bikes. A fleet of homogeneous trucks is employed to reposition bikes between the stations. The objective is to minimize the sum of the bike rebalancing cost and the lost demand penalty cost. We focus on the static version of the problem and formulate it as a mixed-integer nonlinear program. To solve the program, we develop solution approaches leveraging techniques from both dynamic programming and discrete optimization. Our solutions are tested with numerical studies.

## 3 - Optimal Capacity Sizing of Park-and-ride Lots when Parking Availability Information is Publicized

Xinchang Wang, Mississippi State University, Marketing Department, 324C McCool Hall; Mailstop: 9582, Mississippi State, MS, 39762, United States, Qie He

We study the optimal capacity sizing of parking lots for park-and-ride commuters when parking availability information is publicized. Commuters' choice of parking lots follows a multinomial logit model accounting for the effects of road congestion and parking availability information. The objective is to maximize the total social welfare of all park-and-ride commuters. The problem is formulated as a stylized non-convex optimization model with the choice model. We provide a characterization of the optimal capacities with homogeneous routes. For the general case, we develop an efficient search algorithm to solve the model.

## 4 - A Multiplayer Parking Pricing Problem for Emerging On-line Markets

Hossein Fotouhi, George Mason University, 4630 Buckhorn Ridge, Fairfax, VA, 22030, United States, Elise Miller-Hooks

A bi-level, multi-player, parking pricing problem is presented. In the upper level, competing parking operators seek to maximize their revenue, while in the lower level users seek to minimize their parking choice disutility. The problem is formulated as an Equilibrium Problem with Equilibrium Constraints (EPEC). A heuristic algorithm is presented based on a concept of Nash domination.

### Drone-assisted Logistics

Sponsored: TSL/Facility Logistics

Sponsored Session

Chair: Mehdi Behrooz, Northeastern University, Boston, MA, United States

## 1 - On Travelling Salesman Problems with Drone-truck Synchronizations

Minh Hoang H, PhD, University of Engineering and Technology, Vietnam National University, Hanoi, Viet Nam

In this talk, we will study two variants of travelling salesman problems with drone-truck synchronizations. In the first variant, while visiting a customer to provide a delivery, truck can launch a drone to service other customers, then continue to visit other customers before retrieving the drone at another customer location. In the second variant, truck arrives at a location and launches several drones to service customers. It has to stay there to retrieve all the drones before visiting other locations. Mathematical formulations, solution approaches and result discussions are presented.

## 2 - A Multi-modal Drone Delivery System for Urban Logistics

Mohammad Moshref-Javadi, Massachusetts Institute of Technology, 1 Amherst St, E40-247A, Cambridge, MA, 02142, United States, Ahmad Hemmati, Matthias Winkenbach

We present a mathematical formulation and heuristic solution approach for the optimal planning of last-mile delivery routes in a customer-centric, multi-modal urban logistics system combining truck and UAV-based delivery operations. The mathematical model and heuristic solution approach are applied to several generated and adapted problem instances from the literature. Further, we consider a real-world case study for e-commerce deliveries in Brazil.

## 3 - Integrated Pickup and Delivery Operations using Trucks and Drones

Nawin Yanpirat, Auburn University, Auburn, AL, United States, Daniel F. Silva, Alice E. Smith

We study optimal routing to perform both delivery and pickup operations with a single truck, outfitted with a single UAV, that it can deploy en-route to reach some drone-enabled customers. On each sortie, the drone can perform a single delivery operation, a single pickup or a delivery followed by a pickup. We model the problem as a mixed integer program and perform numerical experiments to measure the benefit to total route time of incorporating pickup operations. We also discuss the effects of battery life, drone speed and ratio of pickup to delivery customers on the total route time.

## 4 - The Multi Visit Drone Routing Problem

Stefan Poikonen, Assistant Professor, University of Colorado Denver, 1475 Lawrence Street, Denver, CO, 80202, United States

Many papers have considered hybrid truck-and-drone delivery models. Often they assume there is a single drone per truck, each package is homogeneous, the drone is capable of carrying one package at a time, the set of feasible launch locations is restricted to customer locations, and the drone has a fixed time battery life. In the Multi-visit Drone Routing Problem, we consider the case of a heterogeneous set of packages, a drone that is capable of carrying multiple packages at a time, a more flexible launch site set, and a user-defined energy drain function, which specifies the energy expenditure required by a drone to carry a given set of packages. Heuristics tractable for large instances will be presented.

## 5 - Travelling Salesman Problem with Drones

Mehdi Behrooz, Northeastern University, Department of Mech. & Ind. Engineering, 334 Snell Engineering Center, Boston, MA, 02115, United States, Dinghao Ma, Reyhaneh Mohammadi

Unmanned Aerial Vehicles (UAVs), commonly known as drones, have opened up their way into the massive industry of parcel delivery. In this paper, we study a travelling salesman problem with a drone in which a drone is dispatched from a delivery truck and while the truck is delivering the packages, the drone can also deliver a package and return to the truck after each delivery to pick up the next package. We present optimization models and heuristics to solve this problem. We show that the combination of a truck and a drone provides a much more efficient last-mile delivery service when compared to the truck-only delivery option under reasonable assumptions for the ratio of the speeds of the drone and the truck.

Sponsored Session

Chair: Zhen Qian, Carnegie Mellon University, China

Co-Chair: Shanjia Zhu, George Mason University, Fairfax, VA, 22030, United States

## 1 - Understanding Ride-sourcing Drivers' Customer Search Behaviors

Zhengtian Xu, University of Michigan, 2489 Stone Rd, Ann Arbor, MI, 48105-2540, United States, Yafeng Yin

Ride-sourcing services have become increasingly important in meeting travel needs in metropolitan areas. Even though extensive studies were conducted to advance our understanding for such an emerging service, few of them paid attention to drivers' behaviors, partially due to the lack of related datasets disclosed by ride-sourcing companies. By leveraging the empirical evidences from Didi Chuxing, this study aims to comprehensively survey ride-sourcing drivers' decision making on customer search. We will investigate how drivers' search behaviors are interacted with different factors, and provide insights for ride-sourcing companies in managing drivers' labor supply.

## 2 - Measuring and Optimizing the Network Disequilibrium Levels through Ridesourced Vehicle Data

Wei Ma, Carnegie Mellon University, Pittsburgh, PA, 15213, United States, Zhen Qian

With the boom of the mobile internet, on-demand ride sourcing services such as Uber, are becoming an indispensable component of urban transportation systems. This research proposes a novel measure of network disequilibrium level with ridesourced vehicle data. It also proposes an information disclosure scheme such that the transportation networking companies are able to disclose the traffic information to benefit the public society without leaking the commercial confidential. A real-time NDL based routing method under the proposed information disclosure scheme to reduce total network congestion. Two large-scale real networks with disaggregated and aggregated ridesourced vehicle data.

### 3 - Trip Purpose Inference and Prediction with Social Media Data and Google Places

Yu Cui, University at Buffalo, The State University of New York,  
314 Bell Hall, Buffalo, NY, 14260, United States, Chuishi Meng,  
Qing He, Jing Gao

This research has addressed the problem of trip purpose prediction with both Google Places and social media data. First, this paper provides a new approach to match Point of Interests (POIs) from Google Places API with historical Twitter data. Therefore, the popularity of each POI can be obtained. Moreover, a Bayesian neural network (BNN) is employed to model the trip dependence within each individual's daily trip chain and infer the trip purpose.

### 4 - Quantifying Disruption Impact Across Transportation Networks

Priyadarshan Patil, The University of Texas at Austin, Austin, TX,  
United States, Steve Boyles, William Alexander

This research quantifies the propagation of impact on a transportation network, caused by a disruption on the network. We propose to model the impact using explanatory variables such as network characteristics, flow patterns, and link interactions. A classical statistical regression-based approach is contrasted with a method based on neural networks, applied and evaluated on real-world urban networks along with megaregional networks. The results assist in resource allocation and rapid response to network disruptions.

### Joint Session TSL/MIF: Sustainable City Logistics – Improving Efficiency of Movement of Freight

Sponsored: TSL/Freight Transportation & Logistics

Sponsored Session

Chair: Diana Gineth Ramirez-Rios, Rensselaer Polytechnic Institute,  
Troy, NY, 12180, United States

#### 1 - Assessing Impacts of Emerging Market and Technological Trends for Freight-efficient Land-uses

Sofia Perez-Guzman, Rensselaer Polytechnic Institute, Troy, NY,  
12180, United States, Jose Holguin-Veras, Diana Gineth Ramirez-  
Rios, Juvena Ng, Wilfredo Yushimito Del Valle, Joshua Schmid

This study proposes an assessment of market trends and emerging technologies, and how the impacts brought by these disruptors affect the planning of freight-efficient land uses. To this extent, an evaluation framework was developed, which incorporates how trends affect decisions of stakeholders involved in different supply chains. The framework systematically captures each one of the decisions made by stakeholders based on the minimization of their total social costs (i.e. private costs and externalities) and translates these into short and long-term effects and land-use measures.

#### 2 - A Spatial Methodology for Characterizing Freight in Metropolitan Areas on the US

Carlos Rivera-Gonzalez, Rensselaer Polytechnic Institute, Troy, NY,  
United States, Jose Holguin-Veras, Juvena Ng,  
Diana Gineth Ramirez-Rios

This study proposes an innovative spatial methodology for understanding the economic activities in Metropolitan Statistical Areas (MSAs). Through the development of a spatial index and the incorporation of freight activity estimated at a ZIP code level, the study was able to identify freight activity clusters and freight corridors that could be useful for the decisions on the allocation of facilities in different urban settings. The analysis responds to a selected group of MSAs in the United States that represent a diversity of urban areas in terms of size and geographic location.

#### 3 - State of the Art and Practice of Urban Freight Management

Johanna Amaya Leal, Iowa State University, 2167 Union Drive,  
Room 3127, Ames, IA, 50011, United States, Jose Holguin-Veras,  
Ivan Sanchez-Diaz, Michael Browne, Jeffrey Wojtowicz

This paper conducts a review of the public-sector initiatives that could be used to improve freight activity in metropolitan areas; collects data about initiatives that have been implemented and their performance; and produces a ranking of suggested initiatives. The characterization and performance of the initiatives was based on a survey that collected data from countries and cities throughout the world. The paper ends with a discussion of chief findings.

#### 4 - Patrol Police Routing

Ruben Yie, Universidad el Norte, Km 5 Antigua via Puerto  
Colombia, Barranquilla, Colombia, Andrea Margarita Ditta

It is well-known that police patrolling is one of the best preventive practices for public safety against urban crimes. This work, deals with the problem of planning police patrol routes to minimize the overall risk at minimum cost. A specific mathematical formulation, models the problem under critical time constraints and resources. Algorithms of ant colony and evolutionary techniques, offers effective solutions for this model. A case study in Barranquilla (Colombia), allows validate the performance of our approach in real scenarios.

### George B Dantzig Dissertation Prize I

Emerging Topic: George B Dantzig Dissertation Prize

Emerging Topic Session

Chair: Mor Armony, New York University, 44 West 4th Street #8-62,  
New York, NY, 10012, United States

#### 1 - Models and Algorithms for Transportation in the Sharing Economy

Daniel Freund, Cornell University, Ithaca, NY, USA.

This thesis consist of two parts. The first deals with bike-sharing systems which are now ubiquitous across the U.S.A. We have worked with Motivate, the operator of the systems in, for example, New York City, Chicago, and San Francisco, to innovate a data-driven approach to managing both their day-to-day operations and to provide insight on several central issues in the design of their systems. This work required the development of a number of new optimization models, characterizing their mathematical structure, and using this insight in designing algorithms to solve them. Many of these projects have been fully implemented to improve the design, rebalancing, and maintenance of Motivate's systems across the country.

#### 2 - Optimization and Machine Learning Methods for Diagnostic Testing of Prostate Cancer

Selin Merdan, PhD Candidate, University of Michigan,  
Ann Arbor, MI, USA.

Technological advances in biomarkers and imaging tests are creating new avenues to advance precision health for early detection of cancer. These advances have resulted in multiple layers of information that can be used to make clinical decisions, but how to best use these multiple sources of information is a challenging engineering problem due to the high cost and imperfect sensitivity and specificity of these tests. Questions that need to be addressed include which diagnostic tests to choose and how to best integrate them, in order to optimally balance the competing goals of early disease detection and minimal cost and harm from unnecessary testing. To study these research questions, we present new optimization-based models and data-driven analytic methods in three parts to improve early detection of prostate cancer (PCA).

#### 3 - Latent Variable Model Estimation via Collaborative Filtering

Christina Lee Yu, Cornell University, Ithaca, NY, USA.

Similarity based collaborative filtering for matrix completion is a popular heuristic that has been used widely across industry in the previous decades to build recommendation systems, due to its simplicity and scalability. However, despite its popularity, there has been little theoretical foundation explaining its widespread success. In this thesis, we prove theoretical guarantees for collaborative filtering under a nonparametric latent variable model, which arises from the natural property of "exchangeability", i.e. invariance under relabeling of the dataset. The analysis suggests that similarity based collaborative filtering can be viewed as kernel regression for latent variable models, where the features are not directly observed and the kernel must be estimated from the data. In addition, while classical collaborative filtering typically requires a dense dataset, this thesis proposes a new collaborative filtering algorithm which compares larger radius neighborhoods of data to compute similarities, and show that the estimate converges even for very sparse datasets, which has implications towards sparse graphon estimation.

Sponsored Session

Chair: Chia-Mei Liu, Federal Aviation Administration, Washington, DC, 20591, United States

#### 1 - Airline Network Evolution Forecasting

Reed Harder, Dartmouth, 14 Engineering Drive, Hanover, NH, 03755, United States, Vikrant Vaze

Airline networks evolve as airlines enter and exit various markets and routes. Accurate modeling of this evolution would allow for better forecasting of airport activity and more effective long-term planning by decision makers in the air transportation system. However, forecasting airline network evolution remains a challenge because of the complicated, interdependent nature of available data and the relative sparsity of entry and exit events. We present approaches for the probabilistic modeling of airline network evolution that leverage multiple sources of information on potential market and route entries.

#### 2 - Unmanned Aircraft System (UAS) National Forecast in the U.S.

Bhadra Dipasis, Federal Aviation Administration

Abstract not available.

#### 3 - Air Route Traffic Control Center (ARTCC) Operation Forecast

David Hechtman, Senior Modeling and Simulation Engineer, The MITRE Corporation, 7515 Colshire Drive, McLean, VA, 22102-7539, United States, Michael Yablonski, Ricky Marske

The FAA Office of Aviation Policy and Plans requested that The MITRE Corporation develop a forecasting method for Air Route Traffic Control Center (ARTCC) operations using an origin-and-destination (O-D) passenger demand framework. FAA's Terminal Area Forecast-Modernization (TAF-M) predicts O-D segment demand but not ARTCC operations. To provide this information, MITRE developed a TAF-based ARTCC forecast incorporating O-D segment demand from TAF-M and historical routing data from the FAA Traffic Flow Management System.

#### 4 - The Effect of Oil Price Pass Through Rate on U.S. Domestic Airfare Forecast

Chia-Mei Liu, Federal Aviation Administration, 800 Independence Avenue SW, Washington, DC, 20591, United States, Kang Hua Cao

FAA publishes Terminal Area Forecast (TAF) annually. TAF includes enplanement and operation forecasts for all U.S. airports. Among the heavily traveled airports, FAA also publishes optimistic and pessimistic forecasts to quantify forecast uncertainty. One important driver for the forecast uncertainty is the uncertainty in oil price, which leads to the uncertainty in airfares and enplanements subsequently. This research studies airlines' ability to pass oil price change to the consumers by raising or reducing airfares. We control for factors such as airline competition and economic activities to quantify the airfare elasticity with respect to oil price change.

#### 1 - Adaptive Learning with Unknown Information Flows

Ahmadreza Momeni, Stanford University, Stanford, CA, 94025, United States

We introduce a generalized multi-armed bandit formulation in which additional information on each arm may appear arbitrarily throughout the decision horizon,

and study the impact of such information on the achievable performance and the design of efficient decision-making policies. We characterize the regret complexity of this family of problems and introduce a general and practical adaptive exploration approach for designing policies that, without any knowledge on the information arrival process, attain the best performance that is achievable when that arrival process is a priori known.

#### 2 - Stochastic Game for Fuel Follower Problem: N vs MFG

Renyuan Xu, University of California-Berkeley, 4141 Etcheverry Hall, OR Department, Berkeley, CA, 94720, United States

In general, finding a Nash equilibrium (NE) or proving Pareto optimality (PO) for continuous-time stochastic game with multiple players is hard, even when there are only two players in the game. Mean Field Game (MFG) provides a powerful tool and analytically feasible framework to approximate the NE and the PO of the N-player stochastic games. In this talk, we will first define the stochastic game for the classical fuel follower problem in the seminal paper by Benes, Shepp, and Witsenhausen (1980). We will then solve and compare with explicit solutions for the NE and the PO of the N-player game, and the corresponding MFG when the number of players goes to infinity. This is a joint work with Xin Guo (UC Berkeley).

#### 3 - Statistics of Robust Optimization: A Generalized Empirical Likelihood Approach

Hongseok Namkoong, Stanford University, Stanford, CA, 94305, United States

We study statistical inference and distributionally robust solution methods for stochastic optimization problems, focusing on confidence intervals for optimal values and solutions that achieve exact coverage. We develop a generalized empirical likelihood framework—based on distributional uncertainty sets constructed from nonparametric f-divergence balls—for Hadamard differentiable functionals, and in particular, stochastic optimization problems. Our theory prescribes the robustness level that provide one- and two-sided confidence intervals that achieve exact coverage.

#### 4 - SOAP: One Clean Analysis of All Age-Based Scheduling Policies

Ziv Scully, Carnegie Mellon University, 5000 Forbes Avenue, GHC 7121, Pittsburgh, PA, 15213, United States

We consider an extremely broad class of M/G/1 scheduling policies called SOAP: Schedule Ordered by Age-based Priority. The SOAP policies include most policies in the literature as well as infinitely many variants which have never been analyzed. SOAP policies range from classic policies, like first-come, first-serve (FCFS), foreground-background (FB), class-based priority, and shortest remaining processing time (SRPT); to much more complicated scheduling rules, such as the famously complex Gittins index policy and shortest expected remaining processing time (SERPT). We present a universal analysis of all SOAP policies, deriving the mean and Laplace-Stieltjes transform of response time.

### Stochastic Models for the Blockchain

Sponsored: Applied Probability

Sponsored Session

Chair: Ciamac Cyrus Moallemi, Columbia University, New York, NY, 10027, United States

Co-Chair: Jacob Leshno, Columbia University, New York, NY, 10027, United States

#### 1 - Bitcoin: A Natural Oligopoly

Nicholas A. Arnosti, Columbia Business School, 3022 Broadway, Uris Hall rm 402, New York, NY, 10027, United States

Although Bitcoin was intended to be a decentralized digital currency, in practice, mining power is quite concentrated. This fact is a persistent source of concern for the Bitcoin community. We provide an explanation using a simple model to capture miners' incentives to invest in equipment. In our model, n miners compete for a prize of fixed size. Each miner chooses an investment level, incurring cost proportional to their investment. Miners receive rewards proportional to their investment. We show that seemingly small cost differences result in highly concentrated mining power, and discuss the implications of our results for cryptocurrency design.

#### 2 - Scaling Cryptocurrency Blockchains

Rhys Bowden, Rhys Bowden, Anthony Krzesinski, Peter G. Taylor

Cryptocurrency blockchains form the globally distributed ledgers of their associated cryptocurrencies. A blockchain is updated at random intervals, when a miner adds a new block (referencing the most recent block they have heard about) on to the end of the chain, then that block is communicated to the other miners and the rest of the network as a whole. Typically the time taken to communicate a new block is much less than the average time between blocks arriving. We model this process to show how the system functions when blocks arrive so frequently that consensus is rare.

### 3 - The Economics of Bitcoin

Ciamac Cyrus Moallemi, Columbia University, Columbia Business School, 3022 Broadway Uris 416, New York, NY, 10027, United States, Gur Huberman, Jacob Leshno

The Bitcoin payment system is a platform with two main constituencies: users, who make and receive payments; and profit-seeking miners, who maintain the system's infrastructure. We seek to understand the economics of the system: How does the system raise revenue to pay for its infrastructure? How are usage fees determined? How much infrastructure is deployed? What are the implications of changing parameters in the protocol? To address these questions, we offer and analyze an economic model of a cryptocurrency system featuring user-generated transaction fees, and focus on Bitcoin as the leading example. The analysis leads to design suggestions for future cryptocurrencies.

### Markov Decision Processes

Sponsored: Applied Probability

Sponsored Session

Chair: Daniel Silva, Auburn University, Auburn, AL

#### 1 - Pooled Dynamic Matching in Freight Networks

Ankur Mani, University of Minnesota, Saint Paul, MN, 55114, United States

We study online matching of trucks to shipments over a geographic network. We evaluate the impact of pooling and flexibility of truck drivers on the size of the matching and total welfare. Surprisingly, by only allowing truck drivers to submit their top two preferences, nearly optimal matching can be guaranteed with very high probability. In the dynamic setting, when shipment demands arrive everyday, a small fraction of flexible drivers can increase the total welfare significantly.

#### 2 - Reannealing for Exploration in Deep Q-networks

Xing Wang, Auburn University, Auburn, AL, 36830, United States, Alexander Vinel

Existing exploration strategies in reinforcement learning (RL) often either ignore the history or feedback of search, or are complicated to implement. There is also a very limited literature showing their effectiveness over diverse domains. We propose an algorithm based on the idea of reannealing, that aims at encouraging exploration only when it is needed, for example, when the algorithm detects that the agent is stuck in a local optima. The approach is simple to implement, and the experimental results have shown effectiveness of our exploration strategy on accelerating training procedure as well as obtaining a better policy on hard RL problems.

#### 3 - Optimal Pricing for Tandem Queues with Finite Buffers

Xinchang Wang, Mississippi State University, Marketing Department, 324C McCool Hall; Mailstop: 9582, Mississippi State, MS, 39762, United States, Sigrun Andradottir, Ayhan Hayriye

We consider optimal pricing for a two-station tandem queueing system with finite buffers. The service provider quotes prices to incoming customers using either static or dynamic pricing. The objective is to maximize either the infinite-horizon discounted profit or the long-run average profit. We show that there exists an optimal dynamic policy that exhibits an interesting monotone structure, in which the quoted prices have greater dependency on the queue length at station 1 than at station 2. We show that the optimal static policy performs as well as the optimal dynamic policy for the long-run average problem when the buffer size at station 1 becomes large and the arrival rate is either small or large.

#### 4 - Easy Decomposable Markov Decision Processes

Jie Ning, Case Western Reserve University, Department of Operations, 328 Peter B. Lewis Building, Cleveland, OH, 44106, United States

We characterize a special class of Markov decision processes (MDPs) called easy decomposable MDPs. These MDPs have vector-valued continuous endogenous states and actions and a set of feasible actions that are decomposable and are independent of the endogenous state. The expected single-period reward and dynamical equations have special structures that allow an analytical characterization of the value function and an optimal policy. Particularly, we show that the value function and optimal policy depend on the solution of a set of auxiliary equations which depend only on the exogenous state. Finally, we give examples of this class of easy decomposable MDPs.

#### 5 - Optimal Routing in Loss Systems with Flexible Customers

Avnish Malde, Clemson University, Clemson, SC, United States, Tugce Isik

We study a loss system with two classes of servers and a multiple customer types. We assume that there is at least one class of flexible customers that can receive service from servers of either type. We formulate the problem as a Markov decision process with rewards that are dependent on the customer type. For small systems, we use our formulation to characterize the policies that maximize the long-run average reward. For larger systems, we study the structure of the

optimal policies. Our analysis shows that the optimal policies are structured, and of threshold type. We also provide an application of our model and numerical examples in the context of electric vehicle charging.

### Stochastic Systems

Sponsored: Applied Probability

Sponsored Session

Chair: Mark S. Squillante, IBM Thomas J. Watson Research Center, Yorktown Heights, NY, 10598, United States

#### 1 - On Stochastic Gradient Descent for Distributionally Robust Optimization (DRO)

Soumyadip Ghosh, IBM TJ Watson Research Center, 1101 Kitchawan Road, Route 134, Yorktown Heights, NY, 10598, United States, Mark S. Squillante, Ebisa D. Wollega

Current approaches to DRO do not scale well because of the high dimensionality of the decision variable of the probability mass function (pmf) over the entire dataset. We propose a new SGD algorithm to efficiently solve these min-max formulations. In each iteration, we approximate the optimization over the uncertainty set by sub-sampling the support, where the size of the sub-sample is itself generated from another pmf. We develop asymptotic guarantees on how this procedure optimally balances, in a strong statistical sense, the computational effort with the required level of accuracy.

#### 2 - Distributionally Robust Optimal Bidding in Online Advertising

Jose Blanchet, Stanford University, CA, United States

We study practical and easy to implement distributionally robust optimal bidding strategies for online advertising in the context of first price auctions in which the bidder has imperfect information.

#### 3 - Functional Cumulant Moments

William A. Massey, Princeton University, ORFE Department, Sherrerd Hall, Princeton, NJ, 08544, United States, Jamol Pender

Given a specific measurable real-valued function, functional cumulant moments of a random variable, when appropriately defined, are a new but complementary variation on cumulant moments. We demonstrate their utility to Markovian queueing systems by applying these functional moments to the cumulant moments of birth-death process. These results have applications to the steady state analysis of some given time-homogeneous queueing models as well as the transient behavior of their time-inhomogeneous counterparts.

#### 4 - On Density-dependent Population Processes with Time-varying Behavior

Mark S. Squillante, IBM Research, 1101 Kitchawan Road, Yorktown Heights, NY, 10598, United States, Yingdong Lu, Chai W. Wu

We consider density-dependent population processes and the control of such stochastic processes, both with time-varying parameters. Such behaviors are of mathematical interest in general, and can be especially important and arise often in many existing and emerging applications.

### Making Good Decisions

Sponsored: Decision Analysis

Sponsored Session

Chair: Johannes Siebert, MCI

#### 1 - Explaining Proactive Decision Making

Reinhard Kunz, Philipp Rolf

The Proactive Decision Making scale, which is based on the concepts of value-focused thinking and decision quality, measures proactive personality traits and cognitive skills in decision-making. Using SEM, we show that proactive cognitive skills can explain up to 36% of life satisfaction, i.e. proactive decision makers are more satisfied with their decisions and with their lives. Furthermore, we provide empirical evidence that proactive cognitive skills can be trained in a course on decision-making. We recommend schools, colleges, and universities to offer more courses on decision-making to enhance student's proactive cognitive skills and satisfaction with their decisions and lives.

## 2 - Constructing a Value Model for an Organization

Ralph L. Keeney, Duke University, CA, United States

Constructing an organizational value model provides a foundation to build agreement on the organization's objectives and to guide consistent decision-making among all important decisions. The concepts, process, and procedures to construct an organizational value model are discussed and illustrated using a value model constructed for the US Army Corps of Engineers.

## 3 - The Costs and Benefits of Homeland Security Research

Delfot von Winterfeldt, CA, United States

Since 2004 the U.S. Department of Homeland Security's Office of University Programs has funded close to half a billion dollars on research, resulting in over two hundred research products, including software tools and other technologies. We evaluated the costs and benefits of selected research products, showing a high rate of return on this investment.

## 4 - Exploring Benefits of Value-focused Brainstorming Based on Associative Network Model

Chen Wang, Tsinghua University, Beijing, China, Ying Xiang

Generating alternatives is crucial for making good decisions. We propose an empirical method that helps examine the ability of decision makers to generate effective alternatives and the impact of objective-related stimuli. We apply machine learning methods to construct the cognitive map of a brainstorming exercise by projecting key words of the group discussion onto a latent cognition space. We then measure the degrees of exploitation and exploration for the alternative-generation process and demonstrate the benefits of value-focused brainstorming using recorded data.

### Joint Session ISim/Practice Curated: Simulation Modeling Applications

Sponsored: Simulation

Sponsored Session

Chair: Mohammad Dehghanimohammadabadi, Northeastern University, Boston, MA

#### 1 - Estimating the Real Demand in Bike-Sharing Systems

Ashkan Negahban, Pennsylvania State University, 30 E. Swedesford Rd, Malvern, PA, 19355, United States

The objective of the first part of this presentation is to: (1) provide a formal comparison between the distribution of bike-inter pickup times and the underlying (latent) customer inter-arrival time; and, (2) propose an alternative data filtering method to improve demand estimation by preserving the portion of the observed bike inter-pickup times that represent actual customer inter-arrival times. The second part introduces an iterative methodology combining simulation, nonparameteric bootstrapping, and indifference-zone analysis to estimate the true demand in bike-sharing systems when data analysis approaches fail.

#### 2 - Introducing an Efficient Way to Optimize a Simulated Model with Data-table Inputs

Mohammad Dehghanimohammadabadi, Northeastern University, 170 Brookline Avenue, Unit 1025, Boston, MA, 02115, United States

The major goal in simulation-optimization studies is to obtain the most appropriate configuration settings of the model. This could be easily achieved via embedded optimizers in simulation packages such as OptQuest. However, these optimizers fail to optimize the simulation models designed based on data-table inputs. This study extends the boundaries of the existing simulation-optimization tools by incorporating data-tables as a control parameter of the simulation model. This new approach could significantly enhance the applicability of the simulation and reduce efforts to optimize data-table driven simulation models.

#### 3 - An Agent-based Model of Individual Forgetting and Learning Behavior in Epidemics

Kaiming Bi, Kansas State University, 1605 Roof Drive, Manhattan, KS, 66502, United States, Yuyang Chen, Chih-Hang Wu, David Ben-Arieh

We presents two mathematical models, information forgetting curve (IFC) model and memory reception fadingcumulating (MRFC) model, to examine forgetting and learning behaviors of individuals during an epidemic. Both models consider behavior-change information may affect agent emotions and subsequently influence an individual's behavior. IFC model utilizes a forgetting curve to process epidemic information, and MRFC model formulates disease information variations using the It process. An agent-based simulation model also developed to mimic the epidemic prevalence of the 2009 Chicago H1N1.

### Energy and Climate I

Emerging Topic: Energy and Climate

Emerging Topic Session

Chair: Peter Larsen, Lawrence Berkeley National Laboratory, Berkeley, CA, 94720, United States

#### 1 - Integrated Modelling Tool for Electricity Rate Design in Systems with High Penetration of DERs

Miguel Heleno, Lawrence Berkeley National Laboratory, Berkeley, CA, United States

This talk presents a modeling tool to support decision-making for electricity system planning and retail rate design in the context of distribution grids with high penetration of distributed energy resources (DERs). This tool is based on an interaction between two layers of optimization: the first, representing end-users, aims at finding the optimal behind-the-meter DER adoption; the second, representing the system operation, determines the optimal portfolio of utility assets that mitigates the impact of DERs deployment and ensures the steady state operation of the distribution grid.

#### 2 - Drivers of the Reliability Contribution of Solar+Storage for Utilities in Florida

Andrew Mills, Lawrence Berkeley National Lab., 1 Cyclotron Red, Uc Berkeley, CA, 94720, United States

Abstract not available.

#### 3 - Evaluating the Economics of Power Interruptions and Investments in Resilience

Peter Larsen, Lawrence Berkeley National Laboratory, 1 Cyclotron Road, MS 90-4000, Berkeley, CA, 94720, United States

This presentation will introduce and elaborate on a number of U.S. government-sponsored projects that explore the economics of power interruptions and investments that mitigate cyber security threats and other risks to U.S. power system reliability and resilience.

#### 1 - The Regional Economic Accounting Tool: A Demonstration of Updates and Extensions

Vanessa Vargas, Sandia National Laboratories, Albuquerque, NM, United States

The Regional Economic Accounting tool (REAct) was developed by economists at Sandia National Laboratories (SNL) for estimating order-of-magnitude economic impacts within scenario/real-time analysis. REAct uses input-output modeling, geo-spatial data computational tools, and publicly available economic data to estimate the impacts of disruptive events and allows for detailed specification of sectors, regions, and disruption intervals. There are a number of improved capabilities for REAct, including seasonal impact analyses, improved indirect impact estimation, and a proxy for economic system resilience. System resilience is related to a system's ability to absorb, adapt, and recover from a disruptive event. Studies of past disruptive events indicate that factors which affect an economic system's ability to recover can vary across regions, industries, or even firms in the same industry. We have established a preliminary method for incorporating resilience based on firm and industry characteristics in regions affected during an acute disruptive event. Incorporating quarterly data into the analysis helps tailor the results of analyses both to current economic conditions and economies with seasonal production. This paper details the changes to REAct and provides a demonstration of the tool for specific geographies.

**Stability and Solvability of Power Flow Systems**

Sponsored: Energy, Natural Res &amp; the Environment/Electricity

Sponsored Session

Chair: Andy Sun, Georgia Institute of Technology, Atlanta, GA, 30312, United States

Co-Chair: Konstantin Turitsyn, Massachusetts Institute of Technology, Cambridge, MA, 02139, United States

**1 - Load-flow in Multiphase Distribution Networks: Existence, Uniqueness, Non-singularity, and Linear Models**

Andrey Bernstein, Senior Scientist, National Renewable Energy Laboratory (NREL), Golden, CO, United States

We consider unbalanced multiphase distribution systems with generic topology, and extend the Z-bus iterative load-flow algorithm based on a fixed-point interpretation of the AC load-flow equations. Explicit conditions for existence and uniqueness of load-flow solutions are presented, guaranteeing convergence of the load-flow algorithm to the unique solution. The methodology is applicable to generic systems featuring wye connections, ungrounded delta connections, and a combination thereof. A sufficient condition for the non-singularity of the load-flow Jacobian is proposed. Linear load-flow models are derived, and their approximation accuracy is analyzed.

**2 - A Theory of Solvability for Lossless Power Flow Equations**

John W. Simpson-Porco, Assistant Professor, University of Waterloo, Waterloo, ON, Canada

This talk presents a theory of solvability for power flow equations in lossless networks. We formulate a new model of power flow, termed the fixed-point power flow (FPPF), which is parameterized by three graph matrices quantifying the internal coupling strength of the network. The FPPF leads to an explicit approximation of the high-voltage solution. For a subclass of acyclic networks, we derive necessary and sufficient parametric conditions for the existence of a power flow solution which is unique within a specified set, generalizing the classic textbook result for a two-bus system.

**3 - Convex Restriction of Power Flow Feasibility Set**

Dongchan Lee, Massachusetts Institute of Technology, Cambridge, MA, United States, Hung Nguyen, Krishnamurthy Dvijotham, Konstantin Turitsyn

Convex restriction of the power flow feasibility set identifies the convex subset of power injections where the solution of power flow is guaranteed to exist and satisfy the operational constraints. In contrast to convex relaxation, convex restriction provides a sufficient condition for feasibility and is particularly useful for problems addressing uncertainty and security analysis. In this talk, we present a general framework of constructing convex restriction of an algebraic set and apply the framework for power flow feasibility problem. The results provide a nearly tight approximation of the actual feasible set for many of the IEEE test cases.

North Bldg 228A

**Joint Session ORAM/CYBER: Cyber Manufacturing Systems: Emerging Challenges and Opportunities**

Emerging Topic: OR and Advanced Manufacturing

Chair: Mohammed Shafae, University of Arizona, Tucson, AZ, USA.

**1 - Challenges and Opportunities in Additive Manufacturing for Industry 4.0**

Bianca Maria Colosimo, Politecnico di Milano, Milan, Italy.

This contribution discusses opportunities and challenges for quality assessment, monitoring and control of Additive Manufacturing (AM) processes and products. Special attention is devoted to in-situ data gathering and modeling.

**2 - Advancing the Security of Cybermanufacturing Systems: Challenges and Opportunities**

Lee Wells, Western Michigan University, Portage, MI, USA, Mohammed Shafae

As technology progresses, cyber-physical systems are becoming susceptible to a wider range of attacks. In manufacturing, these attacks pose a significant threat to ensuring products conform to their original design intent and to maintaining the safety of equipment, employees, and consumers. This talk discusses the importance of research and development of cyber-security tools specifically designed for manufacturing. A critical review of current research efforts will be presented as well as opportunities for the future of this emerging research area.

**3 - Blockchain in Manufacturing – A Critical Review**

Soundar Kumara, Pennsylvania State University, PA, USA

Blockchain is becoming popular in several domains. In this talk we explore the technical foundations of Blockchain and their applicability in (big-M) manufacturing. We will discuss provenance, platforms and the relevance of blockchain. With specific example in manufacturing, we will explore the integrated use of blockchain-analytics and AI. We will address the questions on hyperledger and Ethereum platforms.

## ■ SD46

**Electricity Market Modeling**

Sponsored: Energy, Natural Res &amp; the Environment/Energy

Sponsored Session

Chair: Steven A. Gabriel, University of Maryland, College Park, MD, 20742-3021, United States

Co-Chair: Ben Hobbs, Johns Hopkins University, Baltimore, MD, United States

**1 - Pricing Environmental Externalities in Regions with Asymmetrical Policies**

Robin Broder Hytowitz, Johns Hopkins University, Baltimore, MD, 21201, United States, Benjamin Field Hobbs

We examine integration of regional carbon policies into multi-regional real-time electricity markets, as is the case with California's cap-and-trade system and Energy Imbalance Market. Five methods for dispatch and pricing are compared. Findings suggest that there is a trade-off between emissions and cost, with no one dominant method to identify and manage carbon leakage from the region with a carbon policy.

**2 - Market Power under Nodal and Zonal Congestion Management Techniques**

Mette Bjørndal, NHH Norwegian School of Economics, Helleveien 30, Bergen, 5045, Norway, Endre Bjørndal, Somayeh Rahimi Alangi, Linda Rud

European electricity day-ahead markets use simplified methods such as uniform or zonal pricing, which only partly address congestion. Re-dispatch is then necessary to achieve a feasible flow. We discuss that simplified methods (e.g. uniform pricing) combined with re-dispatch, in theory can achieve the maximum optimal surplus, however this only occurs under the assumptions of full participation in re-dispatch and no extra costs of readjustment. We show that violations of these assumptions, i.e. limited participation and extra costs of readjustment can make the day-ahead and re-dispatch model of handling congestion inefficient compared to nodal pricing.

**3 - Convex Hull Pricing in Power Markets: Recent Developments in Theory, Computational Efficiency and Practice**

Peter Whitman, Federal Energy Regulatory Commission, 10808 Gainsborough Road, Potomac, MD, 20854-2510, United States

All power markets have non-convexities which make efficient, transparent pricing challenging. Given the changing conditions in power markets, there is renewed interest in Convex Hull Pricing (CHP). An approximation of CHP (ELMP) has been implemented for fast-start resources in the Midcontinent Independent System Operator (MISO), and it has been discussed in other markets. This paper reviews the rationale for CHP and summarizes some key theorems. In particular, it discusses the characterization and role of side payments, reviews revenue adequacy, and explains approximations that make solutions computationally feasible.

**4 - A Price-based Bidding Strategy for Electric Storage Resources in Electricity Markets**

Qingyu Xu, Johns Hopkins University, Baltimore, MD, 21218, United States, Nikita Singhal, Erik Ela

FERC Order 841 requires the ISOs to remove the barriers that prevent electric storage resources (ESRs) to enter electricity markets. During the process, instead of proposing direct managing the state of charge (SoC) of ESRs, several ISOs provide ESRs with the option to manage their own SoC through their offers. In this work, using price signals, we formulate a MILP to bid offer curves for ESRs 1) to maximize the profits from arbitraging energy and providing ancillary services, meanwhile 2) to maintain the SoC feasibility when dispatched by ISO, who is not aware of ESR's SoC information.

### Joint Session Tutorial/Practice Curated: Machine Learning and Data Mining with Combinatorial Optimization Algorithms

Emerging Topic: Practice Curated Track

Emerging Topic Session

Chair: Scott J. Mason, Clemson University, 273 Freeman Hall, Clemson, SC, 29634, United States

#### 1 - Machine Learning and Data Mining with Combinatorial Optimization Algorithms

Dorit Simona Hochbaum, University of California-Berkeley, Dept of IEOR, 4135 Etcheverry Hall MC 177, Berkeley, CA, 94720-1777, United States

The dominant algorithms for machine learning tasks fall most often in the realm of AI or continuous optimization of intractable problems. This tutorial presents combinatorial algorithms for machine learning, data mining, and image segmentation that, unlike the majority of existing machine learning methods, utilize pairwise similarities. These algorithms are efficient and reduce the classification problem to a network flow problem on a graph. One of these algorithms addresses the problem of finding a cluster that is as dissimilar as possible from the complement, while having as much similarity as possible within the cluster. These two objectives are combined either as a ratio or with linear weights. This problem is a variant of normalized cut, which is intractable. The problem and the polynomial-time algorithm solving it are called HNC. It is demonstrated here, via an extensive empirical study, that incorporating the use of pairwise similarities improves accuracy of classification and clustering. However, a drawback of the use of similarities is the quadratic rate of growth in the size of the data. A methodology called "sparse computation" has been devised to address and eliminate this quadratic growth. It is demonstrated that the technique of "sparse computation" enables the scalability of similarity-based algorithms to very large-scale data sets while maintaining high levels of accuracy. We demonstrate several applications of variants of HNC for data mining, medical imaging, and image segmentation tasks, including a recent one in which HNC is among the top performing methods in a benchmark for cell identification in calcium imaging movies for neuroscience brain research.

### Joint Session ENRE/Practice Curated: Wildland Fire Decision Support I

Sponsored: Energy, Natural Res & the Environment Forestry

Sponsored Session

Chair: Yu Wei, Colorado State University, Fort Collins, CO, 80523, United States

#### 1 - Identify and Present Large Fire Containment Strategies

Yu Wei, Colorado State University, Department of FRWS, Forestry 102, Fort Collins, CO, 80523, United States, Matt Thompson

Catastrophic large wildfire could threaten human lives, properties and natural resources. Fire containment involves complicated decisions. We build an OR model to use stochastic fire simulation results to support large fire suppression effort. Instead of selecting only one optimal suppression strategy, our analyses provide a range of "good fire containment strategies based on a wide range of fire situation predictions, manager's risk preferences, resource availability levels, and other management restrictions. Model results lead to alternative suppression solutions that are organized through decision-trees to support fast decisions during a fire event.

#### 2 - A Decision Support System for Dispatching Interagency Hotshot Crews

Erin Belval, Colorado State University, 1472 Campus Delivery, Fort Collins, CO, 80523, United States, Dave E. Calkin, Yu Wei, Crystal S. Stonesifer, Alex Taylor Masarie

Interagency Hotshot Crews (IHCs) are an important wildland fire suppression resource. During the fire season, they drive long distances to respond to ongoing and emerging fires; previous research has indicated that this driving could be reduced. We spent the summer of 2018 working with dispatchers to refine an existing optimization model to produce 1) a real-time dispatching tool and 2) a model that uses historical data to realistically examine the impacts on IHCs of changing various policies. In this presentation we discuss the process of refining the model with dispatching input, the current state of the real-time tool, and some results from the model utilizing historical data.

#### 3 - Evaluating Alternative Models for Evaluating the Daily Deployment of Airtankers for Forest Fire Suppression

David L. Martell, University of Toronto, Faculty of Forestry, 33 Willcocks Street, Toronto, ON, M5S 3B3, Canada

Forest fire management agencies often use airtankers to assist with initial attack on fires and as is the case with other emergency response systems, response time is crucial. Each day the regional duty officer must decide where to deploy his or her airtankers to minimize their expected response time given the predicted fire arrival rates. Resolution of the daily airtanker deployment problem calls for the design and control of a complex spatial queueing system with time-dependant arrival rates and complex service processes. We explore the merits of using alternative simplified initial attack process models to evaluate daily airtanker deployment strategies.

### Optimization and Systems Engineering Methods in Petrochemicals and Energy

Sponsored: Energy, Natural Res & the Environment/Natural Resources Petrochemicals

Sponsored Session

Chair: Christos T. Maravelias, University of Wisconsin-Madison, Madison, WI, 53706, United States

#### 1 - Minimum Number of Matches in Heat Recovery Networks for Energy Efficiency

Georgia Kouyialis, Imperial College London, London, United Kingdom, Dimitrios Letsios, Ruth Misener

Heat exchanger network synthesis exploits excess heat by integrating process hot and cold streams and improves energy efficiency by reducing utility usage. Determining provably good solutions to the minimum number of matches problem is a bottleneck of designing a heat recovery network. This subproblem is an NP-hard mixed-integer linear program (MILP). We (i) explore this MILP from a graph theoretic perspective, (ii) discuss its symmetric properties, (iii) develop heuristic methods with performance guarantees, and (iv) develop a new MILP formulation without big-M parameters for special cases. Numerical results from a collection of 51 instances substantiate the methods.

#### 2 - Solving Mixed-integer Linear Bi-level Optimization Problems through an Augmented Lagrangean Method

Francisco Trespalacios, ExxonMobil Research & Engineering, Clinton, NJ, United States, Stuart M. Harwood, Dimitri Papageorgiou, Myun-Seok Cheon

In this work, we present a model that demonstrates the relevance of bi-level optimization in the energy industry. Then, we present a novel method for solving mixed-integer linear bi-level optimization problems by using the Augmented Lagrangean of the subproblem. Finally, we present numerical examples that demonstrate the efficiency of this method against other methods.

#### 3 - Integration of Crude-oil Scheduling and Refinery Planning by Lagrangean Decomposition

David E. Bernal, Carnegie Mellon University, Carnegie Mellon University, Pittsburgh, PA, 15213, United States, Haokun Yang, Ignacio E. Grossmann

We address the optimization of integrated refinery problem, involving crude oil scheduling and refinery operation planning. We study several modeling approaches for the Crude Distillation Unit (CDU): fixed yield, swing cuts, fractionation index. Our model, which solves both the scheduling and planning simultaneously with linking constraints for the CDU, is compared against a non-integrated approach to the crude oil scheduling and followed by the refinery planning. Furthermore, we present a Lagrangean Decomposition algorithm for this problem, whose solution time is compared versus the case that the monolithically integrated model is solved using state-of-the-art MINLP solvers.

#### 4 - Combining the Advantages of Discrete- and Continuous-time MIP Scheduling Models

Christos T. Maravelias, University of Wisconsin-Madison, 1415 Engineering Drive, Engineering Hall 2024, Madison, WI, 53706, United States, Ho Jae Lee

We develop a solution algorithm, for large-scale chemical production scheduling problems, that consists of three stages: (1) solution of a discrete-time models to obtain batching, task-unit assignment, and sequencing decisions; (2) mapping of solution, preserving the three aforementioned decisions, onto time grids; and (3) solution of an LP to obtain accurate solution based on the decisions made in the first stage. We also discuss how to use two algorithmic parameters to obtain good first-stage decisions, and how to model complex processing features. We close with an extensive computational study showing the effectiveness of the proposed algorithm.

Edelman Reprise II**

Sponsored: INFORMS Section on Practice (formerly CPMS)

Sponsored Session

Chair: Anne G. Robinson, Verizon Wireless, Basking Ridge, NJ, 07920, United States

Co-Chair: Carrie Beam, University of Arkansas, Fayetteville, AR, 94596, United States

**1 - Pediatric Heart Network**

Eva Lee, Georgia Tech, Industrial &amp; Systems Engineering, Ctr for Operations Research in Medicine, Atlanta, GA, 30332-0205, United States

The Pediatric Heart Network enlisted researchers with the Georgia Institute of Technology to create clinical practice guidelines (CPG) for pre-, intra-, and post-surgical care of patients with congenital heart defects (CHDs), the most common birth defect, impacting nearly 1 million children and 1.4 million adults in the U.S. Substantial variances in surgical practices to treat patients with CHDs among different healthcare centers were reflected in inconsistent surgical outcomes, some of which resulted in negative consequences for patients. By studying the nine leading U.S. pediatric centers, the researchers identified seven significant factors for influencing surgical outcome, and implemented a CPG that enables patients to be removed from breathing apparatuses earlier, lowered the rate of reintubation, and decreased the time patients need to remain in the intensive care unit. These guidelines also realized a cost savings of 27 percent, which translates to \$13,500 per patient.

**2 - Analytics Makes Inventory Planning A Lights-Out Activity at Intel Corporation**

Sean Willems, University of Tennessee, 617 Commodore Lane, Knoxville, TN, 37934, United States

Intel, which employs more than 100,000 people in over 70 countries around the world and has an annual revenue of \$60 billion, implemented a fully automated Multi-Echelon Inventory Optimization (MEIO) based inventory target-setting system managing \$1 billion daily in finished goods inventory representing over \$40B a year in sales. Algorithm-derived inventory targets at Intel are accepted by planners +99.5 percent of the time and have simultaneously driven higher customer service and lower inventory levels resulting in over \$1.3B in gross profit since 2014. In addition, customers are delighted: since MEIO was implemented at all of Intel's vendor managed inventory hubs in 2012, customer satisfaction has never been higher and Intel has landed in the top-10 of Gartner's Supply Chain Top-25 every year. Faculty in the department of Business Analytics and Statistics at the University of Tennessee, Knoxville and the supply chain software company Logility also contributed to this project.

**1 - Scheduling Jobs on Mixed Batching Machines**

Guoqiang Fan, Northwestern Polytechnical University, 127 West Youyi Road, Xi'an, SN 29, China, Junqiang Wang

This paper considers a mixed batching model that is different from the parallel-batch and the serial-batch. The mixed batching machine can process at most  $b$  jobs simultaneously. The processing time of a batch is the weighted sum of the maximum processing time and the total processing time of the jobs in the batch. The objective is to minimize the makespan. We first prove that the Full Batch Longest Processing Time (FBLPT) algorithm yields an optimal schedule for the problem on a single mixed batching machine. Then we show the NP-hardness of the problem on parallel mixed batching machines. We analyze the worst-case ratio of FBLPT algorithm and a modified-FBLPT algorithm.

**2 - Introducing Swing Shifts to Dynamically Respond to Emergency Department Workload Uncertainty**

David L. Kaufman, University of Michigan - Dearborn, 19000 Hubbard Drive, Fairlane Center South, Dearborn, MI, 48126, United States, Kalyan Pasupathy, Daniel Cabrera, Mustafa Y. Sir

A fundamental problem of emergency care is matching resources to uncertain patient demands. Staffing allocation decisions require good matching with workloads but also consider the needs of emergency providers at very high risk of burnout. Mayo Clinic Emergency Department recently introduced a "swing shift," which allows physicians to leave early depending on a workload threshold. While popular, swing shifts introduce several challenges: How to design a threshold mechanism? What is the optimal length of the furlough? When should these shifts start and what is their impact? We introduce an effective and tractable data-driven optimization model for a complex stochastic problem.

**3 - Maximizing On-time Jobs for the Customer Order Scheduling Problem**

Hairong Zhao, Purdue University Northwest, 2200 169 Street, Hammond, IN, 46323, United States

We consider the problem of scheduling multi-task jobs on parallel machines. Each job consists of one or more tasks. Each job has a release date and a due date. A task of a job can be processed by any one of the machines. Multiple machines can process the tasks of a job concurrently. The objective is maximizing the number of on-time jobs. We show that while the general problem is NP-hard, some special cases are solvable. For the general case, we develop some heuristics whose performance is evaluated by experimental results.

**4 - Cost Allocation in Rescheduling with Machine Unavailable Period**

Zhixin Liu, University of Michigan-Dearborn, 19000 Hubbard Drive, Dearborn, MI, 48126-4100, United States, Liang Lu, Xiangtong Qi

We study a rescheduling problem faced by multiple jobs owners sharing a single machine, where jobs need to be rescheduled, when the machine becomes unavailable for a period. We define a feasible schedule over which cost saving can be achieved by optimal rescheduling, and then formulate a cooperative game for job owners accordingly, to share the cost saving. Given that the optimization problem is computationally intractable, we find several optimal properties and develop an optimal pseudopolynomial time dynamic programming algorithm for rescheduling. We provide a simple closed form core allocation of the total cost saving for all the jobs, and provide the Shapley value of the game in a computable form.

**Social Media for Socially Responsible Operations**

Emerging Topic: Social Media Analytics

Emerging Topic Session

Chair: Moravec Tricia, IN, United States

Co-Chair: Alfonso Pedraza, Indiana University, Bloomington, IN, 47405, United States

**1 - Transparency in Crowdfunding for Emergency Management**

Gloria Urrea, Indiana University, Bloomington, IN, 47408, United States, Jorge Mejia, Alfonso J. Pedraza-Martinez

We study online crowdfunding as a tool to increase funding for emergency relief campaigns. Crowdfunding campaigns can use two tools to increase the transparency provided to potential donors: certification and online updates. Certification is a form of conventional transparency that ensures the campaign is benefiting a charitable purpose. Alternatively, updates are additional status posts and are a form of operational transparency when they communicate the work of the campaign. Using data from a large crowdfunding website, we show that work-related updates (operational transparency) have a stronger effect on increasing donations than certification (conventional transparency).

**2 - Matching Donors to Projects on Charitable Giving Platform**

Yicheng Song, University of Minnesota, Minneapolis, MN, United States, Zhuoxin Li, Nachiketa Sahoo

Matching donors with causes is critically important in philanthropy. We propose a donors-project match mechanism, considering donors' preferences, budget, and cognitive limitations as well as the dynamic status and budgetary needs of the projects. The proposed model better captures donation behavior than several benchmarks. Using the estimated model, we design optimal recommendation policies to maximize fundraising success. By matching projects to donors, not only based on the donors' preference, but also their budget, and their willingness to support projects with different odds of success, the optimal recommendation strategies increase the donations raised by about 22%.

### 3 - Competition and Coopetition among Social Media Content in Disasters

Eunae Yoo, University of Tennessee, Knoxville, TN, United States,  
Elliot Rabinovich, Bin Gu

Humanitarian organizations may convey similar content when communicating on social media platforms during disasters. Our study examines if the diffusion for a piece of content is detracted by or is augmented by the spread of similar content. Therefore, we test whether a competitive or coopetitive dynamic exists among similar content. To that end, we formulate a generalized Hawkes model and estimate the model using Twitter data from multiple disasters. The results from our analysis indicate that similar content tends to interact competitively. Based on the results, we provide implications for humanitarian organizations for coordinating the release of similar social media content during crises.

### 4 - Reducing Fear through Credible Information During Crisis

Tricia Moravec, Indiana University, Bloomington, IN, United States

The increase in global natural disasters and crises throughout the past 10 years, combined with the increased usage of online social media in transmitting information during these disasters, had led to increased need to understand the process through which social media enables at-risk people to stay informed. People panic in the face of a natural disaster, and the first method to enable rational response is to calm the public down. We examine whether information provided from one with an authoritative, reliable reputation helps people calm down, so they may more rationally deal with the crisis. We find that increased informational support does negatively influence fear, such that fear decreases when information is posted by the premier authority on wildfire fighting. Our results suggest that informational support is highly effective in enabling people to make the most effective decisions during the disaster response phase by helping them toward a more rationale state of mind.

### Machine Learning in Market Design

Sponsored: Auction and Marketing Design

Sponsored Session

Chair: Sven Seuken, University of Zurich, Zurich, 8050, Switzerland

Co-Chair: Benjamin Lubin, Boston University, Boston, MA, 02215, United States

#### 1 - The Power of Machine Learning and Market Design for Cloud Computing Admission Control

Ludwig Dierks, University of Zurich, Zurich, Switzerland,  
Ian Kash, Sven Seuken

Cloud computing providers must handle customer workloads that wish to scale their use of resources such as virtual machines up and down over time. Currently, this is often done using simple threshold policies to reserve large parts of compute clusters, which leads to a low average utilization of the cluster. We present new, more sophisticated policies that can take learned or elicited probabilistic information about the future behaviors of arriving workloads into account. Based on these policies, we show the high potential machine learning and market design have for increasing efficiency.

#### 2 - Combinatorial Auctions via Machine Learning-based Preference Elicitation

Gianluca Brero, University of Zurich, Stettbachstrasse, 93, Zurich, 8051, Switzerland, Benjamin Lubin, Sven Seuken

Combinatorial auctions (CAs) are used to allocate items among bidders with complex valuations. Since the value space grows exponentially in the number of items, it is often impossible for bidders to report all their values, thus leading to inefficiencies. We introduce a machine learning-based elicitation algorithm to identify which values to query from the bidders. We integrate this algorithm in a new CA mechanism we call PVM where payments are determined so that bidders' incentives are aligned with allocative efficiency. We validate PVM experimentally and we show that it achieves high allocative efficiency even when only few values are elicited from the bidders.

#### 3 - A Bayesian Clearing Mechanism for Combinatorial Auctions

S. Bastien Lahaie, Google, New York, NY, 10011, United States,  
Gianluca Brero

We cast the problem of combinatorial auction design in a Bayesian framework to incorporate prior information into the auction process and minimize the number of rounds. We develop a generative model of bidder valuations and market prices, which then forms the basis of an auction process which alternates between refining estimates of bidder valuations, and computing candidate clearing prices. We provide an implementation of the auction, empirically evaluate it over a range of valuation domains, and find that it is extremely competitive against a conventional combinatorial clock auction.

### 4 - Learning to Branch for Winner Determination in Combinatorial Auctions

Tuomas W. Sandholm, Carnegie Mellon University, Gates Center for Computer Science, Pittsburgh, PA, 15213, United States,  
Maria Florina Balcan, Travis Dick, Ellen Vitercik

Tree search algorithms, e.g. branch-and-bound, are the most widely used tools for combinatorial/nonconvex problems - e.g. MIP/CSP. To get small trees, it is key to decide, when expanding a node, on which question (e.g. variable) to branch. Many techniques have been proposed, but theory was lacking. We show how to use machine learning to determine an optimal weighting of any set of branching rules for the instance distribution at hand using samples from the distribution. We prove the first sample complexity guarantees for tree search algorithm configuration. The theory gives rise to a learning algorithm. It dramatically reduces tree size, e.g. in optimal combinatorial auction winner determination.

### Behavioral Research in Sustainability and Supply Chains

Sponsored: Behavioral Operations Management

Sponsored Session

Chair: Stephen Leider, University of Michigan, Ann Arbor, MI, 48109, United States

#### 1 - Relative Performance Transparency: Effects on Sustainable Consumer Behavior

Yanchong Zheng, MIT, Cambridge, MA, 02142, United States,  
Ryan Buell, Shwetha P. Mariadassou

We study how transparency into the levels and changes of relative sustainability performance affects consumer behavior. In a series of online consumer choice studies, we show that when the relative performance concerns comparison of a firm to its competitors, transparency into the firm's relative performance level has a stronger impact on behavior than transparency into the firm's relative performance change. Conversely, when concerning performance comparison of the consumer him/herself to other consumers, transparency into relative performance changes has a more dominant effect on behavior. We identify the mechanisms underlying these results and confirm them in our last study.

#### 2 - Shared Supplier Capacity as a Barrier to Socially Responsible Sourcing

Jacob Chestnut, Cornell College of Business, SHA, Ithaca, NY, United States, Ravi Anupindi

This experimental project considers the role of buyer behavior (e.g., time pressure, low margin, near delivery specification changes) in their supplier's performance along the dimension of social sustainability (forced OT, child labor, unauthorized outsourcing, etc.). We attempt to understand the relevant features (contractual and non-contractual) that suppliers use when creating a preference ranking over buyers. Doing so allows us to assess the effectiveness of the operational and non-operational levers that a "good buyer might employ to improve their rank, thereby decreasing the likelihood that deviations occur on their order.

#### 3 - The Role of Psychological Distance and Construal Level on Sustainable Operations Decision Making

Saif Mir, Assistant Professor, College of Charleston, Charleston, SC, 29424, United States, Stephanie Eckerd, John Aloysius

We evaluate the role of psychological distances and construal levels in influencing operations manager propensity to make sustainable decisions. Previous studies have largely investigated cases when the two mechanisms are congruent. Specifically, near psychological distances are linked with concrete construal and far psychological distances are linked with abstract construal. In our study we evaluate the interaction of these mechanisms and the resulting effect on decision making behavior, using a 2 (Psychological distance: Near/Far) x 2 (Construal level: High/Low) vignette experiment.

#### 4 - Building Alliances for Socially Responsible Sourcing

Han Zhang, Student, Kelley School of Business, Indiana University Bloomington, 1309 E. 10th St Ste 4100, Bloomington, IN, 47405, United States, Ruth Beer, Kyle D. Cattani

Following the mandate by the Dodd-Frank Act that US public companies disclose the use of conflict minerals in their products and processes, five well-known companies established a fund to audit mineral suppliers. This initiative has been a success at raising funds despite the incentives of companies to free ride on the contributions by other companies. Our game-theoretical model incorporates two elements that explain the phenomenon: an invitation stage and heterogeneity in the statuses of the firms. Our lab experiment shows that the invitation stage is key to high contributions, and status significantly influences whether the invitation succeeds.

**Joint Session Sports/Practice Curated:  
Sports Analytics III**

Sponsored: SpORts

Sponsored Session

Chair: Keith A. Willoughby, University of Saskatchewan, Saskatoon, SK, S7N 5A7, Canada

**1 - Ratio Breakers: Analyzing Drafting Strategy in the Canadian Football League**

Keith A. Willoughby, University of Saskatchewan, Department of Finance and Management Science, Saskatoon, SK, S7N 5A7, Canada, Kent Kostuk

The Canadian Football League (CFL) deploys a "game rule ratio mandating that Canadian athletes comprise at least 21 members of a team's 44-player roster. This regulation requires team management to strategically evaluate Canadian talent in order to assemble competitive rosters. The primary source of Canadian player recruitment is the league's annual draft. We analyze over two decades of draft results and determine a number of insights to guide drafting strategies.

**2 - Modeling Extra Inning Decisions in Softball**

Kent J. Kostuk, Federated Co-Operatives Limited, 9 Cantlon Crescent, Saskatoon, SK, S7J 2T2, Canada, Keith A. Willoughby

In softball when teams are tied after the regulation 7th inning they continue to play additional innings to determine a winner. In an effort to reduce the number of extra innings, each half inning starts with a runner on 2nd base. A typical defensive philosophy is to always focus on preventing runners from advancing. Alternatively, offensively teams will typically bunt; sacrificing an out in an effort to improve the likelihood of scoring. We will develop a model that will allow us to quantify the efficacy of these classic defensive and offensive strategies.

**3 - Understanding the Female/male Velocity Ratio of Olympic Champions in Running, Speed Skating, Swimming and Rowing**  
Raymond Stefani, California State University, Long Beach, CA, United States

Photographs of male and female Olympic champions taken about 80 years apart show little change in physiology but major changes in the competitive conditions that would increase efficiency. Thus, if both genders are now equally trained and equally efficient, then performance ratios should depend on physiology ratios, which are likely to have changed little. Equations are derived from physiology and physics for which power times efficiency depends on performance, physiology and other factors common to both genders. Assuming equal training and efficiency, the velocity ratio of female/male Olympic champions simplify when populated with kinesiology data from over 2000 athletes in the various types of competition. The velocity ratio for running and speed skating is estimated to be the relative lean-to-weight (LTW) ratio while for swimming and rowing the estimate is the 8/9 power of the relative LTW ratio. The approach appears to be validated in that, for 1992-2016, elite female athletes had 90% of the lean-to-weight ratio that men had and, in fact, their Olympic champions ran, swam and rowed about 90% as fast. For 1980 to 2014, in speed skating, elite female athletes had 92% of the lean-to-weight ratio of men and their Olympic champions skated 92% as fast.

**4 - Predictive Power of the (1, a) Method Compared to Traditional Sports Ranking Methods**

Baback Vaziri, James Madison University, 2210 Reserve Circle, Unit 203, Rockingham, VA, 22801, United States, Shaunak Dabaghao

Ideally, a ranking method for a sports tournament will be not only fair and comprehensive, but it will also possess strong predictive power. In a recent article, the (1, a) method was proposed as being fair and comprehensive in comparison with other popular sports ranking methods. In this study, we compare the predictive power of the (1, a) method against five (5) popular sports ranking methods for NFL, NHL and NBA seasons from 2001-2015. We also show which values of a are best suited for the (1, a) method to maximize the methods' predictive power based on sport.

**5 - Effects of Major League Baseball Manager Attributes on Team Performance**

Seong Dae Kim, Associate Professor, University of Tennessee at Chattanooga, Chattanooga, TN, 37403, United States, J.C. Kim

For the 2017 season, an average salary of the top-5 highest-paid managers is a \$4.5 M. 4 out of 5 managers are employed with teams located in large cities. Many of them have a lot of experience as a manager and are highly paid. But hiring an experienced manager could be a difficult decision to teams in small markets. Teams may want to consider hiring a more affordable and less experienced but promising young manager to save money to hire good players. To address this problem, this study analyzes data sets about MLB managers using data analytics techniques to explore the effects of the manager's attributes on the team performance. This study will help MLB teams hire a right manager with a tight budget.

**Social Interactions in the Sharing Economy**

Sponsored: Manufacturing &amp; Service Oper Mgmt/Supply Chain

Sponsored Session

Chair: Laurens G. Debo, Dartmouth College, Hanover, NH, 03755, United States

Co-Chair: Guangwen Kong

**1 - Blockbuster or Niche? Competitive Strategy under Network Effects**

Ming Hu, University of Toronto, Rotman School of Management, 105 St. George Street, Toronto, ON, M5S 3E6, Canada, Yinbo Feng

We provide a theory that unifies the long tail and blockbuster phenomena. We show analytically that a growing network effect always contributes to more sales concentration on a small number of products, supporting the blockbuster phenomenon. However, product variety and investments in quality, as an outcome of firms' ex ante competitive decisions, may increase or decrease, as the network effect grows.

**2 - The Leverage from Family and Friends: Manage Outside Funds in a Crowd-funding though Inside**

Behrooz Pourghannad, University of Minnesota, Minneapolis, MN, 55414, United States, Guangwen Kong, Laurens G. Debo

We study how an entrepreneur can use the funds from her social network, i.e. her family and friends, during his crowd-funding campaign. We investigate how the investment from family and friends may impact on the amount of investment that entrepreneur could seek, and how reciprocities play a role in revealing the information of a crowd-funding campaign.

**3 - Strategic Surge Pricing and Forecast Communication in On-demand Service Platforms**

Harish Guda, University of Texas-Dallas, 2700 Waterview Parkway, #4424, Richardson, TX, 75080, United States, Upender Subramanian

We examine pricing and communication strategies of on-demand service platforms, explicitly accounting for the platform's and workers' incentives to serve consumers in adjacent market zones. We show when, how and why surge pricing may be counterintuitively used even in zones where supply exceeds demand to further imbalance supply and demand.

**4 - Choosing the Optimal Campaign Mode in Reward Based Crowdfunding**

Simone Marinesi, Assistant Professor of Operations Management, The Wharton School, University of Pennsylvania, Philadelphia, PA, 19103, United States, Ekaterina Astashkina, Karan Girotra

We compare two alternative campaign modes for rewards-based crowdfunding campaigns, Fixed Funding and Flexible Funding. In contrast to prior literature, which argues that Fixed Funding is superior to Flexible Funding, we show that each campaign mode can outperform the other, depending on the characteristics of the project, and we provide recommendations for how to choose between the two.

**New Advances in Appointment Scheduling and Online Resource Allocation**

Sponsored: Health Applications

Sponsored Session

Chair: Mark P. Van Oyen, University of Michigan, Ann Arbor, MI, 48109-2117, United States

Co-Chair: Esmaeil Keyvanshokoh, University of Michigan-Ann Arbor, Ann Arbor, MI, 48108-1020, United States

**1 - Prioritizing Access to Hepatitis C Treatment in U.S. Prisons**

Turgay Ayer, Georgia Institute of Technology, School of Industrial and Systems Engineering, Groseclose 417, Atlanta, GA, 30332, United States, Can Zhang, Anthony Bonifonte, Jagpreet Chhatwal, Anne Spaulding

HCV prevalence in prison systems is ten times higher than the general population, and hence prison systems offer a unique opportunity to control the HCV epidemic. New HCV treatment drugs are very effective, but providing treatment to all inmates is prohibitively expensive. As such, current practice recommends prioritizing treatment based on clinical and incarceration-related factors. However, there is controversy about how these factors should be incorporated because of the complicated tradeoffs. In this study, we propose a restless bandit modeling framework to support hepatitis C treatment prioritization decisions in U.S. prisons.

## 2 - Impact of Mobile Technologies on Health Outcomes for Patients with Chronic Disease

Leon Cui, Binghamton University, 62 Decatur St, Binghamton, NY, 13903, United States, Sal Agnihothri, Balaraman Rajan, Mohammad Delasay

Chronic conditions place a high cost burden on the healthcare system and deplete the quality of life for millions of Americans. Mobile technologies can be used to provide efficient and effective healthcare. We attempt to evaluate the impact of using these technologies on health outcomes for patients with chronic disease.

## 3 - Managing Appointment-based Services in the Presence of Walk-in Patients

Shan Wang, Shanghai Jiao Tong University, Xuhui District, 1954 Huashan Road, Shanghai, 200030, China, Nan Liu, Guohua Wan

We study how to manage daily operations of a healthcare facility that accepts both scheduled and walk-in patients. In particular, we develop a data-driven optimization approach to determine the optimal appointment schedule in the presence of potential walk-ins. Our approach can handle highly complex environments with general walk-in processes and heterogeneous, time-dependent patient no-show behaviors. Using data from practice, we predict a significant cost reduction (42%-73% on average) if the providers were to switch from current practice (which tends to ignore walk-ins in planning) to our proposed schedules.

## 4 - Advance Online Scheduling with Overtime:

### A Primal-Dual Approach

Esmaeil Keyvanshokoh, University of Michigan-Ann Arbor, Ann Arbor, MI, 48108-1020, United States, Cong Shi, Mark P. Van Oyen

We study an online advance scheduling problem with reward and service time heterogeneity as well as budgeted overtime in which patients arrive one by one. Upon each arriving patient, the scheduler chooses both a resource and a day over a planning horizon without any information on the subsequent patients. By solving an online linear program, we design online optimization algorithms for this purpose and prove a worst-case performance guarantee. A case study of outpatient clinic scheduling is conducted.

Chair: Burhaneddin Sandikci, University of Chicago, Chicago, IL, 60637, United States

Co-Chair: Sait Tunc, University of Chicago, Chicago, IL, 60637, United States

## 1 - Size Based Exception Points for Fair Liver Allocation

Mustafa Akan, Carnegie Mellon University, 5000 Forbes Ave. Posner 381C, Pittsburgh, PA, 15213, United States, Musa Celdir, Sridhar R. Tayur

Patients on the waiting list for liver transplants receive priority based on their Model for End-Stage Liver Disease (MELD) scores, which reflect the severity of liver disease. Recent studies have shown that for patients with Hepatocellular Carcinoma (HCC), shorter candidates and women (which may relate to smaller stature) have longer wait times and lower probability of liver transplant. Using a queueing model and data from the Scientific Registry of Transplant Recipients (SRTS), we investigate whether additional MELD exception points would help equalize the size-based disparity in organ access.

## 2 - Delay Aware Allocation Policies in Kidney Allocation Systems

Chaithanya Bandi, Kellogg School of Management, Northwestern University, 2211 Campus Dr, room 4169, Evanston, IL, 60208, United States

We investigate the problem of designing fair and delay aware allocation policies for the Kidney Allocation systems. We formulate the problem as a Robust Queueing control problem and present various structural results.

## 3 - Incentivized Kidney Exchange

M. Utlu Unver, Boston College, Chestnut Hill, MA, 02467, United States, Tayfun Sonmez, Bumin Yenmez, Bumin Yenmez

Over the last 15 years, kidney exchange has become a mainstream paradigm to increase transplants. However, compatible pairs do not participate, and the full benefits from exchange can be realized only if they do. We propose incentivizing compatible pairs to participate in exchange by insuring their patients against future renal failure via increased priority in the deceased-donor queue. Efficiency and equity analyses of this scheme are conducted and compared with that of kidney exchange in a new dynamic continuum model. We calibrate the model with US data and quantify substantial gains from adopting incentivized exchange in efficiency and access equity.

## 4 - Treating to the Priority in Heart Transplantation

Sait Tunc, University of Chicago, McGiffert House 4th Floor, 5751 S. Woodlawn Avenue, Chicago, IL, 60637, United States, Burhaneddin Sandikci, Philipp Afeche, William Parker

US heart allocation system assigns priorities to waiting candidates based on the therapies they receive, where the severity of therapies used is assumed to measure the urgency of a candidate to receive a heart transplant. It is, however, constantly debated that therapy-based prioritization opens up room for gaming the system. We propose a novel framework to analytically study the gaming decisions of heart transplant centers, understand when strategic gaming emerges under different competition types, and how it can be prevented within the confines of the current system.

## Managing Capacity of Surgical and Procedural Areas

Sponsored: Health Applications

Sponsored Session

Chair: Vikram Tiwari, Vanderbilt University Medical Center, Nashville, TN, 37221, United States

Co-Chair: Joonyup Eun, Vanderbilt University Medical Center, Nashville, TN, 1211 21st Avenue South, Room 708, Nashville, TN, 37212, United States

## 1 - Influence of Patient Experience and Shared Decision-making on Surgical Scheduling

Franklin Dexter, University of Iowa, Department of Anesthesia, Division of Management Consulting, Iowa City, IA, 52242, United States

We surveyed patients' perceptions of the service being provided by elective surgery, and desire to share in the decision of scheduling. Most patients (59% lung cancer and gallbladder surgery) would choose another surgeon at the same hospital if that would permit surgery within 4 workdays. Patients may value discussing change in surgeon because they have little prior surgical experience. We considered every patient in the State of Iowa having outpatient surgery at a hospital during 3 months. Most patients (64.3%) had no subsequent outpatient or inpatient surgery at any hospital statewide for at least 2 years.

## 2 - Adaptive Capacity Planning for Ambulatory Surgery Centers

Seokjun Youn, Texas A&M University, 320M Wehner Building, 4217 Texas A&M University, College Station, TX, 77840-4217, United States, Harry Neil Geismar, Chelliah Sriskandarajah, Vikram Tiwari

Capacity planning for Ambulatory Surgery Centers (ASCs) is challenging due to multi-stage nature of services and significant uncertainty in patient-mix as well as service duration. We propose a bed capacity planning framework for ASCs and provide implications for practitioners, for example, the impacts of changes in patient-mix or ASC operating structures on capacity.

## 3 - Evaluating Appointment Scheduling Policies at the Division of Colon and Rectal Surgery of Mayo Clinic

Narges Shahraki, Mayo Clinic, Rochester, MN, United States, Mustafa Y. Sir, David Larson, Brian Bernard, Todd Huschka, Gabriela Martinez, Curtis Storlie, Kalyan Pasupathy

In this study, we develop a novel multi-level model to evaluate the impact of a priority-based scheduling policy implemented at the Division of Colon and Rectal Surgery of Mayo Clinic. Access time to surgery and variability on the surgeon end-of-day are considered as the performance metrics in our comparison. The results show that the priority-based policy is an effective scheduling policy since it distributes the demand properly through the planning horizon and helps the system to service the high priority patients more efficiently.

## 4 - Integrated Routing and Scheduling of Anesthesiologists to Off-locations

Joonyup Eun, Vanderbilt University Medical Center, Nashville, TN, United States, Vikram Tiwari, Mitchell H. Tsai, Max Breidenstein, Warren S. Sandberg

We develop a scenario-based stochastic optimization model that factors in distances between off-location sites, idle time, and tardiness of cases to determine anesthesiologists' assignment. Most solutions reduce the number of required anesthesia providers than scheduled in real situations. By changing the relative weights, we evaluate the trade-offs among the four performance measures.

**Capacity Management in Healthcare**

Sponsored: Health Applications

Sponsored Session

Chair: Nan Liu, Boston College, Chestnut Hill, MA, 02467, United States

Co-Chair: Pengyi Shi, Purdue University, West Lafayette, IN, 47907, United States

**1 - Flexible FDA Approval Policies**

Taylor Corcoran, UCLA Anderson School of Management, 110 Westwood Plaza, Los Angeles, CA, 90024, United States, Fernanda Bravo, Elisa Long

The FDA requires clinical trial evidence that is statistically significant at the 2.5% level when approving novel drugs, but the agency often uses regulatory discretion when interpreting these standards. Factors such as target disease severity, prevalence, and availability of existing therapies are qualitatively considered, yet no quantitative framework is used to evaluate how such characteristics impact approval standards. We propose a novel queueing network model to analyze the drug approval process, which explicitly incorporates these factors, as well as obsolescence among drugs.

**2 - Coordinated Clinic Surgery Appointment Scheduling: A Multi-stage Stochastic and Distributionally Robust Approach**

Esmaeil Keyvanshokoo, University of Michigan-Ann Arbor, Ann Arbor, MI, 48108-1020, United States, Pooyan Kazemian, Mark P. Van Oyen

Providing timely access to surgery/clinic is crucial for patients with high acuity diseases like cancer. In this paper, we present an integrated multi-stage stochastic and distributionally robust optimization approach for coordinating both clinic and surgery appointments to meet access delay service levels. The methodology is applied to historical hospital data to benchmark its better performance.

**3 - An Empirical Investigation on Overflow Decisions in Inpatient Flow and Their Impact on Patient Outcomes**

Jing Dong, Columbia University, Uris Hall 413, 3022 Broadway, New York, NY, 60208, United States, Pengyi Shi, Fanyin Zheng

Using patient level data from a large teaching hospital in Singapore, we study the overflow decision in inpatient flow management and its impact on both individual-level patient outcomes and system-level congestion. We first empirically investigate the causal effect of overflow on inpatient length-of-stay (LOS). Then, we develop a structural model to estimate what factors drive the overflow decision in practice. Finally, motivated by the empirical findings, we use simulations to identify optimal overflow decisions that balance the cost and benefit of overflow.

**4 - Balancing the Scale: Readmission Risk at Discharge vs Inpatient Unit Congestion**

Pengyi Shi, Purdue University, 403 W. State St, Krannert School of Management, Kran 472, West Lafayette, IN, 47907, United States, Jonathan Helm, Jivan Romain Deglise-Hawkinson, Julian Pan

Early discharging patients at high inpatient occupancy mitigates the impact of ward overcrowding, but early discharged patients may experience increased readmission risk and other adverse outcomes. In this work, we develop a practical decision support tool to aid hospitals balance between individual discharge risk and ward congestion. We start from building a prediction model that updates the readmission risk over a patient's stay in the hospital. We then integrate this prediction model into a discharge optimization framework and develop a series of methods to overcome the curse of dimensionality. Lastly, we discuss the ongoing implementation efforts of this discharge optimization tool.

**Recent Frontiers on Energy Markets**

Emerging Topic: Energy and Climate

Emerging Topic Session

Chair: Feng Qiu, Argonne National Laboratory, Lemont, IL, 60439, United States

**1 - Computational Challenges to ISO Markets and Planning**

Richard Paul O'Neill, Federal Energy Regulatory Commission, Silver Spring, MD, United States

This presentation will look at the computational challenges in the ISO markets and planning transmission. In ISO markets there is needed for good solutions in a specific time period. Problems can be characterized as MIPs and non-linear optimizations. In ISO markets, the transmission expansion problem is much more

difficult than for vertical integrated utilities and IRPs. Transmission expansion depends on assumptions concerning the future type and location of generation and load. Presentation will address newer models for transmission expansion and cost allocation that could improve the process.

**2 - Ongoing Challenges on Wholesale Electricity Market Clearing**

Yonghong Chen, Midwest ISO, 720 City Center Drive, Carmel, IN, 46032, United States

This presentation introduces on-going challenges faced by wholesale electricity market and the R&D efforts to overcome these challenges, especially in the area of improving computational capabilities to incorporate future resources such as storages, distributed energy resources, virtual power plants, etc.

**3 - Challenges in Integrating Variable Energy Resources in RTO Markets**

Khai Le, PCI, Norman, OK, United States

This presentation explores the key operating challenges that RTOS are currently facing as more variable energy resources (VERs) are added to their generation mix: ? What are the potential impacts of adding wind & solar resources on system operations and system reliability? ? As more VERs are added, do you have to increase your regulating-reserve requirements to maintain NERC CPS1 and CPS2 requirements? ? What are the potential increases in ancillary-service costs for integrating VERs?

**4 - Challenges in Integrating Solar Resources in Large Balancing Areas**

Mark Oliver, Duke Energy

This presentation provides an overview of challenges faced by non-RTO/ISO utilities in meeting NERC balancing requirements while accommodating rapid growth of PURPA solar energy, including forecasting and monitoring of distributed solar energy, investments to improve operational flexibility of the conventional generation fleet, and implications of third party energy "solar plus storage" resources.

**5 - Polynomial Time Algorithms and Extended Formulations for Unit Commitment Problems**

Yongpei Guan, University of Florida, 303 Weil Hall, P.O. Box 116595, Gainesville, FL, 32611, United States, Kai Pan, Kezhou Zhou

Unit commitment is fundamental and embedded in the models at different stages of power system operations. In this talk, we present polynomial-time algorithms for the unit commitment problems with a general convex cost function and piecewise linear cost function, respectively. We also report the corresponding extended formulation and further study on its stochastic counterpart.

**1 - Annual Report Readability, Timeliness, and Earnings**

Yuan Song, Tongji University, Room 1413, Tongji Building A, Siping Rd 1500, Shanghai, 200092, China, Shouyi Wang, Hongwei Wang

This paper studies the associations between earnings and annual report readability and timeliness based on China's capital market. Empirical results indicate that firms with higher earnings are likely to disclose their annual reports earlier in a timely manner and smaller document size; the annual reports of firms with lower earnings are later disclosed and harder to read in a larger file size. The results are consistent with both firms reporting a loss and firms with positive earnings. Additionally, among China's multi-tier capital market system, the annual report readability and timeliness in SHSE are more powerful to explain earnings than in SZMB and SME.

**2 - Rethinking Resilience Analytics for Cyber-physical-social Systems**

David L. Alderson, Naval Postgraduate School, 1411 Cunningham Road, Monterey, CA, 93943, United States, Daniel Eisenberg, Thomas P. Seager

The concept of 'resilience analytics' has been proposed to leverage the promise of big data and associated analytic techniques to improve the resilience of interdependent critical infrastructure systems and the communities supported by them. Given the prevalence of high-profile disasters and advances in data-driven analytic techniques, the temptation to develop resilience analytics without question is almost overwhelming. However, without critical examination of the assumptions and limitations of existing analytics, such efforts may ironically create more brittle cyber-physical-social (CPS) systems from overconfidence, myopia, and/or loss of adaptive or innovative capacity.

### 3 - A Deep Learning Approach for Travel Time Prediction

Mohammad Abdollahi, Wayne State University, 4815 Fourth Street, Room 1067, Detroit, MI, 48202, United States, Kai Yang

Travel time is a fundamental measure in transportation which its accurate prediction is also crucial to the development of intelligent transportation systems. In this paper, we study travel time prediction for New York cabs using deep learning. First, we extract features (by clustering and other techniques) and combine different datasets such as weather and fastest routes. Then, a deep stacked autoencoder for feature representation is presented. These feature transformation makes the feature space more robust and less prone to overfitting. Finally, we compare the effect of feature extraction on performance of different regressors such as boosted trees, deep belief networks, and etc.

#### 1 - Feature-efficient Multi-value Rule Sets for Interpretable Patient Mortality Prediction

Tong Wang, University of Iowa, Pappajohn Business Build, 21 East Market Street, Iowa City, IA, 52245, United States, Allareddy Veerajalandhar, Sankeerth Rampa, Veerasathpurush Allareddy

We propose Multi-vAlue Rule Set (MARS) for predicting patient mortality. Compared to rule sets built from single-valued rules, MARS introduces a more generalized form of association rules that allows multiple values in a condition. Rules of this form are more concise than classical single-valued rules in capturing and describing patterns in data. Our formulation also pursues a higher efficiency of feature utilization, which reduces possible cost in data collection and storage. We applied MARS model on a dataset from Nationwide Inpatient Sample and our model achieved better performance than baseline interpretable models and the patient risk classification system currently used by hospitals.

#### 2 - Optimizing Patient Outcomes via Inverse Classification

Michael Lash, University of Iowa, 2 West Washington Street, B4 MacLean Hall, Iowa City, IA, 52242, United States

Inverse classification, the process of optimizing the decision features of a test instance using a classifier-based oracle, is a powerful technology that produces personalized, outcome-optimized recommendations. In our formulation, these recommendations are produced by taking into account patient-specific preferences regarding feature priority and cumulative effort. Subsequently, a result is produced showing the improvement in outcome probability and the changes the instance must make to achieve such an improvement. In this talk I present this formulation, along with our corresponding set of methodology, and discuss its application to patient decision making.

#### 3 - Flame – A Fast Large Almost Exact Matching Algorithm for Causal Inference

Cynthia Rudin, LSRC / Box 90129, Durham, NC, 27708, United States

The FLAME algorithm (Fast Large Almost Matching Exactly) is a large scale matching technique for causal inference. It can handle data so large that it cannot fit in memory, and creates high-quality matches. I will discuss this algorithm and related methods.

#### 4 - Limits of Interpretable Machine Learning in Healthcare

Muhammad Aurangzeb Ahmad, University of Washington, Tacoma, WA, United States

While interpretability of machine learning systems is critical in holding such systems accountable, practical constraints limit the use of interpretable systems: Comparison of explanations across interpretable machine learning systems, theoretical guarantees of mimic models, soundness vs. completeness of explanations against cognitive limitations, comparison of risk across multiple factors for interpretable models etc. Addressing these limitations will allow us to build better interpretable machine learning systems in healthcare.

#### 1 - Advances in Density-based Gaze Fixation Identification: Optimization for Outlier Sensitivity, and Automated Detection of Density-modulation Parameter

Wen Liu, Worcester Polytechnic Institute, Worcester, MA, United States, Andrew C. Trapp, Soussan Djamabasi

Eye tracking is an increasingly common technology with applications to healthcare. Of great interest in eye-tracking studies are fixations, indicative of attention and awareness. However, eye-tracker imprecision can lead to outlier points, e.g. blinks or other anomalies. We extend our density-based fixation identification optimization formulations to account for outlier sensitivity. As our formulations are parameterized by a key density-modulation parameter, we also discuss machine learning approaches for its automatic detection. We conclude with encouraging computational results.

#### 2 - A Continuous Time Bayesian Network Model for Identifying Patterns of Multiple Chronic Conditions

Syed Hasib Akhter Faruqi, Graduate Research Assistant, University of Texas-San Antonio, San Antonio, TX, 78256, United States, Adel Alaeddini, Carlos A. Jaramillo, Mary Jo Pugh

Emergence of multiple chronic conditions (MCC) adds complexity in managing patient healthcare design, care, and cost. Hence, it is required to have an effective management of MCC that uses real-time decision making in a big data setting. The proposed study uses de-identified data from a large national cohort of patients (N = 608,503) who entered care in the Department of Veterans Affairs, to identify the risk factors that affect the evolution of MCC. A Continuous Time Bayesian Network is used to examine the interactions of patient disease states and identify major dependencies among MCC that can be used to predict the onset of emerging conditions according to patient level risk factors.

#### 1 - Dynamic Seed Identification and Activation for Influence Maximization

Yerasani Sinjana, Research Scholar, Indian Institute of Technology Kharagpur, Kharagpur, 721302, India, Monalisa Sarma, Manoj Kumar Tiwari

In this paper, we consider a network where a set of nodes are termed as seed nodes at each time interval in scheduling seed activation. Seeds are tactically activated for maximizing the spread of influence on social networks: Given a time period for activation, campaign budget, and a network where a set of nodes can be selected as seeds to propagate information. At each stage, time-dependent partial activation of nodes information is used to track the opinions and awareness of users. Activating different users at different periods of time can be termed as Dynamic Seed Activation Problem and can be rewritten as mixed integer programming. A memetic algorithm is employed for scheduling seed activation.

## 2 - Putting Prediction into Practice: The Case of Restaurant Hygiene Inspections

Michael Luca, Harvard Business School, Boston, MA,  
United States, Edward Glaeser, Andrew Hillis, Hyunjin Kim

Partnering with Yelp and the City of Boston, we run an experiment comparing an inspector-curated list of restaurants to inspect (i.e. business-as-usual) to algorithm-created lists based on predictions of which restaurants are most likely to have health code violations. We find that even simple algorithms outperform business-as-usual, identifying 50% more violations per inspection. However, one practical barrier to implementing algorithms is compliance - inspectors were less likely to comply with a directive to inspect a restaurant based on the algorithm. The algorithm also has fairness implications. For example, the algorithm-based predictions were more likely to target ethnic restaurants.

## 3 - Text Analysis for Educational Crowdfunding Success: Comparison between Different Textual Components

Mingyan Xu, Baruch College, New York, NY, 10075, United States

Educational crowdfunding is emerging as a salient hit on online platforms. Despite its growing popularity, the antecedents of funding success are far from certain. To help the fundraisers (i.e. teachers) better understand factors affecting funding success and improve their success rate, this study provides an empirical analysis on one large U.S. educational crowdfunding platform. Specifically, it analyzes the impact of the textual features from different components of the project description on funding success and identifies the differences of the impact on different levels of the project economic needs. The implications of the findings for fundraisers have also been discussed.

## 4 - How User-generated Content Predict Box-office Sales for Different Movie Genres

Pei-Hua Chen, National Chiao Tung University, Hsin-Chu, 300, Taiwan, Chia-Tze Chang

This study explored the factors that affect two kinds of movie-goers: innovators and imitators. For innovators, we included casts of the movies and various movie attributes to predict box-office sales on opening weekends. In addition to the variables used for innovators, we added user-generated contents to predict sales increase for imitators. We analyzed the effects of movie-goer emotions and experiences on box-office sales for different movie genres. The results showed that different movie genres provide different experiences and emotions for movie-goers.

## 5 - Using Text Mining to Analyze Consumer Brands Sentiments of Smart Watches

Amarpreet Kohli, Associate Professor, University of Southern Maine, P.O.Box 9300, Portland, ME, 04104, United States, Solomon Nkhalamba, Zhenning Xu

Social media has been a significant part of many businesses and organizations. Many firms are utilizing social media platforms to interact with their customers and clients to gauge value of their products and services through diverse stakeholders. The advent of social media platforms such as Twitter and Facebook have provided companies with easier access to collect customer opinions or reviews than the traditional survey methods and focus group approaches. To demonstrate the great potential of social media in unlocking the useful knowledge of market products, this paper uses text mining to analyze consumers' twitter sentiments of smart watches.

## 1 - The Effects of Online Social Interactions on the Emotions of Depression Patients

Qingpeng Zhang, City University of Hong Kong, 83 Tat Chee Avenue, 6/F, Academic 1, Kowloon, 12180, Hong Kong, Jiaqi Zhou, Xin Li

Social media-based online health communities (OHCs) present a new platform for patients to seek social support, particularly for depressive patients. In this talk, we will introduce our research on characterizing the effect of social interactions in OHCs. We collected the full data of a major Chinese OHC. Quantitative analyses revealed that the social interactions with other patients in OHCs could positively influence the emotion of patients with depression.

## 2 - Mining User-generated Content in an Online Smoking Cessation Community to Identify Smoking Status: A Machine Learning Approach

Kang Zhao, University of Iowa, S224 PBB, Iowa City, IA, 52242, United States, Xi Wang, Amanda Graham, Sarah Cha, Michael Amato, George Papandonatos, Amy Cohn, Jennifer Pearson

Online smoking cessation communities attract hundreds of thousands of smokers each year. Content shared by users in such communities may contain important information that could enable more effective and personally tailored cessation treatment recommendations. This study demonstrates a novel approach to identify individual users' smoking status by applying machine learning techniques to user-generated content in online cessation communities. Evaluate by data from a popular online community for smokers in U.S., our approach can improve the performance of cessation identification by 9.7%.

## 3 - The Impact of Doctors Joining in Expert Groups on Individual Performance in Online Health Communities

Wanxin Qiao, Beijing Institute of Technology, No.5,Zhongguancun Street, Haidian District, Beijing, 100081, China, Lini Kuang, Zhijun Yan, Tianmei Wang, Baowen Sun

Despite a growing literature on the impacts of person-group fit on group performance, there is little evidence on how the person-group fit affects individual performance. Using a unique panel dataset, we explore the impact of doctor-expert group fit on doctor's performance, and how the effects differ among doctors with different professional titles. Our results show that doctor joining in groups has positively affect individual performance, and doctors with low titles have positive impact on individual performance. Our work contributes to provide a deeper understanding of the relationship between doctors and expert groups in online health community.

## 4 - AI Enhanced Innovations for Large National Healthcare Survey Data Analytics

Steven B. Cohen, RTI International, 701 13th Street NW, Washington, DC, 20005-3967, United States

This presentation focuses on the development and implementation of AI and machine learning enhanced applications to imputation for national health and health care survey efforts that achieve efficiencies in terms of cost and time while satisfying well defined levels of accuracy that ensure data integrity. Attention is given to enhanced processes that serve as an alternative solution to manual, repetitive or time-intensive tasks; operationalize decisions based upon predefined outcome preferences and upon access to input data that sufficiently informs the decisions; and facilitate real-time interpretation and interactions for accessing and acting upon the AI-derived decisions.

## 1 - Reinforcement Mechanism Design, with Applications to Dynamic Pricing in Sponsored Search Auctions

Michael Zhang, Professor, Chinese University of Hong Kong, Decision Sciences and Managerial Economics, 9th Floor, CYT Building, Shatin, N.T., Hong Kong, Weiran Shen, Binghui Peng, Hanpeng Liu, Ruohan Qian, Yan Hong, Zhi Guo, Zongyao Ding, Pengjun Lu, Pingzhong Tang

We apply reinforcement learning techniques and propose what we call reinforcement mechanism design to tackle the dynamic pricing problem in sponsored search auctions. In contrast to previous works that rely on rationality and common knowledge among the bidders, we take a data-driven approach. We implement our proposed technique at a major search engine: We first train a buyer behavior model with a real bidding data set. We then put forward a reinforcement/MDP (Markov Decision Process)-based algorithm that optimizes reserve prices over time, in a GSP-like auction. Experiments demonstrate that our framework outperforms several strategies currently in use.

## 2 - The Dynamic Impact of Quantity Restriction on Backers' Investment Intention

Zhijin Zhou, University of Washington, Foster School of Business, Seattle, WA, 98195, United States, Chaoliang Ma, Yong Tan

We analyze the effect of implementing quantity restriction, a prevalent marketing strategy to promote sales in the off-line market, in the context of crowdfunding. Using a dynamic panel dataset, we start with a preliminary analysis to get insights into backers' basic response patterns. Then, we extend our model and allow for (a) varying parameters to fully capture the underlying dynamics, (b) correlation in the errors that might affect parameter evolving process. Our results suggest that the scarcity of a product increases backers' overall evaluation of the product, while it plays a moderating role in attenuating backers' reliance on peers' action and decreasing their price sensitivity.

## 3 - A Model of Smart Technologies

Xinxin Li, University of Connecticut, 2100 Hillside Road U-1041, Storrs, CT, 06269, United States, Yuxin Chen, Monica Sun

We study the optimal pricing and design of smart technologies that are based on artificial intelligence (AI) and can learn consumers' preferences over time. Our preliminary analysis suggests that it is not always profitable to increase the smartness of a firm's technology even when doing so does not involve direct costs. The "price" in our model can be interpreted as either a direct price that consumers have to pay to the firm or a form of advertising exposure. Correspondingly, our model has implications not only for the pricing and design of smart technologies and their interaction with consumers, but also for platforms on which advertisers aim to target the users of smart technologies.

## 4 - Too Much of a Good Thing?

Wei Zhou, PhD Student, University of Arizona, Tucson, AZ, 85721, United States, Mingfeng Lin

The importance of reputation online is well established and is especially true for service-oriented markets spanning such as professional services. We explore limits to such claims using a detailed transactional dataset and discuss implications for designing such reputation systems.

## 1 - Causation-based Process Monitoring and Diagnosis for Multivariate Categorical Processes

Jian Li, School of Management, Xi'an Jiaotong University, No 28 Xianning West Road, Xi'an, China

Many applications involve causal relationships among multiple categorical variables/factors, where shifts at cause factors will propagate to their effect factors. A causation-based rather than correlation-based description would better account for such causal relationships. We integrate a Bayesian network and construct one general and one directional control charts for detecting shifts in the conditional probabilities of categorical factors. Simulations have demonstrated their effectiveness.

## 2 - Ensemble Bayesian SPC: Multi-Mode Process Monitoring for Novelty Detection

Irad Ben-Gal, Tel Aviv University, Tel-Aviv, Israel, Marcelo Bacher.

We propose a monitoring method based on a Bayesian analysis of an ensemble-of-classifiers for Statistical Process Control (SPC) of multi-mode systems. A specific case is considered, in which new modes of operations (new classes), also called "novelties," are identified during the monitoring stage of the system. The proposed Ensemble-Bayesian SPC (EB-SPC) models the known operating modes by categorizing their corresponding observations into data classes that are detected during the training stage. Ensembles of decision trees are trained over replicated subspaces of features, with class-dependent thresholds being computed and used to detect novelties. In contrast with existing monitoring approaches that often focus on a single operating mode as the "in-control" class, the EB-SPC exploits the joint information of the trained classes and combines the posterior probabilities of various classifiers by using a "mixture-of-experts" approach. Performance evaluation on real datasets from both public repositories and real-world semiconductor datasets shows that the EB-SPC outperforms both conventional multivariate SPC as well as ensemble-of-classifiers methods and has a high potential for novelty detection including the monitoring of multimode systems.

## 3 - Discussant

Matthew Plumlee, Northwestern University, IL, United States

## 1 - An Efficient Surrogate Model for Emulation and Physics Extraction of Large Eddy Simulations

Chih-Li Sung, PhD, Georgia Institute of Technology, Atlanta, GA, United States, Simon Mak, Xingjian Wang, Shiang-Ting Yeh, Yu-Hung Chang, Roshan J. Vengazhiyil, Vigor Yang, C. F. Jeff Wu

In the quest for advanced propulsion and power-generation systems, high-fidelity simulations are too computationally expensive to survey the desired design space. In this paper, we propose a new surrogate model that provides efficient prediction and uncertainty quantification of turbulent flows in swirl injectors with varying geometries. The novelty of the proposed method lies in the incorporation of known physical properties of the fluid flow as simplifying assumptions for the statistical model. In view of the massive simulation data at hand, which is on the order of hundreds of gigabytes, these assumptions allow for accurate flow predictions in around an hour of computation time.

## 2 - Dynamic Curve Alignment Based on Penalized-spline Smoothing

Kaibo Wang, Professor, Tsinghua University, Department of Industrial Engineering, Tsinghua University, Beijing, 100084, China

Unaligned profiles with amplitude and phase variabilities have to be registered (aligned) through shifting, time warping or coordinate alignment so that samples are comparable and easy to handle. This work proposes a penalized-spline smoothing method for profile alignment. The strategy is to capture the smoothness and spatially correlated features of warping shifts through a penalized registration function. A dynamic programming algorithm is developed to obtain the optimal path.

## 3 - Nearest-neighbor Gaussian Process Emulation for Tensor Responses in Freeze Nano Printing

Hongyue Sun, University at Buffalo, 319 Bell Hall, Industrial and Systems Engineering, Buffalo, NY, 14260, United States, Guanglei Zhao, Chi Zhou

Existing energy storage devices have either high power density or high energy density, but not both. Freeze nano printing can potentially solve the problem by combining inkjet printing and freeze casting to print multi-scale porous structures. In this process, the thermal history is fundamental to its quality and productivity. The thermal history evolves over space and time, and cannot be fully captured by existing sensors. The physical simulation models can describe the spatial-temporal thermal history (i.e., tensor response) but are computationally demanding. We propose a Nearest-Neighbor Gaussian Process (NNGP) based emulator to address the computation problem for the tensor response.

## 4 - Experimental Designs for Studying Dynamic Response Modeled by B-splines

Rong Pan, Arizona State University, School of Computing Informatics & Decision Sys, P.O. Box 878809, Tempe, AZ, 85287-8809, United States

In this talk we discuss the B-spline models used for modeling dynamic responses from industrial experiments and how to design the experiment to collect system responses more efficiently.

### 1 - Intrinsic Decomposition of Acoustic Emission and Nonparametric State Machine Model for Real-time Monitoring of Precision Micro-machining Process

Zimo Wang, Texas A&M University, Industrial & System Engineering Dept, college station, TX, 77843, United States, Satish Bukkapatnam

We present an approach using intrinsic time-scale decomposition and Dirichlet processes Gaussian state machine to analyze the transient behaviors of Acoustic Emission signals. Experimental studies showed that the presented approach could timely detect changes when the precision micro-machining process undergoes variations on material structures and/or fundamental cutting mechanisms.

### 2 - Defect Classification using Ensemble Convolutional Neural Network in Semiconductor Manufacturing

Hyung-Seok Kang, Samsung Electronics, Hwaseong-si, Gyeonggi-do, Korea, Republic of, Jaewoong Shim, Kim Kil Soo, Seung Hoon Tong

In semiconductor manufacturing, visual inspection is a fundamental process for defect detection and classification. In the case of 3D-Stacked DRAM with VIA (vertical interconnect access) technology, electrical inspection can be performed after assembly, so that defects in the VIA process can be detected only by appearance. The inspection equipment shoots multiple images at different angles with high and low magnification for failure analysis. In this study, we apply the ensemble Convolutional Neural Network (CNN) which utilizes multiple images in combination, and also conduct experiments on open set recognition that recognizes untrained types considering the actual environments.

### 3 - Prioritize Interaction Effects on Wafer Defects for Multistage Semiconductor Fabrication Based on Applied Association Rule Mining

Jinsik Kim, Samsung Electronics, Hwaseong, Gyeonggi-do, Korea, Republic of, Jaewoong Shim, Chanhwi Jung, Doh Soon Kwak, Kunhan Kim, Seung Hoon Tong

The methodology of finding the single cause of defects in semiconductor manufacturing has been studied a lot. However, as the product matures, the single causes are largely resolved and necessity of the search for the interaction of two factors emerges. The number of combinations of two or more factors in a complex manufacturing process is enormous, so it is impossible to inspect all cases. We propose a methodology to identify interaction of factors that leads to Wafer Defects using association rule mining algorithm. In addition, we validate this methodology by applying it on real-world data.

### 4 - A Scale-invariant Method for Quality Inspection of Objects Created by Additive Manufacturing

Yu Jin, Ph.D Student, University of Arkansas, 4207 Bell Engineering Center, Fayetteville, AR, 72701, United States, Haitao Liao

Additive Manufacturing (AM) has shown great advantages in producing objects with complex geometric features. In broader applications, the functionality of printed parts is significantly affected by not only the quality but also the relative positioning of key features. In this research, a new scale-invariant quality profile is established based on the point clouds of printed parts obtained from a laser scanner. The new quality inspection method is able to quantify the fabrication non-conformity of individual features and the key features' relative positioning. Numerical examples are provided to demonstrate the effectiveness and efficiency of the proposed quality inspection method.

### Joint Session ICS/Practice Curated: Advances in Computational Stochastic Optimization and Applications

Sponsored: Computing

Sponsored Session

Chair: Harsha Gangammanavar, Southern Methodist University, Dallas, TX, 75275, United States

#### 1 - Monte Carlo Tree Search with Sampled Information Relaxation Dual Bounds

Lina Al-Kanj, Princeton University, Olden Street, Sherrerd Hall, Office 115, Princeton, NJ, 08542, United States, Daniel Jiang, Warren B. Powell

MCTS is a well-known strategy for solving sequential decision problems, particularly in the area of game-play AI. We propose a new technique called Primal-Dual MCTS that utilizes sampled information relaxation (Brown et al., 2010) bounds on potential actions in order to make tree expansion decisions. The approach shows promise when used to optimize the behavior of a driver navigating a graph while operating on a ride-sharing platform.

#### 2 - Variable Sample-size Stochastic Approximation Scheme for Two-stage Stochastic Economic Dispatch

Wendian Wan, Pennsylvania State University, 351 Leonhard Building, University Park, PA, 16802, United States, Uday Shanbhag, Mort David Webster

This talk introduces the development of variable sample-size stochastic approximation schemes for two-stage stochastic convex programs. Our focus lies in applying this class of schemes towards the solution of a broad class of adaptive stochastic decision-making problems arising in the operation of large-scale power systems. In this talk, we consider the stochastic economic dispatch problem. In such problems, a first-stage dispatch is made contingent on taking a recourse decision when the uncertainty reveals itself. Preliminary numerics reveal that the proposed schemes provide accurate solutions but require far less time than traditional approaches like standard stochastic approximation.

#### 3 - Stochastic Decomposition for Two-stage Stochastic Linear Programs with Random Cost Coefficients

Harsha Gangammanavar, Southern Methodist University, Department of EMIS, P.O. Box 750123, Dallas, TX, 75275, United States, Yifan Liu, Suvrajeet Sen

The Stochastic Decomposition (SD) algorithm has been a computationally proficient tool to tackle real-scale stochastic optimization problems arising in practical applications. In this talk we present new enhancements to this sequential sampling-based algorithm to address two-stage stochastic linear programs with random cost coefficients. We demonstrate their performance through results from our computational experiments.

#### 4 - Simulation-based Hybrid Stochastic Approximation using Common Random Numbers

Marie Chau, Virginia Commonwealth University, 1015 Floyd Avenue, Richmond, VA, 23220, United States, Jong J. Lee, Michael Fu

Common Random Numbers (CRN) is a variance reduction method, which can be used to increase the typical  $O(n^{-1/3})$  convergence rate of gradient-free stochastic approximation (SA) to match the optimal  $O(n^{-1/2})$  convergence rate of gradient-based SA. Secant-Tangents AveRaged (STAR) and adaptive Secant-Tangents AveRaged (aSTAR) simultaneous perturbation SA are hybrid methods, which combine gradient-free and gradient-based SA algorithms. By applying CRN assumptions, STAR and aSTAR can achieve the optimal asymptotic convergence rate under milder conditions.

### Decision Process: Practical and Methodological Issues in MCDM/A

Sponsored: Multiple Criteria Decision Making

Sponsored Session

Chair: Adiel Teixeira De Almeida, Universidade Federal de Pernambuco, Recife PE, 50630-970, Brazil

Co-Chair: Danielle Costa Morais, Universidade Federal de Pernambuco, Recife - PE, 52020-212, Brazil

#### 1 - Preference Elicitation for Multicriteria Group Decision Making using FITradeoff

Adiel Teixeira De Almeida, Universidade Federal de Pernambuco, Cx Postal 7462, Recife PE, 50630-970, Brazil, Eduarda Asfora Frej

Preference elicitation of Decision Makers (DMs) is one of the most relevant tasks in multicriteria group decision making (MCGDM). The facilitation process uses knowledge in the intersection of several topics, such as: analytical models, cognitive process of DMs and the organizational and social interaction of a DMs' group. In this work the decision process considers a framework for building multicriteria decision models. FITradeoff (Flexible and Interactive Tradeoff) method is used for preference elicitation in this MCGDM process, with criteria aggregation by an additive model in MAVT scope, using partial information. A decision support system, available at [www.fitradeoff.org](http://www.fitradeoff.org), is applied.

#### 2 - Group Decision Model for Logistics Problem using Ordered Weighted Distance

José Leao Silva-Filho, Master, Universidade Federal de Pernambuco, Recife, Brazil, Danielle Morais

In corporative scenario, logistics is characterized by extreme competition, requiring efficiency in its processes. Decisions in this field can be complex depending on their strategic level and the number of Decision-Makers involved. This study proposes a group decision model for strategic logistics problem, using ordered weighted vectors. A numerical simulation of a real company relocation is presented to illustrate the applicability of the model.

### 3 - Multicriteria Model for Public Security Planning

Caroline Miranda Mota, Associate Professor, Universidade Federal de Pernambuco, Rua General Salgado 180 Apartment 201, Boa Viagem Recife PE, Recife, 51130320, Brazil, Ciro Figueiredo, Debora Pereira

Public security planning involves the effective use of resources to deal with crime prevention and reduction. Countries all over the world have made many efforts to reduce crime rates, although this phenomenon is more critical in developing nations. This study is concerned with an effective resource allocation in the context of public policies to prevent crime occurrence. It involves the application of combined methodologies to explore the influence of crime risk factors and to prioritize places that deserve more resources. We considered social, economic, and demographic variables to analyze critical zones, using GIS and multi-criteria approach.

### 4 - Multicriteria Model to Support Maintenance Planning of Infrastructure Devices

Cristiano Cavalcante, Associate Professor, Universidade Federal de Pernambuco, Av. da Arquitetura, s/n, Centro de Tecnologia e Geociências (CTG), Prédio do Departamento de Engenharia de Produção, Sala 201 A, Cidade Universitária, Recife - Pernambuco, 50740-550, Brazil, Alexandre R. Alberti

The objective of this work is to present contributions to the definition of maintenance policies for protection devices in infrastructure systems. A hybrid inspection and preventive replacement policy is described by a mathematical model that incorporates important aspects of maintenance quality. The model enables to measure the consequences of unmet demands of protection devices as a resilience factor. An approach based on the application of Multiattribute Utility Theory is proposed to find the best compromise relationship between these two criteria in order to define maintenance policies aligned with the decision-maker's preferences.

### Advances on Resilient Infrastructure Networks: Modeling and Implementation

Sponsored: Multiple Criteria Decision Making

Sponsored Session

Chair: Shima Mohebbi, PhD, University of Oklahoma, Norman, OK, 73019, United States

#### 1 - Resilience Analyses of Interdependent Water-Transportation Infrastructures: Simulation-Optimization Approach

Shima Mohebbi, University of Oklahoma, 202 W. Boyd St., Room 124, Norman, OK, 73019, United States, leili soltanishehat

This study develops agent-based simulation-optimization models to evaluate the resilience of water and transportation networks by considering their physical-socioeconomic interdependencies. We first analyze water and transportation infrastructures using network measures. Different network failure scenarios, based on the degree of interdependency, will be simulated and resilience curves

for restoration strategies will be analyzed. A case study will be demonstrated in the City of Tampa, FL.

#### 2 - Bi-objective Optimization for Traffic Signal Restoration After Disruptive Events

Tingting Zhao, University of South Florida, 4202 E. Fowler Avenue, ENB 118, Tampa, FL, 33612, United States

A bi-objective optimization problem is formulated for traffic signal restoration sequence design after disruptive events. Both instantaneous resilience measure (Maximum Delay During Restoration) and accumulated resilience measure (Accumulated Total Delay) are optimized to provide various perspectives for decision maker to restore transportation system effectively with limited resources. Network-wide system performance is evaluated based on traffic simulation. NSGA-II is applied to solve this bi-objective optimization problem without enumerating all possible restoration sequences.

#### 3 - A Hybrid Machine Learning Approach to the Stochastic Network Design Problem for Mitigation Strategies

Charles D. Nicholson, University of Oklahoma, Norman, OK, United States, Alexander Rodriguez

A new paradigm for stochastic network mitigation is proposed. The approach leverages realizations from scenario event simulations to develop a probabilistic framework that supports constrained decision making. This framework incorporates component fragilities, correlated failures, and other physical aspects that affect failure probabilities. Machine learning is used to enable metaheuristic search for high-quality mitigation strategies in a discrete solution space.

#### 4 - Resilient Transportation Network Design Against Hurricane Disruptions

Yusuf Secerdin, University of Miami, 1251 Memorial Drive McArthur, Engineering Building Room 271, Coral Gables, FL, 33146, United States, Murat Erkoc

From the logistics network perspective, hurricanes significantly differ from other natural disasters in that they emerge as progressive events sweeping across regions. This distinct aspect calls for new adaptive transportation design procedures across time and space. In this study, we propose new models and efficient solution methodologies at both strategical and tactical levels for hurricane-prone logistics networks. The strategic level concerns designing resilient logistics networks and the tactical level involves rescheduling and rerouting as a response to hurricanes.

West Bldg 212B

### What if Type of Analyses for Assessing Events, Operations, and Effects

Sponsored: Military and Security

Sponsored Session

Chair: Gitanjali Adlakha-Hutcheon, Department of Defence, ON, K2H 8G1, Canada

#### 1 - Revisiting the Largest Non-nuclear Explosion

Derek Baingo, DRDC, halifax, NS, Canada, Baingo, DRDC

What if the Halifax Explosion of 1917 were to occur today? How would contemporary urban population and modern infrastructure be affected? By virtually recreating the catastrophic event from a century ago we can apply the lessons learned to better plan, design and build the cities of tomorrow.

#### 2 - A Means to Work on FATE

Gitanjali Adlakha-Hutcheon, Department of Defence, 60 Moodie Drive, Ottawa, ON, K2H 8G1, Canada

Futures Assessed alongside socio-Technical Evolutions (FATE) is a method developed by a NATO Systems Analysis Studies Panel (SAS-123). It entails studying the interactions between diverse futures and socio-technical evolutions concurrently to provide decision-makers with input on socio-technical disruptors in the context of described futures. Examples of emerging technologies and their fate in about 15 years from today will be presented.

#### 3 - Modeling Mission Effects Chains

Mark Gallagher, US Air Force, Doug Fullingim, David Quick

We discuss building a detailed series of events to represent various mission effect chains including kill chains. Adding parallel redundancies where multiple systems are available may provide an improved measure of realized mission effects for the Air Force. The horizontal (series) assessment indicates the ability to accomplish various mission. A vertical assessment (parallel redundancy) provides the basis for the mission-area health. Additionally, this mission effect chain dependencies could provide an improved basis for estimating dependencies between mission areas within the Air Force.

#### 4 - Capability Analysis for Canada's Special Operations Forces

Ramzi Mirshak, DRDC, Centre for Operational Research and Analysis, Ottawa, ON, Canada

The Canadian Special Operations Forces Command (CANSOFCOM) is developing its future operating concept. To guide this evolution, wargames were used to review capabilities of key missions both now and in the future. Assessments included ordinal scoring of criteria and gathering of comments. We present the methods and approach used, including efforts to minimize respondent bias.

#### ■ SD76

West Bldg 212C

### New Developments in Planning Production and Inventories

General Session

Chair: Reha Uzsoy, North Carolina State University, Raleigh, NC, 27695-7906, United States

#### 1 - Planning Releases during Product Transitions in Semiconductor Manufacturing

Atchyuta B. Manda, North Carolina State University, Campus Box 7906, Raleigh, NC, 27695-7906, United States, Reha Uzsoy

We use simulation optimization to model the introduction of a new product into an operating semiconductor manufacturing facility, which can have significant adverse effects on both current and new products. Our results show that planning releases by simulation optimization model yields significant improvements in performance over simple alternatives, and provides intuitive solutions.

#### 2 - A Matheuristic for Integrated Production Planning and Order Acceptance Decisions

Lars Moench, Professor, University of Hagen, Universitaetsstrasse 1, Hagen, 58097, Germany, Hung-Kai Wang

We discuss a production planning model with load-dependent lead times. Order acceptance decisions with respect to flexible due dates are allowed in addition to release decisions. We show that the resulting production planning problem is NP-hard. A variable neighborhood search (VNS) technique is hybridized with linear programming to solve large-sized problem instances. Results of computational experiments for problem instances that are derived from a scaled-down wafer fab model are presented. The results demonstrate that the proposed matheuristic outperforms time-based decomposition approaches from the literature

#### 3 - Optimizing End-item Inventory Control under Rolling Scheduling

A.G. de Kok, Eindhoven University of Technology, Eindhoven, Netherlands

We discuss a simulation-based methodology to optimize end-item inventories in multi-item multi-echelon inventory systems. We build on a sufficient condition for the Newsvendor equation to hold for end-items. This condition requires that a change in an end-item control parameter yields the same change in the net stock of this end-item at each point in time. This sample path property can be exploited for an efficient simulation-based approach to find the optimal end-item inventory control parameters.

#### 4 - Extending Clearing Functions by Including the Process History: Approaches and Research Gaps

Hubert Missbauer, University of Innsbruck, Universitaetsstrasse 15, Innsbruck, 6020, Austria

The fit of clearing functions to empirical or simulated data can be improved substantially by including explanatory variables that reflect the history of the process prior to the period under consideration. We show by means of numerical examples that the resulting multi-dimensional clearing functions cannot be integrated into existing clearing function models in a straightforward manner. Using simulation results we elaborate on the discrepancy between clearing function fit and performance of the order release model. These results, together with some structural properties of one-dimensional clearing function models, raise the question what clearing functions really are.

#### 5 - Reenactment Fluid Flow Simulation in Semiconductor Manufacturing

Ivo Adan, Eindhoven University of Technology, Den Dolech 2, Eindhoven, 5600 MB, Netherlands, Jelle Adan, Stephan Sneijders, Alp Akcay

We present a reenactment fluid-flow simulation-based method to optimize buffer sizes in a semi-conductor assembly line. The optimization method is a combination of a discrete-event fluid-flow simulation model and a multi-start search algorithm. The method is applied to a real-world case in semiconductor manufacturing.

### Disaster Operations Management

Sponsored: Public Sector OR

Sponsored Session

Chair: Christopher Zobel, Virginia Tech, Blacksburg, VA, 24061-0235, United States

Co-Chair: Andrew N. Arnette, University of Wyoming, Laramie, WY, 82071-2000, United States

#### 1 - Extensions to Pre-Positioning Disaster Relief Asset Optimization Model

Andrew N. Arnette, University of Wyoming, 1000 E. University Avenue, Dept 3275, Laramie, WY, 82071-2000, United States, Christopher Zobel

In this work, we extend an existing model for disaster relief asset pre-positioning so that it applies to a range of different types of resources, some of which may be perishable or substitutable. The relative performance of the general model formulation is examined with respect to problems such as allocating medical supplies to support post-disaster relief efforts.

#### 2 - Forecasting for Disaster Management

Nezih Altay, DePaul University, 1 E. Jackson Blvd., Driehaus College of Business, Chicago, IL, 60604, United States

We present the results of a structured literature review on the use of forecasting methods in for disaster management. Based on our findings we identify research gaps and make recommendations for future research.

#### 3 - Modeling Cascading Failures and Recovery of Interconnected Systems: Case Study of Puerto Rico after Hurricane Maria

Felipe Aros-Vera, Ohio University, 277 Stocker Center, 1 Ohio University, Athens, OH, 45701, United States, Shital Thekdi

Understanding interdependencies and cascading effects is of key importance for the design of critical infrastructure and further response and recovery from disruptions. This work studies these interdependencies using network design and risk-management tools. The presentation includes empirical evidence and a case study of interdependent infrastructure systems after Hurricane Maria in Puerto Rico.

#### 4 - Illicit Drug Abuse and Seizure Patterns: Insights from Data

Hossein Najmi, University of North Texas, Denton, TX, United States, Shailesh S. Kulkarni, Debjit Roy

Approximately 90 people die every day in the USA as a result of illicit drug abuse and in 2017, President Trump declared the opioid crisis a health emergency. However, there are few studies on the patterns of drug seizure, especially using advanced analytics. To address this limitation, we collected data on all drug seizures between 2010-2016 at the state level, classified them based on the Drug Schedule of the Drug Enforcement Administration (DEA) and performed data analysis on over hundred thousand data points to gain insight into the dynamics of drug seizure. By studying patterns, this study tries to develop a potential tool to increase seizure amounts and to help better control the drug disaster.

### Location Models II

Sponsored: Location Analysis

Sponsored Session

Chair: Zvi Drezner, California State University-Fullerton, Fullerton, CA, 92834, United States

#### 1 - A Cover Based Competitive Facility Location Model with Continuous Demand

Zvi Drezner, California State University Fullerton, Steven G. Mihaylo College of Business and Economics, Dept of ISDS, Fullerton, CA, 92834, United States, Tammy Drezner, Atsuo Suzuki

We propose and solve a competitive facility location model when demand is continuously distributed in an area and each facility attracts customers within a given distance. This distance is a measure of the facility's attractiveness level which may be different for different facilities. The market share captured by each facility is calculated by two numerical integration methods. These numerical approaches can be used for evaluating functional values in other Operations Research models.

**2 - Sequential BTST Algorithm for the Multiple War Problem**

Atsuo Suzuki, PhD, Nanzan University, Zvi Drezner

We apply the BTST (Big Triangle Small Triangle) method to the multiple Weber problem with attraction and repulsion (WAR). We formulate a variation of the WAR problem where several existing facilities are located in an area. The customers access to the nearest facility. The problem is to find the location of a new facility so as to minimize the weighted sum of the distances from the customers to their nearest facilities. We apply the BTST method to the problem. By solving the problem sequentially, we obtain an approximate solution of the multiple WAR problem.

**3 - Recent Results on Solving the Quadratic Assignment Problem using Graphics Processing Unit Clusters on the Blue Waters Supercomputer**

Rakesh Nagi, University of Illinois Urbana-Champaign, 8 Transportation Building, 104 S. Mathews Ave., Urbana, IL, 61801, United States, Ketan Date

We discuss parallel implementations of RL2 formulation and branch-and-bound algorithm for solving the Quadratic Assignment Problem (QAP). Our parallel architecture consists of NVIDIA Graphics Processing Unit (GPU) clusters on the Blue Waters supercomputer at the University of Illinois at Urbana-Champaign. We implement a “distributed Dual Ascent algorithm for the GPUs, which shows excellent parallel speedup, and can effectively solve some of the well-known QAPs from the literature.

**4 - Computational Results for Solving the Euclidean Distance Min-Max Location Problem with Fixed Distances in N-Dimensions**

Mark Cawood, Clemson University, 220 Parkway Drive, Clemson, SC, 29634-0975, United States, P. M. Dearing

Computational results for primal and dual algorithms are presented for the problem, also called the minimum covering Euclidean ball of a set of Euclidean balls in n-dimensions. Both algorithms search along a directed path that is either a ray or a hyperbola. The step size is computed explicitly at each iteration.

**Monday, 8:00AM - 9:30AM****■ MA01**

North Bldg 121A

**Bayesian Machine Learning**

Sponsored: Optimization/Optimization Under Uncertainty

Sponsored Session

Chair: Matthias Poloczek, University of Arizona, Tucson, AZ, 85721, United States

**1 - Continuous Multi-task Bayesian Optimization with Correlation**  
Juergen Branke, University of Warwick, UK, Warwick Business School, Orms Group, Coventry, CV4 7AL, United Kingdom, Michael Pearce

We consider the problem of simultaneously identifying the optima for a set of correlated tasks, where the performance of a particular input parameter on a particular task can only be estimated from noisy samples. We propose a general multi-task Bayesian optimization framework and two myopic sampling procedures that determine task and parameter values for sampling, in order to efficiently find the best parameter setting for all tasks simultaneously.

**2 - Bayesian Optimization of Combinatorial Structures**

Ricardo Baptista, Massachusetts Institute of Technology, Cambridge, MA, 02139, United States, Matthias Poloczek

The optimization of expensive-to-evaluate black-box functions over discrete domains is a ubiquitous task in machine learning and engineering. The combinatorial explosion of the search space and costly function evaluations pose challenges for current techniques. In this talk we will propose Bayesian optimization of combinatorial structures (BOCS). Our algorithm is based on an adaptive statistical model that identifies useful combinatorial structures even when data is scarce, and a scalable acquisition function that uses semidefinite programming. We will also present experimental results demonstrating that BOCS outperforms other methods from combinatorial and Bayesian optimization.

**3 - Bayesian Optimization with Expensive Integrands**

Saul Toscano, Cornell University, Ithaca, NY, 14850-5645, United States, Peter Frazier

We propose a Bayesian optimization algorithm for objective functions that are sums or integrals of expensive-to-evaluate functions, allowing noisy evaluations. These objective functions arise in multi-task Bayesian optimization for tuning machine learning hyperparameters, optimization via simulation, and sequential design of experiments with random environmental conditions. Our method is average-case optimal by construction when a single evaluation of the integrand remains within our evaluation budget. We also show consistency of our method for objective functions that are sums. In numerical experiments, our method performs as well or better across a wide range of problems.

**■ MA02**

North Bldg 121B

**Policy Search – Solving Stochastic Optimization by Searching Over Parameterized Classes of Policies**

Sponsored: Optimization/Optimization Under Uncertainty

Sponsored Session

Chair: Warren B. Powell, Princeton University, Princeton, NJ, 08544, United States

**1 - Learning to Learn How to Bid: Efficient Meta-learning based on Policy Search in Adaptive Algorithms for Sponsored Search Auction Bidding**

Donghun Lee, Princeton University, 11 Lawrence Drive, Apt 503, Princeton, NJ, 08540, United States

In online optimization problems where the cost of obtaining examples is accounted for, the need for better efficiency in learning algorithm becomes clear. Contrary to traditional big-O notation asymptotic sample complexity analysis, we take practical perspective to efficiency: learning algorithms become more efficient if its performance is improved over less iterations and samples. We propose a meta-learning framework that improves the practical efficiency of a given generic learning algorithm by finding better parameters for the algorithm. We evaluate the meta-learning framework in adaptive bidding algorithms deployed in sponsored search auctions such as Google Adwords platform.

**2 - Structured Actor Critic for Managing and Dispensing Public Health Inventory**

Yijia Wang, University of Pittsburgh, 331 Devonshire Street, Pittsburgh, PA, 15213, United States, Daniel Jiang

Public health organizations face the problem of dispensing medications to groups of affected populations during emergency situations, typically in the presence of complexities like demand stochasticity and limited storage. We formulate an MDP model with two levels of decisions: the upper-level decisions come from an inventory model that “controls” a lower-level problem that optimizes dispensing decisions. We then derive structural properties of the MDP model and propose an ADP algorithm that leverages structure in both the policy and the value space.

**3 - Parametric Cost Function Approximations for Multistage Stochastic Programming**

Saeed Ghadimi, PhD, Princeton University, Princeton, NJ, 08544, United States, Warren B. Powell, Raymond Theodore Perkins

The parametric cost function approximation represents an alternative to stochastic lookahead models that represent the foundation of stochastic programming. Parametric CFAs require some intuition into how uncertainty might affect the optimal solution.

**4 - Adaptive Aggregation with Exogenous Transition Uncertainty**

Bing-Zhen (Amy) Zhang, Cornell University, Ithaca, NY, United States, Itai Gurvich, Huseyin Topaloglu

Approximation is often used in dynamic programming due to the high computational cost for high-dimensional problems, incurring a loss in optimality. However when transition probabilities are inaccurate due to limited empirical data, even the exact model would have produced suboptimal results. We look at the interplay of the two when applying approximation, specifically state aggregation, in the presence of model uncertainty; we show that aggregation will only cause limited additional loss, if any, and propose selection procedure for an aggregation mechanism that reduces such loss.

**■ MA03**

North Bldg 121C

**Advances in Crowdfunding Research**

Sponsored: Technology, Innovation Management &amp; Entrepreneurship

Sponsored Session

Chair: Philipp Cornelius, Rotterdam School of Management, Rotterdam, Netherlands

**1 - Designing Crowdfunding Platform Rules to Deter Misconduct**

Simone Marinesi, Assistant Professor of Operations Management, The Wharton School, University of Pennsylvania, Philadelphia, PA, 19103, United States, Elena Belavina, Gerry Tsoukalas

Lacking credible rule enforcement mechanisms to punish entrepreneurial misconduct, existing reward-based crowdfunding platforms can leave campaign backers exposed to two sources of risk: the risk that entrepreneurs run away with backers' money (funds misappropriation) and the risk of product misrepresentation (performance opacity). We examine the adverse consequences of both misconduct risks and propose practically implementable platform designs aimed at curbing their harmful effects.

## 2 - An Analysis of Product Innovation as Recombinant Search using Topic Modelling

Philipp Cornelius, Rotterdam School of Management, Rotterdam, Netherlands

Product innovation is often understood as the recombination of components such as ideas, knowledge, input factors, and technologies. An important question is whether certain recombination patterns increase innovation success. The existing literature has predominantly studied recombination of technologies using patent data. I extend this literature by studying recombination during the development of new consumer products. Interestingly, recombination strategies that create successful technologies (such as patents) do not always coincide with product success.

## 3 - Revenue Management in Crowdfunding

Jiding Zhang, The Wharton School, 3730 Walnut St, 500 Jon M. Huntsman Hall, Philadelphia, PA, 19104, United States, Sergei Savin, Senthil Veeraraghavan

Crowdfunding, a mechanism in which funds are raised online using small donations from a large number of individual donors, has recently emerged as a popular approach to funding new ideas. In our paper, we model a setting where a creator of a crowdfunding project selects the amount of contribution it requests from donors and the duration of crowdfunding campaign with the goal of maximizing the raised amount. Our analysis provides project creators with detailed, practical, and intuitive guidelines on how to successfully manage the revenue generation process in a crowdfunding campaign.

## 4 - Learning as a Signal in Online Debt Market

Qiang Gao, Baruch College, City University of New York, 55 Lexington Ave, New York, NY, 10010, United States

## Algorithmic and Polyhedral Analysis of Applied MIP Problems

Sponsored: Optimization/Integer and Discrete Optimization

Sponsored Session

Chair: Manish Bansal, Virginia Tech., Blacksburg, VA, 24060, United States

## 1 - Recent Advances on Solving Generalizations of the Single Item Capacitated Lot-sizing Problem

Kartik Kulkarni, Virginia Tech, Manish Bansal

In this talk, we present our recent advances on solving a generalization of the classical single-item economic lot-sizing problem where the total production capacity in each period can be the summation of some binary multiples of several capacity modules of different sizes. We also develop a new algorithm for the lot-sizing problem with piecewise concave production costs and concave holding costs. Finally, we present results of our computational experiments performed on the aforementioned problems.

## 2 - Multi-module Capacitated Network Design Problem and Its Generalizations

Haochen Luo, Texas A&M University, College Station, TX, United States, Kiavash Kianfar

In this work, we consider the multi-module capacitated network design (MMND) problem, where minimum cost flows and flow transfer capacities are to be decided on a network and capacities are composed of multiples of differently sized modules. We also study generalizations of MMND to networks with special requirements so that more complicated decisions need to be made. For both MMND and its generalizations, we introduce new classes of facet-defining valid inequalities not obtainable from polyhedral results in previous research. We present computational results that show the effectiveness of the new classes of inequalities for MMND and its generalizations.

## 3 - On the Robust Single Machine Scheduling Problem with Relative Robust Deviation

Juliana Arango, Clemson University, 211 Fernow St, Clemson, SC, 29634, United States, J. Cole Smith

We consider a single machine scheduling environment where the performance criterion is the total flow time, and processing times are uncertain but belong to a distinct interval for each job. We consider the case in which the uncertainty level in the problem is limited by enforcing the condition that only a constant number of jobs can have a processing time greater than the interval's lower bound. We examine characteristics of the problem for maximizing regret given a job processing sequence, and subsequently explore algorithms for minimizing maximum regret.

## 4 - Remote Microgrid Design Optimization under Photovoltaic and Load Uncertainty

Alexander Zolan, University of Texas-Austin, Austin, TX, United States, David Morton, Michael S. Scioletti, Amanda Hering

We consider a microgrid that consists of a battery, photovoltaic (PV) systems, and diesel generators, and optimize the components it comprises and a corresponding dispatch strategy at hourly fidelity to minimize procurement, operations and maintenance, and fuel costs. We use historical weather data to generate base load and PV system power output scenarios. We present a case study with weather profiles from different locations and show that solutions to instances that account for these uncertainties produce a lower-cost, more robust solution than solutions which use point forecasts as input.

North Bldg 122B

## Large-Scale Optimization Algorithms

Sponsored: Optimization/Linear and Conic Optimization

Sponsored Session

Chair: Yuyuan Ouyang, Clemson University, Clemson, SC, United States

## 1 - Quadratic Averaging for Smooth Convex Optimization

Michael Eldredge, Clemson University, Clemson, SC

First-order methods have been a popular research area in recent years, due to their efficiency on solving big data optimization problems. There had been many studies on designing efficient gradient based algorithms and understanding their performance. In this talk, we consider the interpretation of a class of accelerated gradient methods, by extending recent studies on quadratic averaging and estimating sequences. Based on the fact that many gradient based algorithms can be interpreted as designs of sequences of quadratic approximation, we design a quadratic averaging framework for solving smooth convex optimization with optimal performance.

## 2 - A Modified Conditional Gradient Sliding Method for Structured Convex Optimization

Hamid Nazari, Clemson University, Clemson, SC, 29631, United States, Yuyuan Ouyang

Based on the conditional gradient sliding (CGS) method proposed by Lan and Zhou, we design a modified CGS method for structured convex optimization. Similar as the CGS method, when minimizing structured convex functions, the proposed method is able to skip some time-consuming operations from time to time. Our modification is mainly on the acceleration technique of the sliding scheme. We prove that the convergence rate of the proposed method is at least as good as the CGS method. Some preliminary computational results comparing the proposed method and CGS will also be presented.

## 3 - Inexact Augmented Lagrangian Method for Convex Optimization

Yangyang Xu, Rensselaer Polytechnic Institute, Department of Mathematical Sciences, 110 8th Street, Troy, NY, 12118, United States,

In this talk, I will present inexact ALMs for convex programs with both equality and inequality constraints. For these problems, we establish the global convergence rate of inexact ALM and estimate its iteration complexity in terms of the number of gradient evaluations. We first establish an ergodic convergence rate result. By relating to the inexact proximal point algorithm, we also show a nonergodic convergence rate result of inexact ALM that uses geometrically increasing penalty parameters. The nonergodic iteration complexity result is in the same order as that for the ergodic result. Numerical tests on QCQP are conducted to compare the performance of the inexact ALM with different settings.

## 4 - Random Gradient Extrapolation for Distributed and Stochastic Optimization

Yi Zhou, ISyE Ga Tech, 755 Ferst Drive, NW, Atlanta, GA, 30332, United States, Guanghui Lan

In this talk, we consider a class of finite-sum convex optimization problems defined over a multiagent network with  $m$  agents connected to a central server. Our major contribution is to develop the random gradient extrapolation method (RGEM), which does not require any exact gradient evaluation even for the initial point, but achieve the optimal linear rate in terms of the number of gradient evaluations. For stochastic case, RGEM maintains the optimal sublinear rate in terms of the number of stochastic gradient computations, but attains linear communication complexity. This is the first time that these complexity bounds have been obtained for distributed and stochastic optimization problems.

### Decomposition in Large-Scale Computational Optimization

Sponsored: Optimization/Computational Optimization and Software  
Sponsored Session

Chair: Matthew Galati, SAS Institute, Inc., Glen Mills, PA, 19342, United States

#### 1 - Decomposition Algorithm for a Capacity Expansion Problem with Permanent and Temporary Capacities

Rahman Khorramfar, PhD Student, NC state University, 2804  
Brigadoon Dr, 1, Raleigh, NC, 27606, United States, Osman Ozaltin

We study a type of stochastic capacity expansion problem where there are multiple capacities to open in each planning period. We consider capacities of temporary nature and permanent capacities, and formulated the model as a multi-stage mixed integer stochastic program with uncertain demand. We apply Dantzig-Wolfe decomposition algorithm to solve the problem. We also extended our model to include a mean-risk objective in order to reflect the sensitivity of decision makers to risk factors. Computational results are presented for different applications.

#### 2 - Dantzig Wolfe Decomposition Approach to Inland Waterway Disruption

Liliana Delgado Hidalgo, Universidad del Valle, Cl. 13 #100-00,  
Cali, 760001, Colombia

We study inland waterway disruption response to redirect disrupted barges to available terminals and prioritize offloading to minimize total cargo value loss. We formulate a mixed integer linear programming model as a heterogeneous vehicle routing problem with time windows (HVRPTW) and working to reformulate the HVRPTW via Dantzig-Wolfe decomposition approach to explore advantages of the Branch-and-Price and column generation approaches. A case example is presented to illustrate our approach and findings.

### Optimizing over Networks with Dynamics

Sponsored: Optimization/Network Optimization  
Sponsored Session

Chair: Christopher Quinn, Purdue University, West Lafayette, IN, 47907, United States

#### 1 - Optimal Versus Selfish Resource Allocation Dynamics Over Networks

S. Rasoul Etesami, University of Illinois at Urbana-Champaign,  
Urbana, IL, United States

Motivated by many emerging resource allocation problems such as web caches and peer-to-peer networks, we consider and study optimal and selfish resource allocation over a network of agents. In this model the nodes can store only a limited number of resources while access the remaining ones through their neighbors. We first study the complexity and approximability of the optimal resource allocation. We then extend our results to selfish setting by formulating the problem as a noncooperative game. We show that such a game always admits a pure-strategy Nash equilibrium and device stochastic learning dynamics to obtain one of such equilibrium points.

#### 2 - Dynamic Public Learning in Networks of Strategic Agents

AMIR Ajorlou, Massachusetts Institute of Technology, 32 Vassar  
Street, 32-D569, Cambridge, MA, 02139, United States,  
Ali Jadbabaie

There are abundant sources of information (e.g., news channels, social networks, online forums, surveys, and data bases), with every person having access to a personalized set of the sources. The aggregate action of the whole population partially accumulates the information shared within different information communities. An interesting question here is how the quality of information aggregation is affected by the influences between and within different information communities. We show that the inter-community interactions exhibit a double-edged effect that may result in a phase transition in quality of learning between different information-action structures.

#### 3 - Sparse Modeling of Network Interactions

Christopher Quinn, Purdue University, 315 N. Grant Street,  
West Lafayette, IN, 47907, United States

There are many natural and emergent systems with complex interactions between components. It is often easier to conduct observational than experimental studies. However, there are significant statistical and computational challenges in modeling and characterizing the interactions from observational data. In this talk, we will discuss recent methods to efficiently and non-parametrically identify sparse network approximations from data, with guarantees of optimality under certain conditions.

#### 4 - On Incentivized-social-influence-based Programs to Promote Behavioral Changes: A Case Study for Incentivizing Households to Save Energy

John Fontecha, University at Buffalo, 413 Bell Hall, Buffalo, NY, 14260, United States, Manjunath Jois, Alexander Nikolaev,  
Jose Luis Walteros

We present a social influence program that allocates investments as random economic incentives for a targeted community to promote changes in its energy-spending behavior. By design, an energy provider funds the program; all the members of the community are eligible to receive an incentive (win); each round of the program features many winners; the winners are chosen randomly but active savers are more likely to win; customers are informed of the winnings in their neighborhoods, fueling the program's reach. We provide the theoretical basis for the design and operation of such programs and develop methods to optimize their impact by modeling their dependence on the investment allocation strategy.

#### 5 - Workforce Management under Social Link Based Corruption

Abhinav Perla, University at Buffalo, 342 Bell Hall, University at  
Buffalo, North Campus, Buffalo, NY, 14260, United States,  
Alexander Nikolaev, Eduardo Pasillao

Development of relationships enabling corrupt behavior can be a hindrance to the productivity of an organization. This work introduces the Link Based Corruption (LBC) model, offering a perspective to curb corruption through workforce rotation. The agents are assumed to be embedded into a directed peer-to-peer monitoring network. Corruption is taken to be a threat whenever an agent and their supervisor(s) are all corruption-prone; once they identify each other as such, which takes time, a productivity loss takes place. This work addresses the policy-maker's problem of fixing the agent monitoring structure and timing the workforce rotation so as to minimize the expected long-time loss.

### Infrastructure Optimization

Sponsored: Optimization/Network Optimization  
Sponsored Session

Chair: Robert Mark Curry, Clemson University, Clemson, SC, 29634, United States

#### 1 - Robust Location of Transparent Interdictions on a Shortest Path Network

N. Orkun Baycik, Shenandoah University, Winchester, VA,  
United States, Kelly Sullivan

We study a shortest path network interdiction problem in which the follower seeks to find a path of minimum length on a network and the leader seeks to maximize the follower's path length by interdicting arcs. We consider placement of interdictions that are not visible to the follower; however, we seek to locate interdictions in a manner that is robust against the possibility that some information about the interdictions becomes known to the follower. We formulate the problem as a bi-level program, and apply a Benders decomposition approach to optimally solve it. We derive supervalid inequalities to improve the performance of the algorithm and test the algorithm on grid networks and acyclic graphs.

#### 2 - Two-stage Stochastic Interdependent Networks Mitigation and Restoration

Cheng-Lung Chen, University of Central Florida, Orlando, FL,  
United States, Qipeng Zheng, Alexander Veremyev,  
Vladimir Boginski

We propose a two-stage stochastic program for determining the optimal mitigation and restoration strategy on two-layer interdependent networks with cascading node failure caused by random disruption. Previous studies mainly focused on either static or deterministic type of network failure, while our model features a dynamic failure propagation given initial stochastic node disruption. The first-stage problem allows capacity expansion and node fortification to mitigate the impact of disruption, while the objective of second-stage is to restore network performance with minimum costs. We propose a delayed cut generation algorithm with various types of cutting plane to solve the problem.

#### 3 - A Post Disaster Infrastructure Restoration Model: The Interdependent Integrated Network Design and Scheduling Problems with Machine Movement.

Aniela Garay Sianca, University of Arkansas, Fayetteville, AR,  
72701, United States, Sarah G. Nurre

Over the past years, post-disaster operations research models have become necessary due to the increasing number of disasters. We propose a new optimization model that looks to schedule work crews to restore damaged components on a set of interdependent networks while explicitly considering the availability and restoration of the transportation network which enables work crew movement. On realistic data representing interdependent infrastructure networks in Panama, we perform computational experiments to deduce insights and show improvement as compared to existing restoration models.

#### 4 - Tri-level Optimization for Enhancing Interdependent Network Resilience

Nafiseh Ghorbani Renani, The University of Oklahoma, 202 West Boyd St. room 124, Norman, OK, 73019, United States, Kash Barker, Andres David Gonzalez

The reliability and resilience infrastructure networks are a growing concern among communities due to the occurrence of disruptions. Resilience is often thought of as the ability to withstand a disruption and recover quickly from the disruption. The vulnerability could describe the extend to which a network is disrupted, and recoverability could describe its trajectory of recovery. As such, we propose a tri-level protection/interdiction/restoration to represent decisions made (i) by a defender before a disruption to reduce network vulnerability, (ii) by an attacker to effectively disrupt the network, and (iii) by a defender after the disruption to enhance recoverability.

#### Large-scale Optimization

Sponsored: Optimization/Nonlinear Programming  
Sponsored Session

Chair: Aryan Mokhtari, Massachusetts Institute of Technology, Cambridge, MA, 02139, United States

Co-Chair: Alejandro Ribeiro, Wynnwood, PA, 19096, United States

##### 1 - Theory on the Absence of Spurious Optimality

Cedric Jozs, University of California, Berkeley, Berkeley, CA, United States, Ouyang Yi, Richard Zhang, Javad Lavaei, Somayeh Sojoudi

We study the set of continuous functions that admit no spurious local optima which we term global functions. They satisfy various powerful properties for analyzing nonconvex and nonsmooth optimization problems. For instance, they satisfy a theorem akin to the fundamental uniform limit theorem in analysis regarding continuous functions. Global functions are also endowed with useful properties regarding composition of functions and change of variables. Using these new results, we show that a class of nonsmooth nonconvex optimization problems arising in tensor decomposition applications are global functions (e.g. with L1 objective functions).

##### 2 - Generative Adversarial Networks (GANs) and Compressed Sensing

Alexandros Dimakis, University of Texas at Austin, Austin, TX, United States

The goal of compressed sensing is to estimate a vector from an underdetermined system of noisy linear measurements, by making use of prior knowledge on the structure of vectors in the relevant domain. For almost all results in this literature, the structure is represented by sparsity in a well-chosen basis. We show how to achieve guarantees similar to standard compressed sensing but without employing sparsity at all. Instead, we suppose that vectors lie near the range of a generative model, e.g. a GAN or a VAE. We show how the problems of image inpainting and super-resolution are special cases of our general framework.

##### 3 - Fast Nonconvex SDP Solver for Large-scale Power System State Estimation (PSSE) Problem

Hao Zhu, The University of Texas at Austin, 2501 Speedway, Austin, TX, 78712, United States

Convex relaxation to a semi-definite program (SDP) has shown great success in power flow related problems of quadratic relations. High computational complexity of SDP solver however, challenges its large-scale application in real-time monitoring such as power system state estimation (PSSE). We will introduce an accelerated solver for large-scale PSSE by leveraging recent advances on non-convex SDP formulation that allows a lower-dimensional matrix search space. The accelerated gradient descent method is adopted to iteratively solve the resultant problem, at low per-iteration complexity thanks to the problem sparsity structure therein.

##### 4 - Quantized Decentralized Consensus Optimization

Ramtin Pedarsani, UC Santa Barbara, ECE Department, UCSB, Santa Barbara, CA, 93106, United States, Amirhossein Reisizadeh, Aryan Mokhtari, Hamed Hassani

We consider the problem of decentralized consensus optimization, where the sum of  $n$  convex functions are minimized over  $n$  distributed nodes that form a connected network. We consider the case that the communicated local decision variables among nodes are quantized to alleviate the communication bottleneck in distributed optimization. We propose the Quantized Decentralized Gradient Descent (QDGD) algorithm, in which nodes update their decision variables by combining the quantized information received from the neighbors with their local information. We prove that under standard strong convexity and smoothness assumptions, QDGD achieves a vanishing mean solution error.

#### Interface of Operations and Finance: Optimization and Game Theory Methods

Sponsored: Manufacturing & Service Oper Mgmt  
Sponsored Session

Chair: Zhen Liu, PhD, Daniel L. Goodwin College of Business, Benedictine University, 5700 College Road, Goodwin Hall Rm 366, Lisle, IL, 60532-2851, United States

##### 1 - An Incentive Mechanism Based on Trade Credit in a Risk-averse Supply Chain under Asymmetric Information

Lian Qi, Department of Supply Chain Management, Rutgers Business School, Newark, NJ, United States, Zhihong Wang, Zhen Liu

We take the model under information symmetry as the benchmark; the trade credit incentive model under information asymmetry is constructed based on the principal-agent framework, and we obtain the optimal trade credit contract configuration and further deduce the optimal decision of the retailer. Then, we analyze the validity of the contract and the influence of the private information and risk-aversion coefficient on the contract parameters and the selling price. The study shows that when the degree of risk aversion is within a certain range, the reasonable trade credit contract designed by the supplier can effectively encourage the retailer to report its real sales cost.

##### 2 - Depth-limited Solving in Imperfect-information Games

Tuomas W. Sandholm, Angel Jordan Professor of Computer Science, Carnegie Mellon University, Pittsburgh, PA, 15213, United States, Noam Brown, Brandon Amos

A key challenge in imperfect-information games is that states do not have defined values. So, depth-limited search algorithms used in single-agent and perfect-information settings do not apply. We introduce a principled way to conduct depth-limited solving in imperfect-information games by allowing the opponent to choose among multiple strategies for the remainder of the game at the depth limit. Each of the strategies results in a different set of values for leaf nodes. This forces an agent to be robust to different opponent strategies. On a 4-core CPU and 16 GB memory, we build a master-level heads-up no-limit Texas hold'em AI that defeats many prior top AIs. Previously this required a supercomputer.

##### 3 - An Analytical Treatment of Dynamic Pricing and Learning with Menu Costs

Zhen Liu, Assistant Professor, Benedictine University Goodwin College of Business, Goodwin Hall Room 366, 5700 College Road, Lisle, IL, 60532, United States

Many firms face the problem of selling a given stock of products by a deadline. In their classic paper, Gallego and Ryzin (1994) show the optimal pricing policy is a function of the stock level and the length of the horizon. However, empirical studies show that the firms do not change their pricing policy as frequently as predicted, which leads to price stickiness. To better explain the discrepancy, we introduce menu costs into the problem and formulate it as a continuous-time impulse intensity control problem with Poisson-style demand processes. We obtain our optimal policy in threshold-type. Based upon this policy, we discuss approximation procedure for pricing policy under Bayesian learning.

#### Topics at the Interface of Finance, Operations and Risk Management

Sponsored: Manufacturing & Service Oper Mgmt/IFORM  
Sponsored Session

Chair: Dan Iancu Iancu, Stanford School of Business

##### 1 - Risk Propagation in the Mortgage Supply Chain and the Financial Crisis

Marco Yu Zhang, Illinois Institute of Technology, Chicago, IL, United States, John R. Birge

Securitization has often been cited as the innovation in the mortgage supply chain that increased mortgage supply and the fragility of the network in leading to the financial crisis of 2008-2009. This supply-driven explanation, however, misses an important demand driver caused by drop in funding ratios increased risk-taking incentives for pension funds. This talk will describe a supply chain model to explain this phenomena and will present empirical support for the dominance of the demand effect.

**2 - Cash Hedging in a Supply Chain**

Yixuan Xiao, City University of Hong Kong, 83 Tat Chee Avenue, Kowloon, Hong Kong, Panos Kouvelis, Xiaole Wu

We study hedging cash flow risks in a supply chain where firms invest internal funds to improve production efficiencies. We offer a decomposition framework to capture the cost reduction and flexibility effect of hedging. It allows us to understand how a firm's hedging choice depends on its supply chain partner's decision, and how such interaction is affected by supply chain characteristics such as market size, cash flow volatility and correlation.

**3 - Financial Incentives to Avoid Major Quality Problems in a Supply Chain**

Matthew Sobel, Case Western Reserve University, Cleveland, OH, United States, Susan Slotnick

Manufacturers who outsource components incur risks as well as benefits. If the supplied product has a major quality defect, the adverse effect on the manufacturer's reputation reduces its market share. This paper presents a discrete-time model of a buyer who collaborates with a sole supplier to avoid quality problems by paying a higher per-unit purchase price to the supplier and/or paying the supplier a lump sum contingent on the absence of a major quality defect. Analytical results include an optimal risk-posture policy for which the buyer should use only one of these financial incentives or the other. Computational results provide insights about the relationship of that optimal policy to various parameters.

**Quantum Computing**

Emerging Topic: OR Frontiers

Emerging Topic Session

Chair: Aaron Lott, D-Wave Systems Inc., Palo Alto, CA, 9, United States

**1 - Towards Quantum-assisted Optimization and Machine Learning on Google Quantum Cloud**

Masoud Mohseni, Google Quantum AI Lab, Venice Beach, CA, United States

We present an overview of our progress quantum optimization and machine learning at Quantum AI Lab at Google. In particular, we present an end-to-end quantum-assisted optimization engine on Google Cloud Platform. Our physics-inspired approaches use an interplay of thermal and quantum fluctuations to sample from inaccessible low-energy states of spin-glass systems that encode certain hard combinatorial optimization and probabilistic inference problems. We also introduce universal discriminative quantum neural networks for classification and purification of quantum data.

**2 - Leveraging Mixed Integer Programming for Evaluating D-Wave Solution Quality**

Carleton Coffrin, Los Alamos National Laboratory, Los Alamos, NM, United States

Unconstrained Binary Quadratic Programs are a challenging class of NP-Hard discrete optimization problems with a wide variety of real-world applications and established solution methods. This work compares the performance of established Integer Programming solvers, a state-of-the-art Large Neighborhood Search heuristic, and a D-Wave QPU on a variety of BQP problem classes from the literature. The computational results suggest that the D-Wave QPU consistently produces high-quality solutions with runtimes that are comparable to the established methods.

**3 - Quantum Machine Learning at the Creative Destruction Lab**

Eric Brown, Creative Destruction Lab, Toronto, ON, Canada

Now is a critical time for the emerging technology of quantum computing. Progress in the field is being fueled increasingly by industry players seeking to capitalize on its disruptive potential. At the Creative Destruction Lab (CDL), through our Quantum Machine Learning initiative, we are incubating pre-seed ventures pursuing commercial quantum computing and its intersection with machine learning. In this talk I will introduce modern quantum computing, the CDL's approach to developing its landscape, and some of the applications being pursued by our quantum alumni ventures.

**4 - Putting Quantum Computing in Your Toolbox**

Aaron Lott, D-Wave Systems Inc., Palo Alto, CA, United States

We present an overview of the D-Wave 2000Q quantum computer architecture and discuss several novel optimization and machine learning algorithms that have been designed to leverage current and future D-Wave quantum computers. We describe the interplay between statistical physics, quantum annealing, Bayesian inference and Boltzmann machines to provide insights into areas where quantum computation and quantum simulation will play a key role in solving data-driven real-world problems.

North Bldg 126B

**Healthcare Operations**

Sponsored: Manufacturing & Service Oper Mgmt/Healthcare Operations

Sponsored Session

Chair: Michael Freeman, INSEAD, Singapore

**1 - The Impact of New Service Delivery Models on Work Hours and Quality**

Hessam Bavafa, Wisconsin School of Business, 4284C Grainger Hall, 975 University Avenue, Madison, WI, 53706, United States, Christian Terwiesch

In many professional services, an expert server such as a physician or lawyer delivers services to customers across multiple channels: in-person meetings, phone calls, and emails. In these settings, there exists a risk that work obligations encroach on the personal lives of the experts and that the quality of their work might suffer. We empirically examine these concerns in the setting of physicians providing care to patients via two channels: in-person office visits and online e-visits. Our data include 3.4 million patient encounters (more than one million of which are e-visits) covering a 8.5-year timespan.

**2 - The Impact of Bundled Payment Policy on Healthcare Operations: Evidence from China**

Jingui Xie, University of Science and Technology of China, School of Management, 96 Jinzhai Road, Hefei, 230026, China, Yiming Fan, Jingqi Wang

The paper studies the impact of bundled payment on health care spending, utilization, and quality, by using insurance claim data. We provide new evidence from China on the impact of bundled payment versus fee-for-service on health care operations. Our main results show that bundled payment reduces medical cost and length of stay in general, while increases readmission and revisit rates. Our results show that cost reduction in provincial hospitals is significant while the quality of care is maintained. However, the medical cost in country hospitals was not reduced after the implementation of bundled payment.

**3 - Physician Leadership and Operational Strategies:****Focus, Volume and Concentration in General Hospitals**

Sandra S Iz, Erasmus University, Rotterdam, Netherlands, Ludwig M. Kuntz, Michael Wittland

We consider the role of physicians in leadership positions and their influence on operational strategies pursued in general hospitals. We distinguish between volume strategies, focus strategies, and internal routing strategies and analyze how the involvement and the turnover rate of the medical director is related to the choice of these strategies.

**4 - Continuity of Care versus a Second Opinion: Evidence from the Opioid Crisis**

Katherine Bobroske, Cambridge Judge Business School, Trumpington Street, Cambridge, CB2 1AG, United Kingdom, Michael Freeman, Lawrence Huan, Stefan Scholtes

In the US, mortality from the opioid crisis is quickly eclipsing the AIDS epidemic, taking an estimated 49,000 lives in 2017 alone. Despite risk warnings, opioids continue to be frequently used in general practice. We investigate the impact of continuity of care versus a second opinion for patients with a first opioid prescription. Continuity of care is generally commended as a single doctor has full oversight into the patient's treatment plan. However, in the context of opioids, it may be difficult for a doctor who prescribed the first opioid to transition the patient to a different treatment. Using a nationwide dataset, we find that the second opinion may be a critical tool in curbing opioid dependence.

Chair: Serguei Netessine, The Wharton School, Philadelphia, PA, 19104, United States

**1 - Investing in Performance: Information and Merit-based Incentives in K-12 Education**

Vanitha Virudachalam, Wharton School, OID, 3730 Walnut Street, 500 Jon M. Huntsman Hall, Philadelphia, PA, 19104, United States, Sergei Savin, Matthew Steinberg

We study performance-based contracts in a K-12 educational setting, where a school district contracts with teachers to meet student performance goals. We examine the trade-offs between information and monetary incentives faced by districts using a two-period dynamic principal-agent model, where the school district (principal) decides on the level of merit-based incentive to offer and whether to invest in assessments that provide more accurate mid-year student performance information and the teachers (agents) decide the level of effort to exert in each period. We identify settings where the benefits of the additional information justify their costs.

**2 - When to Innovate and when to Grow? Empirical Analysis of Startup Operation**

Christophe Pennetier, INSEAD, 6 Marina Boulevard, # 27-15, Singapore, 018985, Singapore, Serguei Netessine, Karan Girotra

Using a new curated dataset with more than half a million startups, we use customized text mining / machine learning techniques to identify business model changes and study their effects on startups' success. We are the first to empirically relate startup operations to performance.

**3 - Efficiency of Streethail vs. Booking Apps**

Jussi Keppo, National University of Singapore, Mochtar Riady Building, BIZ 1 8-69, 15 Kent Ridge Drive, Singapore, 119245, Singapore, Shih-Fen Cheng, Ming Hu

We study the efficiency of taxi divers to serve passengers by using streethail vs. booking apps. Our key metric is the percentage of time the taxi drivers spend in serving their passengers. We find that on average the service time of streethail and booking is about the same. Although booking technologies reduce the roaming time, the resulting response time makes the booking as efficient as streethail. We study the heterogeneity of our findings, and show that guided roaming combines the advantages of streethail and booking apps, and improves the efficiency of taxi drivers.

**4 - Reading Between the Stars: Understanding the Effect of Online Customer Reviews on Product Demand**

Hallie Cho, INSEAD, Boulevard de Constance, PhD Office, Fontainebleau, 77300, France, Sameer Hasija, Manuel Sosa

Many studies have examined quantitative customer reviews (i.e. star ratings) and found that they are a relevant source of quality information. We also examine the qualitative part of customer reviews by implementing a novel algorithm to assess the sentiment of the text and study how the interplay between sentiment and star ratings relates to product demand. Using the U.S. Automobile market data, we find that sentiment and star ratings both have a decreasingly positive effect on demand and that their interaction effect suggests they act as non-trivial complements: positive sentiments in text reviews compensate for the tendency to discount highly positive ratings.

**1 - Pooling Queues in Discretionary Services**

Guillaume Roels, INSEAD, Boulevard de Constance, Fontainebleau, 77305, France, Mor Armony, Hummy Song

Contrary to the classical theory of operations management, recent case studies in retail, call centers, and healthcare indicate that pooling queues may not necessarily result in less expected work in process. In this paper, we propose that this phenomenon may arise when servers choose their own capacity to trade off their capacity costs with the holding costs of customers in service (when the queue is not visible to the servers) or of all customers in the system (when the queue is visible). We show that the difference in operational performance between the two configurations is marginal when the queue is visible, but can be substantial, with a preference for dedicated queues, when the queue is not visible.

**2 - Service Delivery Platforms: Pricing, Welfare, and Revenue Implications**

Andrew E. Frazelle, Duke University-Fuqua School of Business, 540 South LaSalle Street, #4340, Durham, NC, 27705, United States, Pnina Feldman, Robert Swinney

Service delivery platforms maintain a symbiotic relationship with the existing providers in their industry. While this relationship entails cooperation between the platform and the restaurant, there is substantial opportunity for misalignment. We model the restaurant's kitchen as an M/M/1 queue with customer waiting costs. We first study the revenue maximization problem faced by a monopolist who controls both the dine-in and delivery prices and receives all revenues from the system. We then investigate means of coordinating this supply chain via different contracts between the restaurant and the platform, and we find that a two-way revenue-sharing contract coordinates the system.

**3 - Managing the Interaction of Acquisition and Retention in Customer Intensive Services**

Vasiliki Kostami, London Business School, Regent's Park, London, NW1 4SA, United Kingdom, Vasiliki Kostami, HEC Paris, Paris, France, Oded Koenigsberg

Customer acquisition affects customer retention and vice versa due to budget constraints but this is not the sole factor. Loyal customers and potential customers have different reception of prices and the quality they are offered which adds an extra layer of interaction between the two segments. We study the optimal prices and service rates in customer intensive services under the consideration of the linking between customer acquisition and retention.

**4 - Overbooking with Endogenous Demand**

Jingxing (Rowena) Gan, Wharton School of Business, University of Pennsylvania, Philadelphia, PA, 19104, United States, Gerry Tsoukalas, Noah Gans

Traditional models of airline overbooking assume exogenous demand that is not affected by the booking policy. We study how the overbooking policy can affect consumer demand ex ante. Given a rational choice model for consumers, we derive an airline's optimal booking, pricing and compensation policy for a single flight with a deterministic individual no-show rate. We model and compare two compensation schemes, a fixed scheme and an auction scheme. Our results show that the airline overbooks less when considering strategic consumer behavior as opposed to treating demand as exogenous.

**1 - Optimizing First-mile Logistics in Smallholder Supply Chains**

Sergio Camelo, Stanford University, Stanford, CA, United States, Joann de Zegher, Dan Andrei Iancu, Daniela Saban

We study the logistics surrounding pick-ups and deliveries of palm fruit in the Indonesian smallholder palm oil supply chain. Using data from roughly 3,000 smallholder farmers and 100 transport providers from our field site in Sumatra, we reconstruct current transportation routes, and propose novel algorithms that rely on spatial or temporal optimization. We find that centralized vehicle routing algorithms can improve the transportation distances by 25%, and reduce the number of days that middlemen have to work by 30%. We expect the implementation of our results to reduce overall costs in the market, and ease the digitization of agricultural data in smallholder palm oil supply chains.

## 2 - Show or Tell: What Improves Agent Decision Making in the Mobile Money Industry? - Evidence from a Field Experiment in Tanzania

Jason Acimovic, Penn State University, 462 Business Building,  
University Park, PA, 16802, United States,  
Christopher Dalton Parker, David F. Drake,  
Karthik Balasubramanian

Two key decisions operations managers must make when designing systems to support their employees are: 1) what guidance to deliver, and 2) what kind of training (if any) to provide. We examine these choices in the context of mobile money platforms. In partnership with a Tanzanian mobile money operator, we perform a randomized controlled trial to examine how differing types of guidance and training impact the agents' inventory management. Agents who are trained in person and receive an explicit recommendation are less likely to stockout of electronic currency during the day.

## 3 - Multi Stakeholders Perspectives on the Impacts of Safety Violation: An Event Study of Manufacturing Firms

Chris Lo, Hong Kong Polytechnic University, Hong Kong, Di Fan, Yi Zhou

We conducted a safety violation event study in the US and we found market react negatively. If the violation happened in the non-Republicans states and in the presence of labour union, the abnormal returns of stock price were more negative. It is the first evidence that the political leadership could moderate firm's abnormal stock return on social issue. To confirm our prediction, we found that both the number of violations and inspections significantly decreased after a Democrats state changed to Republican state. The enforcement of safety regulation weaken in Republicans' tenure and investors reacted accordingly. It shows that a political neutral structure is necessary for social governance.

## 4 - Operations Management Challenges in a "Cloud Factory": Distributed Manufacturing of Handmade Goods in Kenya

Andre Du Pin Calmon, INSEAD, Boulevard de Constance,  
Fontainebleau, 77300, France, Victor Araman, Anton Ovchinnikov

Motivated by a social enterprise in Kenya that manufactures fashion accessories using a distributed network of artisans, we analyze the operational challenges of managing a decentralized "virtual" or "cloud factory. The artisans have limited capabilities and varying production quality, while the company faces uncertain demand. We investigate operational issues that emerge in this unique setting by formulating the scheduling problem faced by the manufacturer as a stochastic dynamic optimization problem. We present preliminary results and numerical experiments.

## 1 - Wine Analytics: The Impact of Weather and Market on En Primeur Prices

Mert Hakan Hekimoglu, Rensselaer Polytechnic Institute, 110 8th Street, Pittsburgh Building, Troy, NY, 12180, United States, Burak Kazaz

Many businesses in the wine industry do not engage in wine futures (also, known as En Primeur) because they cannot predict the release prices in order to make efficient plans and purchasing arrangements. Our work provides guidance to winemakers in their price selection, and buyers (negociants, distributors, merchants) on the appropriateness of these prices. We examine empirically how weather and market fluctuations influence the release prices of fine wine. Higher temperatures and appreciation in the Liv-ex 100 index as market indicator increase prices while higher levels of precipitation reduce them.

## 2 - How Sourcing and Price Leadership Affect Optimal Store-Brand Quality

Candace Arai Yano, University of California-Berkeley, IEOR Department, 4141 Etcheverry Hall, Berkeley, CA, 94720-1777, United States, Bo Liao, Minakshi Trivedi

We study the effects of sourcing and pricing power on optimal store-brand quality under three sources (in-house, a national-brand manufacturer with a competing product, and a strategic third-party manufacturer), and under two types of price leadership (Manufacturer-Stackelberg and Retailer-Stackelberg). We characterize the retailer's optimal quality levels and their relative values across the six scenarios and present other equilibrium results. Among other things, we show that the retailer optimally uses the quality level both for differentiation and to induce competition between suppliers, and that the power to decide the source is more important to the retailer than having pricing power.

## 3 - Optimal Procurement Contracts under Hidden Information and Actions about Supply Disruptions

Xi Shan, University of Texas at Dallas, Richardson, TX, 75075, United States, Chenglin Zhang, Suresh P. Sethi

We consider a supply chain in which a retailer (the principal) facing a stochastic demand orders from a supplier (the agent) subject to supply disruption. The supplier has private information on his initial supply reliability, which he is able to improve upon when needed by an effort not observed by the retailer. We find a contract menu, consisting of an order quantity along with a transfer payment and a penalty if there is no delivery, which induces the supplier to reveal his private information. We show that the supplier under the contract would exert less than the first-best effort. Moreover, it is not optimal for the contract to require the supplier to exert an effort to become fully reliable.

## 4 - Procurement Mechanism Design for Assembler under Asymmetric Information

Jennifer K. Ryan, Dept of Supply Chain Management & Analytics, College of Business Administration, Lincoln, NE, 68588-0491, United States, Zhaolin Li, Lusheng Shao, Daewon Sun

Assembly systems are found in a variety of industries, such as consumer electronics. In many practical settings, the assembler possesses incomplete information regarding the marginal cost of each supplier. This lack of complete information poses a challenge for the assembler in designing contract mechanisms. We propose a contract that is incentive compatible in dominating strategies (ICDS), ensuring that every supplier truthfully reveals their own production cost, regardless of how the other suppliers might behave. We also introduce a hybrid mechanism, under which the complexity of the contract offered to a given supplier depends on the importance of that supplier to the assembler's profit.

## Advances in Pricing and Revenue Management

Sponsored: Revenue Management & Pricing  
Sponsored Session

Chair: Ruxian Wang, Johns Hopkins University, Carey Business School, Baltimore, MD, 21202, United States

## 1 - Pricing of Services

Ozlem Yildiz, University of Virginia, Darden School of Business, 100 Darden Blvd. Darden School of Business., Office: FOB 189, Charlottesville, VA, 22903, United States, Dana Popescu

In this paper we analyze simple pricing strategies for access services. We characterize the optimal service (flat fee) price as well as the optimal resource (usage) price. We then identify the conditions under which service pricing outperforms resource pricing and analyze the performance of simple service and resource pricing heuristics.

## 2 - Pricing Problems under the Markov Chain Choice Model

A. Serdar Simsek, University of Texas-Dallas, Naveen Jindal School of Management, 800 W. Campbell Road, Richardson, TX, 75080, United States, James Dong, Huseyin Topaloglu

We consider three fundamental pricing problems when customers choose under the Markov chain choice model. First, for the monopolistic pricing problem, we show how to compute the optimal prices efficiently. Second, for the competitive pricing problem, we show that a Nash equilibrium (NE) exists, prove that NE prices are no larger than the prices set by a central planner and characterize NE that Pareto dominates all other Nash equilibria. Third, for the dynamic pricing problem with a single resource, we prove structural properties of the optimal prices. We also report on numerical analyses.

## 3 - Attribute-based Modeling of Product Recommendations

Sajad Modaresi, Assistant Professor of Operations Management, UNC Chapel Hill, Chapel Hill, NC, 27599, United States, Denis R. Saure, Fernando Bernstein

We study efficient real-time data collection approaches for an online retailer that dynamically personalizes the assortment offerings based on customers' attributes (e.g., gender and age). We propose policies that leverage the transaction data of customers with similar attributes to expedite the learning process and maximize revenue. We prove that the proposed policies are near-optimal and test their performance using a dataset from a large Chilean retailer.

## 4 - Pricing Ancillary Service Subscriptions

Ozge Sahin, Johns Hopkins University, 100 International Drive, R1288, Baltimore, MD, 21231, United States

We investigate heterogeneous customer choice behavior in the presence of main products, ancillary services with options of pay-per-use and subscription. Ancillary service subscriptions may result in "win-win for the firm, competitors and customers in a variety of monopolistic and duopolistic scenarios. Ancillary service subscription can help firms to better price-discriminate heterogeneous customers through different subscription decisions and subsequent main product purchase behavior.

**Marketplaces**

Sponsored: Revenue Management &amp; Pricing

Sponsored Session

Chair: Xuanming Su, University of Pennsylvania, Philadelphia, PA, 19104, United States

**1 - Ride-hailing Networks with Strategic Drivers:****The Impact of Platform Control Capabilities on Performance**Zhe Liu, Columbia Business School, New York, NY, USA,  
Philipp Afeche, Costis Maglaras

We study the performance impact of two operational controls, demand-side admission control and supply-side repositioning control, in ride-hailing networks with strategic drivers. We characterize the system equilibria for various control regimes, show how the performance gains from these controls depend on the capacity and the network demand imbalance, and provide new results on how admission control affects drivers' repositioning decisions.

**2 - Referral and Learning on Social Network: Implications for Inventory**Guangwen Kong, University of Minnesota, 111 Church Street SE,  
Minneapolis, MN, 55414, United States, Yuanchen Su,  
Ankur Mani

We consider a firm selling differentiated products to customers whose preferences are correlated in a social network. We investigate how the network structure and customer learning influence the demand distribution and therefore have an impact on the firm's inventory decision and the optimal design of referral programs

**3 - Managing Market Thickness in Online B2B Markets**Wenchang Zhang, University of Maryland, College Park, MD,  
20742, United States, Kostas Bimpikis, Wedad Jasmine  
Elmaghraby, Kenneth Moon

Platforms can obtain sizable returns by operationally managing their market thickness (i.e., the availability of supply-side inventory). Using data from a natural experiment on a major B2B auction platform specializing in the \$424 billion secondary market for liquidating retail merchandise, we find that thickening the platform's market by closing auctions on certain weekdays increases its revenue by 7.3%, due to the bidders' participation frictions. Using structural modeling, we then study two complementary design levers to control the market thickness: (i) its listing policy, which determines the ending times of auctions, and (ii) a recommendation system.

**4 - Centralized versus Decentralized Routing in Ride-hailing Networks**Xuanming Su, University of Pennsylvania, The Wharton School,  
3730 Walnut Street, Philadelphia, PA, 19104, United States

We build a spatial equilibrium model to study traffic flows in ride-hailing networks. We consider two regimes: drivers follow a central routing plan (i.e., centralized) or choose their own directions (i.e., decentralized). Our results measure the value of centralized routing.

**Emerging Topics in Revenue Management**

Sponsored: Revenue Management &amp; Pricing

Sponsored Session

Chair: George Chen, UT Dallas, Dallas, TX

**1 - Personalized Assortment Optimization with High Dimensional Customer's Data**Sentao Miao, University of Michigan-Ann Arbor, Ann Arbor, MI,  
48104, United States, Xiuli Chao

Motivated by online retailing with mass amount of customer's data, we study the online personalized assortment selection problem. Because the customer's data, such as browsing history, often has extremely high dimension, there are two challenges: the first is high time complexity; the second is performance of the algorithm (to maximize the total revenue). In this paper, we explicitly address these two challenges by combining an upper-confidence-bound (UCB) type algorithm with the so-called random projection method. We prove that our algorithm has low computational time and provably near-optimal performance. Numerical experiments show that our algorithm has great empirical performance.

**2 - Carpool Services for Ride-sharing Platforms**Renyu Zhang, New York University Shanghai, 1555 Century  
Avenue, Shanghai, 200122, China, Xuan Wang

We study the carpool services of a ride-sharing platform. The carpool services allow passengers heading towards the same direction to share a ride at a discount fare. We study the operational issues of a ride-sharing platform in the presence of carpool services. We show that carpool services enable the platform to achieve a larger market coverage and lower prices. Using the operational data from San Francisco, we find that carpool services could also reduce the price variabilities riders face. As two operational leverages to match supply and demand, carpool services and surge pricing are complements when demand-supply ratio is large or small, but are substitutes when demand-supply ratio is moderate.

**3 - Latent Agents in Networks: Estimation and Pricing**Ozan Candogan, University of Chicago, Booth School of Business,  
Chicago, IL, 27708, United States, Baris Ata, Alexandre Belloni

Agents in a social network consume a product that exhibits positive local network externalities. A seller has access to data on past consumption decisions/prices for a subset of observable agents, and can target these agents with discounts. The observable agents potentially interact with additional latent agents, who can purchase the same product from a different channel. Observable agents influence each other both directly and indirectly through the influence they exert on the latent part. The seller does not know the underlying network structure. We provide algorithms that allows the seller to estimate the influence structure from the available data, and improve her pricing decisions.

**4 - Real-time Spatial Dynamic Pricing for Balancing Supply and Demand in a Network**Qi Chen, London Business School, London, United Kingdom,  
Yanzhe Lei, Stefanus Jasin

Motivated by recent expansion of mobile ride-hailing apps in the taxi industry in big cities, we study a real-time spatial dynamic pricing problem where a firm who uses many units of reusable resources (e.g., taxis) in a network to serve price-sensitive customers who arrive over a finite selling season (e.g., one day) in a stochastic and nonstationary fashion. For any origin-destination pair, the quoted price equals a nominal price times an origin-specific price multiplier. The firm can dynamically change quoted prices by adaptively adjusting the price multipliers over time. We develop a Network Balancing Control that has asymptotically optimal performance and discuss some extensions.

## ■ MA22

North Bldg 130

**Revenue Management under Consumer Choice Behavior**

Sponsored: Revenue Management &amp; Pricing

Sponsored Session

Chair: Zizhuo Wang, University of Minnesota, Minneapolis, MN,  
55414, United States**1 - Consumer Choice and Market Expansion: Modeling, Optimization and Implementation**Ruxian Wang, Johns Hopkins University, Carey Business School,  
100 International Dr, Baltimore, MD, 21202, United States

The market size, measured by the number of people who are interested in the products, may be highly affected by the management strategy. We refer to this effect as market expansion. In this paper, we incorporate market expansion effect into consumer choice models and to investigate the problems on assortment, pricing and estimation.

**2 - Irrational Behavior Modeling and Decision Making**Yi-Chun Chen, UCLA Anderson School of Management,  
Los Angeles, CA, United States

Customer preferences are often assumed to follow weak rationality, which assumes that adding a product to an assortment will not increase the choice probability of a product already in that assortment. In this paper, we study a new choice model that relaxes this assumption and can model a wider range of customer behavior, such as anchoring effects between products. We develop efficient procedures for model learning and subsequent decision making. Using synthetic and real data, we show that the model can better predict customer behavior and lead to higher revenue.

**3 - Space Constrained Assortment Optimization under the Paired Combinatorial Logit Model**

Jacob Feldman, Olin Business School, United States

We study the space constrained assortment optimization problem under the paired combinatorial logit choice model. The goal in this problem is to choose a set of products to make available for purchase with the intention of maximizing the expected revenue from each arriving customer. Each offered product occupies a specific amount of space and there is a limit on the space consumed by all of the offered products. The purchasing decision of each customer is governed by the paired combinatorial logit choice model. We provide the first efficient constant factor approximation for this problem.

#### 4 - Multi-stage Assortment Problems under the Multinomial Logit Model

Yuhang Ma, Cornell Tech, 2 West Loop Road, New York, NY, 10044, United States, Nan Liu, Huseyin Topaloglu

We consider an assortment problem where we offer sets of products in multiple stages and the choice process at each stage is driven by the multinomial logit model. In particular, we have  $K$  stages. At each stage, we offer a distinct set of products. If the customer makes a purchase at a certain stage, then her choice process terminates. If the customer does not make a purchase at a certain stage, then she observes the set of products offered at the next stage. The goal is to find a set of products to offer at each stage to maximize the expected revenue obtained from a customer. We show that the problem is NP-hard and develop an FPTAS.

#### Asset Pricing and Portfolio Theory

Sponsored: Finance

Sponsored Session

Chair: Chanaka Edirisinghe, Rensselaer Polytechnic Institute, Troy, NY, 12180-3590, United States

##### 1 - On New Approaches to Modelling and Trading at the Transaction-level Time Scale

James Primbs, California State University Fullerton, 800 N. State College Blvd., Fullerton, CA, 92831, United States, B. Ross Barmish, Sean Warnick

This talk describes our recent research on modelling and trading at a transaction-level time scale. In particular, we utilize ITCH data, which allows for use of order message data to reconstruct the so-called NASDAQ Limit Order Book (LOB). Within this context, we describe numerical experiments aimed at validating our models and evaluating the efficacy of our new high-frequency trading algorithms under development. This talk also includes suggestions for future research motivated by the results of our simulations.

##### 2 - Robo-advising as a Human-Machine Interaction System

Agostino Capponi, Columbia University, 500 W. 120th Street, New York, NY, 10027, United States

The advent of robo-advising has led to an increased interest in applying artificially intelligent agents to the field of portfolio management. Central to all human-machine interactions is the value alignment problem: ensure that an autonomous agent acts according to the human clients that it serves. We introduce a framework to quantify the value of human-machine interaction in a dynamic mean-variance framework. We show that the human-machine tandem exhibits superior performance over traditional robo-advisors.

##### 3 - Portfolio Theory of Three Tales: Risk-adjusted Returns, Liquidity, and Leverage

Chanaka Edirisinghe, Rensselaer Polytechnic Institute, Lally School of Management, Pittsburgh 2118, Troy, NY, 12180-3590, United States, Jingnan Chen, Jaehwan Jeong

Under liquidity costs, we show analytically the Sharpe-maximizing unlevered portfolio is no longer a tangency portfolio, and proportionate-leveraging is not an optimal strategy. As return targets increase, the required minimum portfolio-leverage increases at an increasing-rate, while the Sharpe-Leverage frontiers are progressively-dominated. Empirical analysis verifies our analytical findings, which also shows that ignoring liquidity impact can lead to severe portfolio under-performance.

##### 4 - Optimal Portfolio Deleveraging under Liquidity Costs and Margin Restrictions

Jaehwan Jeong, Assistant Professor, Radford University, Department of Management, P.O. Box 6954, Radford, VA, 24142, United States, Chanaka Edirisinghe

We develop a portfolio deleveraging model under margin restrictions, where trading impacts asset prices. The model objective and constraints are non-convex separable quadratic functions; hence, it is extremely difficult to solve. We develop a new dual-cutting plane technique for solution and test it with leveraged portfolios of ETF assets. Solution efficacy and sensitivity results are reported on leverage and margin limits.

#### User Behavior in Online Marketplaces and Platforms

Sponsored: EBusiness

Sponsored Session

Chair: Yingjie Zhang, Pittsburgh, PA, 15206, United States

##### 1 - Machine Prediction for Better Investment Decision on P2P Platform

Runshan Fu, Carnegie Mellon University, 4800 Forbes Ave., Pittsburgh, PA, 15213, United States, Yan Huang, Param Vir Singh

Two major claimed advantages of P2P lending over traditional banks are 1) funding opportunity for borrowers unqualified for traditional bank loans due to their unattractive credit profiles, and 2) steady and attractive return on investment for lenders. In practice, however, P2P lending platforms often find it difficult to deliver both promises. In this paper, we show that we can achieve both higher return on investment for lenders and more opportunities for borrowers at the same time, by leveraging the predictive power of machine learning techniques. We also demonstrate that while machine learning can be powerful in prediction, realizing its value requires carefully designed economic framework.

##### 2 - Privacy Concerns and Social Recognition Trade Off- Two Natural Experiments on the Role of Online Identity in Crowdfunding

Alvin Zuyin Zheng, 5555 Wissahickon Ave, Philadelphia, PA, 19144, United States, Ohad Barzilay, Paul Pavlou

While online identity has been shown to have significant economic outcomes in online marketplace, disclosure of online identity may cause privacy concerns since it tends to persist across transactions and interactions and thus can carry their own reputation. In this study, we explore the effect of online identity on backers' contribution behavior in crowdfunding by leveraging two natural experiments happened on Kickstarter. Specifically, we are interested two questions: 1) What's the effect of online identity on backer's contribution in crowdfunding? 2) How does this effect differ across different backers (large vs. small)?

##### 3 - Home Bias in Online Employment

Chen Liang, Yili Hong, Bin Gu

We study the nature of home bias in online employment, wherein employers prefer workers hailing from the same countries. Using a large-scale dataset from a major online labor market containing employers' consideration sets and selection of workers, we first estimate home bias in online employment. We disentangle two types of home bias, i.e., statistical and taste-based home bias, using a quasi-natural experiment wherein the platform introduces a monitoring system for employers to observe workers' effort in time-based projects. After matching comparable fixed-price projects as a control group, our DID estimations indicate that home bias is primarily driven by statistical discrimination.

##### 4 - Does Interaction with Promoted Content Help or Hurt Publishers' Readership

Xiaoli Yang, Boston University Questrom School of Business, Boston, MA, 02215, United States, Nachiketa Sahoo

We investigate how interactions with promoted content affect users' tendency to revisit the publisher afterwards. Using a public dataset on users' interactions with promoted content during their visits to multiple publishers, we found that after engaging with promoted content users were 2% more likely to return in a future session to the publisher hosting the links to promoted content. This suggests that interactions with promoted content might have a positive effect on user experience on the publisher's site.

##### 5 - When an Event Comes: A Empirical Analysis on Taxi and Sharing-economy Drivers' Responding Behavior

Yingjie Zhang, CMU, Pittsburgh, PA, 15206, United States

This paper aims to explore the links between users' physical and digital behavior within the social-cyber-physical systems. Specifically, I propose to compare the effects of different types of city events on taxi and sharing-economy drivers. I conduct the study on New York City, using a large-scale trip data of both taxis and for-hire vehicles. From the perspective of city planners, the understanding of responding behavior of drivers, as well as the traffic/demand flows, will allow us to better design countermeasures when an emergency event happens.

**1 - Deep Reinforcement Learning and Transfer Learning for Taxi Driver Dispatching**

Zhiwei Qin, DiDi Research America, 450 National Ave, Mountain View, CA, 94043, United States, Zhaodong Wang, Xiaocheng Tang, Jieping Ye, Hongtu Zhu

Deep reinforcement learning has achieved many successes in solving different types of sequential decision problems. In this work, we propose learning solutions based on deep Q-networks to optimize the dispatching policy for taxi drivers on the DiDi ride-sharing platform. We construct the evaluation environment using real-world spatio-temporal trips data and train dispatching agents for this challenging decision task. Due to problem diversity across different cities, transfer learning is brought in to help increase the learning adaptability and efficiency. We empirically evaluate the performance of our dispatching algorithm and show the benefits of knowledge transfer in the spatial domain.

**2 - Modeling Human-robot Collaboration in a Dynamic Workspace as a Markov Decision Process**

Henry I. Ibekwe, GreenBerry Robotics, 2245 Texas Drive, Suite 300, Sugarland, TX, 77479, United States

We present a method for modeling and evaluating the performance of human-robot collaboration for well-defined material handling tasks in a dynamic workspace. Collaborative Robots involves the use of robots to perform tasks alongside humans with the goal of increasing efficiency of the desired task. We model the robot decision-making process as a Markov Decision Process (MDP) where actions executed by the robot are dependent on both the state of the system and the actions performed by the human. An efficient policy for the Markov Decision Process is solved using a dynamic programming algorithm and the policy is implemented for the robot collaborating with a human in a simulated and real environment.

**3 - Operational Improvements in Healthcare using Blockchain**

Sanjeev K. Bordoloi, University of St. Thomas, Opus College of Business, 1000 LaSalle Avenue, TMH 443, Minneapolis, MN, 55403, United States, Sathiyavani Chandran

Blockchain is a decentralized protocol that combines transparency, immutability, and consensus properties to enable secure, pseudo-anonymous transactions. Many healthcare organizations are currently experimenting with Blockchain technology, and its use is expected to grow rapidly. We explore how Blockchain can be used in healthcare for more effective operations such as saving time, reducing cost, reducing risk and increasing trust among stakeholders.

**4 - Recent Approaches to Creating and Analyzing Big Data in Technology Management and Commercialization**

Clovie Hamilton, Assistant Professor of Management, Winthrop University, 310 Thurmond Building, Rock Hill, SC, 29733, United States

This is a study of three (3) technological advances related to Big Data: web scraping, natural language processing and machine learning. This research identifies ways in which these advances can become more relevant and useful to empirical researchers in the field of technology and innovation management. This research provides a brief look at some applications of these advances in research studies, and engenders a broader discussion around the relevance and impact of these advances to research in technology and innovation management. In particular, making use of these advances in empirical research related to technology commercialization was researched and is discussed.

**5 - Identifying Indicators of Blockchain Adoption**

Ashish Gupta, Associate Professor of Analytics, Auburn University, 417 Lowder Hall, 405 West Magnolia Ave., Auburn, AL, 36830, United States, Alireza Farnoush, Dolatsara Ahady Hamidreza, David Paradice

In this study, we use analytics approaches for understanding the characteristics of companies that have the intention to adopt Blockchain technology. We describe the data acquisition process for identifying companies that have intent to adopt. Subsequently, we use financial indicators of the companies and biographical information of the board members to develop our insights.

**1 - Predictive and Prescriptive Frameworks Leveraging Customer Lifetime Value**

Pallav Routh, The University of Texas at San Antonio, San Antonio, TX, United States, Arkajyoti Roy, Jeff Meyer

The success of deterministic customer relationship management tools, such as the recency, frequency, and monetary model, is limited amid randomness in customer transactions and future uncertainties in customer churn. We develop a predictive customer lifetime value model under a competing risk framework that overcomes such limitations. Furthermore, we present a prescriptive resource allocation model for marketing campaigns to target high-valued customers with high-risk of churn. The models are evaluated on a membership-based firm in the hospitality industry.

**2 - A Bayesian Network Approach for Predicting Customer Churn**

Yugang Yu, University of Science &amp; Technology of China, 96 JinZhai Road, Hefei, China, Huan Yu, Libo Li

Customer churn prediction is an important business research question for companies to identify potential customer loss. This paper is motivated by a consulting experience with a telecom service provider who try to predict customer churn of different communication operators and channels. The main challenges are the high dimensionality and imbalanced datasets. We develop a novel model which combines a lasso logistic regression for the binary outcome of whether the customers being loyal, with a truncated model of Bayesian network for disloyal customers. Using data from this service provider, our proposed method has a better prediction results compared with other benchmark models.

**3 - Organizing Online Crowds for Value Co-creation**

Zhiyi Wang, National University of Singapore, 15 Computing Drive, COM2-01-02, Singapore, 117418, Singapore, Jungpil Hahn

Crowdsourcing has widely been used as a strategy for sourcing ideas and efforts to facilitate innovation and new product development through Information Technology. However, it is challenging for firms to effectively organize online crowds for innovation and value co-creation. In this study, we investigate an online new product invention community and understand what types of crowds are more important to value co-creation process. Our empirical analysis with data mining and econometric modeling identified important types of contributors in the crowd and their influences on innovation outcomes.

**4 - Multi-focal Lead Scoring for Predictive Modeling in Business-to-business Market**

Jingyuan Yang, George Mason University, Fairfax, VA, United States

An important aspect of customer acquisition in B2B marketing is lead prospecting which guides the business to select the right leads to pursue. While the current practice often selects leads with ad-hoc basis or pure managerial intuitions, a more systematic and data-driven approach is needed to improve the quality of lead selection by quantifying a specific lead's tendency to become a customer. To this end, we introduce a multi-focal predictive lead scoring model which can improve the performance of predictive lead scoring. Specifically, leads are first divided into several focal segments. Then, a logistic regression scoring model is learned for each segment with multi-task learning technique.

**5 - Proactive Retention Management in Retailing Identifying Predicting and Preventing Partial Defection**

Daniel Ringbeck, WHU-Otto Beisheim School of Management, Vallendar, Germany, Dmitry Smirnov, Arnd H. Huchzermeier

Maintaining strong customer relationships is a top priority for retailers. We develop a framework for proactive retention management based on data from a German hypermarket chain. We propose a novel definition of partial defection in noncontractual settings, demonstrate how to forecast the likelihood of defection of individual customers, and formulate a retention campaign optimization model.

### Analytics Pedagogy

Sponsored: Education (INFORMED)

Sponsored Session

Chair: Matthew D. Dean, University of Southern Maine, Portland, ME, 04104, United States

#### 1 - Concurrent Undergraduate and Graduate Analytics Program Development Lessons Learned

Stephen Hill, University of North Carolina-Wilmington, 601 South College Road, Wilmington, NC, 28403-5611, United States

Many universities have developed or are developing analytics programs. In this presentation, we will discuss the challenges associated with the simultaneous development of graduate and undergraduate analytics programs. We will share lessons learned and opportunities for improvement.

#### 2 - Teaching Analytics Methods with Jupyter Notebooks and Python

Nickolas K. Freeman, University of Alabama, 14485 Griffin St, Tuscaloosa, AL, 35405, United States

This talk will discuss the use of Jupyter notebooks and the Python programming language for the delivery of analytics content in a classroom setting. Jupyter notebooks are capable of combining rich text elements with executable code, allowing students to execute and visualize analyses in real-time. A simple demonstration will illustrate how the technology may be used to facilitate the presentation of advanced analytics methods. Lessons learned from a recent course based on the technology will also be discussed.

#### 3 - Using the Learning Assistant Model in an Undergraduate Business Analytics Course

Matthew D. Dean, University of Southern Maine, School of Business, 113 Luther Bonney Hall, Portland, ME, 04104, United States

We report the results of the first known implementation of the Learning Assistant Model in a business analytics course (or any business-related course). This pedagogical technique shows promise in helping students master the material better than those who took the course in a traditional lecture-based learning environment. Students' perceptions of the Learning Assistant Model learning environment also improved from the beginning of the semester to the end.

#### 4 - Teaching Experiences of an Elective Operations Research Course in a Business School

Narasimhan Ravichandran, Professor, Indian Institute of Management Ahmadabad, Wing 2 D, Vastrapur, Ahmedabad, 380015, India

I have been teaching a case based course on the applications of OR as an elective in the MBA program at IIMA. Given the changed profile of the participants and the job market compulsions there are some real challenges in teaching this course. In the last three editions we have deployed some innovative methods to deal with the challenges. These ideas are presented in this talk and I explore the options for the future editions of the course.

#### 5 - Lecture Based Tutoring: A New Active Learning Teaching Technique

Todd W. Easton, Kansas State University, 2037 Durland Hall, Manhattan, KS, 66506, United States

This talk describes a new active learning teaching technique called lecture based tutoring. The premise of lecture based tutoring is to tutor students during lectures. The teacher calls a student by name and asks a question. If the student answers poorly, then the student is tutored to the correct answer. Between 20 and 50 such questions are asked each class period and all students participate at least once during a given week. The presentation will demonstrate the method and discuss the statistically significant improvement in both student learning and teacher evaluations. Attendees should leave with sufficient knowledge to attempt this new teaching style.

### Maximizing Railway Network Capacity

Sponsored: Railway Applications

Sponsored Session

Chair: Carl D. Van Dyke, TransNetOpt, West Windsor, NJ, 08550, United States

#### 1 - Rethinking Train Scheduling to Improve Network Capacity Management

Carl D. Van Dyke, TransNetOpt, 6 Snowbird Court, West Windsor, NJ, 08550, United States

N.A. Railroads have traditionally scheduled trains with little respect to their interactions with each other. This is particularly true for unit trains and ad hoc trains. To increase network capacity, train performance predictability, and general network fluidity, railroads should change their approach to tactical train scheduling to take into account these interactions. Adding dispatch optimizers is not enough as a metering process is required to ensure that the plan is achievable and the number of trains the dispatcher is to handle will result in reliable operations.

#### 2 - Interaction Between Yard and Mainline Capacity in Railway Network Performance

Tyler Dick, U. of Illinois at Urbana-Champaign, 1241 Newmark Lab MC-250, 205 N. Mathews Avenue, Urbana, IL, 61801, United States

Mainline, yard and terminal performance all contribute to the quality of railway service. Mainlines and yards are symbiotic; a disruption to one operation quickly manifests in reduced performance of the other. Although routinely observed, there has been little academic study of the capacity interactions between mainlines and yards. This presentation provides a high-level overview of the "network efficiency cycle linking mainline and yard performance, and research on the capacity impact of propagating schedule flexibility from yard-to-yard over connecting mainlines.

#### 3 - Increasing Network Capacity through Use of Dynamic Car Scheduling

Clark Cheng, Sr. Director Operations Res & Chief Data Scientist, Norfolk Southern Corporation, 1200 Peachtree Street NE, Mail Stop 171, Atlanta, GA, 30309, United States, Edward Lin, Gunnar Feldmann

Car scheduling is the key operating system for freight railroads to classify railcars and generate trip plans. With dynamic car scheduling, the classification and trip plan for a shipment may vary in order to maximize capacity utilization while improve customer service. In this presentation, we will describe a dynamic car scheduling model developed at Norfolk Southern and how it can improve capacity utilization, operations efficiency, and customer service.

#### 4 - Impact of Improved Maintenance Programs on Railroad Capacity

David T. Hunt, Oliver Wyman, One University Square, Suite 100, Princeton, NJ, 08540, United States

Railroads have progressed their maintenance practices from curative (fix it when it breaks), to systematic (fix it at predetermined intervals), to condition based (fix it based on inspections), and are now working on predictive approaches. This not only leads to safer operations and improved customer service, but has additional benefits in improved rail capacity. This presentation explores how improvements in rail maintenance have impacted capacity, and the corresponding economic consequences.

### Joint Session TSL/Practice Curated: Game-theoretic Applications in Urban Transport

Sponsored: TSL/Urban Transportation

Sponsored Session

Chair: Joseph Y. J. Chow, New York University, New York, NY, 10012, United States

#### 1 - Highway Infrastructure Protection Against Sea Level Rise: Game Theoretical Approaches

ILIA Papakonstantinou, NYU, Brooklyn, NY, 11209, United States

This research investigates the differences between game theoretical approaches among decision makers protecting their infrastructure against sea level rise. We take into account the hydrodynamic interactions, transportation system adaptation to inundations due to sea level rise, and budget constraints. Both competitive and cooperative games are considered, where each decision maker aims to minimize traffic delays within its territory caused by the network disruptions due to sea level rise. A case study of the San Francisco Bay area for 0.5m sea level rise is used. The results of different games are compared for a range of budgeting scenarios.

#### 2 - A Many-to-many Auction-based Multimodal Network Assignment Game

Theodoros P. Pantelidis, New York University, Brooklyn, NY, United States

Urban transportation networks are multi-dimensional complex systems that serve large numbers of travelers every day. These complex multimodal systems can be considered as multiple smaller networks which are privately owned by transit operators. When considering pricing and capacity decisions, operators take into account only volume flows in their own network and fail to capture the effects of multimodal trips. In this study, we propose an auction-based game theoretic approach, where travelers act as buyers and network edges as market products that belong to a set of sellers, in order to find the optimal allocation that maximizes joint profits.

### 3 - Modeling On-demand Mobility Service: Competition, Surge Pricing, and Subsidy

Xinwu Qian, Purdue University, 3326 Putnam Street,  
West Lafayette, IN, 47906, United States, Satish Ukkusuri

The study presents the mathematical model for the competition among stakeholders, riders, and drivers in the market of on-demand mobility service. We consider that the stakeholders propose the surge pricing and subsidy policies to maximize their revenue, riders decide whether or not make the trip based on the perceived travel cost, and the drivers decide whether they will leave/enter the market and the location to pick up riders based on their perceived utility. Our results indicate that market efficiency depends on how drivers value their lost for leaving the market. We also observe that subsidizing occupied and vacant trips are important as a regulation to drivers' selfish behavior.

### 4 - Modeling Competition of Intermodal Infrastructure Investors Factoring Their Heterogeneity and Maritime Carrier Behavior

Irina Benedyk, Purdue University, 2411 Neil Armstrong Drive,  
# 2A, West Lafayette, IN, 47906, United States, Srinivas Peeta

This study develops a game theoretical framework that allows one-to-many relationship between investors and intermodal ports, and factors impacts of maritime carrier competing behavior, and investor heterogeneity (defined as a number of intermodal ports under their control) on the investment decision-making process. A solution algorithm is developed to identify and analyze the Nash equilibrium and demonstrate its applicability using the case study of the Northeast U.S. intermodal ports. The study findings can be used by the public sector to evaluate impacts of policies and incentives on intermodal infrastructure development.

### 1 - Congestion Reduction through Efficient Empty Container Movement

Santiago Carvajal, University of Southern California, Los Angeles, CA, 90007, United States

My presentation will revisit the Empty Container Problem using double container trucks. This research was started by a METRANS project with the Ports of Los Angeles and Long Beach in an attempt to reduce congestion at the ports. The problem is divide into two sub-problems, a container assignment problem and a vehicle routing problem. In this presentation I will present my methodology for solving the problem and my mathematical models, as well as presenting some general results as well as results from the Ports of Los Angeles and Long Beach.

### 2 - Dynamic Electrical Vehicle Sharing System Design

Xin Wang, University of Wisconsin-Madison, 8916 Red Beryl Drive, Middleton, WI, 53562-4278, United States, Yikang Hua, Dongfang Zhao, Xiaopeng Li

Electrical vehicle (EV) sharing advances the green city development, however it faces various challenges in practical operations such as infrastructure deployment and vehicle relocation. We build a multi-stage stochastic model aiming to reduce cost and customer queueing for EV sharing system. We provide an algorithm which combines Lagrangian relaxation and Benders Decomposition to solve the model. Our model helps design EV sharing infrastructure under uncertain demand arrival together with the daily dispatch and relocation decisions.

### 3 - Inventory Repositioning in On-demand Product Rental Networks

Saif Benjaafar, University of Minnesota, 111 Church Street SE, Department of Industrial and Systems Engr, Minneapolis, MN, 55419, United States, Xiaobo Li

We consider a product rental network with a fixed number of rental units distributed across multiple locations. Customers can pick a unit at one location and return it to another. Both demand for rentals and rental durations are random. To improve the matching of supply and demand, units are periodically repositioned. We formulate the inventory repositioning problem as Markov decision process and characterize the optimal policy. We also describe an efficient heuristic.

### 4 - Shared Autonomous Electric Vehicles for Strengthening Future Urban Microgrids

Wei Qi, McGill University, 1001 Sherbrooke Street West, Montreal, QC, H3A 1G5, Canada, Mengyi Sha, Shanling Li, Hong Chi

We envision the prospect where shared autonomous electric vehicles (SAEVs) will reinforce future urban electricity infrastructure in the form of solar-powered microgrids. We integrate cross-disciplinary modelling of transport and power systems with optimization to investigate the potential of SAEVs for improving the self-sufficiency and resilience of urban microgrids. Our model prescribes optimal citywide SAEV fleet operations of ride-sharing, repositioning, charging and discharging amidst various urban heterogeneities. Our findings highlight the value of centralized dispatchability of SAEVs.

### Shared Mobility Optimization for Public Transportation

Sponsored: TSL/Intelligent Transportation Systems (ITS)

Sponsored Session

Chair: Jiangtao Liu, Arizona State University, Tempe, AZ, 85282, United States

Co-Chair: Xuesong Zhou, Arizona State University, Tempe, AZ, 85281, United States

### 1 - Designing Dynamic and Personalized Incentives in Sustainable Ridesharing Systems

Yanshuo Sun, Florida State University, Tallahassee, FL, 20742, United States

This study considers the option of influencing ridesharing participants' original travel schedules by applying monetary incentives. In this system, drivers can opt for an incentive program where a driver specifies how much she/he expects to be compensated if the earliest departure time at the origin is shifted to be earlier than the originally scheduled time. The level of behavioral realism is thus improved by considering the possibility of drivers' misrepresenting their required compensations to modify their travel schedules. The contribution of this study is to propose a mechanism which ensures only "efficient drivers are eligible for incentives given an incentive budget limit.

### 2 - Accessibility with Time and Resource Constraints

Monireh Mahmoudi, Assistant Professor, Michigan State University, East Lansing, MI, 48824, United States, Ying Song, Harvey Miller, Xuesong Zhou

A common accessibility measure in transportation science is the space-time prisms (STPs) and the network-time prisms (NTPs). STPs and NTPs focus on time as the scarce resource limiting accessibility. However, other resource constraints can constrain space-time accessibility, such as limits or "budgets for energy, emissions, or monetary expenses. This research extends NTPs to include other resource constraints in addition to time. We conceptualize resource hyper-prisms (RHPs) as a constrained optimization problem and develop a resource-dependent time-dependent forward and backward dynamic programming to determine the boundaries of a RHP given time and other resource budgets.

### 3 - Integrated Train Timetabling and Locomotive Assignment

Zhou Xu, The Hong Kong Polytechnic University, Hong Kong, China, Xiaoming Xu, Chung-Lun Li

This work focuses on modeling and solving an integrated train timetabling and locomotive assignment problem. To solve this integrated problem, we first construct a three-dimensional state-space-time network in which a state is used to indicate which train a locomotive is serving. We then formulate the problem as a minimum cost multi-commodity network flow problem with incompatible arcs and integer flow restrictions, and present a Lagrangian relaxation heuristic for solving problem.

### 4 - Dynamic Dial-a-ride and Pricing with Look Ahead for Competitive On-demand Mobility Systems

Hamid Sayarshad, Cornell University, Ithaca, NY, 14850, United States, H. Oliver Gao

We propose a competitive on-demand mobility model using a multi-server queue system under infinite-horizon look-ahead. The proposed approach includes a novel dynamic optimization algorithm which employs a Markov decision process (MDP) and provides opportunities to revolutionize conventional transit services that are plagued by high cost, low ridership, and general inefficiency, particularly in disadvantaged communities and low-income areas. We develop a dynamic pricing scheme that utilizes a balking rule that incorporates socially efficient level and the revenue-maximizing price, and an equilibrium-joining threshold obtained by imposing a toll on the customers who join the system.

**1 - Optimizing Placement of Electric Vehicle Charging Stations and Incentives to Combat Overstaying**

Ragavendran Gopalakrishnan, Postdoctoral Associate, Cornell University, Ithaca, NY, United States, Arpita Biswas, Partha Dutta

In this two-part talk, we first discuss optimizing placement of Electric Vehicle (EV) charging stations with both budget and coverage constraints, by introducing an iterative heuristic to solve a mixed packing-and-covering problem by alternately invoking knapsack and set-cover algorithms. Next, with increasing adoption of EVs, overstaying after active charging lowers utilization, and warrants imposing penalties. Higher penalties could be unacceptable to risk-averse users due to uncertain parking durations, leading to decreased utilization (and revenue). Our solution, validated on London charging data, increases both utilization and revenue while significantly reducing overstaying.

**2 - Charging Station Network Design for Electrified Vehicles in Urban Communities**

Seyed Sajjad Fazeli, Wayne State University, Detroit, MI, United States, Saravanan Venkatachalam, Ratna Babu Chinnam, Alper E. Murat

The societal benefits of large-scale adoption of EVs cannot be realized without the adequate deployment of accessible charging stations due to mutual dependence of EV sales and public infrastructure deployment. Such infrastructure deployment also presents some unique opportunities for promoting livability within communities. In this research, we develop models and methods to improve community's access to the EV charging stations. A choice modeling approach embedded into two-stage stochastic programming model is proposed to determine the optimal network of charging stations including type, capacity, and location of electric charging stations based on EV drivers preference.

**3 - Financial Analysis of Electric Vehicle Fast Charging: A Case Study in San Diego California**

Eleftheria Kontou, National Renewable Energy Laboratory, 15013 Denver West Parkway, Golden, CO, 80401, United States

The objective of this study is financial analysis of electric vehicle (EV) fast charging stations. We focus on a case study in San Diego CA and we utilize three models to simulate chargers utilization over the planning horizon of 2018 to 2025, analyze operational costs of electricity under an EV pricing scheme, and estimate profitability indices and net present values for several scenarios of 125 and 400kW plugs stations. We explore the impact of the station's number of plugs, power level and power-sharing, energy storage sizes, and photovoltaic array collocation on the financial viability of such EV fast charging stations providers.

**4 - Green Inventory Routing Problem for Perishable Products**

Gokce Palak, Shenandoah University, 1460 University Dr., Winchester, VA, 22601, United States

We consider a multi-period multi-vehicle green inventory routing problem for perishable products. Through a numeric study, we analyze the impacts of age-dependent perishability, carbon emissions, and a heterogeneous fleet on inventory management and routing decisions.

**1 - An Optimization Approach for Vehicle Re-balancing in a Mobility-on-demand System**

Liu Xu, University of Maryland-College Park, 1173 Glenn L. Martin Hall, College Park, MD, 20742, United States, Xinlei Zhang, Ali Haghani

With Mobility-on-Demand system serves as the first-and-last-mile solution, the public transit can greatly extend its coverage, thereby alleviating congestion on the roads. In the context of such a hybrid system, due to the imbalanced nature between customer pick-up and drop-off, rebalancing the vehicles is necessary to ensure adequate performance. This study proposes an approximate dynamical programming solution to optimally making the vehicle relocation decisions, aiming at minimizing the number of rebalanced vehicles. Extensive simulation results show that the proposed strategy can significantly reduce the customer walk-aways and allow the system to operate with a smaller fleet size.

**2 - Evaluating Spatial Pricing in Ride Sourcing Systems a Graph Fused Lasso Denoising Approach**

Natalia Zuniga-Garcia, Graduate Research Assistance, University of Texas at Austin, Department of Civil, Architectural and Environmental Engineering, 301 E. Dean Keeton St. Stop C1761, Austin, TX 78712, United States., Austin, TX, 78712, United States, Mauricio Garcia-Tec, James G. Scott, Natalia Ruiz-Juri, Randy B. Machemehl

This study explores the spatial pricing discrimination of ride-sourcing trips using empirical data from over 1 million rides in Austin, Texas. We implement the graph-fused lasso (GFL) technique as a total variation denoising method. GFL globally smooths anisotropic discrete data while maintaining local adaptivity. GFL smoothing is posed as a convex optimization problem, and we solve it using a novel flexible and scalable algorithm with high computational efficiency. Our results include a temporal and spatial exploration of different ride-sourcing operational and productivity variables in Austin.

**3 - Dynamic Traffic Assignment of Autonomous Mobility On-demand**

Rongsheng Chen, University of Minnesota, Minneapolis, MN, 55455, United States, Michael W. Levin

This study explores the traffic conditions of a city road network with many travelers served by autonomous mobility-on-demand. The focus is to model the effect of rebalancing traffic which is caused by the unbalanced distribution of travelers and vehicles. A modified dynamic traffic assignment which includes car-sharing trip chains is used to find user equilibrium behavior. A linear program with flow conservation constraints is used to calculate the number of rebalancing trips with minimum total travel cost and to generate the dispatch strategy.

Vendor Demo Session

**1 - Analyzing Unstructured Text Data with the JMP Pro 14 Text Explorer**

Mia L. Stephens, SAS Institute Inc, P.O. Box 290, York Harbor, ME, 03911, United States

In the era of big data, a majority of the data captured by organizations is unstructured. Much of this unstructured data is in the form of text - from customer feedback, survey results, emails and texts, web reports, social media and other channels. Analyzing this text-based information is particularly challenging, but the new Text Explorer platform in JMP 14 makes it easy. This platform provides an efficient and interactive tool for analyzing unstructured text data, allowing us to easily extract information and transform unstructured text data into structured information. In this session, we'll use case studies to demonstrate how to use the JMP Text Explorer platform to analyze unstructured text data. We'll use a word cloud to visualize word frequency, use latent class analysis to cluster words, and apply other tools to understand underlying themes in unstructured text data. We'll also see how to create a document term matrix (DTM), and will use the resulting structured data in predictive modeling.

**2 - A DOCplex and ODH|Cplex Python Primer**

Robert Ashford, Optimization Direct, Harrington Park, NJ, United States

This short tutorial shows participants how to build a basic model using the DOCplex API in python. This session includes setting the python environment, reading data from a csv or spreadsheet, creating variables, objective functions, constraints, solving the model, and returning the results. Additionally this session points the participants to further reading so that they may expand their capabilities. Furthermore we will present the brand new ODH|Cplex API for python, which improves solution times for large models.

**1 - Impact of Payload Amount on Battery Consumption Rate in a Delivery Application of Drones**

Maryam Torabbeigi, University of Houston, Houston, TX, United States

The drone battery charge limitation is an important factor in drone scheduling in order not to run out of battery during the flight. This study investigates the relationship between battery consumption rate (BCR) and the payload amount, and also the impact of payload amount (customer's demand) on the drone scheduling. The collected data verifies a linear relationship between BCR and the payload amount. A routing problem is proposed for the drone scheduling. The model determines the number of drones, their path, the assigned customers, and the battery charge at each flight segment. The results show the impact of including BCR in the scheduling.

**2 - Airline Passenger Route Share Forecast**

Xufang Zheng, Iowa State University, 537 Bissell Road #2362, Ames, IA, 50010, United States

Airline passenger route share(directShare) is the ratio of direct passengers to total passengers on O&D level. It is an important feature of passenger flow distribution. DirectShare is an O&D specific feature, which is highly correlated with quarterly lag. Various supervised learning methods are carefully explored. The best model is gradient boosting machine(GBM), which has better prediction performance than FAA TAF-M directShareforecast model. Category based learning is newly proposed, which provides better prediction performance than GBM. The C-basedapTC model is the best category based learning model, which can provide a long term directShare forecast with less fluctuations.

**3 - Autonomous On-Demand Free Flight Operations in Urban Air Mobility Using Monte Carlo Tree Search**

Xuxi Yang, Iowa State University, Howe Hall, 537 Bissell Rd, Ames, IA, 50011, United States

Vertical takeoff and landing (VTOL) aircraft for on-demand air taxi will bring fundamental changes to daily commutes. NASA, Uber, and Airbus have been exploring the exciting concept of Urban Air Mobility (UAM). In order to enable safe and efficient autonomous on-demand free flight operations in this UAM concept, a computational guidance algorithm was designed and analyzed with collision avoidance capability. The approach is to formulate this problem as a Markov Decision Process and solve it using Monte Carlo Tree Search. A simplified numerical experiment was created and results show that this algorithm can help aircraft quickly reach the trip destination and avoid conflicts with other aircraft.

**4 - Safe and Efficient Arrival of EVTOLS in On-Demand UAM**

Priyank Pradeep, Iowa State University, 537 Bissell Road, Howe Hall, Ames, IA, 50011, United States

The electric vertical takeoff and landing (eVTOL) aircraft can alleviate ground congestion by utilizing three-dimensional airspace. However, the endurance of Lithium-ion Polymer (Li-Po) batteries imposes constraints on the operational time span. The first part focuses on formulations of a fixed final time multiphase optimal control problem with energy consumption for the eVTOL multirotor and tandem tilt-wing aircraft types. The second part involves a sequencing problem for a mixed fleet of eVTOLs scheduled to land on a vertiport with single landing slot. A sensitivity analysis is performed to see the impact of the fleet mixture and resequencing on the landing completion time.

**Joint Session AAS/Practice Curated: Airline Crew Management**

Sponsored: Aviation Applications

Sponsored Session

Chair: Bruno F. Santos, TU Delft, Delft, 2629 HS, Netherlands

**1 - Generating Crew Pairings for Cargo Aviation**

Junhong Guo, University of Michigan, Ann Arbor, MI, United States, Amy Cohn

We consider a variation of the airline crew pairing problem in which we focus on the challenges faced by a cargo carrier with predominantly long-haul international flights. The difference in rules and pairing characteristics relative to domestic passenger aviation (e.g. pairings are typically on the order of 15 days) provide both challenges and opportunities. We present heuristics and optimization-based approaches for improving this process.

**2 - Dynamic Design of Reserve Crew Pairings for Long Haul Airline Crew**

Lennart Scherp, PhD Candidate, Delft University of Technology, Delft, Netherlands, Richard Janssen, Bruno F. Santos

In this work we propose a new reserve crew pairings generation algorithm. A method is used that iteratively selects a set of pairings and evaluates them based on simulations of roster disruptions to obtain the most efficient set of reserve pairings. The goal is to minimize the effects of disruptions on rosters. Results show improvements of about 5% over the current approach used by a large European airline.

**3 - Airline Crew Scheduling with Re-timing and Complex Aircraft Connection Rules**

Fredrik Altenstedt, Optimization Expert, Jeppesen, Odinsgatan 9, G teborg, SE-411 03, Sweden

This presentation considers finding crew trips covering all flights for an airline given that we may adjust the flight times slightly, commonly known as the pairing problem with retiming. The aircraft routes influence the crew rules, shorter connections are allowed if the crew does not change aircraft. Both re-timings and short connections may require extra aircraft. This is normally prevented using plane count constraints, but these only work for simple connection rules. We give an overview of how we maintain aircraft feasibility for more complex rules by generating aircraft consistency constraints dynamically as well as share our experience from using the system with one of our clients.

**4 - Shift Scheduling with Flexible Execution Times and Sequence Dependent Travel**

Pouya Barahimi, Oregon State University, Corvallis, OR, 97331, United States, Hector Vergara

We consider the scheduling problem where each task may require multiple workers with different skills. Tasks have fixed duration and can be executed within a given time window. Travel times between tasks are different. The objective is to maximize the reward gained by executing tasks given a limited team of workers. A branch-and-price algorithm and two heuristics are developed to solve instances. A numerical study assessing the effect of inputs on run-time and quality of the solutions obtained is presented. The problem is presented in the context of the airline industry where ground crew located at an airport perform tasks to get flights ready for departure.

**5 - Modeling Flight Effort in Air Operations Training Programs**

Sergio Rebouas, Technological Institute of Aeronautics, Praa Marechal Eduardo Gomes, 50, Sao Jose dos Campos, Brazil, Talita Alessandra da Silva, Fernando Teixeira Abrah o

The flight effort forecasting in pilot training programs is a challenge for civil and military organizations. The mobilization of material and human resources to support air operations is the main factor of impact in their economic health and administrative efforts. The logistic and operational support contracts are based on this forecast, whose inaccuracy would imply significant financial and administrative consequences. This article describes a method to estimate flight effort based on a pilot's training program, integrating the individual instructions, operational and maintenance constraints and historical data, with the objective of maximizing its accuracy.

Sponsored Session

Chair: Vivek Farias, Massachusetts Institute of Technology, Cambridge, MA, 02139, United States

Co-Chair: Ciamac Cyrus Moallemi, Columbia University, New York, NY, 10027, United States

**1 - Reinforcement Learning in Portfolio Optimization**

Eli Gutin, Massachusetts Institute of Technology, Cambridge, MA, 02139, United States, Vivek Farias, Ciamac Cyrus Moallemi

In this talk we propose a general deep RL, policy-gradient based algorithm for tackling high-dimensional control problems with continuous state and action spaces, and quasi-linear dynamics. We demonstrate state-of-the-art performance on key benchmark problems in dynamic portfolio optimization and algorithmic trading. On some instances we see a provable near-zero optimality gap, compared to existing cutting-edge approaches that achieve around a 5% gap.

## 2 - A Finite Time Analysis of Temporal Difference Learning

Dan Russo, Columbia University, New York, NY, 10027, United States

Temporal difference learning (TD) is a simple iterative algorithm used to estimate the value function corresponding to a given policy in a Markov decision process. Although TD is one of the most widely used algorithms in reinforcement learning, its theoretical analysis has proved challenging and few guarantees on its statistical efficiency are available. In this work, we provide a simple and explicit finite time analysis of temporal difference learning with linear function approximation. Except for a few key insights, our analysis mirrors standard techniques for analyzing stochastic gradient descent algorithms, and therefore inherits the simplicity and elegance of that literature.

## 3 - Ensemble Sampling

Xiuyuan Lu, Stanford University, Stanford, CA, United States, Benjamin Van Roy

Thompson sampling has emerged as an effective heuristic for a broad range of online decision problems. In its basic form, the algorithm requires computing and sampling from a posterior distribution over models, which is tractable only for simple special cases. In this talk, I will give a brief introduction on ensemble sampling, a heuristic that aims to approximate Thompson sampling while maintaining tractability even in the face of complex models such as neural networks. Ensemble sampling dramatically expands on the range of applications for which Thompson sampling is viable. I will talk about recent progress as well as some applications in digital marketing.

## 4 - Thompson Sampling with Information Relaxation Penalties

Seungki Min, Columbia University, New York, NY, United States, Costis Maglaras, Ciamac Cyrus Moallemi

We propose a general framework for improving Thompson sampling by applying penalties. At each decision epoch, instead of choosing the action myopically optimized to the sampled values of the unknown parameters, we incorporate an additional penalty to compensate for the information relaxation that arises assuming that these parameters are known. We illustrate the flexibility and performance of our method with examples.

## 1 - Mode-suppression: A Simple and Provably Stable Chunk-sharing Algorithm for Peer-to-peer Networks

Srinivas Shakkottai, Texas A&M University, College Station, TX, United States, Vamseedhar Reddyvari, Parimal Parag

The ability of a P2P network to scale up throughput with increasing peer arrival rate depends on the chunk sharing policy. Some policies can result in low frequencies of a chunk, leading to system instability. Recent efforts have focused careful chunk boosting to mitigate this issue. We take a complementary view, and instead recommend preventing sharing of the most frequent chunk(s). We refer to this policy as mode suppression. We prove system stability using Lyapunov techniques, and also show that the total download time under our policy does not depend on peer arrival rate. Finally, we design distributed heuristics, and show numerically that mode suppression outperforms all other policies.

## 2 - On Information State and Sequential Decomposition in Decision Problems with Strategic and Non-strategic Agents

Hamidreza Tavaafoghi, University of California-Berkeley, Berkeley, CA, United States, Ouyang Yi, Demosthenis Teneketzis

We study dynamic multi-agent decision problems with asymmetric information. We propose the notion of sufficient information that provides a compression of agents' private and common information in a mutually consistent manner. We show that restriction to sufficient information-based (SIB) strategies is without loss of generality when agents are not strategic (i.e. teams), and provide a sequential decomposition of dynamic teams over time. When agents are strategic (i.e. games), we show that the class of SIB strategies is closed under the best response map. Consequently, we propose a notion of SIB equilibrium and provide a sequential decomposition of dynamic games over time.

## 3 - On Communication in Multi-agent Reinforcement Learning

Parinaz Nagizadeh, Purdue University, West Lafayette, IN, United States, Maria Gorlatova, Andrew Lan, Mung Chiang, Mung Chiang

We study the role of communication in a multi-agent reinforcement learning problem, where agents aim to learn to coordinate their actions and maximize their rewards through repeated interactions with an unknown, partially observable environment. We assume agents can communicate their partial state observations, and identify two benefits of this information sharing when agents' observation quality is heterogeneous: it facilitates coordination among them, and further enhances the learning rate of both better informed and less informed

agents. We show however that these benefits will depend on the communication timing, in that delayed information sharing may be preferred in certain scenarios.

## 4 - Local Weak Convergence Applied to a Local Preferences Based Random Graph Model

Vijay Subramanian, University of Michigan, 1301 Beal Avenue, #4112 EECS, Ann Arbor, MI, 48109, United States, Mehrdad Moharrami, Mingyan Liu, Rajesh Sundaresan

Random graph models are used to model individual preferences innate to graph construction. Each model proposes a unique construction that covers some properties of real-world networks. We study asymptotics of a new model that uses the self-optimizing behavior of individuals where the cost/benefit of a link factors in its existence: prove the model locally weakly converges to the rooted tree of a branching process, the Erlang Weighted Tree(EWT), and study the EWT. This allows us to study phase transitions to giant components of the graph family when direct and well-studied methods (first-moment and second-moment) do not apply, owing to the dependency structure begot by self-optimization.

### Modern Scheduling

Sponsored: Applied Probability

Sponsored Session

Chair: Alan Scheller-Wolf, Tepper School of Business, Tepper School of Business, Pittsburgh, PA, 15213, United States

Co-Chair: Mor Harchol-Balter, Carnegie Mellon University, Pittsburgh, PA, 15213, United States

## 1 - Soap: One Clean Analysis of all Age-based Scheduling

Mor Harchol-Balter, Carnegie Mellon University, 5000 Forbes Avenue, Computer Science Dept, Pittsburgh, PA, 15213, United States, Ziv Scully, Alan Scheller-Wolf

We consider an extremely broad class of  $M/G/1$  scheduling policies called SOAP: Schedule Ordered by Age-based Priority. The SOAP policies include most scheduling policies in the literature as well as an infinite number of variants which have never been analyzed, or maybe not even conceived. SOAP policies range from classic policies, like Class-based-Priority, Foreground-Background (FB), and Shortest-Remaining-Processing-Time (SRPT), to much more complicated scheduling rules, such as the famously complex Gittins index policy and Shortest-Expected-Remaining-Processing-Time (SERPT), which have resisted analysis. We present a universal analysis of response time for all SOAP policies.

## 2 - Shortest Remaining Processing Time for Multiserver Systems

Isaac Grosf, Carnegie Mellon University, Pittsburgh, PA, United States, Mor Harchol-Balter, Ziv Scully

The Shortest Remaining Processing Time (SRPT) scheduling policy and its variants have been extensively studied. While beautiful results are known for single-server SRPT, much less is known for multiserver SRPT. In particular, stochastic analysis of the  $M/G/k$  under multiserver SRPT is entirely open. We give the first stochastic analysis bounding mean response time of the  $M/G/k$  under multiserver SRPT. Using our response time bound, we show that multiserver SRPT has asymptotically optimal mean response time in the heavy-traffic limit. Beyond SRPT, we prove similar response time bounds and optimality results for several other multiserver scheduling policies.

## 3 - Optimal Scheduling and Exact Response Time Analysis for Multistage Jobs

Ziv Scully, Carnegie Mellon University, 5000 Forbes Avenue, GHC 7121, Pittsburgh, PA, 15213, United States, Mor Harchol-Balter, Alan Scheller-Wolf

Scheduling to minimize mean response time of the  $M/G/1$  queue is usually addressed in one of two cases: that of known job sizes, in which SRPT is optimal, and that of unknown job sizes, in which the more complex Gittins index policy is optimal. However, in real systems we often have partial job size information. We introduce a new model of multistage jobs to capture this case. A multistage job has multiple stages of unknown size, but the scheduler always knows which stage is in progress. We give an optimal algorithm for scheduling multistage jobs and exactly analyze its mean response time. As a special case, we obtain a closed-form expression for mean response time of the Gittins index policy.

## 4 - On Optimal Scheduling in Input-queued Switches

Mark S. Squillante, IBM Research, Yorktown Heights, NY, 10598, United States, Yingdong Lu, Siva Theja Maguluri, Tonghoon Suk

We consider issues related to optimal scheduling in input-queued switches, which are widely used in modern computer and communication networks. Theoretical properties are established and computational experiments are presented to demonstrate the benefits of our approach.

**Joint Session APS/RMP: Revenue Management and Pricing in Service Systems**

Sponsored: Applied Probability

Sponsored Session

Chair: Yasar Levent Kocaga, Sy Syms School of Business, New York, NY, 10033, United States

**1 - Operational Perils and Benefits of Free Trials in Large Scale Service Systems**

Yasar Levent Kocaga, Sy Syms School of Business, Belfer Hall Room # 403/A, 2495 Amsterdam Ave, New York, NY, 10033, United States, Chihoon Lee

We consider a firm that is serving price and delay sensitive customers and that has the option of offering a free trial service to a new market of customers. We first show that it is optimal for the revenue maximizing firm to operate in the QED heavy traffic regime and provide tractable and accurate expressions for the optimal price and revenue. Then, we use these expressions to identify conditions under which offering free trials is beneficial to the firm.

**2 - Naor's Model with Uncertain Arrival Rates and Heterogeneous Customers**

John Hasenbein, University of Texas-Austin, 1 University Station Stop C2200, Department of Mechanical Engineering, Austin, TX, 78712-0292, United States, Chengcheng Liu

We study Naor's model in which the arrival rate is uncertain and customers are heterogeneous in either their value of service or holding cost per unit time, or both. Even characterizing the stability of such systems is non-trivial. We focus on the case when the queue length is observable to the customers, and allow a social optimizer or revenue maximizer to manage the system.

**3 - Managing Service Systems via Disguised Queues: The Role of Customers' Retaliatory Behavior**

Eren Basar Cil, University of Oregon, 1208 University of Oregon, Lindquist College of Business, Eugene, OR, 97403-1208, United States

This paper studies firms that can partially disguise their waiting lines to influence customer demand. We investigate the impacts of customers' retaliatory behavior on the firm's queue hiding decisions and profits. We show that firms can significantly benefit from disguised queues if customers retaliate to queue disguising tactics whereas any disguised queues hurt firms when they face non-retaliating customers.

**4 - Asymptotic Analysis of Multi Queue Service Systems with Dynamic Customer Choice**

Yichuan Ding, University of British Columbia, University of British Columbia, 6333 Larkin Drive, Vancouver, BC, V6T 1C3, Canada, Mahesh Nagarajan, Zhe Zhang

This paper introduces a multiclass queueing model to study a stochastic service system with multiple servers and dynamic consumer choice. We consider service providers of heterogeneous quality distributed at different locations with heterogeneous customers arriving randomly to the system. An arriving customer chooses a service provider to obtain service. We prove that the fluid limit process has a unique equilibrium, and the diffusion limit process is a reflected multi-dimensional Ornstein-Uhlenbeck process centered at that equilibrium.

**Decision Analysis, Game Theory, Big Data, and Disaster Management**

Sponsored: Decision Analysis

Sponsored Session

Chair: Jun Zhuang, University at Buffalo, Buffalo, NY

**1 - Game-theoretic Modeling of Pre-disaster Relocation**

Vicki Bier, University of Wisconsin-Madison, 1513 University Avenue, Room 3234, Madison, WI, 53706, United States, Hongru Du, Yuqun Zhou

This talk uses game theory in conjunction with standard exponential discounting to explore strategies by which governments might encourage pre-disaster relocation by residents living in high-risk areas. We find that offering a subsidy (e.g., a partial buyout) can frequently be effective, if government has a lower discount rate than residents. We also present extensions to our model, exploring the use of a fixed annual benefit after relocation (instead of a one-time subsidy), and hyperbolic instead of exponential discounting.

**2 - Capabilities-based Planning for Emergency Preparedness**

Cameron MacKenzie, Iowa State University, Ames, IA, United States, Rohit Suresh

The Federal Emergency Management Agency's (FEMA) National Preparedness System identifies 32 core capabilities for emergency preparedness. State and local agencies must assess how well their organizations are performing in each of those 32 capabilities. However, measuring these capabilities is very difficult and understanding how these capabilities relate to each other is also very challenging. We apply the principles of value-focused thinking and Bayesian belief networks to help states to conduct capabilities-based planning for emergency preparedness.

**3 - Detection of Fake Social Media Postings Following Soft-target Terror Attacks: A Signal Detection ROC Analysis**

Richard S. John, University of Southern California, Dept of Psychology MC 1061, Los Angeles, CA, 90089-1061, United States, Mengtian Zhao

We investigated the ability of individuals to detect false information from actual posts on social media platforms. In 3 experiments manipulating the base rates for false information and the penalty for incorrect classification, US participants viewed Tweets posted shortly after terrorist attacks on soft targets in the US and Europe, and judged the authenticity of information for each post. Using a signal detection framework, participants performed only slightly better than chance, consistent with previous research on lie detection. Respondents were relatively insensitive to manipulation of base-rates and relative error penalties.

**4 - Analyzing, Modeling, and Detecting the Spread of Misinformation on Social Media during Natural Disasters**

Kyle Hunt, Student, University at Buffalo, Buffalo, NY, 14228, United States, Bairong Wang, Jun Zhuang

Our studies investigate the spread of misinformation on social media through big data analysis and mathematical modeling. We implement techniques such as network analysis, sentiment analysis, predictive modeling, and decision modeling to understand the dissemination features of rumor spreading and rumor debunking information across Twitter's network. Results from data analysis show that official debunks from government accounts were very effective in combating the spread of rumors, which can offer valuable insight on the optimal use of such accounts. Results from current studies will show the attitudes and behaviors of Twitter users during times of rumor spreading on Twitter.

**5 - Prepare or Wait? The Marine Forces Reserve Hurricane Decision Simulator**

Eva D. Regnier, Naval Postgraduate School, 555 Dyer Road, Bldg. 330, Room 287, Monterey, CA, 93943, United States, Cameron MacKenzie

After 2012's Hurricane Ivan, the U.S. Marine Forces Reserve (MFR) asked for help with a challenging decision-whether and when to incur up to \$10M in direct cost to prepare for a hurricane that may or may not affect their operations. We worked with Marines and other local officials to understand and model their decision processes and used data analytics to build a storm-simulation model. The result is an online training tool that the MFR has used since 2016. The simulator lets individual users experience decades' worth of storms in a few hours. In team exercises, MFR reports that the HDS training provides a more realistic experience than hand-generated scenarios used previously.

**Energy and Climate II**

Emerging Topic: Energy and Climate

Emerging Topic Session

Chair: Valerie Thomas, Georgia Tech, GA, United States

**1 - Quantification of Technological Uncertainty in Evaluating the Feasibility of Meeting Emission Targets**

Dong Gu Choi, Pohang University of Science and Technology (POSTECH), 77 Chengam-Ro, Nam-Gu, Pohang, Gyeongbuk, 37673, Korea, Republic of, Hansung Kim

Recent studies have considered uncertainty for GHG reductions by using the stochastic programming model for energy systems. The models require values of input parameters in the form of a scenario tree to handle uncertainty. However, only few studies have used quantitative methods to generate scenarios of the future values of technological input parameters. We show that the scenarios of the future values of the technological input parameter for energy system models can also be generated by a quantitative methodology. In addition, we introduce how to quantify the risk for the feasibility of meeting GHG emission targets by incorporating the technological uncertainty.

## 2 - Optimizing the Use of CO2 Bulk Energy Storage for Transmission Deferral

Ramteem Sioshansi, Associate Professor, The Ohio State University, 240 Baker Systems Engineering Building, 1971 Neil Avenue, Columbus, OH, 43210-1271, United States, Jonathan D. Ogland-Hand, Jeffrey M. Bielicki, Ebony S. Nelson, Benjamin M. Adams, Thomas A. Bushcheck, Martin O. Saar

CO<sub>2</sub>-bulk energy storage (CO<sub>2</sub>-BES) can store electricity by compressing and injecting CO<sub>2</sub> into the subsurface. Electricity is discharged by producing geothermally-heated CO<sub>2</sub> and converting that heat into electricity. We investigate the value that CO<sub>2</sub>-BES may have for transmission line deferral when electricity that is generated from a Class 5 wind resource in Wyoming is sold to a high-demand location in California. Results suggest that CO<sub>2</sub>-BES can increase revenue with less transmission capacity and can have value for transmission deferral, especially if revenue is earned for storing CO<sub>2</sub>.

## 3 - Sociotechnical Network Analysis for Power Grid Resilience in South Korea

Daniel Eisenberg, Arizona State University, 1828 Menerini Place, Martinez, CA, 94553, United States, Thomas Seager, Jeryang Park

Critical infrastructure resilience depends on the functionality of technical components and the actions taken by people to adapt to surprise. Here, we study how social and technical networks influence each other by linking a network model of blackout management in South Korea to a corresponding electric power grid network. Results show that Korean power companies receiving equivalent treatment in emergency management protocols are affected by blackouts in markedly different ways. Also, the comparison between static and time-variant analyses indicate that the roles of organizations shift depending on methods used.

## Computational Problems Related to Optimal Power Flow

Sponsored: Energy, Natural Res & the Environment/Electricity

Sponsored Session

Chair: Andy Sun, Georgia Institute of Technology, Atlanta, GA, 30312, United States

## 1 - A Stability-constrained Optimization Framework for Nonlinear Systems with Applications in Power Grids

Qifeng (Evan) Li, MIT, Cambridge, MA, United States

This talk will present a steady-state optimization framework for nonlinear control systems with their dynamic stability taken into account. Generally, the dynamics of a control system is captured by a set of differential-algebraic equations (DAEs). Adding the DAEs to the steady-state optimization framework as constraints results in a DAE-constrained problem. An existing mature approach for solving the DAE-constrained optimization problems is the “discretize-then-optimize” method. However, it is not suit for solving the DAE-constrained problems in large-scale systems. Differently, the proposed approach estimates the stability region based on a convex Lyapunov function and projects it onto the steady-state domain as algebraic constraints on the control variables of the steady-state optimization problem. The proposed stability-constrained optimization framework can be applied to many types of nonlinear systems, such as Lur’e, polynomial, and non-polynomial systems. In this talk, I will illustrate the idea of the proposed approach based on an application scenario in power grids, which can be formulated as Lur’e systems. The construction of convex Lyapunov functions for Lur’e, polynomial, and non-polynomial systems will also be discussed respectively.

## 2 - Joint State Estimation and Sparse Topology Error Detection for Nonlinear Power Systems

SangWoo Park, UC Berkeley, Berkeley, CA, United States, Reza Mohammadi-Ghazi, Javad Lavaei

This paper proposes a new technique for robust state estimation (SE) in the presence of a small number of topological errors for power systems modeled by AC power flow equations. The developed method leverages the availability of a large volume of SCADA measurements and minimizes the L1 norm of nonconvex residuals augmented by a nonlinear, but convex, regularizer. We show that under mild conditions, the solution obtained by the designed estimator identifies a small subgraph of the network that can be used to find topological errors in the model. Furthermore, we develop a theoretical upper bound on the SE error. The efficacy of the method is demonstrated through numerical simulations on IEEE test systems.

## 3 - Matrix Completion Embedded PDIP Method for SDP Relaxation of Large-scale OPF Problems

Na Li, Harvard University, 33 Oxford Street, MD 147, Cambridge, MA, 02138, United States, Rui Li, Shengwei Mei

Semidefinite programming (SDP) relaxation has been used to solve nonconvex OPF problems. Bottlenecks in solving large-scale SDP with primal-dual interior-point (PDIP) method primarily exist in matrix multiplication, Cholesky

factorization, and eigenvalue decomposition. We revamp the traditional PDIP method by embedding a sparse clique-factorization MC during each PDIP iteration. The MC method avoids substantial consensus equality constraints associated with the existing approaches and is more flexible to be performed in a parallel fashion. Numerical experiments demonstrate the effectiveness of our approaches.

## 4 - Robust Decentralized Secondary Frequency Control in Power Systems: Merits and Trade-Offs

Changhong Zhao, National Renewable Energy Laboratory, Lakewood, CO, 80401, United States, Erik Weitenberg, Yan Jiang, Enrique Mallada, Claudio De Persis, Florian Dörfler

Frequency restoration in power systems is conventionally performed by broadcasting a centralized signal to local controllers. As a result of the energy transition, technological advances, and the scientific interest in distributed control and optimization methods, a plethora of distributed frequency control strategies have been proposed recently that rely on communication amongst local controllers. In this paper we propose a fully decentralized leaky integral controller for frequency restoration that is derived from a classic lag element. We study steady-state, asymptotic optimality, nominal stability, input-to-state stability, noise rejection, transient performance, and robustness properties of this controller in closed loop with a nonlinear and multivariable power system model. We demonstrate that the leaky integral controller can strike an acceptable trade-off between performance and robustness as well as between asymptotic disturbance rejection and transient convergence rate by tuning its DC gain and time constant. We compare our findings to conventional decentralized integral control and distributed averaging-based integral control in theory and simulations.

## ■ MA45

## Joint Session ENRE/Practice Curated: Power Systems Analytics

Sponsored: Energy, Natural Res & the Environment/Electricity

Sponsored Session

Chair: Shmuel S. Oren, University of California-Berkeley, Berkeley, CA, 94720-1777, United States

Co-Chair: Georgios Patsakis, University of California Berkeley, University of California Berkeley, Berkeley, CA, 94702, United States

## 1 - An Oligopoly Power Market Model in Presence of Strategic Prosumers

Sepehr Ramyar, University of California-Santa Cruz, Santa Cruz, CA, United States, Yihsu Chen

We investigate the formation of wholesale power prices in presence of strategic prosumers and analyze how the unconventional behavior of agents capable of consumption and generation at the same time can impact wholesale power markets. In this study, the price is determined endogenously by strategic prosumers along with other market participants. We study the behavior of prosumers under price-taking assumption and then contrast it with results from Cournot oligopoly with strategic prosumers. We discuss and report the results of price and social surplus implications.

## 2 - Sequential Pricing and Intermittent Supply in Electricity Markets with Heterogeneous Traders

Derck Koolen, Rotterdam School of Management, Chris Bennekerslaan 29Q, Rotterdam, 3061EB, Netherlands, Wolfgang Ketter, Liangfei Qiu, Alok Gupta

Motivated by the ongoing integration of renewable energy sources, we analyze sequential market pricing in short-term electricity markets with producers operating under heterogeneous constraints. We propose a multi-stage competitive equilibrium model to analyze retailers and heterogeneous producers’ optimal sequential trading. The simulated value of flexibility, indicating a first-mover advantage, is validated empirically for different countries.

## 3 - Comparison of Tools to Address Profound Uncertainty in Power Systems

Evangelia Spyrou, Johns Hopkins University, 3400 N. Charles Street, Geography and Environmental Engineer, Baltimore, MD, 21218, United States, Benjamin Field Hobbs

Many tools have been developed to aid decision making under uncertainty. However, most power system analyses tend to use a single particular tool such as stochastic programming or robust optimization. Here, we critically review available tools including Robust Decision Making, which is widely used by the climate change adaptation community, and discuss their strengths and weaknesses. We investigate both theoretical properties of the tools and their practical performance through examples drawn from World Bank studies of climate and conflict risks.

#### 4 - A Bound Strengthening Method for Optimal Transmission Switching in Power Systems

Salar Fattahi, University of California-Berkeley, Berkeley, CA, 94702, United States, Javad Lavaei, Alper Atamturk

This paper studies the optimal transmission switching (OTS) problem for power systems. Most of the existing methods for the problem are based on first converting the OTS into a mixed-integer linear program (MILP) or quadratic program (MIQP), and then iteratively solving a series of its convex relaxations. In this work, it is shown that finding the strongest big-M inequalities to be used in an MILP or MIQP formulation of the OTS is NP-hard. Despite the difficulty of obtaining the strongest bounds in general, a simple bound strengthening method is presented to strengthen the convex relaxation of the problem. Remarkable improvements in the performance of the solvers are achieved compared to other methods.

#### The Water-Energy-Food Nexus

Sponsored: Energy, Natural Res & the Environment/Energy

Sponsored Session

Chair: Alexandra M. Newman, Colorado School of Mines, Golden, CO, 80401, United States

##### 1 - Designing River Basin Storage using Optimization

Andy Burrow, Colorado School of Mines, Golden, CO, 80401, United States, Alexandra M. Newman

The ways in which a growing population increases hydrologic demand are often evaluated using simulation models. This research uses data produced by the State of Colorado's Stream Simulation Model as input to an optimization model to determine the flow of unappropriated water so as to minimize the cost of water shortage mitigation while adhering to constraints that force the physical and topographical structures of the river. Solutions combine upstream pumping and new storage in existing reservoirs, as well as storage in new surface and subsurface reservoirs.

##### 2 - Integrated Modeling of Food-energy-water Nexus in Ethiopia

Siram Sankaranarayanan, Johns Hopkins University, Baltimore, MD, United States, Ying Zhang, Jess Carney, Benjamin Zaitchik, Sauleh Ahmad Siddiqui

We present an integrated partial equilibrium model to understand the effects of interventions to improve food, energy, and water security in Ethiopia. We have a food model, which computes the equilibrium land allocated for various crops, and details of the food supply chain each year. This is coupled with an energy model, which models power generation, transmission and consumption. These models are coupled through prices and quantities along their supply chains. The model can be used to assess shifts in welfare under various policies. We run the model under improved irrigation capabilities, which might reduce power generation from hydel plants and understand the difference in welfare.

##### 3 - Optimizing Water Distribution Operation for Providing Energy Demand Flexibility

Konstantinos Oikonomou, University of Utah, Salt Lake City, UT, United States, Masood Parvania

This talk will present a model to optimize the operation of water distribution systems (WDSs) for providing energy flexibility to power systems operation. The proposed model optimizes the operation of pumps and tanks for minimizing the operation cost of WDS, given the expected water demand and electricity prices of the next day. The proposed model then calculates and offers the feasible flexible energy capacity of WDS to the power system operator. The proposed model takes into account the hydraulic operating constraints of water networks, thus ensuring deliverability of the WDS energy flexibility.

##### 4 - Optimal Control of a Single Wave-energy Converter

Mertcan Yetkin, Lehigh University, Bethlehem, PA, United States, Frank E. Curtis, Lawrence V. Snyder, Sudharsan Kalidoss

This research proposes a generic optimal control formulation for a single wave-energy converter (WEC) from an operations research perspective. Our model adds hard and soft constraints on the motion of the WEC in order to promote safe operation of the device. The hydrodynamic coefficients of the system are estimated using simulation. The resulting problem is formulated as a quadratic program (QP) with a non-convex objective function. We demonstrate the trade-off between the safe operation of the device and the power generated. Finally, the optimal control policy is compared to some classical control strategies to illustrate the improvement in the performance.

#### Joint Session Tutorial/HAS: Optimization of Sequential Decision Making for Chronic Diseases: From Data to Decisions

Emerging Topic Session

Chair: Esma S. Gel, Arizona State University, School of Computing, Informatics and, Decision Systems Engineering, Tempe, AZ, 85287-8809, United States

##### 1 - Optimization of Sequential Decision Making for Chronic Diseases: From Data to Decisions

Brian T. Denton, University of Michigan, University of Michigan, Ann Arbor, MI, 48109-2117, United States

Rapid advances in medical interventions for chronic diseases such as cardiovascular disease, cancer, and diabetes have made it possible to detect diseases at early stages and tailor treatment pathways to individual patients based on their risk factors including gender, race/ethnicity, and disease-specific factors. However, the large number of relevant risk factors to be considered, combined with uncertainty in future health outcomes and treatment side effects, makes optimizing these decisions challenging. Randomized trials are the gold standard for selecting treatment interventions but the large number of possible decisions and their high cost makes these trials infeasible. Data-driven operations research methods are showing great promise in helping patients and medical doctors improve decisions about health interventions. Observational data that is now routinely collected in many health systems is a valuable resource for fitting and validating stochastic models for chronic diseases. Moreover, optimization methods for sequential decision making, including Markov decision processes, partially observable Markov decision processes, and reinforcement learning methods, exploit these models to optimize treatment policies that can balance competing criteria such as the harms and benefits associated with treatment of chronic diseases. This tutorial provides an introduction to some of the most commonly used approaches for using raw data for the purpose of optimizing sequential treatment policies. Special attention is paid to the challenges associated with using observational data and the influence of model parameter uncertainty in this context.

#### Empirical Research in Sustainability

Sponsored: Energy, Natural Res & the Environment Environment & Sustainability

Sponsored Session

Chair: Kejia Hu, Vanderbilt University, Nashville, TN, 37215, United States

##### 1 - An Analysis of Time-based Pricing in Retail Electricity Markets

Asligul Serasu Duran, Haskayne School of Business, University of Calgary, Calgary, AB, Canada, Baris Ata, Ozge Islegen

We empirically evaluate the short-term effects of time-based tariffs on the electricity demand, consumer welfare, retailers and the environment. We find that focusing on the peak-load reduction, one can design a flexible time-of-use (TOU) tariff that is simple and predictable yet performs as well as real-time pricing (RTP) given a fixed time horizon for evaluation. The annual electricity bills of consumers decrease only slightly after switching to time-based tariffs, but there can be significant volatility in month to month bills. In contrast, retailers see less volatility in their profits under more flexible tariffs. The environmental impact depends on the electricity market under study.

##### 2 - Retailer Strategies to Encourage Reduced Packaging Adoption

Olga Pak, 105 Carolina Ridge Drive, Columbia, SC, 29229, United States, Michael Galbreth, Mark Ferguson

For manufacturers, the reduction of product packaging is associated with marketing/product positioning risks, like diminished product visibility and lower perceived value. In this paper, we explore the tools retailers can use to mitigate such concerns, and, thus, convince manufacturers to make packaging more operationally efficient and sustainable.

### 3 - A Free Environmental Lunch? The Impact of Environmental Management Systems on Energy Efficiency

Seongkyoon Jeong, Arizona State University, Tempe, AZ, United States, Lee Jaeseok

This study employs novel panel data on energy efficiency obtained from 2,728 South Korean plants operating between 2001 and 2014. We find that the adoption of ISO 14001, the representative environmental management standard, decreases energy efficiency by approximately 4%. The results suggest two main mechanisms through which EMS adoption reduces energy efficiency: 1) the installation of additional facilities for environmental management and 2) intensified environmental management activities. These findings suggest that EMS adoption inevitably produces additional environmental cost. More importantly, we find that this additional cost can be reduced through organizational learning.

### 4 - Are Hazardous Substance Rankings Effective?

Basak Kalkanci, Georgia Institute of Technology, Atlanta, GA, 30339, United States, Wayne Fu, Ravi Subramanian

We empirically investigate the relationship between changes in the relative assessed hazard levels of chemicals and emissions reductions (including the use of source reduction and end-of-pipe treatment) by facilities that use these chemicals. We also examine the moderating effects of operational leanness - an attribute that prior studies have found to be associated with better environmental performance - in the setting wherein the relative assessed hazard levels of chemicals change over time.

### Optimization and Systems Engineering Methods in Petrochemicals and Energy II

Sponsored: Energy, Natural Res & the Environment/Natural Resources Petrochemicals

Sponsored Session

Chair: Yifu Chen, University of Wisconsin-Madison, Madison, WI, United States

#### 1 - Infeasibility Resolution for Multi-purpose Batch Process Scheduling

Apurva Samudra, Rockwell Automation, Austin, TX, United States, Yash Puranik, Nikolaos Sahinidis, Alexander B. Smith, Bijan Sayyar-Rodsari

We present a systematic approach for infeasibility diagnosis focusing on scheduling problems. Our approach exploits the known structure of scheduling models to isolate interpretable infeasible sets of constraints. We demonstrate the power of the algorithm on infeasible instances of the Westenberger-Kallrath multipurpose batch process modeled using a state-task network (STN) representation. The methodology presented in the paper is able to successfully analyze the cause of infeasibility and provide recommendations for resolving it. We demonstrate how these insights and recommendations can be presented to scheduling operators in an intuitive manner.

#### 2 - Accounting for the Automation System when Scheduling Chemical Plant Operations

Blake C. Rawlings, The University of Michigan, Ann Arbor, MI, 48109, United States, Venkatachalam Avadiappan, Stéphane Lafortune, Christos T. Maravelias, John M. Wassick

Scheduling of chemical plant operations often involves solving an optimization problem, e.g., to maximize throughput. An approximate plant model is typically used to address industrial-scale problems. This introduces the possibility that the resulting schedule is not actually feasible, i.e., it could not be executed in the plant. We present a method based on analyzing a detailed model of the plant's automation system to detect such infeasible schedules. In this case, the scheduling problem can then be solved again with additional constraints to avoid the infeasible schedule. Symbolic model checking is used to perform the analysis of the detailed model.

#### 3 - Mathematical Optimization Based Approaches for the Design of Materials in Energy Applications

Chrysanthos Gounaris, Carnegie Mellon University, Doherty Hall 3107, Dept of Chemical Engineering, Pittsburgh, PA, 15213, United States, Christopher H. Hanselman, Natalie M. Isenberg

Energy process systems rely on the performance of advanced materials that serve as catalysts of chemical reactions or as separators of chemical species. Many of these materials are crystalline in nature, and derive their functionality from the precise placement of atomic building blocks in well-defined lattice positions. In turn, this gives rise to a discrete design space that can be suitably modeled and explored as a mixed-integer optimization problem to identify materials that are nanostructured to perform optimally in given energy-related contexts. Several case studies towards the design of metallic and metal-oxide surfaces, nanoparticles and bulk materials are discussed.

### 4 - An MIP Model and Rolling Horizon Approach for Strategic Shale Gas Development

Nathan D. Blandino, EQT Corporation, Pittsburgh, PA, United States, Markus Gustav Drouven

In this work we address the long term shale gas development problem which involves determining the optimal development strategy for drilling and fracturing gas wells, and producing through a constrained pipeline system. The problem is formulated as a large-scale MIP with a solution strategy that decomposes the problem temporally through a rolling horizon approach in order to extend the overall planning horizon while yielding near optimal solutions. The model and solution approach were developed by the Optimization Engineering department at EQT Corporation, a shale gas developer and the largest producer of natural gas in the United States.

### Contemporary Scheduling

Emerging Topic: Project Management and Scheduling, in Memory of Joe Leung,

Emerging Topic Session

Chair: Emrah Cimren, Starbucks, Seattle, WA, 98029, United States

#### 1 - Efficient Approaches for Data-driven Appointment Scheduling

Tugce Gurek, University of California-Berkeley, Etcheverry Hall, Berkeley, CA, 94702, United States, Philip Kaminsky

We consider a stochastic appointment scheduling problem minimizing the expected deviation from the schedule. We develop a sequencing heuristic that directly uses historical data about task duration rather than making distributional assumptions, and analyze worst-case performance of this heuristic. Given this sequence, we develop an algorithm to set the start time of each task.

#### 2 - Efficient Optimization of Energy Costs

Marc E. Posner, Ohio State University, 296 Baker Systems Engineering, 1971 Neil Avenue, Columbus, OH, 43210-1271, United States, Nicholas G. Hall

While scheduling of computer or manufacturing systems can effectively improve energy efficiency, minimizing total energy cost is more difficult under time-of-use tariffs. We study a production problem with discretely variable speeds, where energy usage increases with speed. We describe a strongly polynomial algorithm when tasks arrive at known times within the planning horizon. We also show that a polynomial time algorithm is unlikely to exist for many generalizations of our problem.

#### 3 - A Framework for Fashion Retail Planning

Emrah Cimren, Starbucks, 2401 Utah Ave South, Seattle, WA, 98134, United States

Fashion retailers offer variety of new products and styles at the start of every season and force to clear out stores for the new merchandise by end of the season. Retail planning is a challenging process since every product comes in different styles, colors, and sizes which increase number of stock keeping units exponentially. This talk presents an optimization framework for fashion retail planning. Main objective is to offer right quantity of the right merchandise in the right place at the right time to meet financial goals.

#### 4 - A Parallel Machine Scheduling Problem with Release Dates, Equal Processing Times, and Eligibility Constraints

Kangbok Lee, Associate Professor, POSTECH, 77 Cheongam-Ro, Nam-Gu., POSTECH, Industrial & Management Engineering, Pohang, 37673, Korea, Republic of, Juntaek Hong

We consider a problem of scheduling independent jobs on parallel machines to minimize the total completion time. Each job has a given release date and a set of eligible machines, and all jobs have equal processing times. For the problem with a fixed number of machines, we show its computational complexity of the problem by providing a polynomial time dynamic programming algorithm. For the problem with an arbitrary number of machines, we propose approximation algorithms and they are evaluated by worst-case analysis and numerical experiments.

#### 1 - Market Sensing from User Review for Product Management

Ujjal Kumar Mukherjee, Assistant Professor, University of Illinois, Urbana-Champaign, 306 Wohlers Hall, 1206 South Sixth Street, Champaign, IL, 61820, United States

In this paper, we use social media data on customer reviews to understand how firms can use this data to sense market reaction to their products and services. We use sentiment analysis and text analysis on customer feedback to show that customer sentiment significantly predicts future market share of products. We also compare and contrast several methods of customer feedback analysis.

#### 2 - Similarity in the Crowd(funding): How Funder and Backer Affinity Contributes to Crowdfunding Choices

Lauren Rhue, Wake Forest University, 1834 Wake Forest Rd, 212 Farrell Hall, Building 60, Winston-Salem, NC, 27106, United States, Jessica M. Clark, Lauren Dahlin

Using Kickstarter data, we capture funder and backer attributes to examine whether they share similar characteristics and whether those similarities shape the propensity to contribute to particular projects. We also examine project similarity to uncover whether backers give to projects in particular categories or communities.

#### 3 - Unsupervised Dimensionality Reduction vs. Supervised Regularization for Classification from Sparse Data

Jessica Clark, University of Maryland, College Park, MD, United States, Foster Provost

There is consensus among existing guidelines that supervised regularization is superior to unsupervised Dimensionality Reduction (DR) techniques for mitigating overfitting in predictive modeling; however, these guidelines do not take into account that the two types of techniques are often used in conjunction. Many published studies using DR for applied data mining fail to compare performance using the original feature set. We experimentally compare binary classification performance using DR features versus original features under numerous conditions, and find that generally, DR does not add value beyond supervised regularization, and can even diminish performance.

#### 1 - Learnability and Models of Decision Making under Uncertainty

Pathikrit Basu, California Institute of Technology, 1633, Amberwood Drive, South Pasadena, CA, United States, Federico Echenique

We study whether some of the most important models of decision-making under uncertainty are uniformly learnable, in the sense of PAC (probably approximately correct) learnability. Many studies in economics rely on Savage's model of (subjective) expected utility. The expected utility model is known to predict behavior that runs counter to how many agents actually make decisions (the contradiction usually takes the form of agents' choices in the Ellsberg paradox).

#### 2 - Learning and Efficiency in Games with Dynamic Population

Thodoris Lykouris, PhD Candidate, Cornell University, 107 Hoy Road, Gates 336, Ithaca, NY, 14853, United States, Vasilis Syrgkanis, Eva Tardos

We study multi-player game settings (such as online advertising, internet routing, and bandwidth allocation) where the player set is dynamically evolving over time and participants use some learning algorithms to adapt to the changing environment. Traditional equilibrium notions require too much information for the players since they need to form perfect beliefs about the behaviors of others and do not extend to dynamic settings. In contrast, we show that, under the learning behavioral assumption, players reach outcomes of high quality (measured by the social welfare) even when there is a high churn in the population.

#### 3 - Selling to a No-regret Buyer

Jieming Mao, Princeton University, Princeton, NJ, United States, Mark Braverman, Jon Schneider, Matt Weinberg

We consider the problem of a single seller repeatedly selling a single item to a single buyer (specifically, the buyer has a value drawn fresh from known distribution  $D$  in every round). Prior work assumes that the buyer is fully rational and will perfectly reason about how their bids today affect the seller's decisions tomorrow. In this work we initiate a different direction: the buyer simply runs a no-regret learning algorithm over possible bids. We provide a fairly complete characterization of optimal auctions for the seller in this domain.

#### 4 - Optimal Data Acquisition for Statistical Estimation

Juba Ziani, California Institute of Technology, Pasadena, CA, United States, Yiling Chen, Nicole Immorlica, Brendan Lucier, Vasilis Syrgkanis

We consider a data analyst's problem of purchasing data from strategic agents to compute an unbiased estimate of a statistic of interest. Agents incur private costs to reveal their data and the costs can be arbitrarily correlated with their data. We design an individually rational and incentive compatible mechanism that optimizes the worst-case (over the unknown correlation between costs and data) mean-squared error of the estimation, subject to a budget constraint. We give the optimal mechanism in closed-form. We extend our results to acquiring data for estimating a parameter in regression analysis, where private costs can only correlate with the values of the dependent variable.

### Leveraging Human Intelligence Alongside Analytical Models

Sponsored: Behavioral Operations Management

Sponsored Session

Chair: Blair Flicker, University of Texas-Dallas, Richardson, TX

#### 1 - Managerial Insight and "Optimal" Algorithms

Blair Flicker, University of Texas-Dallas, Richardson, TX, 75208, United States

Stylized models omit many real-world phenomena, and such model misspecification degrades the performance of "optimal" policies in practice. By accounting for unmodeled dynamics, human managers can improve decision making. I formalize "managerial insight" (noisy signal of demand observable only by humans) and apply it to the newsvendor setting. With superior demand information, human newsvendors should improve profits, but experiments reveal costly suboptimal ordering. I recast the newsvendor task as a forecasting task and develop an algorithm to convert forecasts to orders. In the lab, this human-machine hybrid approach consistently outperforms either humans or machines operating alone.

#### 2 - Can We Improve Analytical Models through Judgement and Local Information

Han Oh, Texas A&M University, College Station, TX, 77843, United States, Rogelio Oliva

Using data from a large retailer, we identify the triggers for managers modifying re-stocking order recommendations from a centralized information system and evaluate the performance of such modifications. Our analysis shows that local managers do have local information that adds value to the overall decision making - thereby improving the performance of a centralized information system.

#### 3 - When Models Meet Managers: Integrating Judgmental and Statistical Model-Based Forecasting

John Aloysius, University of Arkansas, Supply Chain Management Department, Wcob 204, Fayetteville, AR, 72701, United States, Enno Siemsen, Rebekah Brau

Technology-enabled big data analytics and machine learning is increasingly a feature of forecasting in practice. However, practitioners continue to use judgment to incorporate private information to improve the accuracy of forecasts generated by statistical models. Our research examines how statistical models and human judgment may be integrated to improve forecast accuracy in different forecasting environments.

#### 4 - A Structured Solution of Prescriptive Analytics: Theory and Experiment

Justin Jia, Purdue University, West Lafayette, IN, United States,  
Elena Katok

Prescriptive analytics problem is when a decision maker solves an optimization problem with uncertainty without knowing the distribution of the random variables, but has a sample. Our insight is that we show that the decision, which is a high-dimensional function of the sample, can be reduced to a simple single-dimensional function of a sufficient analytic statistic. We report on a controlled laboratory experiment with human subjects, and show that behavior qualitatively matches theoretical predictions.

#### He for She: What Does it Mean for Us at INFORMS

Sponsored: Women in OR/MS (WORMS)

Sponsored Session

Chair: Dorothee Honhon, University of Texas at Dallas, Richardson, TX, 75080, United States

Co-Chair: Margarit Khachatryan, MagAnalytics, Bridgeton, MO, 63044, United States

##### 1 - Moderator

Margarit Khachatryan, Founder, MagAnalytics, St. Louis, MO, 63044, United States

In this panel session, a group of influential male speakers will discuss how we can best support women in OR/MS. They will share their experiences working with/for female colleagues, and supervising/mentoring them. They will discuss family-focused, anti-discrimination and sexual harassment institutional policies and share tips on how to make our work places a friendly and safe environment for women and other minorities.

##### Panelists

Rohit Verma, NY, United States

Anton Ovchinnikov, Queen's School of Business, 143 Union Street, Kingston, ON, K7L 3N6, Canada

Richard G. McGrath, United States Naval Academy, Annapolis, MD, United States

Rishabh Bhandawat, University at Buffalo, 25HA Creekside Village, Buffalo, NY, 14261, United States

Leon McGinnis, Georgia Institute of Technology, Isye Dept, 755 Ferst Drive, Atlanta, GA, 30332-0205, United States

Gregory James King, GAP, San Francisco, CA, United States

#### Joint Session DM/HAS: Patient-Centered Health Care

Sponsored: Health Applications

Sponsored Session

Chair: Guihua Wang, Ann Arbor, MI, 48105, United States

##### 1 - Driving Personalized Health Care through Heterogeneous Data Analysis

Guihua Wang, Ross School of Business, University of Michigan, 701 Tappan Street, Ann Arbor, MI, 48105, United States, Jun Li, Wallace J. Hopp

This study addresses the challenges of generating patient-centric outcome information. Using patient-level data from thirty-five hospitals for six cardiovascular surgeries in New York State, we identify patient groups that exhibit significant differences in outcomes with a new instrumental variable tree approach. We find that outcome differences between hospitals are heterogeneous not only across procedure types, but also along other dimensions such as patient age and comorbidities. We illustrate how patient-centric information can help patients make more informed decisions, payers enhance pay-for-performance programs, and providers target quality improvement efforts.

##### 2 - An Analytics Approach to Predicting Treatment Effectiveness: Inter-hospital Transfer of Heart Attack Patients

Susan F. Lu, Purdue University, Krannert 441, West Lafayette, IN, 47907, United States, Qi Feng, George Shanthikumar

Healthcare regionalization is an important topic for the on-going healthcare reform. In this study, we integrate healthcare domain knowledge based structural model into data analytics and apply the method to study the inter-hospital

transfer of heart attack patients. We developed a two-stage support vector machine model to identify heart attack patients who need to be transferred immediately given the limited revascularization resources. Our recommendation performed far better than physicians' decisions in terms of expected lives saved.

##### 3 - Managing the Portfolio of Elective Surgical Procedures

Hessam Bavafa, Wisconsin School of Business, 4284C Grainger Hall, 975 University Avenue, Madison, WI, 53706, United States, Sergei Savin, Lerzan E. Ormeci

We consider the problem of allocating daily hospital service capacity among several types of elective surgical procedures. Our focus is on the interaction between two major, constraining hospital resources: operating room and recovery bed capacity. In our model, each type of surgical procedure has an associated revenue, stochastic procedure duration, and stochastic length-of-stay (LOS). We consider arbitrary distributions of procedure and LOS durations and derive a two-moment approximation for the total procedure duration and the daily number of occupied beds for a given portfolio of procedures.

##### 4 - Using Episodes of Care to Examine Mental Healthcare Quality

Jayakanth Srinivasan, Questrom School of Business, Boston, MA, United States

Episodes of care are useful for integrating the discrete, itemized world view obtained from traditional healthcare utilization data. In this paper, we show how care trajectories can be constructed for Soldiers using de-identified data, and calculate gross measures of resource utilization in the outpatient and inpatient settings at two Army hospitals. I compare two approaches for constructing episodes of mental healthcare within these care trajectories, the first using only administrative data, and the second incorporating heuristics obtained from field research on health systems operations. The approaches developed in this paper provide a new lens for examining quality and patient safety.

West Bldg 101B

#### Emergency Management

Sponsored: Health Applications

Sponsored Session

Chair: Douglas R. Bish, Virginia Tech, Blacksburg, VA, 24061, United States

Co-Chair: Paul Bartholomew, VA, United States

##### 1 - Multi-class Casualties Distribution in Mass Casualty Incidents

Zheqi Zhang, University of North Carolina, Chapel Hill, NC, United States

We study the patient distribution problem in the mass casualty incidents aims to maximize the expected number of survivors. Our Markov decision process(MDP) model assumes patients triaged into two classes distinguished by survival probabilities and medical needs. The decision is to prioritize and distribute patients by limited ambulances to hospitals with different capabilities and capacities. We explicitly modeled the ED and operating room capacities to capture the possible congestion. Base on this MDP formulation, we propose heuristic policies and employ discrete-event simulations to demonstrate the benefits of using the proposed heuristics against benchmark policies from practice.

##### 2 - Coordinating Regional Response to a Mass-casualty Incident

Paul Bartholomew, Virginia Tech, Blacksburg, VA, 24060, United States, Douglas R. Bish, Behrooz Kamali

We study optimally coordinating the response to a mass-casualty incident. An effective response requires coordination of several entities including first responders and hospitals in the region. We develop a model that determines the service order for the casualties and hospital assignment, given hospital and transportation resources. The objective of the model is to maximize the total survival probability using a novel function that accounts for type of the casualty, travel distance, and receiving hospital's quality of care. We compare the results from our model to common real-world policies and relevant studies in the literature and analyze the performance under various resource settings.

##### 3 - Emergency Preparedness and Response for Mass Gatherings

Mohammadreza Torkjazi, Graduate Research Assistant, West Virginia University, Morgantown, WV, United States, Behrooz Kamali

A mass gathering (MG) is an event where a large crowd gathers. This creates a risk of delayed and/or limited response to emergencies. In this research, we propose a framework to quantify and measure this risk by identifying factors affecting the risk and classify them into multiple categories. Then, using "controllable" factors in each category, we develop a mathematical model to minimize the risk exposure to casualties by improving the flow of response. We present several case studies to demonstrate the effectiveness of our approach and analyze its sensitivity to various factors.

#### 4 - Patient Admission Decision at Emergency Department under Mass Casualty Incident

Taesik Lee, KAIST, 291 Daehak-ro, Yuseong-gu, Daejeon, Korea,  
Republic of, Hyun-Rok Lee

In the aftermath of a mass casualty incident, an emergency department (ED) may divert less critical patients to preserve its resources for possible future arrivals of more critical ones. Justification for the diversion is to increase the overall expected survival of the entire casualties. When this decision making is a challenge for a single ED case, multiple ED environment makes it even more difficult. We formulate the problem as a decentralized partially observable MDP model, where individual EDs make a diversion decision with only partial information on other EDs' state. Heuristic solution techniques to approximately solve the model are presented and compared for their performance.

#### Operations Research for Medical Decision Making

Sponsored: Health Applications

Sponsored Session

Chair: Brian T. Denton, University of Michigan, Ann Arbor, MI, 48109-2117, United States

Co-Chair: Lauren N. Steimle, University of Michigan, Ann Arbor, MI, 48105, United States

#### 1 - Robust Personalized Treatment Selection for Partially Observable Chronic Conditions

Jue Gong, University of Washington, Seattle, WA, 98115,  
United States, Shan Liu

For many chronic diseases, an individual patient may experience many progression pathways. Developing a personalized treatment plan is a difficult sequential decision-making problem. The natural stochasticity of the disease progression makes the estimation of the disease model difficult, and inaccurate model reduces the performance of the treatment selection strategy. We will develop novel approaches for modeling the uncertainties in individual disease progression and finding the robust POMDP policy optimal for individual patients. A data-driven method to construct or calibrate the uncertainty set is required to guarantee the effectiveness of the individualized robust policy.

#### 2 - Ovarian Cancer Prevention and Risk Reduction:

##### A Model-based Analysis

Julia L. Hagle, University of Southern California, University Park  
Campus, GER 240B, Los Angeles, CA, 90089-0193, United States,  
Jing Voon Chen

Recent studies indicate the existence of fallopian tube lesions as a precursor to serous ovarian cancer, the most aggressive form of ovarian cancer. This suggests an opportunity for prevention of serous ovarian cancer through surgical removal of the fallopian tubes (salpingectomy). Using a model of ovarian cancer that is differentiated by patient risk (i.e., genetic mutation status) and ovarian cancer sub-type, we examine the potential impact of prophylactic salpingectomy.

#### 3 - Behavioral Intervention Design using Precision Analytics

Yonatan Mintz, UC Berkeley, Berkeley, CA, United States,  
Anil Aswani, Philip Kaminsky, Elena Flowers, Yoshimi Fukuoka

In this talk, we describe a precision analytics framework that uses patient data to effectively design personalized weight loss interventions. Our framework utilizes a utility maximization model for patient behavior which combined with integer programming and Bayesian prediction allows us to create several personalized interventions, as well as aggregate these interventions into a cohort weight loss program. We then present clinical trial and simulation results which show that our method maintains efficacy while potentially reducing the associated person hours and cost of the intervention.

#### 4 - Two-step Markov Process Methodology for Parameterizing Cancer State Transitions in Limited-data Settings

Chaitra Gopalappa, University of Massachusetts Amherst, 160  
Governors Dr, Amherst, MA, 01003, United States, Guo Jiachen,  
Prashant Meckoni, Buyannemekh Munkhbat, Carel Pretorius,  
Jeremy Lauer, Andre Ilbawi, Melanie Bertram

Among all premature deaths from non-communicable diseases (NCDs) reported globally, 90% occurred in low and middle income countries. To address this burden, the WHO-CHOICE analyses developed a map of the 'Best Buy' interventions to update the Global NCD Action Plan for 2013-2020. The evidence for 'Best Buys' were based on model predictions of cost-effectiveness of alternative intervention scenarios. Our team developed models and predictions for 3 types of cancers, breast cancer, colorectal cancer, and cervical cancer, including a new methodology for parameterizing a natural history model for countries where longitudinal cancer registry databases are not available. We will present this work.

#### Teams in Healthcare Delivery

Sponsored: Health Applications

Sponsored Session

Chair: Song-Hee Kim, CA, United States

#### 1 - Collaboration, Interruptions and Changeover Times: Model and Empirical Study of Hospitalist Processing Times

Itai Gurvich, Cornell University, 2 W. Loop Rd, New York, NY,  
10044, United States, Jan A. Van Mieghem, Kevin O'Leary,  
Lu Wang

Collaboration may lead to interruptions. Task switching can introduce changeover times when resuming the preempted task and thus can increase total processing time. We analyze and quantify how collaboration, through interruptions and discretionary changeovers, affects total processing time. We introduce an episodic workflow model that captures the interruption and discretionary changeovers dynamics—each switch and the episode of work it preempts—present in settings where collaboration and multitasking is paramount. We then deploy the model in a field study of hospital medicine physicians—"hospitalists" to estimate the total changeover time they incur.

#### 2 - Learning from Many: Partner Exposure and Team Familiarity in Fluid Teams

Jonas Oddur Jonasson, MIT Sloan School of Management, 30  
Memorial Drive, E62-588, Cambridge, MA, 02142, United States,  
Zeynep O. Aksin Karaesmen, Sarang Deo, Kamalini Ramdas

We use data from London Ambulance Service to study the impact of partner exposure of new paramedics on their operational performance. We find that greater prior partner exposure directly improves performance for an unstandardized process. For a more standardized process, this effect is moderated by a new recruit's total experience. For both processes the effect is more pronounced at times of high workload. We explore the implications of our results for team formation strategies by balancing the benefits of partner diversity with those of team familiarity.

#### 3 - Cross-disciplinary Temporary Teams in Health Care

##### Organizations: The Role of Partner Variety and Shared Experience

Hummy Song, The Wharton School, University of Pennsylvania,  
3730 Walnut Street, 560 Jon M. Huntsman Hall, Philadelphia, PA,  
19104, United States, Song-Hee Kim, Melissa Valentine

We examine how managers can compose temporary teams of cross-disciplinary health care professionals to facilitate team performance. We leverage random team and task assignment in an emergency department to identify the performance effects of shared experience and partner variety as they are accumulated within a shift versus over the longer term among physicians and nurses. We propose easily implementable managerial recommendations. Using simulation, we illustrate that the gains in patient throughput would be substantial, even without increasing staffing levels.

#### 4 - Toward an Effective Design of Preventive Health Care Delivery: Collaboration with Primary Care Providers

Yingchao Lan, Ohio State University, 2100 Neil Avenue,  
Fisher Hall 252C, Columbus, OH, 43210, United States,  
Aravind Chandrasekaran

Chronic diseases are responsible for 70% deaths among Americans each year and around 75% of the nation's health spending. While both practitioners and researchers have recognized the importance to design an effective preventive care delivery system to improve population health and health delivery efficiency, it's still unclear how. This paper addresses this gap by studying how collaboration with primary care providers can improve population health and healthcare delivery efficiency.

Sponsored: Health Applications

Sponsored Session

Chair: Van-Anh Truong, Columbia University, New York, NY, 10027, United States

#### 1 - Continuum of Care for Reducing Readmissions: Balancing Pre- and Post-discharge Efforts

Xiang Liu, University of Michigan, 1205 Beal Ave, Ann Arbor, MI, 48109, United States, Mariel Sofia Lavieri, Jonathan Helm, Ted Skolarus

Hospital readmissions are burdensome and costly. We analytically study, under a Bundled Payment (BP) policy 1) how hospitals balance effort between the inpatient stay stage and the post-discharge stage; and 2) how a public healthcare funder designs a BP policy and readmission penalty program to incentivize hospitals to balance its efforts for readmissions reduction. We develop a novel Strengthen Then Maintain (STM) framework that is generalizable to a set of machine maintenance problems. We uncover novel managerial insights for the design of BP policies and readmission penalty programs.

#### 2 - Optimizing Discharge Decisions in a Hematology Ward

Mor Armony, New York University, 44 West 4th Street #8-62, New York, NY, 10012, United States, Galit Bracha Yom-Tov

Following treatment hematology patients face an increased risk of developing an infection. If a patient remains at the hospital his risk of catching an infection is higher than at home, but once an infection develops the mortality risk at the hospital is lower than at home due to quick access to appropriate treatment. We study the problem of dynamically determining discharge times for hematology patients subject to capacity constraints. We show that in an overloaded operating regime this dynamic problem reduces to a static problem with a simple solution of two-class two-discharge thresholds. We characterize the specific optimal solutions under empirically driven time-to-infection distributions.

#### 3 - Online Resources Allocation with Learning and Reoptimization

Zhen Xu, Columbia University, New York City, NY, 10027, United States, Van Anh Truong

We study a multi-period revenue management problem where a decision maker assigns each arriving customer to one of multiple products made from multiple resources with finite capacity. Every assignment of a customer to a product will generate a random reward. The objective is to jointly learn the mean reward function and maximize the expected revenue. We formulate the problem as a multi-armed bandit problem. We propose a natural and simple extension of the UCB family of algorithms. We show that by taking advantage of re-optimization techniques, our proposed algorithm achieves a regret of  $O(\log^3 T)$ , which significantly reduces the  $O(\sqrt{T})$  bound.

#### 4 - Toward a Genomic Liquid Biopsy

Andrew A. Li, MIT, Cambridge, MA, United States, Jackie W. Baek, Vivek Farias, Chinmay Jha, Deeksha Sinha

The cost of DNA sequencing has fallen 10,000x in the last ten years, and we are finally in sight of the silver bullet for cancer screening: an early-stage blood test. As sequencing can now be performed affordably on a tiny fraction of a genome, what remains is a massive variable selection problem. We provide an efficient algorithm, based on a decomposition at the gene level, that scales to full genomic sequences across thousands of patients. We contrast our selected variables against DNA panels from two recent, high-profile studies and demonstrate that our own panels achieve significantly higher sensitivities at the same cost, along with accurate discrimination between cancer types for the first time.

#### 1 - Integrating CAP Domains into Analytics Courses: Methods & Examples

Concetta A. DePaolo, Indiana State University, Scott College of Business, Terre Haute, IN, 47809, United States

The Certified Analytics Professional (CAP®) designates competencies or domains for analytics professionals. This presentation will describe how these domains have been integrated into an undergraduate business analytics course. In addition, examples of case studies involving real-world data used to teach analytics process and methods will be shared.

#### 2 - Frontier Estimation for Automated Machine Levels Outputs

Sandeep Bhowmick, Indiana State University, Terre Haute, IN, United States

As an alternative to data envelopment analysis, Frontier estimation methods have been found to be more efficient in estimating efficiency measures. Separating random noise component into stochastic and non-stochastic components is found useful in capturing efficiency components of production methods. This presentation shows an application of stochastic frontier estimation method to analyze efficiency values on an industry supplied data at automated machine level outputs.

#### 3 - A Method for Systematic Monitoring of Treatment Receipt in Breast Cancer Patients

Milton Soto-Ferrari, Indiana State University, 30 N. 7th St, Room F-211, Terre Haute, IN, 47807, United States

This research aims to propose a method to monitor the clinical and non-clinical variables that influence the receipt and adherence to treatment in breast cancer patients. Building upon a Bayesian Network model for mining cancer registry data. The method presents a framework for the automatic monitoring of patients to predict radiation treatment receipt. This framework uses information from a regional cancer institution with a sample of 1922 patients from years 2009-2014.

Sponsored: Data Mining

Sponsored Session

Chair: Onur Seref, Virginia Tech, Blacksburg, VA

#### 1 - Adverse Drug Events Detection and Recognition: A Deep Learning Based Approach

Long Xia, Virginia Polytechnic Institute and State University, 880 W. Campus Drive, 2069 Pamplin Hall, Blacksburg, VA, 24061, United States,

Drug safety profiling plays a significant role in medications decision-making. Analyzing the adverse drug events from patients' generated data is an integral part of drug safety profiling. With the practical need for advanced text mining techniques for adverse drug events identification and extraction, we proposed a research framework which utilizes deep learning network as the platform, incorporates both word embeddings features and features obtained from existing models to complement feature coverage and comprehensiveness. By further incorporating human designed features, our approach achieved a significantly improved performance.

## 2 - Effects of User-provided Photos on Hotel Review Helpfulness: An Analytical Approach with Deep Learning

Qianzhou Du, Virginia Tech, Blacksburg, VA, United States,  
Weiguo Fan, Zheng Xiang

Online reviews have been studied in the hospitality and tourism literature. However, while user provided photos embedded in online reviews accumulate in large quantities, their informational value has not been well understood likely due to technical challenges. The goal of this study is to introduce deep learning for computer vision to understand information value of online hotel reviews. Using a dataset collected from two social media sites, we compared deep learning models with other machine learning techniques to examine the effect of user-provided photos on review helpfulness. Findings show that deep learning models are more useful in predicting review helpfulness than other models.

## 3 - Deep Learning-based Sentence-level User Feedback Classification in Mobile App Reviews

Zhilei Qiao, Virginia Institute of Technology, 880 West Campus Drive, Blacksburg, VA, 24061, United States, Alan Gang Wang, Alan Abrahams, Weiguo Fan

It is important for app developers to efficiently extract and understand user needs from online reviews. However, discovering and quantifying potential user needs from massive online reviews is a nontrivial task. In this paper, I propose a domain-oriented deep learning framework that can discover the most critical user needs such as new product features and bug reports from online reviews. I conduct a systematic evaluation to ensure the quality of discovered information. Experimental results demonstrate that the proposed framework outperforms the baseline models. This research has significant managerial implications for app developers.

## 4 - Understanding Meaning of Text in its Context – A Network-based Text Mining Model for Discovering Context Clues

Sukhwa Hong, Virginia Institute of Technology, Pamplin College of Business, 880 West Campus Drive, Blacksburg, VA, 24061, United States, Onur Seref, Michelle MH Seref

We present a network-based framework to identify and cluster phrases or phrases with context clues in classes of text data using prevalence scores of n-gram structures and their connections. Our framework extends the bag-of-words models by network-based clustering methods to create sub-graphs of connected n-grams for finding context clues. The paths in these sub-graphs represent sequences of words, which form connected phrases with richer contextual meaning. We use our method to identify variations of these phrases and apply the proposed framework to study a collection of customer reviews from TripAdvisor and Yelp.

## 1 - Machine Learning Based Hypoglycemia Recognition from Driving Patterns in Individuals with Diabetes Mellitus

Mathias Kraus, ETH Zuerich, Zuerich, Switzerland, Stefan Feuerriegel, Elgar Fleisch, Tobias Kowatsch, Markus Laimer, Christoph Stettler, Felix Wortmann, Thomas Z ger

Hypoglycemia has consistently been shown to be associated with an increased risk of driving mishaps. As a prevention, we propose to utilize machine learning models to detect and predict hypoglycemia based on driving behavior. We compare data about the driving behavior by tracking individuals with/without hypoglycemic condition. Our preliminary evaluation using a driving simulator confirm the effectiveness of our approach.

## 2 - Using Machine Learning Techniques to Determine Preterm Birth Risk Factors

Alireza Ebrahimvandi, Virginia Tech, Blacksburg, VA, 24060, United States

Preterm birth (before 37 weeks) is a major health issue in the US and its predictors are poorly known. Prior studies applied machine learning techniques to identify variables that can predict preterm. We will use two machine learning techniques: lasso regression and support vector machines on a much larger dataset obtained from Center for Disease Control to identify key predictors of preterm. We expect to improve sensitivity of prediction by using a larger dataset. Improving one percent sensitivity of prediction tests is valuable because every preterm birth costs about \$10,000, and 1% decrease in preterm births translates to half a billion dollars saving plus preventing long life deficiencies.

## 3 - Combining Observational Data and Meta-analysis Results for Evaluating Impact of Behavior Changes on Disability Adjusted Life Years

Ozden F. Gur Ali, Koc University, College of Administrative Sciences, Rumeli Feneri Yolu Sariyer, Istanbul, 34450, Turkey, Angi Ghanem

We introduce a method to combine individual level observational data with meta-analysis results of extant research to evaluate the potential impact of a public health intervention. We show that both pieces of information are needed to get causally defensible models that reflect the local effects, adjust for important individual level covariates, and guard against confounding. We apply the method to provide point and interval estimates of the impact of changes in behaviors like physical exercise, smoking, and diet on disability adjusted life years (DALY) due to prevalence of heart disease and diabetes.

## 1 - Randomized Push-pull Method for Optimization on Graphs

Angelia Nedich, ASU, 650 E. Tayler Mall, Goldwater Center, Rm 311, Tempe, AZ, 85281, United States

We consider a randomized push-pull algorithm for distributed optimization on graphs. The method is based on a random asynchronous implementation of push-pull method recently proposed for minimizing the sum of the agents' cost functions in a network that obeys the network connectivity structure. In order to minimize the sum of the cost functions, a new distributed gradient-based method where each node maintains two estimates, namely, an estimate of the optimal decision variable and an estimate of the gradient for the average of the agents' objective functions. We show convergence results for the method over a directed static network.

## 2 - Estimating Optimality Gaps for Stochastic Optimization via Bootstrap Aggregating

Henry Lam, Columbia University, 500 W. 120th St., New York, NY, 10027, United States, Huajie Qian

We present approaches to estimate the optimality gaps of solutions in stochastic optimization using limited data. Our approaches are based on bootstrap aggregating that can demonstrably improve the tightness-variance tradeoff incurred in existing methods. We present our theories and show numerical effectiveness through some examples.

## 3 - Asymptotic Results on Two-stage Stochastic Quadratic Programming

Junyi Liu, University of Southern California, 30 Virginia Avenue, Los Angeles, CA, 91107, United States, Suvrajeet Sen

In this talk, we will present stochastic decomposition (SD) algorithms for two-stage stochastic quadratic programming (STQP) problem. Based on their stochastic linear programming (SLP) predecessor, these iterative schemes in SD algorithm approximate the objective function using affine/quadratic minorants and then apply a stochastic proximal mapping to obtain the next iterate. We show that under certain assumptions the proximal mapping applied in SD obey a non-expansive mapping property and study the convergence rate of SD to the optimal solutions.

## 4 - Smoothing and Acceleration for Stochastic Convex Optimization

Afrooz Jalilzadeh, Pennsylvania State University, 310 Leonhard Building, University Park, PA, 16803, United States, Uday Shanbhag

We consider a class of structured nonsmooth stochastic convex problems. By integrating smoothing, Nesterov acceleration, and increasing batch-sizes, we show that Nesterov's rate of  $O(1/k)$  may be recovered while under strong convexity, a linear rate of convergence is attained. We comment on special cases in the convex regime when the problem is either smooth or merely deterministic.

### ROI of AI: Value and Operational Implications of Artificial Intelligence

Sponsored: Artificial Intelligence

Sponsored Session

Chair: Nigel P. Melville, University of Michigan, Ann Arbor, MI, 48109-1234, United States

#### 1 - Scientometric Review of Business and Operations AI Literature

Nigel P. Melville, University of Michigan, Stephen M. Ross School of Business, 701 Tappan Street, Ann Arbor, MI, 48109-1234, United States

Artificial intelligence is rapidly diffusing across industries. Though firms are employing AI in a variety of contexts for a variety of benefits, research examining the business impacts and implications of AI is not abundant. This paper employs scientometrics to identify and synthesize such research and pose a set of research questions to lay the groundwork for future studies of the impacts and implications of AI in business contexts.

#### 2 - Artificial Intelligence: How Customer Reactions Impact Innovation

Lisa Yeo, University of California, Merced, Merced, CA, United States, Erik Rolland, Jacquelyn Rees Ulmer, Raymond Patterson

Artificial Intelligence (AI) technologies are often included as product features (e.g. facial or voice recognition, autonomous driving systems) that drive product and service innovation. However, such innovations increase software complexity, leading to security and privacy issues. Customer reactions to security or privacy failures may affect product demand; customer demand reaction to the security or privacy implications of new features, such as AI-driven technology, plays a role in regulating the rate of innovation. This work examines the trade-off between product innovation and the increased risk of security breaches in AI-enabled products and services.

#### 3 - Who's Watching TV

Jessica Clark, University of Maryland, Jean-Francois Paiement, Foster Provost

This work introduces the novel problem of “user disambiguation”: estimating the likelihood of each member of a small group using a shared account or device. Specifically, we focus on television Set-Top Box viewership data in multi-person households. Our contributions include formulating a predictive problem; developing a method for estimating individuals' viewership which learns priors for viewership in single-person households then adapts them to the specifics of each multi-person household's viewership history; and evaluating our new method via a comparison to two ad-hoc heuristics currently used for estimating TV audience composition.

#### 4 - To Predict or Not to Predict: The Case of Inpatient Admissions from the Emergency Department

Sriram Somanchi, University of Notre Dame, 344 Mendoza College of Business, University of Notre Dame, Notre Dame, IN, 46556, United States, Idris Adjerid

Novel statistical methods have the potential to dramatically improve the efficiency and quality of healthcare. However, dynamic processes and complex infrastructures result in the data with highly variable acquisition costs. We offer a novel and generalizable method that helps reduce the cost while maintaining high accuracy. We utilize this approach in the Emergency Department (ED) context. Specifically, we focus on accurately predicting whether an ED patient will be admitted to an interior hospital unit or discharged from the ED, while minimizing the time-cost of prediction. We show this reduction in time-cost of prediction could translate into a 20% reduction in total time in the ED per patient.

### Field Experiment in Online Marketplace and Social Network

Sponsored: Information Systems

Sponsored Session

Chair: Tianshu Sun, University of Southern California

#### 1 - Word-of-mouth System Implementation and Customer Conversion: A Randomized Field Experiment

Ni Huang, Arizona State University, 832 W. Wagner Dr, Arizona, Gilbert, AZ, 85233, United States, Tianshu Sun, Pei-yu Chen, Joseph Golden

E-commerce firms often face the decision on whether they should implement a word-of-mouth (WOM) system on their websites. An in-site WOM system can potentially boost customer conversion by conveying signals and information

about product popularity and quality. However, implementing such a system might also have unintended consequences, hindering product sales due to the lack of control over WOM volume and content. This study examines how implementing a WOM system (through social media integration) on an e-commerce website affects customer conversion in the two stages of consumer purchase funnel, namely, adding a product to cart and placing an order.

#### 2 - Be Gentle to the Newbies: A Randomized Field Experiment on Negative Feedback in Online Communities

Wei Chen, University of Arizona, 1130 East Helen Street, McClelland Hall 430, P.O. Box 210108, Tucson, AZ, United States, Laura Brandimarte, Yinchu Zhu, Dong Jing

Negative feedback (e.g., downvotes) in online communities helps to control the quality of contribution but may discourage users from participation, especially for new users. In this paper, we conduct a randomized field experiment to evaluate the causal effect of downvotes on user-generated content. We find that downvotes indeed decrease future user contributions. However, this effect only exists for new users who have less experience. Instead, experienced users increase their contributions after negative feedback. Policy evaluation results using machine learning methods provide design suggestions for downvotes base on the characteristics of contributors.

#### 3 - Impact of the Interplay Between Review Volume and Rating in Digital Platforms on Sales: An Empirical Study

Samayita Guha, Temple University, Philadelphia, PA, United States, Naveen Kumar, Subodha Kumar, Joydeep Srivastava

Impact of the Interplay between Review Volume and Rating in Digital Platforms on Sales: An Empirical Study. Consumers now increasingly depend on user-generated reviews. Based on the data collected from a digital-platform, we empirically examine the impact of interaction between the number of reviews and the average rating. This study would help us in answering an important and relevant question: What is more important - Volume or Quality?

#### 4 - From Broadcasting to Narrowcasting: Examining User Content Consumption, Generation and Sharing in Social Media

Lanfei Shi, University of Maryland College Park, College Park, MD, United States

User engagement (UE) through content consumption (CC), content generation (CG) or content sharing (CS) on social media has been widely studied. However, the fundamental question of how the 3 dimensions of UE interact remains largely unanswered. Therefore, we design a large-scale randomized field experiment to investigate the causal effect of CC reduction on CG and subsequent CS on Snapchat. We are among the first to examine the interplay of different dimensions of UE using a randomized field experiment for causal inference. Our findings complement the current literature of user behavior on social sites and provide useful insights into platform design and marketing campaigns on social platforms.

### IEEE Transactions on Automation Science and Engineering Invited Session

Sponsored: Quality, Statistics and Reliability

Sponsored Session

Chair: Jingshan Li, The University of Wisconsin-Madison

Co-Chair: Xiao Liu, University of Arkansas

#### 1 - Prescriptive Modeling and Compensation of In-plane Shape Deformation for 3D Printed Freeform Products

Qiang Huang, University of Southern California, Dept of Industrial & System Engineering, 3715 McClintock Avenue, Ger 240, Los Angeles, CA, 90089, United States, He Luan

The shape accuracy of 3D printed products is a critical issue, especially for freeform products with complex geometries. In addition, shape accuracy modeling has to be transparent to specific designs and 3D printing processes for wider applications. This study fills the gap by establishing a data-driven approach to predict and compensate the in-plane (x-y plane) shape deviations of 3D printed freeform products based on a limited number of simple trial shapes. Experimental investigation using stereolithography process successfully validates the proposed prescriptive approaches.

## 2 - A Wavelet-based Penalized Mixed-effects Model for Multichannel Profile Detection of In-line Raman Spectroscopy

Xiaowei Yue, Georgia Institute of Technology, 755 Ferst Drive NW, ISYE, Atlanta, GA, 30332, United States, Hao Yan, Jin Gyu Park, Richard Liang, Jianjun Shi

Modeling and analysis of high-dimensional (HD) profiles, is an important and challenging topic. We proposed a wavelet-based penalized mixed-effects decomposition (PMD) method for multichannel profile detection of in-line Raman spectra. The PMD exploits a regularized HD regression with linear constraints to decompose profiles into four parts: fixed effects, normal effects, defective effects, and noise. An APG optimization algorithm is developed for parameter estimation. Finally, extracted coefficients are associated with consistency, uniformity, and defects. In case study, we evaluated the performance of the PMD and demonstrated a better detection power with less computational time.

## 3 - Optimize the Signal Quality of the Composite Health Index via Data Fusion for Degradation Modeling and Prognostic Analysis

Abdallah A. Chehade, Assistant Professor, University of Michigan-Dearborn, 4901 Evergreen Road, 2280 HPEC, Dearborn, MI, 48128, United States

The rapid development of sensing and computing technologies enabled to simultaneously monitor different components of complex systems. This provided unprecedented opportunity to understand the degradation behavior of complex systems. In this paper, a signal-to-noise ratio (SNR) metric that is tailored to the needs of degradation signals is proposed. Then, based on the SNR metric, we develop a data-level fusion model to construct a health index via fusion of multiple degradation-based sensor data. Our goal is that the health index provides better estimates for the health condition and the remaining lifetime. A case study that involves the degradation dataset of aircraft gas turbine engines.

## 4 - Publication at IEEE T-ASE

## Degradation Test and Data Analysis

Sponsored: Quality, Statistics and Reliability

Sponsored Session

Chair: Rong Pan, Arizona State University, Tempe, AZ, 85287-8809, United States

Co-Chair: Guanqi Fang, Arizona State University, Tempe, AZ

## 1 - Bivariate Accelerated Degradation Modeling Based on Heterogeneous Marginal Stochastic Processes

Guanqi Fang, Arizona State University, 745 N. Dobson Rd, Unit 115, Mesa, AZ, 85201, United States

This presentation discusses a flexible modeling approach when dealing with bivariate degradation data. An example about application on polymer material is given to demonstrate the proposed modeling and data analysis flow.

## 2 - Predicting Lifetime by Degradation Tests: A Case Study of ISO 10995

Steve Rigdon, Saint Louis University, St. Louis, MO, 62026, United States

ISO 109951 is the international standard for the reliability testing and archival lifetime prediction of optical media. The standard specifies the testing conditions in terms of the combinations of stress variables - temperature and relative humidity. The standard assumes that the projected failure time is the actual failure time and these projected failure times are then analyzed. Since true failure times are not directly observed, the uncertainties in the failure time must be taken into account. In this paper, we present a hierarchical model for degradation that can directly infer failure time at the use condition and compare this model with the ISO standard through a simulation study. Not accounting for the uncertainty in the projected failure times leads to unjustified confidence in the estimation for the median lifetime at both the stress conditions used in the experiments and at the use condition.

## 3 - On Degradation Modeling Under Dynamic Environment

Xiao Liu, University of Arkansas, 4172 Bell Engineering Center, Fayetteville, AR, 72701, United States, Mohammad Mahdi Hajiha

This presentation discusses the modeling of degradation under dynamic environment. Application examples are presented to demonstrate the proposed modeling approach.

## Joint Session QSR/DM: Machine Learning for Manufacturing Informatics

Sponsored: Quality, Statistics and Reliability

Sponsored Session

Chair: Hao Yan, Arizona State University, Tempe, AZ

## 1 - Robust Change Detection via Affine and Quadratic Detectors

Yao Xie, Georgia Institute of Technology, GA, United States, Yang Cao, Vincent Guigues, Anatoli Juditsky, Arkadi Nemirovski

Change-point detection is a fundamental problem in statistics and signal processing with applications in manufacture systems. Given a sequence of data, the goal is to detect any change in the underlying distribution as quickly as possible. However, classic approaches usually require exact specification of the pre- and post-change distributions forms, which may not perform well with real data. We present a set of computationally efficient methods with certain near optimality properties, which allow uncertainties about the pre-and post-change distribution, by building a connection of change-point detection with robust convex optimization.

## 2 - Online Anomaly Detection with Adaptive Sampling for Multivariate Streaming Data

Chen Zhang, National University of Singapore, E1-07-26, 3 Engineering Drive, Singapore, 117576, Singapore

This paper addresses online anomaly detection of a system with multivariate variables, when only a subset of variables can be observed at each sensing epoch. We first propose a weighted Bayesian estimation framework for system state estimation which can deal with missing variables. Then based on the confidence region of the estimated system state, an anomaly detection scheme is constructed by considering correlations of different variables. We formulate its detection power as a multi-armed bandit problem, and propose an adaptive sampling strategy using the upper confidence bound algorithm. With the proposed strategy, we further derive the asymptotic detection power of our scheme.

## 3 - Understanding the Effects of Predictor Variables in Black Box Supervised Learning Models

Jingyu Zhu, Northwestern University, Evanston, IL, United States, Daniel Apley

A shortcoming of many supervised learning models is their lack of interpretability and transparency, in terms of understanding how the predictor variables affect the response. Partial dependence plots are used for visualization but involve unreliable extrapolation when the predictors are highly correlated. We present a new visualization approach termed accumulated local effects (ALE) plots that avoid extrapolation like functional ANOVA but are far more computationally efficient. They also yield convenient variable importance measures for quantifying and ranking the impact of each predictor.

## 4 - Real-time Anomaly Detection for Spatial-temporal Correlated Profile

Hao Yan, 699 S. Mill Ave, Tempe, AZ, 85281, United States, Kamran Paynabar, Massimo Paccella

Advanced 3D metrology technologies such as Coordinate Measuring Machine (CMM) and laser 3D scanners have facilitated the collection of massive point cloud data, beneficial for process monitoring, control and optimization. However, due to their high dimensionality and structure complexity, modeling and analysis of point clouds are still a challenge. In this paper, we utilize multilinear algebra techniques and propose a set of tensor regression approaches to model the variational patterns of point clouds and to link them to process variables. The performance of the proposed methods is evaluated through simulations and a real case study of turning process optimization.

### Joint Session ICS/ IOS Uncert: Adaptive/Sequential Sampling for Stochastic Programs

Sponsored: Computing

Sponsored Session

Chair: Yongjia Song, Clemson University, SC, 29634, United States

#### 1 - Variance Reduction in Sequential Sampling for Stochastic Programming

Jangho Park, PhD Candidate, The Ohio State University, 1971 Neil Avenue, Columbus, OH, 43210-1271, United States, Rebecca Stockbridge, Guzin Bayraksan

We investigate variance reduction techniques Latin Hypercube Sampling (LHS) and Antithetic Variates (AV) in sequential sampling for stochastic programming. Sequential sampling takes a sequence of solutions and assesses their quality by sequentially increased samples. We show conditions under which the procedures stop in a finite number of iterations and are valid. We computationally compare LHS and AV in sequential and non-sequential settings. Our results indicate that while both are effective, LHS dominates in the non-sequential setting and AV gains an advantage in the sequential setting.

#### 2 - Adaptive Sequential Sampling for Stochastic Programs

Yongjia Song, Clemson University, 211 Fernow Street, 264 Freeman Hall, Clemson, SC, 29634, United States, Raghu Pasupathy

In this talk, we propose a new sequential sampling approach that unifies existing literature on the sequential sampling approach and the retrospective approximation approach for solving stochastic programs. Specifically, we stipulate schedules of sample size used for solving each sample-path problem at each iteration as has been done in the sequential sampling literature. In addition, we choose optimality gap tolerance adaptively, making it a factor of the sample error corresponding to the current iterate in the sample-path problem. We show that these choices are optimal under a precisely defined criterion. Numerical results on two-stage stochastic linear programs will be reported.

#### 3 - Adaptive Sampling with Norm and Inner Product Tests for Smooth Stochastic Optimization

Raghu Pasupathy

We characterize the sample-path behavior of stochastic gradient descent (a.k.a. stochastic approximation). Such characterization leads naturally to adaptive sampling structures within stochastic gradient descent. We will discuss two specific variations of adaptive sampling SGD that use what has recently been called the norm test and inner product test, along with sample-path complexity results. Numerical results routinely demonstrate better practical performance while achieving sample-path convergence rates that are arbitrarily close to the best possible.

#### 4 - Stochastic Algorithms for Conditional Stochastic Optimization

Shuotao Diao, University of Southern California, Los Angeles, CA, 90007, United States, Suvrajeet Sen

Conditional stochastic optimization models arise when the uncertainties involve correlated latent random effects. This presentation discusses several algorithms based on first-order methods in the context of nonparametric regression (e.g. k-NN). We study the asymptotic convergence of these algorithms.

### Joint Session Wagner/Practice: Daniel H. Wagner Prize for Excellence in Operations Research Practice

Emerging Topic: Daniel H. Wagner Competition

Emerging Topic Session

Chair: Patricia Neri, SAS Institute, Inc., 104 Grandtree Ct., Cary, NC, 27519, United States

#### 1 - Analytics and Bikes: Riding Tandem with Motivate to Improve Mobility

Daniel Freund, Cornell University, 109 Lake St, Ithaca, NY, 14850, United States, Shane Henderson, David B. Shmoys, Eoin O'Mahony

Bike-sharing systems are now ubiquitous across the U.S. We have worked with Motivate, the operator of the largest such systems, including in New York, Chicago and San Francisco, to innovate data-driven approaches for bike-sharing. With them we have developed methods to improve their day-to-day operations and also provide insight on central issues in the design of their systems. This work

required the development of a number of new optimization models, characterizing their mathematical structure, and using this insight in designing algorithms to solve them. In our presentation, we focus on two particularly high-impact projects, an initiative to improve the allocation of docks to stations, and the creation of an incentive scheme to crowdsource rebalancing. Both of these projects have been fully implemented to improve the performance of Motivate's systems across the country: Motivate has moved hundreds of docks in its systems nationwide and the Bike Angels program now aids rebalancing in San Francisco and NYC. In NYC, Bike Angels yields improvement comparable to that obtained through Motivate's traditional rebalancing efforts, at far less financial and environmental cost.

#### 2 - What's Wrong with My Dishwasher: Advanced Analytics Improve the Diagnostic Process for Miele Technicians

Segev Wasserkrug, IBM Haifa Research Lab, Haifa, 31905, Israel, Evgeny Shindin, Sergey Zeltyn, Martin Krueger, Yishai Feldman

Miele, a leading appliance manufacturer, is looking to optimize the ways in which they solve customer problems quickly and efficiently. A crucial part of this task is precise diagnosis of faults, before and during technician visits. A correct diagnosis allows technicians to take with them the necessary parts and complete the repair with a minimal spending of time, effort, and spare parts. We created a decision-support system to help Miele optimize its service process, based on statistics learned from historical data about technician visits, containing both structured and unstructured (textual) data that had to be combined to create the probabilistic model. We used a novel process in which a semantic model informed the creation of the probabilistic model, as well as the analysis pipelines for the structured and unstructured data, combining expert knowledge with large heterogeneous data. The results of a pilot study demonstrated a significant improvement of efficiency, concomitant with an increase of an already very high first-fix rate.

### Crop Challenge

Emerging Topic: INFORMS Special Sessions

Emerging Topic Session

Chair: Chris Tutino, Syngenta, 9 Davis Drive, Research Triangle Park, NC, 27709, United States

#### 1 - Using Data Analytics to Help Improve Agriculture in the 2019 Syngenta Crop Challenge in Analytics

Greg Doonan, Syngenta, 2369 330 Street, Slater, IA, 50244, United States

The 2019 Syngenta Crop Challenge in Analytics is a collaborative effort between Syngenta and the INFORMS Analytics Society that brings together experts in mathematics, agriculture and big data to demonstrate how data can be used to feed a growing global population with limited natural resources. Join Greg Doonan, head of novel algorithm advancement at Syngenta, to learn how you can use your data analytics skills to help scientists develop better crops. This year's question asks participants to determine if corn hybrid performance data can be used to develop models that predict crop performance across a range of environmental scenarios. Understanding how a hybrid reacts to certain stresses can help breeders develop better seeds that allow farmers the potential to grow corn where they couldn't before. The contest is unique because Syngenta gives participants real-world, proprietary data to create their models. The contest is open and submissions will be accepted until Jan. 18, 2019. Finalists will be announced in March and will be invited to present their entries at the 2019 INFORMS Conference on Business Analytics & Operations Research April 14-18, 2019 in Austin, Texas. The winners will be announced during the event. The first place winner will be awarded \$5,000. Second place receives \$2,500 and third place will receive \$1,000.

**Joint Session MCDM/Practice Curated: Multiobjective Optimization: Theory and Applications**

Sponsored: Multiple Criteria Decision Making

Sponsored Session

Chair: Margaret M. Wiecek, Clemson University, Clemson, SC, 29634-1907, United States

**1 - On Highly Robust Efficient Solutions for Uncertain Multiobjective Linear Programs**

Margaret M. Wiecek, Clemson University, Mathematical Sciences Dept, Clemson, SC, 29634-1907, United States

We develop properties of the highly robust efficient (HRE) solutions to uncertain multiobjective linear programs (UMOLPs) with objective-wise uncertainty in the objective function coefficients. A characterization using the cone of improving directions, several bound sets on the HRE set, and a robust counterpart for a class of UMOLPs are provided. A bilevel method for computing the HRE solutions is proposed.

**2 - Multiobjective Design of a Fin in a Steady-State Regime**

Lakmal Weerasena, University of Tennessee Chattanooga, 615 McCallie Ave, Chattanooga, TN, 37403, United States, Boris Belinskiy, James Hiestandzand.

Removal of waste heat to another material or the environment by convection and radiation is important in everyday life and industrial applications. Extended surfaces are often used to remove heat and such surface extensions for convective heat transfer frequently are called fins. The design of a fin is modeled as bi-objective optimization problem. The efficiency of the fin and its mass are considered as two objective functions and the multi-objective optimization carried out to maximize the efficiency and the minimize the mass simultaneously. The approach is based on a piece-wise constant design of the fin.

**3 - Balancing Mission Goals and Maintenance Demands using a Force Structure Model**

Chris Grubb, Systems Planning and Analysis, Inc., Alexandria, VA, United States, Stephanie Diane Brown, Jonathon Leverenz, Brian Chen

A Force Structure Model designs a day-to-day schedule for a set of assets to meet mission goals and maintenance demands while satisfying travel, duration, and operational constraints. Tension in the schedule arises from the desire to maximize time allotted for maintenance against the need to provide a sufficient number of assets for missions each day. A network-based model and branch-and-bound algorithm are used to investigate tradeoffs between allocating time for mission goals and maintenance demands. The network model offers more flexibility than existing timetabling methods when designing the schedule and the algorithm is shown to outperform CPLEX for longer, more difficult problems.

**4 - Multi-objective Optimization for Political Districting with Explicit Fairness Considerations**

Rahul Swamy, Champaign, IL, 61820, United States, Douglas M. King, Sheldon H. Jacobson

Political redistricting is a multi-objective problem with conflicting objectives such as compactness, population balance, etc. While the problem is well-studied, the use of political fairness metrics has been relatively under-explored. In addition, contiguity enforcement within an exact method has been a challenging task. This research presents a multi-objective approach explicitly considering political criteria such as efficiency gap and competitiveness within a branch and cut framework. The results show that compactness does not always ensure political fairness, and vice versa.

**Joint Session MAS/Practice Curated: Advanced Analytics for Military Cyber Security, Defense and Readiness**

Joint Session

Chair: Nathaniel D. Bastian, PhD, Army Cyber Institute, West Point, NY, 10996, United States

**1 - Early Warning Systems for Cyber Security**

Isaac Faber, PhD Candidate, Stanford University, 141 Aryshire Farn Ln #113, Stanford, CA, 94305, United States

Through the paradigm of early warning systems, from risk analysis, early-stage cyber attack signals can be generated using machine learning techniques. The past ten years have seen the growth of interest in cybersecurity. As cyber threats become more sophisticated, system defenders must keep pace with better methods of detection and response. Advanced cyber-attacks are a set of discrete,

observable steps called a 'kill chain.' Using burgeoning techniques within analytic systems and machine learning, data produced from early kill chain steps can be used to mitigate downstream consequences. An application of ensemble classification using supervised learning techniques is explored.

**2 - Bots in Nets: Empirical Analysis of Bot Evidence in Online Social Networks**

Ross Schuchard, George Mason University, 4400 University Drive, Fairfax, VA, 22030, United States

Online social networks (OSNs) continue to play an increasing role as a primary source of information in today's society. The emergence of social bots within OSNs to diffuse information at scale has given rise to many efforts to detect bots. While methodologies employed to detect the evolving sophistication of bots continue to improve, much work can be done to characterize the impact of bots on actual communication networks. This study proposes a social network analysis framework to characterize the pervasiveness and relative importance of bots in various OSN conversations.

**3 - Fake News: Fearing the End of Truth, a Quantitative Risk Analysis**

Travis Trammell, Stanford University, Stanford, CA, United States

Strategically using information to affect the views of a population is certainly nothing new and dates all the way back to the earliest development of political systems. The speed of distribution and the number of people that can be reached by leveraging the modern information infrastructure is unprecedented. The rapid distribution of fake news can cause contagion, manipulate markets, spark conflict, or fracture strategic relations. Probabilistic Risk Analysis (PRA) can be leveraged to quantitatively describe the risk associated with fake news by examining all relevant factors to evaluate associated probabilities and costs resulting from fake news campaigns.

**4 - Saving the Army from Cyberspace: A Strategy to Seize the Initiative Using Big Data**

Gregory Bew, U.S. Army Cyber Command, Fort Belvoir, VA, United States

In the information age the defense of the Department of Defense Information Network (DoDIN) is arguably our most mission essential task. Mission command, logistics, medical support, and weapons systems all rely on access to the DoDIN or we will operate in a severely degraded state. In war, that means people will die. To ensure access, Army Cyber Command decided to rely on big data and developed a phased approach to seize initiative, increase confidence, and change our culture to defend our cyber terrain. The results of this approach have created the DoD's largest and most capable cyber big data platform, providing a common environment to develop apps and analytics to help the Army defend the DoDIN.

**5 - An Advanced Analytics Framework for Optimizing Army Cyber Mission Force Readiness and Manning**

Nathaniel D. Bastian, Operations Research Scientist, Army Cyber Institute, U.S. Military Academy, West Point, NY, 10996, United States, Andrew O. Hall, Christopher B. Fisher

Given the unique expertise required of military personnel to execute the DoD cyber mission, the US Army created the Cyber Branch to establish managed career fields for Army cyber warriors, while providing a force structure with successive opportunities for career development and talent management via leadership and broadening positions, technical training, and advanced education. In order to optimize Cyber Mission Force readiness and manning levels across the Army's operating and generating forces, we proffer the Cyber Force Manning Model (CFMM) to project the optimal number of accessions, promotions and personnel inventory for each cyber specialty across the Army cyber enterprise.

West Bldg 212C

**Production Logistics and Supply Chain**

General Session

Chair: Feng Ju, Arizona State University, Tempe, AZ, 85281, United States

Co-Chair: Feifan Wang, Arizona State University, Arizona State University, Tempe, AZ, 85281, United States

**1 - A Facility Location Problem with Inventory-level-dependent Hazard Zones**

Mina Aliakbari, Texas A&amp;M, College Station, TX, United States, Joseph Geunes

We consider a location problem for administrative facilities and hazardous stock. Each stock location creates an inventory-level-dependent hazard zone within which no administrative facilities may be located. Increasing the stock at a location increases the radius in which administrative offices are forbidden. We seek a set of administrative and stock locations that can accommodate required warehouse and office space at a minimum total cost. Such problems arise, for example, on military bases or in the production of hazardous materials. This results in a large-scale combinatorial optimization problem, for which we propose using Lagrangian relaxation and heuristic solution techniques.

### 3 - Performance Evaluation of Geometric Serial Lines with Residence Time Constraints

Feifan Wang, Arizona State University, 669 S. Mill Ave, Tempe, AZ, 85281, United States, Feng Ju

Residence time constraints are commonly required in production systems, where parts need to stay in each buffer for some time within a predefined range. Due to a large state space, the direct analysis of such production systems is difficult. To address this problem, we develop an approximate model for a two-machine-one-buffer sub-system. An aggregation method, which takes the sub-system as a building block, is proposed to obtain the performance measures of a multi-machine line. Numerical experiments suggest that the approximate method can capture the system performance in both transient and steady state.

### 4 - Real-time Scheduling of Complex Resource Allocation Systems through Fluid Relaxations

Spyros Reveliotis, Georgia Institute of Technology, 765 Ferst Drive ISyE, Atlanta, GA, 30332-0205, United States, Michael Ibrahim

This work addresses the problem of the efficient real-time management of resource allocation in complex workflows that involve blocking and deadlocking effects. To this end, we adapt to the considered problem setting the scheduling approach that is based on the formulation and solution of a pertinent “fluid relaxation” of the addressed operations. Our results are substantially empowered by our ability to develop efficient deadlock avoidance policies for the considered resource allocation, that take the form of linear inequalities imposed on the underlying system state. Extensive numerical experimentation reveals the operational and computational efficiency of the derived policies.

### 5 - An Introduction to Framework of Simulation Analytics for Real-time Optimal Decision on What-if Scenarios

Haobin Li, National University of Singapore, 1 Engineering Drive 2, Singapore, 117576, Singapore, Xiao Jin, Weizhi Liu, Chenhao Zhou, Loo Hay Lee, Ek Peng Chew

A concept of simulation that supports a real-time decision making has raised much attention in recent years. However, it remains unclear how to combine simulation with an online decision in a valid way. To categorize main issues and pave a way for a possible application, we propose a new framework, namely “Simulation Analytics” that can be treated as an interface between simulation and real-time decision process. We expect such a paradigm to be universal in the new era for simulation-based optimization. A literature study is first conducted followed by a demonstration of the full framework. A brief case study is attached at the end which hints a possible application under this frame.

## MA77

### Location Models III

Sponsored: Location Analysis

Sponsored Session

Chair: Pawel J. Kalczynski, CSU-Fullerton, 800 N. State College Blvd., Fullerton, CA, 92834-6848, United States

#### 1 - Self-organized Carpools with Meeting Hubs

Pawel J. Kalczynski, California State University-Fullerton, 800 N. State College Blvd., Fullerton, CA, 92834-6848, United States, Malgorzata M. Miklas-Kalczynska

We incorporate optional meeting hubs into the original car pooling problem. A meeting hub is a common origin for all carpool participants. It may be one of the participants' origins or a chosen meeting point such as a plaza or gasoline station. We present a new heuristic, formulated and tested on real-world and simulated car pooling problem instances, that mimics a decentralized carpool self-organization process by allowing commuters to maximize their own savings. Our findings reveal system-wide savings similar to centralized models, and a potential strategy for improving carpool utilization.

#### 2 - Cooperative Cover of Uniform Demand

Zvi Drezner, California State University Fullerton, Steven G. Mihaylo College of Business and Economics, Dept of ISDS, Fullerton, CA, 92834, United States, Tammy Drezner

We investigate the total covered area by multiple facilities applying the cooperative cover model. The cooperative cover area is much larger than the one found by standard cover models. We also show that for a large number of facilities located in a symmetric grid, an hexagonal grid is best. We also investigated covering a given area by a given number of facilities, such as a square, with the weakest possible signal emitted by the facilities.

### 3 - A Voronoi Based Heuristic for the Planar Multiple Obnoxious Facilities Location Problem

Pawel J. Kalczynski, California State University-Fullerton, 800 N. State College Blvd., Fullerton, CA, 92834-6848, United States, Zvi Drezner, Said Salhi

Consider a situation in which a given number of facilities must be located in a convex polygon with the objective of maximizing the minimum distance between facilities and a given set of communities subject to the facilities being farther than a certain distance from one another. This continuous multiple obnoxious facility location problem is very difficult to solve by commercial nonlinear optimizers. We propose a mathematical formulation of two variants of the problem and a heuristic approach based on Voronoi diagrams and a binary linear program. We found that our results are much better and were obtained in a fraction of the time required by other popular state of the art solvers

### 4 - Advances in Competitive Facilities Models

Tammy Drezner, California State University Fullerton, 800 N. State College, Fullerton, CA, 92834, United States, Zvi Drezner, Dawit Zerom

Two improvements to the Huff gravity model are proposed and tested. 1) Assuming that facilities' attractiveness has a random distribution. Perception of facilities' attractiveness vary among customers. 2) Assuming different decay functions for different facilities. In existing models the distribution of demand by distance has the same shape. However, more attractive facilities attract customers from larger distances. The decline in patronage is slower than the decline for less attractive facilities.

### Joint Session PSOR/SOLA: Location Models for Social Good

Sponsored: Location Analysis

Sponsored Session

Chair: Kayse Lee Maass, Northeastern University, 360 Huntington Ave, Boston, MA, 02115, United States

#### 1 - Using Spatial Data Analytics to Identify Associations Between Home Healthcare Accessibility and Socioeconomic Factors

Ashlea Bennett Milburn, University of Arkansas, 4207 Bell Engineering Center, Fayetteville, AR, 72701, United States, Jessica Heier Stamm, Mehmet Serdar Kilinc

Home healthcare can improve health outcomes and reduce healthcare costs, but only if the service is accessible. We use healthcare system and socioeconomic data to fit space-varying coefficient models, from which we make inference about spatially explicit relationships between home healthcare accessibility and socioeconomic factors including rural/urban status, income, and race/ethnicity. We find statistically significant and spatially varying relationships at the ZIP Code level in Arkansas. Our results suggest policies to address disparities and improve outcomes.

#### 2 - Human trafficking: Barriers of Using Supply Chain Methodologies/Interdiction Models to Disrupt Illicit Supply Chains of Human Traffickers

Felipe Aros-Vera, Ohio University, 277 Stocker Center, 1 Ohio University, Athens, OH, 45701, United States, Cami Jones, Alana Weszelits

Human trafficking, specifically sex trafficking, is a form of modern day slavery that is occurring on a global scale and continues to gain foothold in the United States. This presentation maps the similarities of the sex trafficking supply chain to a standard supply chain framework and propose useful metrics specific to the sex trafficking supply chain. The main objective of this work is to provide foundational basis for future quantitative analysis on interdiction models to cripple sex traffic supply chains.

#### 3 - A Broader Perspective: Integrating Societal Factors Into Human Trafficking Shelter Location Models

Kayse Lee Maass, Assistant Professor, Northeastern University, Boston, MA, United States, Renata Alexandra Konrad, Andrew C. Trapp

Rehabilitative shelters play a critical role in the safety, stabilization, and long term recovery of human trafficking survivors. Yet, in every U.S. state the demand for such shelters greatly exceeds the current capacity, and the lack of available, reliable data poses a challenge to human trafficking modeling. Using concepts from health and social welfare economics, we develop a decision analytic approach to maximize the societal value of locating additional shelters at the state level under budget constraints. We discuss our methods for quantifying societal factors and illustrate how the optimal placement of shelters is affected by changes to the budget, shelter costs, and societal benefits.

West Bldg 301AB

#### Plenary: Learning in Games (Philip McCord Morse Lecture)

Plenary Session

Chair: Margaret L. Brandeau, Stanford University, Management Science and Engineering, 475 Via Ortega, Stanford, CA, 94305-4026, United States

##### 1 - Learning in Games

Eva Tardos, Cornell University, Ithaca, NY, United States

Selfish behavior can often lead to suboptimal outcome for all participants, a phenomenon illustrated by many classical examples in game theory. Over the last decade we developed good understanding on how to quantify the impact of strategic user behavior on the overall performance in many games (including traffic routing as well as online auctions). In this talk we will focus on games where players use a form of learning that helps them adapt to the environment, and consider two closely related questions: What are broad classes of learning behaviors that guarantee high social welfare in games, and are these results robust to situations when game or the population of players is dynamically changing.

#### Chance Constrained Optimization

Sponsored: Optimization/Optimization Under Uncertainty

Sponsored Session

Chair: Bismark Singh, Sandia National Laboratories, Albuquerque, NM, 87185, United States

##### 1 - Approximating Two-Stage Chance-Constrained Programs with Classical Probability Bounds

Bismark Singh, Sandia National Laboratories, P.O. Box 5800, MS 1326, Albuquerque, NM, 87185, United States, Jean-Paul Watson

We consider a joint-chance constraint (JCC) as a union of events, and approximate this union using bounds from classical probability theory. When these bounds are used in an optimization model constrained by the JCC, we obtain corresponding upper and lower bounds on the optimal objective function value. We investigate the strength of these bounds under two different sampling schemes, and observe that a larger correlation between the uncertainties results in a more computationally challenging optimization model.

##### 2 - A Sigmoidal Approximation for Chance Constrained Nonlinear Programs

Yankai Cao, University of Wisconsin-Madison, 2011 Engineering Hall, 1415 Engineering Drive, Madison, WI, 53706, United States, Victor M. Zavala

We propose a sigmoidal approximation for the value-at-risk and we use this approximation to tackle nonlinear programs with chance constraints. We prove that the approximation is conservative and that the level of conservatism can be made arbitrarily small for limiting parameter values. We establish explicit connections between SigVaR and other approximations reported in the literature. A key benefit of SigVaR is that one can establish an explicit connection with the conditional value at risk approximation and exploit this connection to obtain initial guesses for the approximation parameters. We present small- and large-scale numerical studies to illustrate the developments.

##### 3 - Chance Constrained Optimization Based Solar Microgrid Design and Dispatch for Radial Distribution Networks

Hossein Dashti, University of Arizona, Tucson, AZ, United States, Jianqiang Cheng, Pavlo A. Krokhmal

We propose a two-stage model for optimal placement and planning of distribution generation (DG) and energy storage system units. We incorporate time series modeling to characterize the solar irradiance uncertainty. Design (location and sizing of DGs) and dispatch decisions (how much to generate and store) are made such that electricity demand is met reliably and cost effectively. We employ chance constraints to control the real load shedding within a predefined probability. We combine sample average approximation (SAA) and linearization techniques to solve the problem. Finally, we conduct an out-of-sample simulation on a case study in Arizona to assess the effectiveness of our approach.

##### 4 - On a Class of Chance-constrained Nonlinear Programming Problems

Belleh Fontem, University of Mary Washington, Fredericksburg, VA, United States, Jeremiah Smith

We consider the non-convex problem of minimizing a linear deterministic cost objective subject to a probabilistic requirement on a nonlinear multivariate stochastic expression attaining, or exceeding a given threshold. The stochastic expression represents the output of a noisy system featuring the product of mutually-uncorrelated, uniform random parameters each raised to a linear function of one of the decision vector's constituent variables. We prove a connection to (i) the probability measure on the superposition of a finite collection of uncorrelated exponential random variables, and (ii) an entropy-like affine function. Numerical experiments shed light on several model properties.

#### Optimization under Multistage Uncertainty

Sponsored: Optimization/Optimization Under Uncertainty

Sponsored Session

Chair: Beste Basciftci, Georgia Institute of Technology, Atlanta, GA, 30332, United States

##### 1 - Matheuristic Algorithms for Multistage Location-assignment Problems under Uncertainty

Araceli Garin, Ph. Dr., University of the Basque Country, Bilbao (Bizkaia), 48015, Spain, Laureano Fernando Escudero, Celeste Pizarro, Aitziber Unzueta

We present two matheuristic procedures to build good feasible solutions (frequently, the optimal one) by considering the solutions of relaxed problems of large-sized instances of the multi-period stochastic pure 0-1 location-assignment problem. Additionally, for both procedures, a lazy heuristic scheme, based on scenario clustering, is considered for obtaining a feasible solution as an upper bound of the solution value of the full problem. Then, the same framework provides for the two procedures lower and upper bounds on the solution value. A broad computational experience is reported for 14 instances, up to 15 facilities, 75 customers, 6 periods, over 260 scenarios in the scenario tree.

##### 2 - On the Value of Multistage Stochastic Facility Location with (or without) Risk Aversion

Xian Yu, University of Michigan, Shabbir Ahmed, Siqian Shen

We consider facility location over a finite time horizon with uncertain demand. Comparing to a two-stage approach, we formulate a multistage stochastic integer program using scenario tree, to dynamically locate facilities at each period. We examine an expectation-based risk-neutral model and a risk-averse variant based on coherent risk measure. We show that the gaps between optimal objective values of the two multistage models and their two-stage counterparts are bounded from below, and the bound with risk aversion is at least as large as the risk-neutral bound. We also develop algorithms using SDDiP for solving both multistage models and demonstrate the computational efficiency.

##### 3 - Adaptive Two-stage Stochastic Programming

Beste Basciftci, Georgia Institute of Technology, H. Milton Stewart School, 755 Ferst Drive NW, Atlanta, GA, 30332, United States, Shabbir Ahmed, Nagi Gebraeel

In this study, we propose a novel adaptive stochastic programming approach, in which the best time to realize the uncertainty is a decision variable. Our approach can be considered as an approximation to multi-stage stochastic programming where the decision maker is not allowed to revise the decisions in each stage due to the problem restrictions. We provide theoretical bounds on the performance of the proposed approach compared to two-stage and multi-stage programs. We also propose algorithms for efficiently solving the resulting optimization model. In order to illustrate our results, we study various cases demonstrating the advantages of the adaptive two-stage approach.

#### 1 - Short Construction for Bounded Pitch Inequalities for Set Covering and Minimum-knapsack Problems

Daniel Bienstock, Columbia University, Dept of IEOR, 342 Mudd, New York, NY, 10027, United States

It is known that all undominated, nontrivial valid inequalities for a set covering problem are of the form  $a^T x \geq b$ , where  $a \geq 0$  and  $b > 0$ . Such an inequality is said to be of pitch  $k$  if the sum of the  $k$  smallest positive  $a_i$  is at least  $b$ , and  $k$  is smallest with regards to this property. In previous work, Bienstock and Zuckerberg described a compact extended relaxation for set covering problems that is guaranteed to satisfy all valid pitch  $\leq k$  inequalities, for each fixed  $k$ . As a corollary, for any fixed  $p > 0$  the rank- $p$  Gomory closure of a set covering problem can be approximately optimized over, for any fixed  $p$ . In this talk we consider minimum knapsack problems, which are implicitly set covering problems, albeit with an exponential number of covering constraints. We show that for any fixed integer  $k > 0$ , there is polynomial-time near-separation routine for the relaxation provided by all valid inequalities with coefficients in  $\{0, 1, 2, \dots, k\}$ . We discuss extensions and related problems. Joint work with Y. Faenza, I. Malinovic, M. Mastroilli, O. Svensson and M. Zuckerberg.

#### 2 - Algorithms and Results for Multi-row Group Problems

Robert Hildebrand, Virginia Tech, 223 Durham Hall, 1145 Perry St, Blacksburg, VA, 24061, United States

We study the 2-dimensional Infinite Group Problem and valid cut generating functions. We report on results and algorithms related to understanding these functions and determining their relative strength.

#### 3 - Assessing Parametrized Linear Programming Relaxations with Superadditive Duality

Temitayo Ajayi, Rice University, 2825 Bellefontaine Street #246A, Houston, TX, 77025, United States, Christopher Thomas, Andrew J. Schaefer

The integer programming gap is a foundational concept in optimization. Because linear programming relaxations are vital in most integer programming algorithms, it is important to assess the accuracy of linear programs as approximations of integer programs. Studies on gap functions over the past half-century either use abstract algebraic techniques or do not provide exact bounds. We present superadditive dual-based formulations to compute various metrics of model quality based on gap functions. Our formulations evaluate families of models parametrized by right-hand sides from discrete sets or hyper-rectangles.

#### 4 - The Subadditive Dual is a Strong Dual

Diego Moran, Universidad Adolfo Ibañez, Santiago, 24060, Chile

The subadditive dual of a conic mixed-integer program is a strong dual under a mixed-integer strict feasibility condition in the general case and rationality of the data in the linear case. In this talk, we present other sufficient conditions for strong duality. In particular, we show that strong duality holds if either the dual of the continuous relaxation or the subadditive dual are feasible. Moreover, we show that all known conditions imply dual feasibility. Finally, we present some duality results that use the concept of generator subadditive functions introduced by Klabjan (2007).

### Conic Optimization in Machine Learning I

Sponsored: Optimization/Linear and Conic Optimization

Sponsored Session

Chair: Xudong Li, Princeton University, Princeton, NJ, United States

#### 1 - A Fast Globally Linearly Convergent Algorithm for the Computation of Wasserstein Barycenters

Lei Yang, National University of Singapore, Singapore, Singapore, Jia Li, Defeng Sun, Kim-Chuan Toh

In this paper, we consider computing a Wasserstein barycenter for a set of discrete distributions with finite supports. When the supports in the barycenter are prespecified, this problem can be modeled as a large-scale linear programming (LP). To solve this LP, we derive its dual problem and adapt a symmetric Gauss-Seidel based ADMM. We then analyze its global convergence and its global linear convergence rate without any condition. All subproblems involved can be solved exactly and efficiently. This makes our method suitable for large datasets. Numerical experiments on synthetic dataset and image dataset show that our method is more efficient than two existing representative methods and Gurobi.

#### 2 - Multi-level Stochastic Gradient Methods for Nested Composition Optimization

Shuoguang Yang, Columbia University, 500 West 120th Street, Room 315, New York, NY, 10027, United States, Mengdi Wang, Ethan Xingyuan Fang

Stochastic gradient methods are scalable for solving large-scale optimization problems that involve empirical expectations of loss functions. Existing results mainly apply to optimization problems where the objectives are one- or two-level expectations. We propose a class of multi-level stochastic gradient methods that are motivated from the method of multi-timescale stochastic approximation.

#### 3 - Fully Decentralized Multi-Agent Reinforcement Learning with Networked Agents

Zhuoran Yang, Princeton University, NJ, United States, Zhuoran Yang, Princeton University, Princeton, NJ, 08544, United States

We consider the problem of fully decentralized multi-agent reinforcement learning (MARL), where the agents are located at the nodes of a time-varying communication network. For this problem, we propose two decentralized actor-critic algorithms with function approximation, which are applicable to large-scale MARL problems where both the number of states and the number of agents are massively large. Our algorithms are fully incremental and can be implemented in an online fashion. Convergence analyses of the algorithms are provided when the value functions are approximated within the class of linear functions.

#### 4 - Geometry and Algorithms for Sparse Blind Deconvolution

Yuqian Zhang, Columbia University, New York, NY, United States, Han-Wen Kuo, John Wright

Blind deconvolution aims to recover a convolution kernel and an activation signal from their convolution. This talk focuses on the “short and sparse” variant, where the convolution kernel is short, and the activation signal is sparsely and randomly supported. We assume the kernel to have unit Frobenius norm, and formulate it as a nonconvex optimization problem over the sphere. By analyzing the optimization landscape, we argue that when the activation signal is sufficiently sparse, then on a region of the sphere, every local minimum is close to some shift truncation of the kernel. This geometric characterization implies that efficient methods obtain the ground truth under the same conditions.

### 5 - QSDPNAL: A Two-phase Augmented Lagrangian Method for Convex Quadratic Semidefinite Programming

Xudong Li, Princeton University, NJ, United States, Defeng Sun, Kim-Chuan Toh

In machine learning, statistics, and other areas, numerous interesting problems can be modeled in the form of convex composite quadratic conic programming. In this talk, we use the convex quadratic semidefinite programming (QSDP) problem as an example to introduce a two-phase augmented Lagrangian method (ALM), called QSDPNAL, for solving QSDP with linear equality and inequality constraints. Under mild conditions, we are able to establish the rate of convergence of the proposed algorithm and prove the R-(super)linear convergence of the KKT residual. Extensive numerical results show that our algorithm is highly efficient and robust in obtaining accurate solutions.

#### 1 - Comparison of Solution Methods in Evaluating a System of Risk Assessments

Mark Gallagher, Air Force, Washington, DC, United States, John Lepird, Daniel Fenn, Shane Hall

Military operations are a synthesis of capabilities, challenging integrated risk assessment. We establish a framework to integrate capabilities using a common risk metric, proposing a novel approach to establishing relationships between them, and deriving models aggregating risks and dependencies. This framework has informed billions of dollars of Air Force investments.

#### 2 - Offensive and Defensive Naval Weapon Assignment to Swarming Threats

Connor S. McLemore, Navy, Washington, DC, United States

We propose an automated decision aid capable of generating offensive and defensive engagement profiles for naval weapons. It allows the efficient pairing of multiple weapon systems to multiple swarming threats operating in multiple domains by providing the operator with recommended weapon-target pairings based on current capabilities and threat profiles. The model consists of pre-processing algorithms and reward-based mixed-integer programming models that takes as inputs the available weapon system capabilities and target information and outputs a recommended engagement profile.

#### 3 - A System-of-Systems Methodology for Analysis of the Behavior of Complex System

Dan DeLaurentis, Purdue University, West Lafayette, IN, United States, Cesare Guariniello

System Operational Dependency Analysis (SODA) is a methodology to assess the effect of dependencies between constituent elements of complex systems. The analysis, based on a parametric model of the behavior of the elements, is domain-agnostic and provides identification of critical areas, study of cascading effect of disruptions, and assessment of features of the whole system, such as robustness and resilience. SODA can be used to compare different systems architecture for decisions in early design phase, and to assess vulnerabilities and potential improvements of existing architectures.

#### 4 - Mission Dependency Analysis with Physical Network Relationship

Les Servi, The MITRE Corporation, M/S M230, 202 Burlington Road, Bedford, MA, 01730-1420, United States

A functional dependency network is a useful framework to evaluate alternative decisions under a constrained budget. It captures the impact of decisions on the hierarchy of goals and sub-goals required to achieve a mission. Motivated by cyber security considerations, this talk will describe the use of mixed integer linear programming to optimize the defending or attacking such networks but also taking into account the physical network associated with the functional network.

Sponsored Session

Chair: N. Orkun Baycik, Shenandoah University, Winchester, VA, n/a, United States

#### 1 - Computing the Vulnerability of Multi-hop Wireless Networks: A Search for the $\delta$ Best Interference Model

Hugh Medal, Mississippi State University, P.O. Box 9542, MSU, MS, 39762, United States, Randy K. Buchanan

This paper studies the problem of placing a set of jammers in 3-D space in order to minimize the throughput of a wireless communication network. The main goal of this paper is to study the effects of jamming under several different models of interference (e.g., physical, capture, protocol, interference range). Toward this end, this paper presents a mixed-integer programming (MIP) formulation and branch-and-cut procedure for the jammer location problem under several models of interference as well as a study of the effect of different interference models on runtime and solution tractability.

#### 2 - Fishing and Trafficked Labor: An Examination of Policies to Address the Intersection of Prosperity and Exploitation

Renata Alexandra Konrad, Worcester Polytechnic Institute, School of Business, 100 Institute Road, Worcester, MA, 01609, United States, Khalid Saeed, Matt Kammer-Kerwick

Human exploitation in the seafood industry is a complex transnational problem jeopardizing human rights and marine ecosystems. Labor trafficking, environmental sustainability, aquaculture, and socio-economic development interact interdependently, and form a large system with multiple decision makers with conflicting goals. We present the results of a System Dynamics simulation model which incorporates resource management of fish stocks and illicit labor markets. Using this model, we examine the implications on trafficked labor of several policies including: imposing an excise tax, trafficking prevention campaigns, and increased policing.

#### 3 - Interdicting Layered Physical and Information Flow Networks

N. Orkun Baycik, Shenandoah University, Winchester, VA, United States, Thomas Sharkey, Chase Rainwater

We focus on the problem of interdicting layered networks that involve a physical flow network and an information flow network. There are interdependencies between the networks which leads to a network interdiction problem with a discrete inner problem. The objective of the defender is to send the maximum amount of flow through its physical flow network whereas the attacker seeks to minimize this maximum flow. For the case where the information supply arcs are uncapacitated, we apply a multi-step, dual-based reformulation technique. We apply this technique to law enforcement efforts against illegal drug trafficking and cyber vulnerability analysis of infrastructure networks.

### Connectivity and Networks

Sponsored: Optimization/Network Optimization  
Sponsored Session

Chair: Hosseinali Salemi, Oklahoma State University, Stillwater, OK, 74075, United States

#### 1 - Connectivity and Power Domination in Graphs

Logan Smith, Graduate Student, Rice University, Houston, TX, United States

Power domination is related to the placements of sensors in electrical networks. Minimum power dominating sets in a graph correspond to minimal sensor arrays that are able to fully observe a given power grid. Nearby sensors can be supported with reduced infrastructure, thereby incentivizing the identification of minimum power dominating sets with induced subgraphs having a minimum number of components. Methods in power domination and connectivity constraints are adapted to solve this problem and computational experiments compare runtime performances.

#### 2 - A Lagrangian Relaxation Upper Bound on Clique Number of Graphs

Seyedmohammadhossein Hosseini, Texas A&M University, 3131 TAMU, College Station, TX, 77843-3131, United States, Sergiy Butenko

We introduce a new analytic (i.e., closed-form) upper bound on clique number of graphs. This bound is derived from a Lagrangian relaxation of an integer (linear) programming formulation of the maximum edge weight clique problem, and is characterized by degrees of vertices in the graph. We compare this bound with other analytic bounds proposed in the literature.

**3 - The Weighted Target Set Selection Problem on Cycles**

Rui Zhang, Assistant Professor, University of Colorado Boulder, Boulder, CO, 80309, United States, Subramanian Raghavan

The study of viral marketing strategies on social networks has become an area of significant research interest. In this setting, we consider the weighted target set selection (WTSS) problem. Motivated by the desire to develop a better understanding of fundamental problems in social network analytics, we focus on a special case where the underlying graphs are cycles. First, we propose a linear time algorithm for the WTSS problem on cycles. More importantly, we present a tight formulation in the node space. It provides a complete description of this polytope. Our work can be a building block for developing exact methods for tackling this important problem in social network analytics.

**4 - A Shortest Path Interdiction Problem with Improvement**

Timothy Holzmman, Clemson University, Engineering, Computing and Applied Sciences, Freeman Hall, Clemson, SC, 29634, United States, Cole Smith

We consider a shortest path interdiction problem with improvement. As in standard interdiction problems a leader and a follower play a Stackelberg game, wherein the leader seeks to maximize the follower's shortest path between two nodes on a graph. In our variant, in addition to the leader raising edge costs with a budget, the follower also has an opportunity to lower costs within a budget. We employ a multiobjective optimization model for problem where the leader is uncertain of the follower's budget. We present two solution methods and consider their comparative strengths and weaknesses.

**5 - New Integer Programming Formulations for Detecting Critical Nodes**

Hosseinali Salemi, Oklahoma State University, 15 North University Place, Apartment Number 2, Stillwater, OK, 74075, United States, Austin Buchanan

Recently, researchers have studied the problem of identifying so-called "critical nodes in networks, which are small subsets of nodes whose deletion maximally deteriorates a network. In this talk, we consider variants of this problem in which the task is to delete at most  $B$  nodes so as to minimize the number of node pairs that remain connected by: (1) a path, or (2) a path of length at most  $k$ . We propose new cut-like IP formulations for these problems and compare with previous approaches.

**1 - Rank Minimization Based Sparse Data Reconstruction in Sensory Networks**

Constantino Lagoa, PSU, State College, PA, United States, Ashkan Jasour

In this work, a novel approach to reconstruct a noisy sparse  $n$ -dimensional data is proposed. The main idea is to complete the data with least possible complexity. The complexity is defined as the number of exponential signals that could describe the data. We show that the number of exponential signals corresponds to the rank of block Hankel matrix constructed from given data. In this context, the problem of data reconstruction can be reformulated as matrix completion and rank minimization problems where the nuclear norm is used as a convex relaxation of the matrix rank. A first-order augmented Lagrangian algorithm is implemented for solving the resulting optimization problem.

**2 - On Stochastic Quasi Newton Methods for Illposed Stochastic Optimization Problems**

Farzad Yousefian, Oklahoma State University, 317D Engineering North, School of Industrial Engineering & Management, Stil, OK, 74074, United States, Angelia Nedich, Uday Shanbhag

We consider stochastic quasi-Newton (SQN) methods for solving unconstrained convex optimization problems. Much of the convergence analysis of SQN methods, in both full and limited-memory regimes, requires the objective function to be strongly convex and have Lipschitzian gradients. We develop SQN methods addressing absence of these assumptions. Particularly, we develop a regularized stochastic limited-memory BFGS algorithm, where the stepsize, regularization parameter, and the Hessian inverse approximate are updated iteratively. We establish convergence of the iterates to an optimal solution of the original problem. A convergence rate is derived in terms of the objective function.

**3 - Hierarchical Sparse Modeling**

Jacob Bien, University of Southern California, Los Angeles, CA, United States

It is common in statistics to demand sparsity patterns honoring certain problem-specific constraints. In hierarchical sparse modeling (HSM), these constraints specify that one set of parameters be set to zero whenever another is set to zero. Numerous papers have developed convex regularizers for this sparsity structure, which arises in many areas of statistics including interaction modeling and covariance estimation. We observe that these methods are based on two different types of group lasso that have not been systematically compared in the context of HSM. We investigate the differences both in terms of statistical properties and computational efficiency. Joint work with Xiaohan Yan.

**4 - Distributed Proximal Algorithms for Statistical Learning with Structured Sparsity**

Sam Davanloo Tajbakhsh, The Ohio State University, 210 Baker Systems Building, 1971 Neil Ave, Columbus, OH, 43210, United States

In some sparse statistical learning problems, solutions should follow sparsity structures between variables known a priori. Being able to generate such structures helps to obtain more interpretable models. Our study focuses on hierarchical sparsity structures represented as Directed Acyclic Graphs. Designed penalty functions exploit group overlaps to induce solutions with desired hierarchical structures. In this talk, we will present new distributed proximal algorithms to solve the underlying optimization problems with theoretical convergence guarantees. Some numerical results supporting the proposed algorithms will be provided.

**On-demand Service Platforms**

Sponsored: Manufacturing & Service Oper Mgmt

Sponsored Session

Chair: Kaitlin Daniels, Washington University

**1 - Labor Welfare in On-demand Service Platforms**

Saif Benjaafar, University of Minnesota, 111 Church Street SE, Department of Industrial and Systems Engr, Minneapolis, MN, 55419, United States, Jian-Ya Ding, Guangwen Kong, Terry Taylor

We study labor welfare in on-demand service platforms that rely on independent agents. The platform chooses wages and prices knowing that customers are sensitive to both price and delay. In contrast to settings where customers are insensitive to delay, we show that an increase in labor supply does not necessarily result in lower wages and lower labor welfare.

**2 - Competition of On-demand Platforms**

Ming Hu, University of Toronto, Rotman School of Management, 105 St. George Street, Toronto, ON, M5S 3E6, Canada, Yan Liu

We study competition of on-demand platforms, where firms compete on both supply and demand sides. We consider various modes of competition, and study their implications on platforms' profit, prices on the demand side, wages on the supply side, and matching quantities at equilibrium. We also establish Kreps-Scheinkman equivalence in this type of two-sided markets.

**3 - Peak-period Pricing Strategies in the Presence of Customer Impatience and Store and Time Flexibility**

Steve Yoo, University College London, London, United Kingdom, Christopher S. Tang

Should a service firm charge higher prices during peak periods? We examine this question formally by analyzing a stylized duopoly model where firms compete for homogeneously impatient consumers. We consider four settings, defined by whether consumers are (i) flexible in their choice of store (where) and/or (ii) flexible in their choice of shopping time (when). For each setting, we use the concept of a rational expectation equilibrium to characterize how consumers endogenously segment themselves regarding where and when to shop to avoid congestion. We examine how the firms can profitably influence consumers' self-segmentation process by employing the peak-period pricing strategy.

**4 - Rewarding Loyalty: Bonus Design on Ridesharing Platforms**

Puping Jiang, Olin Business School, Washington University in St. Louis, Washington University Olin Business School, Knight Hall, Campus Box 1156, Saint Louis, MO, 63130-4899, United States, Kaitlin Daniels, Fuqiang Zhang

Ridesharing platforms commonly offer drivers a bonus payment that is contingent on the number of rides completed. The bonus constitutes a costly incentive that encourages drivers to drive exclusively for one platform. In this paper, we explain the existence of bonuses in the context of competing platforms and describe the market conditions that lead to their use.

**1 - Cancelability in Trade Credit Insurance**

Christopher J. Chen, London Business School, Regent's Park, London, NW14SA, United Kingdom, S. Alex Yang, Nitin Bakshi

Trade credit insurance (TCI) is a risk management tool commonly used by suppliers to guarantee against payment default by buyers. Unlike insurance policies in other sectors, TCI policies often allow the insurer to cancel this guarantee during the insured period. This paper explores the role of cancelability in TCI and its operational implications.

**2 - Risk-neutral or Risk-averse? An Empirical Study of Managed Print Services**

Jie Ning, Case Western Reserve University, Department of Operations, 328 Peter B. Lewis Building, Cleveland, OH, 44106, United States, Volodymyr O. Babich, John Handley, Jussi Keppo

We study the risk attitude of a service provider in the context of Managed Print Service (MPS), a type of business-to-business (B2B) service. We develop a hierarchical game theoretic model with asymmetric information to capture the contracting features of MPS. Using a proprietary data set from Xerox, we estimate Xerox's risk-aversion parameter using a structural approach and find empirical evidence that Xerox is risk-averse. We offer a new explanation for this result.

**3 - What Operations Management Researchers Should Know About Blockchain Technology**

Volodymyr O. Babich, Georgetown University, 37th & O. St NW, McDonough School of Business, Washington, DC, 20057, United States, Gilles Hilary

We examine the Blockchain technology's implications for operations management (OM). After briefly reviewing the technical foundations, we explore multiple business and policy aspects. Blockchain technology has emerged through the appearance of crypto-currencies. This may have been of limited interest to OM. The technology has now evolved beyond these markets and has started to offer the possibility to execute "smart contracts." This has immediate implications for the improvement of production and distribution networks. We identify five key advantages, five main drawbacks, and three themes associated with the Blockchain technology as it is applied to OM.

**4 - A Supply Chain Theory of Factoring and Reverse Factoring**

Fasheng Xu, Washington University in St. Louis, Campus Box 1156 One Brookings Drive, KH401, PhD Suite, Saint Louis, MO, 63130, United States

We develop a supply chain theory of factoring and reverse factoring showing when these post-shipment financing schemes should be adopted and who really benefits from the adoption. Given supplier's credit rating and trade credit term, recourse factoring is preferred when the supplier's cash investment return rate is relatively high; non-recourse factoring is preferred within certain medium range; otherwise, factoring should not be adopted. Further, we find that reverse factoring should only be offered to suppliers with medium cash investment return, and it is not always optimal for the retailer to extend the payment term in reverse factoring.

**3D Printing**

Sponsored: Manufacturing &amp; Service Oper Mgmt

Sponsored Session

Chair: Michael R. Wagner, University of Washington, Seattle, WA, 98195, United States

Co-Chair: Mohammad Ebrahim Arbabian, University of Washington, Seattle, WA, 98105, United States

**1 - Managing Self-replicating Innovative Goods**

Bin Hu, University of North Carolina, Chapel Hill, NC, United States, Zhankun Sun

Inspired by self-replicating 3D printers, we investigate the business model for innovative goods whose demands follow Bass diffusion and whose production is through self-replication. Modeled as an optimal-control problem, we identify

clean structural properties of optimal production and sale policies and find them to be robust for a number of variations of the demand model. We also investigate uncertainty and learning of the diffusion parameter.

**2 - IP Licensing and 3D Printing of Spare Parts**

Bram Westerweel, Eindhoven University of Technology, Den Dolech 2, Eindhoven, 5600MB, Netherlands, Rob J. Basten, Jing-Sheng Jeannette Song

We consider an original equipment manufacturer (OEM) that supplies its customers with spare parts. In addition to a traditional channel for direct purchasing, the OEM can also offer customers the option of purchasing the spare parts design via a license agreement through which the customers can purchase spare parts from a local 3D printing service provider. We characterize the optimal contract structure to maximize the OEM's profit and we generate insights into the degree of decentralization of the supply chain when customers are offered a license agreement for local 3D printing.

**3 - The Impact of 3D Printing on Manufacturer Retailer Contractual Relationships**

Mohammad Ebrahim Arbabian, University of Washington, 5243 22nd Avenue NE, # 4, Seattle, WA, 98105, United States

As 3D printing is being recognized as a new technology in manufacturing, we study a wholesale-price contract where, on top of the traditional manufacturing, either the manufacturer or the retailer could adopt this new technology to produce final products. We analyze the equilibrium of the resulting games.

**4 - Moving to 3D Printing Technology for Spare Parts Supply**

Nils Knofius, University of Twente, Drienerlolaan 5, Building Ravelijn, Enschede, 7522NB, Netherlands, Matthieu van der Heijden, Henk Zijm

We analyze how and when a transition to 3D printing technology is advisable for spare parts supply during the remaining service horizon. Therefore, we consider an evolving inventory system where 3D printing production costs and demand rates may change over the course of the service horizon. Using a stochastic dynamic programming approach, we demonstrate that moving to 3D printing technology pays off under various conditions.

**Emergency Department Operations**

Sponsored: Manufacturing &amp; Service Oper Mgmt/Healthcare Operations

Sponsored Session

Chair: Hummy Song, Philadelphia, PA, 19104, United States

**1 - Balancing Patient Care and Resident Supervision in Emergency Medicine: Resident Effect on Attending Physician Workload Study**

Yue Yin, Northwestern University, Evanston, IL, United States, Ernest Wang, Itai Gurvich, Jan A. Van Mieghem

We delineate the relationship between the presence of residents and the proportions of time spent on different tasks by emergency medicine attending physicians. We observed and compared how 25 emergency medicine attending physicians spent their time in an academic emergency department versus in a non-academic emergency department. We applied multivariate beta regression models to examine whether the overall presence of residence was associated with significant changes in physicians' time expenditures, controlling for physician workload, physician productivity, average patient acuity, waiting room crowdedness, and resident seniority.

**2 - An Econometric Analysis of How Facility Layout Impacts Care Provision in the Emergency Department**

Lesley Meng, The Wharton School, University of Pennsylvania, 3730 Walnut Street, Suite 500 JMH, Philadelphia, PA, 19104, United States, Robert Batt, Christian Terwiesch

We study how the facility layout of ED patient rooms impacts nurse workflow decisions. Specifically, linking our infrared nurse location tracking data to room occupancy patient data, we are able to investigate the impact of facility layout variables, such as distance from the nurses' station, on patient care quality in the ED.

**3 - Measuring Primary Care Performance Using ED Data**

Sandra S Iz, Erasmus University, Rotterdam, Netherlands, Nicos Savva

In the UK, access and clinical quality of GPs are difficult to measure either due to data unavailability, low frequency of data collection, or inconsistent data collection across GPs. ED-level data, however, exists and is comparable across hospitals. We therefore analyse whether ED-level data can be used to assess GP performance thereby distinguishing between accessibility for acute conditions and management of long-term care conditions.

**4 - Impact of Universal Healthcare on Patient Choice**

Diwas S. Kc, Emory University, 1300 Clifton Road, Goizueta Business School, Atlanta, GA, 30322, United States

This paper examines the role of universal healthcare on patient choice and quality of care. Lack of health insurance is a leading contributor to Emergency Department (ED) visits from the uninsured. We find that the availability of health insurance has a significant impact on the type of healthcare sought by the previously uninsured. Specifically, individuals are less likely to continue visiting the ED, and choose hospital inpatient and outpatient services instead. We also find an effect of the policy on quality of care, as measured by same-month patient revisits. Although overall revisit rates remain unchanged, frequent users experience a decline in same-month revisits.

**1 - Matching Supply and Demand in a Service Network**

Levi DeValve, Duke University, 716 Turmeric Lane, Durham, NC, 27713, United States, Sasa Pekec, Yehua Wei

A service provider wishes to match stochastic supply and demand located on a network. With limited resources, the service provider can only choose a subset of nodes in the network where matches can be made, and wants to choose a subset maximizing its expected profit. Although this problem is NP-hard, we provide constant factor approximation guarantees for various heuristics, including a simple greedy policy. We also discuss several applications of this problem.

**2 - Spatial Pricing for Taxi Rides in New York City**

Nasser Barjesteh, Chicago, IL, 60615, United States, Baris Ata, Sunil Kumar

We conduct an empirical study of the impact of spatial prices on the performance of the taxi industry in New York City. We use a mean-field model, in which the taxi drivers strategically search for customers in different neighborhoods across the city taking into account the distribution of the supply and demand as well as the prices across the city. We conduct a series of counterfactual analyses to explore the impact of spatial prices on the distribution of supply and demand. We also investigate how spatial prices affect the welfare of customers and drivers and how the distribution of supply, demand, the destination of the rides, and the price sensitivity of the customers impact the optimal spatial prices.

**3 - Does the Bullwhip Matter Economically? A Cross-sectional Firm-level Analysis**

Jeffrey Callen, University of Toronto, Toronto, ON, Canada

We investigate whether the bullwhip effect measured at the firm level impacts firms' profitability. We estimate the relation between the bullwhip and various financial performance measures with a large panel of cross-sectional firm-level data. Performance is measured both in terms of mean effects and volatility effects. Our analysis yields results inconsistent with the notion that the bullwhip at the firm level has significant negative consequences on profitability. In particular, we find almost no significant statistical or economic negative relation between financial measures of profitability and the empirical bullwhip measures at the firm level, both with and without covariate controls.

**4 - Learning by Doing Versus Learning by Viewing: An Empirical Study of Data Analyst Productivity at Ebay on a Collaborative Platform**

Yue Yin, Northwestern University, Evanston, IL, United States, Itai Gurvich, Stephanie McReynolds, Debora Seys, Jan A. Van Mieghem

Effective data analytics drives business success by enhancing managerial decision-making. Companies, however, often struggle to maintain growth in the productivity of their data analysts. In this paper, we investigate how data-analyst productivity benefits from collaborative platforms that facilitate learning-by-doing (i.e. analysts learning by writing queries on their own) and learning-by-viewing (i.e. analysts learning by viewing queries written by peers). Productivity is measured using the time from creating an empty query to first executing it.

**Joint Session MSOM/Practice Curated: Empirical Service Operations**

Sponsored: Manufacturing & Service Oper Mgmt/Service Operations

Sponsored Session

Chair: Vinayak Deshpande, The University of North Carolina at Chapel Hill

**1 - Improving Customer Compatibility with Operational Transparency**

MoonSoo Choi, Harvard Business School, 700 Soldiers Field Road, Wyss House, Boston, MA, 02163, United States, Ryan Buell

Recent research has demonstrated the impact of customer compatibility - the degree of fit between the needs of customers and the capabilities of the operations serving them - on service performance. Companies with more compatible customers receive higher satisfaction scores and exhibit faster growth. However, when marketing their offerings to prospective customers, companies often shroud the operational tradeoffs inherent in their offerings in favor of emphasizing their advantages. Through a large-scale field experiment with a nationwide retail bank, we investigate how providing prospective customers with transparency into an operation's tradeoffs affects acquisition and engagement.

**2 - Don't Call Us, We'll Call You: An Empirical Study of Caller Behavior under a Callback Option**

Brett Hathaway, The University of North Carolina at Chapel Hill, 1800 Baity Hill Drive #310, Chapel Hill, NC, 27514, United States,, Seyed Emadi, Vinayak Deshpande

Using call center data from a bank, we empirically study callers' decision-making process in the presence of a callback option. We formulate a structural model of their decision-making process, and impute their underlying preferences from the data. Our estimates of their preferences show that they experience almost no discomfort while waiting for a callback, and they incur a high cost of switching from their offline tasks to answer a callback. We conduct a counterfactual analysis of how various callback policies affect the service quality and system throughput of this call center. Our results indicate that offering callbacks increases service quality without substantially impacting throughput.

**3 - At Your Service on the Table: Impact of Tabletop Technology on Restaurant Performance**

Fangyun Tan, Southern Methodist University, 6212 Bishop Blvd, Dallas, TX, 75275, United States, Serguei Netessene

We use granular data to examine the impact of a tabletop device that facilitates the order process on the check size and meal duration aspects of restaurant performance. We find that the tabletop technology is likely to improve average sales per check by 2.91% and reduce the meal duration by 9.74%, which increases the sales per minute or sales productivity by approximately 10.77%. Overall, our results indicate great potential for introducing tabletop technology in a large service industry that currently lacks digitalization.

**4 - Decision Bias in the News Vendor Problem: Evidence from Airline Flight Scheduling**

Vinayak V. Deshpande, University of North Carolina at Chapel Hill, Kenan Flagler Business School, McColl Building, CB #3490, Chapel Hill, NC, 27514, United States, Milind Sohoni, Chandrasekhar Manchiraju

Research in Behavioral Operations Management has documented "Demand Chasing" and "Pull to Center" as two prevalent behavioral biases in the single period newsvendor problem in laboratory experimental settings. Using flight-scheduling data from the US Airline industry, we show that these biases exist even in real world managerial decisions. We also show that these biases exist not only at the individual level, but are also at the firm level.

**Joint Session MSOM/Practice Curated: Renewable Energy Operations**

Sponsored: Manufacturing &amp; Service Oper Mgmt/Sustainable Operations

Sponsored Session

Chair: Nur Sunar, UNC, Chapel Hill, NC, 27517, United States

**1 - Pricing and Information in Short-term Sequential Power Markets with Renewable Energy**

Derck Koolen, Erasmus University-Rotterdam, Rotterdam, 3062PA, Netherlands, Derek W. Bunn

Motivated by the ongoing integration of renewable energy sources, we analyze sequential pricing in short-term power markets with a varying technology mix. We propose a multi-stage competitive equilibrium model to analyze retailers and heterogeneous producers' optimal sequential trading, allowing to capture the information transparency effect of large-scale and decentralized production on individual market participants' risk related hedging pressure. Empirical results, comparing the British and Californian market, validate the approach with respect to market specific exogenous operational constraints.

**2 - Smart Bike Lanes: A Data-driven Approach**

Sheng Liu, University of California, Berkeley, 1731 Spruce St Unit B, Berkeley, CA, 94709, United States, Zuo-Jun Max Shen, Xiang Ji

We develop a bike lane planning model based on the bike trajectory data. We formulate the bike lane planning problem as an integer program to maximize the coverage of cyclists as well as the continuity of bike lanes. We develop a Lagrangian relaxation method to solve the model efficiently by exploiting its structure. We apply the model to Zhuhai city of China using the real trajectory data from a dock-less bike sharing system. The construction plan of our model can benefit tens of thousands of cyclists in Zhuhai and promote cycling as a healthy and sustainable transit mode. We collaborate with the urban planning institution of Zhuhai to implement the model.

**3 - Capacity Investment in Wind Farms: The Role of Subsidy Policies**

Foad Iravani, University of Washington, Foster School of Business, ISOM Department, Box 353226, Seattle, WA, 98195-3226, United States, Saed Alizamir, Safak Yucel

The U.S. government offers output-based and cost-based subsidies to promote investment in wind farms. We analyze the decision of wind farms to choose one of the two subsidies and study the effect of subsidies on the farms' capacity decisions.

**4 - Meeting Corporate Renewable Energy Targets**

Selvaprabu Nadarajah, College of Business, University of Illinois at Chicago, 601 South Morgan Street., UH 2406, Chicago, IL, 60607, United States, Danial Mohseni-Taheri, Alessio Trivella

Several companies have committed to procuring a percentage of their power demand from renewable sources by a future date. We study the dynamic procurement problem to meet this target by purchasing power via virtual power purchase agreements (PPA) and the wholesale spot market, which are two dominant strategies. We analyze the change in procurement cost under different target levels and PPA strike price structures used in practice, as well as, characterize substitution between the strike price and the target level. To assist in computing multi-stage procurement portfolios, we develop a dual reoptimization based approximate dynamic programming policy and present results on realistic instances.

**5 - Implications of Independent Renewable Power Producers for Utility Companies**

Nur Sunar, UNC, 1604 Village Crossing Drive, Chapel Hill, NC, 27517, United States, Jayashankar M. Swaminathan

It is widely believed that the existence of independent renewable power producers hurts the profitability of utility companies. We identify a prevalent practical setting in which the existence of independent renewable energy producers increases the profitability of utilities. We complement our results with data analysis.

**New Models for Assortment Planning and Pricing**

Sponsored: Revenue Management &amp; Pricing

Sponsored Session

Chair: Sumit Kunnumkal, Queen's University, Smith School of Business, Kingston, ON, Canada

**1 - Assortment Optimization for a Multi-stage Choice Model**

Zizhuo Wang, University of Minnesota, 1009 5th Street SE, Minneapolis, MN, 55414, United States, Yunzong Xu

Motivated by a practical selling scenario that requires previous purchases to unlock future options, we consider a multi-stage assortment optimization problem, where the seller makes sequential assortment decisions with commitment, and the customer makes sequential choices to maximize her expected utility. We show that this problem is polynomial-time solvable when the customer is fully myopic or fully forward-looking. The optimal policy entails that the assortment in each stage is revenue ordered and a product with higher revenue always lead to a wider range of future choices. We also show that the problem is NP-hard in general and give precise/approximation algorithms for various scenarios.

**2 - Price Optimization under an N-pack Choice Model**

Guang Li, Queen's University, Smith School of Business,  
Kingston, ON, Canada, Ying Cao

We consider the price optimization problem for a retailer under an n-pack choice model. Under such a model, each customer would either purchase n items from a collection of m products or leave with no purchase. Given an offered assortment, the retailer aims at maximizing his total revenue by setting the right price for each product. We study the structural properties of the optimal prices under different pricing schemes and develop efficient algorithms for price optimization

**3 - Operations Management under Sequential Choice Models**

Ruxian Wang, Johns Hopkins University, Carey Business School,  
100 International Dr, Baltimore, MD, 21202, United States

Consumers may follow a sequence to choose the products they would like to choose. We study the operations management problems and derive useful managerial insights.

**4 - Assortment Planning with N-pack Purchasing Consumers**

Ying Cao, University of Texas at Dallas, Dallas, TX, United States,  
Dorothee Honhon

For many product categories, customers often buy multiple differentiated products on a given store visit for staggered consumption until the next store visit. Such customers are referred to as n-pack purchasing customers in Fox et al (2017). We consider a retailer who makes product assortment decisions in a given product category facing n-pack purchasing customers. We study the structural properties of the optimal assortment under two different customer choice rules. And we explore how the retailer's assortment decision and total profits are impacted when the retailer ignores the "choice premium which captures the utility that consumers derive from variety in their shopping basket.

North Bldg 129A

**Joint Session RMP/Practice Curated: Sharing Economics**

Sponsored: Revenue Management & Pricing

Sponsored Session

Chair: Han Zhu

**1 - Courteous or Crude? Operational Tools to Shape User Behavior in Ride-sharing Platform with Bilateral Ratings**

Yunke Mai, Duke University, Durham, NC, United States,  
Yuhao Hu, Zilong Zou, Bin Hu, Sasa Pekec

We study the impact of riders' manners and drivers' selectiveness on the performance of ride-sharing platforms. We develop an evolutionary game-theory model to study how user behavior on the platform evolve over time under a bilateral rating system. We identify evolutionary trajectories of user behavior and stable equilibria for the platform usage as a function of the system parameters. In addition, we investigate how platform's operational decisions such as pricing, supply/demand management, and choice of matching protocols impact user behavior and platform's long-run performance.

**2 - Analysis of Incentivized Ride Matching as Stackelberg Queue**

Shumin Ma, The Chinese University of Hong Kong, ERB615,  
CUHK, Hong Kong, Qi Wu

We study incentive strategies using a queueing game approach. Our key assumption is that the driver supply is finite and reusable while riders arrive stochastically. With this assumption, we first establish the endogenous forces driving the imbalances between supply and demand with zero monetary incentive. We then administer incentives between the platform and the driver population via Stackelberg games and study the system's intrinsic capacity bounds in steady state. We show that the optimal amount of myopic incentives is achieved when the circulation of the reusable pool of the driver supply is the fastest. Further spending beyond the optimal, however, is potentially disruptive.

**3 - Dynamic Type Matching**

Yun Zhou, McMaster University, 1280 Main Street West,  
Hamilton, ON, L8S 4M4, Canada, Ming Hu

Motivated by the sharing economy, we consider a dynamic matching problem with heterogeneous supply and demand types. This paper studies the optimality and near-optimality of matching policies under a given priority rule. For two cases with vertical and horizontal types, respectively, we characterize the optimal prioritized matching policy.

**4 - Short-term Asset Rentals and Corporatization of Platform Pricing**

Han Zhu, McGill University, Montreal, QC, H3H 1K4, Canada,  
Mehmet Gumus, Saibal Ray

Recently, we have seen the emergence of short-term rentals platforms. In this paper, we focus on how the platform decides on the price to charge their customers. Specifically, in a platform like Airbnb, the price is effectively set based on a market mechanism that matches supply and demand. But, some other platforms are more active. They take turnkey control of the assets and determine the price on behalf of the owners that maximizes their profits. Our primary goal in this paper is to understand the implications of this difference in pricing strategy for the direct stakeholders of the platform such as customers, owners and the platform as well as indirect stakeholders such as long-term rentals and hotels.

**Advances in Demand Learning for Revenue Management**

Sponsored: Revenue Management & Pricing

Sponsored Session

Chair: Pavithra Harsha, IBM Research, Yorktown Heights, NY, 10598, United States

**1 - Choice Model Trees: A Joint Framework for Market Segmentation and Decision Making**

Ryan McNellis, Columbia University, 540 West 122nd Street,  
Apartment 6C, New York, NY, 10027, United States,  
Mohammed Ali Aouad, Prasad Chalasani, Adam Elmachtoub,  
Kris Johnson Ferreira, Michael R. Young

We propose a new method for incorporating feature information into marketing decision-making problems. Relevant applications include the recommendation of personalized product assortments, personalized pricing, and customizing bids for advertising exchanges. Our method uses a decision tree to segment the market (e.g., customers), and a choice model involving the decision variable (e.g., product assortment) is then fit locally in each segment. The resulting model is interpretable and easily visualized. We propose a new training algorithm which directly optimizes the likelihood of the resulting collection of choice models. Modifications are explored for improved scalability.

**2 - A Model-based Embedding Technique for Segmenting Customers**

Ashwin Venkataraman, Harvard University, Cambridge, MA,  
United States, Srikanth Jagabathula,  
Lakshminarayanan Subramanian

We consider the problem of segmenting a large population of customers into non-overlapping groups with similar preferences, using diverse signals such as purchases, ratings, clicks, etc. over a large universe of items, when each customer provides only a few signals. We propose a model-based embedding technique which takes the customer observations and a probabilistic model class generating the observations as inputs, and outputs an embedding—a low-dimensional representation in Euclidean space—for each customer. We then cluster the embeddings to obtain the segments. We demonstrate the speed and performance of our method in two case studies including a real implementation on eBay data.

**3 - Dynamic Pricing of Limited Inventories with Product Returns**

Xing Hu, University of Oregon, 1208 University Of Oregon, 484  
Lillis, Eugene, OR, 97403, United States, Zhixi Wan,  
Nagesh N. Murthy

Many online retail channels face high rates of product returns. This poses a new challenge to the sellers' dynamic pricing problem when some returns in good condition can be resold in the selling season. To study the impact of product returns and guide sellers to adjust pricing policies, we build a product returns model by augmenting the classic monopolist's dynamic pricing framework. We address the technical challenges both analytically and numerically. Our analysis finds that ignoring returns leads to over-pricing and can cause significant revenue loss. The analysis yields easy-to-implement heuristic policies that have good and robust performance relative to the theoretical benchmarks.

North Bldg 130

**Topics in Market Design and Multi-agent Systems**

Sponsored: Revenue Management &amp; Pricing

Sponsored Session

Chair: Itai Ashlagi, Stanford University, Stanford, CA, 94305, United States

**1 - Information and Pricing Mechanisms for On-demand Platforms**

Guido Martirena

I consider the design of information and pricing mechanisms in an unobservable queue with strategic and heterogeneous customers that are privately informed. I show that 1) if the platform releases all the information, then among all possible pricing mechanisms the platform wishes to set a sequence of posted prices, 2) for any information policy, the steady-state can be replicated by full-information and prices while achieving a higher revenue, 3) optimizing among all possible pricing and information mechanisms, the optimum is to disclose all the information and set a sequence of posted prices, and 4) I identify conditions under which the platform profits from releasing information strategically.

**2 - Exploration vs. Exploitation in Team Formation for Collaborative Work**

Hannah Li, Stanford University, Palo Alto, CA, 94306, United States, Ramesh Johari, Vijay Kamble, Anilesh Krishnaswamy

Service platforms face an online learning problem in matching workers with jobs and using the performance on these jobs to create better future matches, a problem complicated by the presence of complex tasks that require a team of workers to complete. The success of a complex job depends on the skills of all workers, which may be unknown to the platform. We analyze two settings where the performance of a team is dictated by its strongest and weakest member, respectively, and find that both problems pose an exploration-exploitation tradeoff. We establish regret bounds and show how certain myopic strategies are optimal depending on the setting as well as the proportion of high quality to low quality workers.

**3 - Maximum Weight Online Matching with Deadlines**

Maximilien Burg, PhD Student, Massachusetts Institute of Technology, 77 Massachusetts Avenue, Cambridge, MA, 02139, United States, Itai Ashlagi, Amin Saberi

We study the finite horizon problem of matching agents who arrive at a marketplace over time and leave after  $d$  time periods. Each pair of agents can yield a different match value, and we study matching algorithms that perform well over adversarial graphs, when the arrival order of agents is random.

We show that the widely used “batching” algorithm, which periodically computes a maximum-weight matching, is 0.279-competitive when the period is  $d$ . Our analysis relies on a reduction to a graph-theoretic covering problem. We show that the competitive ratio is the limit solution of a family of linear programs, and we provide a computer aided bound on this limit.

**4 - Markets for Public Decision-making**

Nikhil Garg, Stanford University, Ashish Goel, Ben Plaut

A public decision-making problem consists of a set of issues, each with multiple possible alternatives, and a set of competing agents, each with a preferred alternative for each issue. We study adaptations of market economies to this setting. We first show that when each issue has a single price that is common to all agents, market equilibria can be arbitrarily bad. We then transform the problem into an equivalent Fisher market, the simplest type of private goods market. We show that the equilibrium prices in the constructed Fisher market yield a pairwise pricing equilibrium in the original public decision-making problem which maximizes Nash welfare.

**1 - R&D in Bitcoin Mining**

Humoud Waleed Alsabab, Columbia University, New York, NY, United States

We study a two-stage game where firms first invest in research and development (R&D) to subsequently compete in a Bitcoin mining game at reduced costs. We show that whether or not a firm is active in a mining game depends on the firm's hash rate costs and not on the rewards that can be obtained from mining. Increasing rewards, on the other hand, induce firms to exert higher hash rates and R&D efforts. We show that while an increase in R&D spillover reduces the

firm's R&D investment, it may still trigger the exertion of a higher total hash rate.

**2 - Propagation of Credit Freezes in Financial Lending Networks**

James Siderius, Massachusetts Institute of Technology, Boston, MA, United States

We consider a network model of financial intermediation where banks decide whether to extend credit to other banks, which may then default on those loans. In contrast to previous literature on financial networks, the focus is on how “fear of future default” can lead to “credit freezes” before the realization of these uncertainties. Specifically, we show that increases in the riskiness of one or a few banks can lead to systemic credit freeze throughout the financial network. This occurs because the consequences from uncertainty travel throughout the network as well as decrease the profitability of loans. We use this framework to analyze the effects of policy interventions on systemic credit freezes.

**3 - DGM: A Deep Learning Algorithm for Solving Partial Differential Equations**

Konstantinos Spiliopoulos, Boston University, 111 Cummington Mall, Boston, MA, 02215, United States

We propose to solve high-dimensional PDEs by approximating the solution with a deep neural network which is trained to satisfy the differential operator, initial condition, and boundary conditions. We prove that the neural network converges to the solution of the partial differential equation as the number of hidden units increases. Our algorithm is meshfree, which is key since meshes become infeasible in higher dimensions. We implement the approach for American options in up to 200 dimensions. We call the algorithm a “Deep Galerkin Method (DGM)” since it is similar in spirit to Galerkin methods, with the solution approximated by a neural network instead of a linear combination of basis functions.

**4 - Welfare Analysis of Central Bank Digital Currency: Privacy versus Efficiency**

Christoph Frei, University of Alberta, Mathematical and Statistical Sciences, CAB 621, Edmonton, AB, T6G 2G1, Canada, Agostino Capponi

A Central Bank Digital Currency (CBDC) is electronically transacted and stored money, similar to existing cryptocurrencies like Bitcoin, but guaranteed by a central bank. If a central bank introduced a CBDC, it could provide the public with a cheaper payment system, leading to efficiency gains compared to a traditional currency. However, a CBDC may compromise users' privacy because transactions could be monitored by the state's authority. In this talk, we present a model featuring the trade-off between efficiency and privacy faced by people who decide between different payment methods, and analyze the welfare implications of a CBDC.

**Emerging Business Models in Information Systems**

Sponsored: EBusiness

Sponsored Session

Chair: Manmohan Aseri, The University of Texas at Dallas, Richardson, TX

**1 - Are You Paying Too Much for Financial Advice? Measuring the Value of Information on a Social Trading Platform**

Mingwen Yang, The University of Texas at Dallas, JSOM, UTD, 800 W. Campbell, SM 33, Richardson, TX, United States, Vijay S. Mookerjee, Zhiqiang Eric Zheng

This study investigates the information value on a social trading platform. The platform releases the on-going transactions adding some time delays for public. Investors face the tradeoff between receiving real-time trading information paying higher commission and receiving delayed information with lower commission. Using individual trading data from a social trading platform and Forex spot price data, we simulate the profits with some time delays and measure the information value of following a trader in real time. We investigate how different factors (e.g., open time delay, close time delay, amount following by investors, market volatility, etc.) influence the information value.

**2 - Selecting a Portfolio of Mobile Ad Exchanges**

Leila Hosseini, The University of Texas at Dallas, Richardson, TX, Vijay Mookerjee

The trend of the last several years has been that people spend most of their mobile time in Apps. Following this trend, mobile advertisers and publishers have been focusing on running advertising campaigns inside mobile Apps to maximize their revenue. Mobile Ad delivery platforms participate in some auctions to buy supply from mobile Ad exchanges who help App owners to sell their Ad places. In this study, we analyze a planning model for a platform which needs to cover advertisers' demand by procuring supplies from multiple Ad exchanges. The planning problem amounts to selecting which of the given set of Ad exchanges to retain, so as to minimize total costs while ensuring that the advertisers' demand is met.

**3 - Bitcoin and Its Cost**

Sailendra Mishra, The University of Texas at DallasRichardson, TX

As cryptocurrencies are bid to become more mainstream, we investigate resources needed to operationalize these at large scale. Our research highlights how Bitcoin's complexity, transaction volume, and exchange rate affect computing power required in validating transactions in Bitcoin. Our findings suggest that Bitcoin's protocol induces competition and computational power race, which may deterrence to the future growth of the system.

**4 - How to Sell a Dataset? Pricing Policies for Data Monetization**

Sameer Mehta, The University of Texas at Dallas, 800 W. Campbell Rd, SM 33, Richardson, TX, 75080, United States,

Milind Dawande, Ganesh Janakiraman, Vijay Mookerjee

The wide variety of pricing policies used in practice by data-sellers suggests that, as yet, there is no common understanding on how data should be priced. The selling of data - arranged in a row-column format, where rows represent records and columns represent attributes of the records - is significantly different from that of information goods like telephone minutes and bandwidth, in the sense that, for a buyer, it is not just the amount of data (i.e., the number of records) that matters but also the "type of the data. In this study, we develop a utility framework that is appropriate for data-buyers and address the corresponding pricing of the data by a seller.

**1 - NSF Funding Opportunities for Service Science Researchers**

Alexandra Medina-Borja, PhD, National Science Foundation, Alexandria, VA, 22314, United States

Technologies are enabling an era of smart everything while service systems continue to dominate industrialized economies. As the concepts of smartness and service are starting to fuse, modeling of smart engineered systems is becoming challenging. While applying a "service framework to this partnership of humans and machines could help, society is still concerned with machines replacing workers in the service sector. Myriad convergent research opportunities in this new landscape are possible. NSF Program Officers will discuss some funding opportunities at the National Science Foundation, both in terms of the NSF's Ten Big Ideas for Future Investment and research funding for re-skilling the service workforce.

**1 - Jobenomics - Text Data Analytics on Job Posting**

Jing Wu, City University of Hong Kong, Department of Management Sciences, Rm 7-233, Lau Ming Wai Academic Building, Hong Kong, Hong Kong

We use natural language processing tools on >50-million job postings representing >30,000 private and public companies as well as >20-billion words captured in the position descriptions to explain firm performance and human capital investment. Our preliminary results show that job posting information has strong predictive power on firm productivity growth and stands out uniquely compared to common asset pricing factors.

**2 - Dynamic Pricing of the Ride Sharing Market in a Spatial Search Model**

Weiming Zhu, IESE Business School, Avenida Pearson 21, Barcelona, 08034, Spain, Liu Ming, Jingting Fan, Wenlan Luo

Ride-sharing platforms employ flexible pricing during peak hours to match supply with demand. In this study, we build a spatial search model to study the geographic dynamics among drivers. Utilizing data from a leading ride-sharing platform, we assess the impact of different pricing schemes on drivers' capacity distribution, platform profit, and consumer surplus.

**3 - Coping with the Bullwhip Effect through Inventory or Cash: An Environment-behavior-performance Paradigm**

Baile Lu, Zhejiang University, Hangzhou, China, Weihua Zhou, Baofeng Huo, Qihui Gong

An environment-behavior-performance paradigm was proposed to examine the impact of the bullwhip effect on coping behavior and performance, where the bullwhip effect is regarded as an environmental factor, inventory and cash holdings are regarded as factors for coping with the bullwhip effect, and risk is defined as company performance. Our analysis shows that the bullwhip effect is positively related to both operating and equity risks, and is positively related to inventory and cash holdings. A moderate level of inventory is negatively related to operating and equity risks, and cash is only negatively related to operating risk; however, excess resource holdings are positively related to risk.

**4 - Is on Demand Car Rental a Complement or Substitute for Private Car and Public Transit?**

Lixian Qian, Xi'an Jiaotong-Liverpool University, IBSS Building, South Campus, Xi'an Jiaotong-Liverpool University, Suzhou, 215123, China, Zhan Pang, Didier Soopramanien

On-demand car rental has emerged as a prominent alternative mobility mode to private car usage in urban areas. However, it remains unclear whether it is a complement or substitute for private car and public transit. To find the empirical evidence, we conducted a choice-based conjoint study in Beijing. We find that service accessibility and mobility speed, as well as consumer car ownership and purchase intention, are key drivers of mobility choice. Although on-demand car rental may reduce private car usage, it may also attract public transit users, resulting in an unanticipated rise in total car usage.

**Developing Robust Analytics Curricula**

Sponsored: Education (INFORMED)

Sponsored Session

Chair: Carrie Beam, University of Arkansas, Fayetteville, AR, 94596, United States

**1 - What We Hire: Analytics Skills We Want Schools to Teach our Job Applicants**

Aaron Burciaga, VP Data Science and Machine Intelligence at Booz Allen Hamilton,

Will give a spirited overview of analytics skills and that are critical to hire, and others that differentiate, in today's workplace. Aaron will provide useful insights towards attaining and balancing the right mix of education, experience, and elocution needed for a successful and enduring career and legacy.

**2 - Arkansas Robust Analytics Curricula**

Carrie Beam, University of Arkansas, Walnut Creek, CA, 94596, United States

How can you teach R programming, online, to students who have never written code before? Is it possible to get them running K-Means, linear regression, and rpart trees without breaking the Internet? In this session, I'll show you the mechanics of how we implemented an Introduction to Analytics class online at the University of Arkansas.

**3 - Designing and Deploying a Profession-centered Business Analytics Program**

Sanjay Saigal, University of California-Davis, Davis, CA, United States

As the "sexiest profession of the 21st century" gains prominence, colleges have responded: ~40 new programs start up in Analytics & Data Sc every year. How do we create a program that balances department strengths with employer needs and student profiles? UC Davis offers three established MBA programs and a newer master's in Accountancy. Our "all new" MS in Business Analytics aims for industry relevance, practicality, and student ROI. We evaluate our MSBA design elements and their deployment in the 2017-18 school year, our first. We focus on the highly intensive year-long Industry Practicum and related courses covering one quarter of the total credits.

**4 - Analytics for Undergrads: How It's Done at a Small Liberal Arts College**

Anthony Bonifonte, Denison University, 3267 Raccoon Valley Rd, Granville, OH, 30106, United States

Denison University's Data Analytics program was founded in 2016 and has already attracted considerable student interest. As a small, undergraduate only liberal arts institution, the program is highly interdisciplinary and focuses on equipping students with the knowledge and skills to solve practical data problems and training them to effectively communicate results. Each core course is project-driven, and students complete a semester-long mock consulting experience with on-campus clients. Student also choose 7 concentrations in natural and social science disciplines. In this talk I will share the curriculum and philosophy behind its' design and some initial student outcomes.

**5 - Results from an Analytics Benchmarking Study**

Andrew Urbaczewski, University of Denver, Daniels College of Business 593, 2101 S. University Boulevard, Denver, CO, 80208, United States

I will present the results from my Analytics Benchmarking Study. I have looked at dozens of Business Analytics/Data Analytics/Analytics/Data Science/etc. Programs and compared tuition, pre requisites, credit hours, and expected length to complete.

**Yard and Terminal Operations**

Sponsored: Railway Applications

Sponsored Session

Chair: Tyler Dick, U. of Illinois at Urbana-Champaign, Urbana, IL, 61801, United States

**1 - The Digital Transformation of Rail Yard Planning and Operations**

Jeremiah Dirnberger, GE Transportation, 7572 Old Kings Rd S, Jacksonville, FL, 32217, United States

Rail yards are vital to overall network fluidity but have had limited technological investment relevant to other areas. GE Transportation is advancing a holistic solution to enhance reliability, reduce maintenance overhead, improve utilization of existing capacity, and increase margins and volume through these critical nodes. Information is analyzed at the edge and passed on for use by an integrated suite of inventory management and decision support tools. The work impact at downstream yards on and off each network are considered and decisions automatically made to improve productivity, reliability and flexibility, while enabling safer operations through effective use of automation.

**2 - Improving the Flat Switching Process**

Roger Baugher, TrAnalytics, Johns creek, GA, United States, Daril Vilhena

One of the most daunting challenges in many yards and terminals is developing and implementing efficient switching sequences - the process of taking cars from multiple tracks and building blocks most expeditiously while ensuring train makeup rules are enforced. The challenge is especially daunting in medium-sized to large flat yards. Railroads have spent heavily to implement yard management systems, but these systems typically provide little guidance on how to switch the cars. Excellent yardmasters can perform this mathematically-challenging task well, but their population is dwindling as experienced railroaders retire. The author will discuss the development of a set of new tools that provides new capabilities and improves yard performance in both time and cost.

**3 - Traffic Complexity and the Performance of Railway Classification Yards**

Tyler Dick, U. of Illinois at Urbana-Champaign, 1241 Newmark Lab MC-250, 205 N. Mathews Avenue, Urbana, IL, 61801, United States

In designing a train plan for a railway network, one decision is to determine the number of blocks to be handled by each train and the number of blocks to be assembled at each classification yard while maintaining a certain level of service. This research uses Optym YardSYM to investigate the relationship between throughput volume, the total number of blocks assembled and the level of service at a hump classification yard. To supplement this initial analysis, the research also investigates the influence of number of departing trains, block size distribution and schedule and volume variability on yard performance.

**4 - Car-Scheduling Based Hump Sequencing**

Roger Baugher, TrAnalytics LLC, Johns Creek, GA, United States, Chip Kraft

In a car-scheduling driven approach to hump sequencing, the goal is not to make all connections, but to ensure that at least the most important ones are protected. Yard management uses the tool to decide whether to hold outbound train departures for a short time, or else drop the connection if the delay would be too long.

Sponsored Session

Chair: Laiyun Wu, SUNY-Buffalo, 326 Bell Hall, Buffalo, NY, 14226, United States

**1 - Modeling Spatiotemporal Information Flow Propagation in a Vehicle-to-vehicle- Communication System Considering Communication Delays**

Yangjiao Chen, Purdue University, West Lafayette, IN, United States

This study develops an analytical Markov model to characterize the spatiotemporal propagation of information under vehicle-to-vehicle (V2V) communications while factoring traffic dynamics and communication delays due to communication failure and communication frequency. A closed-form solution of the expected information propagation speed is derived under different densities of equipped vehicles. Numerical experiments demonstrate the effectiveness of the proposed model in various traffic conditions.

**2 - Evaluating the Cognitive Effects of Real-time Travel Information using Psychophysiological Analysis and their Implications for Driver Decision-making**

Shubham Agrawal, Purdue University, West Lafayette, IN, 47906, United States

This study conducts interactive driving simulator-based experiments to evaluate the impacts of driver cognitive state (for example, mental workload and engagement level) on the driver route choice decision-making process under real-time travel information provision. The driver cognitive state is estimated by analyzing the physiological data collected using electroencephalogram (EEG), electrocardiogram (ECG) and wearable eye-tracking glasses. The systematic differences in driver cognitive state are analyzed based on the characteristics of the disseminated real-time information and heterogeneity in individual characteristics.

**3 - Expectations of the Driver's Role when Using an Automated Driving System**

Dustin Souders, Purdue University, West Lafayette, IN, United States

This study investigates the effects of introductory materials on participants' interaction with an automated driving system (ADS; SAE level 3) in a simulated environment. Young and old participants are engaged in a secondary task while monitoring an ADS, and vigilance patterns (eye-tracking, EEG), take-over performance, trust and acceptance attitudes will be assessed. Results will inform how licensing agencies and OEMs should train drivers when using level 3 automation during this transitional period in road vehicle automation to ensure proper expectations and encourage safety.

**4 - Cooperative Adaptive Cruise Control for Connected Autonomous Vehicles by Factoring Communication-Related Constraints**

Chaojie Wang, Purdue University, West Lafayette, IN, United States

We propose cooperative adaptive cruise control (CACC) strategies for connected autonomous vehicles (CAVs) to enhance platoon performance by temporarily switching off the V2V communication functionality for some CAVs in the platoon. An optimization model is established to determine the optimal information flow topology that can maximize platoon performance based on one or more objectives (string stability, smoothness and convergence rate of the platoon control strategy) under the communication-related constraints. The effectiveness and efficiency of the proposed CACC strategies for CAV platoons will be illustrated using numerical simulation.

**5 - Inferring Origin-Destination and User Preference in Multi-modal Travel Environment by Using Automated Fare Collection Data**

Laiyun Wu, SUNY-Buffalo, 326 Bell Hall, Buffalo, NY, 14226, United States

The Origin-Destination (OD) demand data availability and quality are critical for the effective and efficient operation and management of a transit system. Understanding of transit user preferences, at the same time, is also important for planning and assessing transit systems. In this paper, we develop and apply an inference framework for distilling multi-modal routing preferences for transit system users and their true OD through a probabilistic learning method, based on a real-world Automated Fare Collection data set.

### Joint Session TSL-FAC/SOLA: Strategic Location/Allocation of Resources

Sponsored: TSL/Facility Logistics

Sponsored Session

Chair: Felipe Aros-Vera, Ohio University, Athens, OH, 45701, United States

#### 1 - Optimal Districting of Disaster Areas

Johanna Amaya Leal, Iowa State University, Ames, IA, United States, Jose Holguin-Veras, John E. Mitchell

This paper describes a methodology to solve the problem of districting a disaster area among relief groups in post-disaster situations. Building upon formulations that minimize the total social costs of the operation, a districting strategy is proposed to expedite the flow of critical supplies to demand points. The model considers the resources the relief groups, capacity of sites, and the needs of the population to minimize the human impacts of the disaster

#### 2 - The Integration of Research and Development, Manufacturing and Distribution in Humanitarian Supply Chains

Nico Vandaele, KU Leuven, Naamsestraat 69, 0419.052.173, Leuven, 3000, Belgium, Catherine Jenny Decouttere, Kim De Boeck, Stef Lemmens, Mauro Bernuzzi

Based on both our academic as well as our field work we elaborate on the importance of interconnecting R&D, manufacturing and distribution activities in vaccine supply chains. The ultimate goal of immunization and being prepared for outbreaks is highly dependent on a number of design and managerial decisions taken decades before the operations materialize and when responsiveness becomes key. We illustrate this with evidence from our modelling work in vaccine manufacturing as well as in local distribution settings in some sub-Saharan countries.

#### 3 - A Framework to Assess Location of Micro Grids to Increase Energy Grid Resilience

Felipe Aros-Vera, Ohio University, 277 Stocker Center, 1 Ohio University, Athens, OH, 45701, United States, Shayne Gillian, Austin Rehmar, Landon Rehmar

This paper develops a framework to assess the location of microgrids to increase resilience of an electrical power system and mitigate the impact of catastrophic grid failure in disaster situations. Using optimization models and network vulnerability analysis, the framework determines where to locate a set number of microgrids to provide maximum benefit to a population. This paper uses a case study of the 2017 hurricane season that caused catastrophic grid failure on the island of Puerto Rico to evaluate the allocation of microgrids on critical infrastructure.

#### 4 - A Stochastic Model to Allocate Water in Post-disaster Environments

Diana Ramirez-Rios, Rensselaer Polytechnic Institute, 134 25th Street, Troy, NY, 12180, United States, Sofia Perez-Guzman, Trilce Encarnacion, John E. Mitchell, Jose Holguin-Veras

This study develops a stochastic mixed integer programming formulation for the allocation of water when there exists an uncertainty of time the population will return to normalcy. In the case of water deprivation, this commodity is usually expected during the first days after the disaster occurs, and it is known that if a person lacks water, after 5 days they will die. This formulation considered five scenarios related to the days expected for return to normalcy. Results from a case study provide an idea of the magnitude of human suffering in distribution of aid during post-disaster response.

### New Data, Models, and Technology for Public Transportation

Sponsored: TSL/Intelligent Transportation Systems (ITS)

Sponsored Session

Chair: Stefan Voss, University of Hamburg, Institute of Information Systems (IWI), Von-Melle-Park 5, Hamburg, 20146, Germany

#### 1 - A Stochastic User Equilibrium Model for Integrated Transit and Ride-Sourcing Services

Yufeng Zhang, University of Minnesota, 500 Pillsbury Drive S.E., Room 175, Minneapolis, MN, 55455, United States, Alireza Khani

Integrating transit and ride-sourcing services can improve mobility by providing solutions for the "first/last mile problem. This study explores the equilibrium between the demand for the integrated system and the ride-sourcing drivers'

participation (supply), where interactions exist in that a service quality improvement of the integrated transit-ride-sourcing will attract more users for the combined mode and thus create incentives for more driver participation. An elastic demand stochastic user equilibrium model is developed and shows overall service improvement.

#### 2 - Integrating Ride-shared Mobility-on-Demand (MOD) System with Public Transit

Liu Xu, PhD Candidate, University of Maryland-College Park, 1173 Glenn L. Martin Hall,, College Park, MD, 20742, United States, Xinlei Zhang, Ali Haghani

Seamless integration of ride-shared MOD service with public transit may offer sustainable and convenient multi-modal transportation. This paper proposes a partition-based real-time network optimization model for the hybrid system that capable of (i)scales to a large number of trips; (ii) incorporates dynamic ride-sharing to MoD services and (iii)generates optimal routes for real-time demands. To enhance applicability, the proposed model accounts for transit frequency, waiting time, MoD vehicle capacity and fleet size, travel delay and operations cost for vehicles. Extensive experimental results show a significant reduction of vehicle empty miles and a boost to mobility enhancement.

#### 3 - Interoperable Smart Card Data Management in Public Mass Transit

Stefan Voss, Professor, University of Hamburg, Institute of Information Systems (IWI), Von-Melle-Park 5, Hamburg, 20146, Germany, Filip Covic

Due to a lack of shared practices of deployment, installation and application, smart ticketing is often built on proprietary specifications limiting their scope of integration and compatibility among each other. Therefore, interoperability in public mass transit has become a central aspect of e-ticketing. We develop a standardised process on how to handle smart card data in an interoperable environment. We present a unified approach where data mining tools and model applications can be tested and implemented in every region embedded in the integrated network. Our Interoperable Smart Card Data Chain provides a continuous procedure for standardised data handling and management.

### Data-driven Freight Logistics

Sponsored: TSL/Freight Transportation & Logistics

Sponsored Session

Chair: Satya Sarvani Malladi, Georgia Institute of Technology, Atlanta, GA, 30318, United States

Co-Chair: Shahab Derhami, Georgia Tech, 755 Ferst Drive, NW, Atlanta, GA, 30332, United States

#### 1 - Algorithms for Travel Speed Prediction using Big Data Provided by Home Delivery Company

Maha Gmira, École Polytechnique de Montréal, Montreal, QC, Canada  
Maha Gmira, Canada Excellence Research Chair in Data Science for Real-Time Decision-Making, Montreal, QC, Canada,  
Michel Gendreau, Andrea Lodi, Jean-Yves Potvin

In an urban environment, vehicle speed and consequently travel time can be highly variable, capturing time-varying features when modeling travel speeds provide an immediate benefit to commercial transportation companies that distribute goods. We present a travel speed prediction methodology based on data collected from mobile location devices installed inside commercial delivery vehicles. An analysis is conducted using unsupervised learning to cluster data, dimensionality reduction techniques, imputation methods and a Long Short Term Memory neural network to forecast travel speeds.

#### 2 - Adoption of Electric Trucks in Freight Transportation

Osman Alp, University of Calgary, Haskayne School of Business, 2500 University Drive, Scurfield Hall 120, Calgary, AB, T2N1N4, Canada, Tarkan Tan, Maximiliano Udenio

We analyze a fleet management problem of a freight transportation company, which aims to adopt a fleet of sustainable vehicles in a finite planning horizon. In particular, we optimize the transformation of their fleet into a mixed fleet of electric and diesel trucks. Our model also optimizes for the choice of charging technology as well as the number of charging facilities and their capacities. The objective of the decision maker is to minimize the investment costs for vehicles and the charging infrastructure, and the carbon emission related costs. We present a numerical study to generate insights about how to facilitate and incentivize the adoption of sustainable vehicle technologies in practice.

**3 - Data-driven Dynamic Smart Locker Logistics**

Shahab Derhami, Georgia Tech-ISYE, 755 Ferst Drive, NW,  
Atlanta, GA, 30332, United States, Satya Sarvani Malladi,  
Louis Faugere, Benoit Montreuil, Chelsea C. White

We consider the problem of dynamic management of mobile locker storage on a multi-location network. We model the non-stationary uncertainty of demand for lockers in our problem and propose effective heuristic solution approaches.

**Joint Session ORAM/CYBER: CyberManufacturing Systems: Emerging Challenges and Opportunities**

Emerging Topic: OR and Advanced Manufacturing  
Emerging Topic Session

Chair: Mohammed Shafae, Virginia Tech, Blacksburg, VA, 24061, United States

**1 - Challenges and Opportunities in Additive Manufacturing for Industry 4.0**

Bianca Maria Colosimo, Politecnico di Milano, Via La Masa, 1,  
Milan, I-20156, Italy

This contribution discusses opportunities and challenges for quality assessment, monitoring and control of Additive Manufacturing (AM) processes and products. Special attention is devoted to in-situ data gathering and modeling.

**2 - Advancing the Security of Cybermanufacturing Systems: Challenges and Opportunities**

Lee Wells, Western Michigan University, 2827 Daventry Ave.,  
Portage, MI, 49024, United States, Mohammed Shafae

As technology progresses, cyber-physical systems are becoming susceptible to a wider range of attacks. In manufacturing, these attacks pose a significant threat to ensuring products conform to their original design intent and to maintaining the safety of equipment, employees, and consumers. This talk discusses the importance of research and development of cyber-security tools specifically designed for manufacturing. A critical review of current research efforts will be presented as well as opportunities for the future of this emerging research area.

**3 - Blockchain in Manufacturing - A Critical Review**

Soundar Kumara, Pennsylvania State University, PA,  
United States, Qianyu Hu

Blockchain is becoming popular in several domains. In this talk we explore the technical foundations of Blockchain and their applicability in (big-M) manufacturing. We will discuss provenance, platforms and the relevance of blockchain. With specific example in manufacturing, we will explore the integrated use of blockchain-analytics and AI. We will address the questions on hyperledger and Ethereum platforms.

**11:00 - 11:45 SAS/11:45 - 12:30 Gurobi**

Vendor Demo Session

**1 - Building and Solving Optimization Models with SAS**

Edward P. Hughes, SAS Institute, Inc., Sas Institute Inc., Sas  
Campus Drive, Cary, NC, 27513, United States, Rob Pratt

SAS provides a broad and deep array of data and analytic capabilities, including data integration, statistics, data and text mining, econometrics and forecasting, and operations research. The SAS optimization, simulation, and scheduling features coordinate easily and fully with other SAS strengths in data handling, analytics, and reporting. OPTMODEL from SAS provides a powerful and intuitive algebraic optimization modeling language and unified support for building and solving LP, MILP, QP, NLP, CLP, and network-oriented models. And because the OPTMODEL optimization modeling language is contained within the OPTMODEL procedure, a SAS software module, it integrates seamlessly with the entire family of SAS functions, procedures, and macros. We'll demonstrate how you can use OPTMODEL to solve both basic and advanced problems, highlighting its newer capabilities and its support for both standard and customized solution strategies.

**2 - Advanced Heuristics with Gurobi**

Daniel Espinoza, Senior Developer, Gurobi Optimization,  
Houston, TX, United States

This talk covers one capability of MIP that is often overlooked: its ability to find and subsequently improve good quality solutions to exceedingly difficult problems. In particular, we will focus on techniques for using the Gurobi MIP solver as a heuristic, and a discussion on what makes a model more amenable to optimization.

**■ MB35**

**Joint Session AAS/Practice Curated: AAS Best Student Presentation Competition II**

Sponsored: Aviation Applications

Sponsored Session

Chair: Susan Hotle, Virginia Polytechnic Institute and State University,

**1 - A Game-Theoretic Analysis of the Scaled Airline Preferences Mechanism for Airport Landing Slots**

Jackie W. Baek, Massachusetts Institute of Technology,  
77 Massachusetts Ave, Bldg E40-103, Cambridge, MA, 02139,  
United States

As arrival capacities increasingly constrain the air transportation system, there is a need for mechanisms by which airlines can exchange landing slots. Currently, when the number of aircraft is projected to exceed the capacity, flights are allocated slots in a first-scheduled-first-served manner. However, flights have different delay costs and can be assigned more efficiently. We focus on a reallocation mechanism called scaled airline preferences (SAP) and evaluate it on individual rationality, incentive compatibility, and fairness. The flight delay cost functions are scaled where the average unit delay cost by airline is equal and the mechanism minimizes the total scaled delay cost.

**2 - Forecasting Airport Transfer Passenger Flow Using Real-Time Data and Machine Learning**

Xiaojia Guo, University College London, International Hall,  
Lansdowne Terrace, London, WC1N 1AS, United Kingdom

Air passengers missing their connection can have a major impact on satisfaction and airline delays. Accurate forecasts of the flow of passengers and their journey times through an airport can help improve the experience of connecting passengers and support airline, airport, and air space punctuality. In collaboration with Heathrow Airport, we utilize real-time data to develop a predictive system based on a regression tree and Copula-based simulations. These real-time predictions can be used to inform target off-block time adjustments and determine resourcing levels at security and immigration.

**3 - An Assessment of the Potential Benefits of Dynamic Airline Scheduling**

Ahmet Esat Hızir, Massachusetts Institute of Technology,  
Cambridge, MA, United States,

The commonly used approach to airline schedule design does not enable airlines to effectively adapt to changes in passenger demand and airspace system capacity. This study investigates the potential benefits of a dynamic scheduling approach in which flight frequencies, schedules and aircraft types are finalized closer to the day of operations based on the most current demand information. Our integrated schedule design and fleet assignment model satisfies the passenger demand without inconveniencing passengers, to evaluate the maximum possible benefits of a dynamic scheduling strategy.

Sponsored Session

Chair: Konstantinos G. Zografos, Lancaster University, LA1 4YX, United Kingdom

Co-Chair: Alexandre Jacquillat, Carnegie Mellon University, Pittsburgh, PA, 15213, United States

**1 - A Passenger-centric Approach to Air Traffic Flow Management**

Alexandre Jacquillat, Carnegie Mellon University, Heinz College,  
5000 Forbes Avenue, Pittsburgh, PA, 15213, United States

Existing Air Traffic Flow Management (ATFM) approaches are based on aircraft-centric objectives. However, the ultimate impact of delays is amplified by passenger misconnections on connecting itineraries. We present a novel approach to flow management that balances flight delay costs with passenger delays. We develop a dual approach involving an analytical Markov Decision Process model and a large-scale integer optimization model. Results suggest that passenger disruptions can be greatly reduced through no, or limited, increases in flight delays, thus making the outcomes of ATFM initiatives more consistent with airline and passenger preferences. Implications for practice are discussed.

## 2 - Active Routing and Guidance Framework for Robust and Intelligent Taxiing

Jun Chen, Queen Mary University of London, London, United Kingdom, Michal Weizser

With increasing demand for air travel and overloaded airport facilities, inefficient airport taxiing operations are identified as a significant. An Active Routing and Guidance Framework is proposed for complex ground handling problems at major airports to reduce taxi times, operating costs and environmental impact. The problem is interdisciplinary and multi-dimensional as the efficiency of airport operations depends on aircraft dynamics, airport layout, air traffic, and other constraints. Results show that by considering all these factors in an integrated decision making framework the generated routing and guidance solutions are more realistic for pilots to follow, saving time and fuel.

## 3 - Dynamic Control of Airport Capacity Allocation with Stochastic Considerations

Robert Shone, Lancaster University, Lancaster, United Kingdom, Kevin D. Glazebrook, Konstantinos G. Zografos

The ever-increasing demand for air transport services continues to put the resources of the world's busiest airports under tremendous pressure. Many optimization models have been proposed for runway scheduling, aircraft sequencing and other problems related to air traffic flow management. In this talk we discuss how to develop new approaches which explicitly take into account uncertainty caused by weather conditions and other operational factors.

## Machine Learning and Causality

Sponsored: Applied Probability

Sponsored Session

Chair: Nathan Kallus, Cornell University, New York, NY, 10044, United States

Co-Chair: Stefan Wager, Stanford GSB, Stanford GSB, New York, NY, 10023-2154, United States

### 1 - Interpreting Predictive Models for Human-in-the-loop Analytics

Hamsa Sridhar Bastani, Wharton School, Philadelphia, PA, United States, Osbert Bastani, Carolyn Kim

Interpretability has become an important issue as machine learning is increasingly used to inform consequential decisions. We propose an approach for interpreting complex blackbox models by extracting a decision tree that approximates the model. The algorithm avoids overfitting by actively sampling new training points using the blackbox model. We use this technique to interpret a random forest classifier for predicting diabetes risk. Physicians successfully used our interpretation to discover an unexpected causal issue in the diabetes classifier.

### 2 - Long Tail Phenomenon in Discrete Choice Estimation

Pu He, Columbia University, Uris Hall, Cub 4H, New York, NY, 10027, United States, Fanyin Zheng

Long tail distribution of sales or market share data is a common phenomenon in empirical studies in economics, operations, and marketing. Classic discrete choice estimation framework ignores the long tail and can lead to biased estimates. In this work, we introduce a new two-step procedure to solve the problem. Our solution applies machine learning algorithms to estimate market shares in the first stage, and in the second stage we estimate a weighted multinomial logit model to recover customer preference parameters. We show that our proposed approach corrects for the bias in demand estimates and improves profits when these estimates are used in pricing decisions.

### 3 - Learning to Personalize Safely Under Unobserved Confounding

Nathan Kallus, Cornell University, 2 W. Loop Road, # 316, New York, NY, 10044, United States

Recent work on counterfactual learning from observational data aims to leverage large-scale data — much larger than any experiment can ever be — to learn individual-level causal effects for personalized interventions. The hope is to transform electronic medical records to personalized treatment regimes, transactional records to personalized pricing strategies, and click- and “like”-streams to personalized advertising campaigns. Motivated by the richness of the data, existing approaches make the simplifying assumption that there are no unobserved confounders: unobserved variables that affect both treatment and outcome and would induce non-causal correlations that cannot be accounted for. However, all observational data, which lacks experimental manipulation, no matter how rich, will inevitably be subject to some level of unobserved confounding and assuming otherwise can lead to personalized treatment policies that seek to exploit individual-level effects that are not really there, may intervene where not necessary, and may in fact lead to net harm rather than net good relative to current, non-personalized practices.

## 4 - Quasi-oracle Estimation of Heterogeneous Treatment Effects

Stefan Wager, Stanford University, 655 Knight Way, Stanford, CA, United States, Xinkun Nie

Flexible estimation of treatment effects lies at the heart of many statistical challenges. We develop a class of algorithms for heterogeneous treatment effect estimation in observational studies. We estimate marginal effects and treatment propensities to form an objective function that isolates the causal signal. Then, we optimize this objective function. For both steps, we can use any loss-minimization method fine-tuned by cross validation. In the case of penalized kernel regression, we show that even if the pilot estimates for marginal effects and treatment propensities are not particularly accurate, we achieve the same regret bounds as an oracle who has a priori knowledge of them.

### 1 - Power Grid State Estimation Following Cyber-physical Attacks

Saleh Soltan, Princeton University, NJ, United States, Mihalis Yannakakis, Gil Zussman, Prateek Mittal, H. Vincent Poor

I will provide a summary of our recent results on power grid state estimation following cyber-physical attacks in which an adversary attacks an area by: (i) disconnecting some lines within the attacked area, and (ii) blocking/modifying the measurements from monitoring devices within the area to mask the line failures. We demonstrate that by using tools from graph theory and by leveraging the algebraic properties of the power flow equations, one can detect the attacked area as well as line failures in polynomial time under some topological constraints on the area. I then show that stochastic version of these methods can be used to detect line failures efficiently in general attacked area topologies.

### 2 - Understanding the Inefficiency of Security-constrained Economic Dispatch

Enrique Mallada, Johns Hopkins University, 3400 N. Charles St, Barton Hall 312, Baltimore, MD, 21218, United States, Mohammad Hajiesmaili, Wuhan Desmond Cai

The security-constrained economic dispatch (SCED) problem tries to maintain the reliability of a power network by ensuring that a single failure does not lead to a global outage. In this talk, we analyze the economic cost of incorporating security constraints in economic dispatch. Inspired by inefficiency metrics in game theory, we introduce the notion of price of security as a metric that formally characterizes the economic inefficiency of SCED. We investigate the impact of generation availability and demand distribution on the price of security. Our results show that renewable sources, with nearly zero marginal costs, can have a high impact on the price of security.

### 3 - Robust Volt-var Optimization in Power Distribution Systems

Weixuan Lin, Cornell University, Ithaca, NY, United States, Eilyan Bitar

We consider the decentralized reactive power control of photovoltaic (PV) inverters spread throughout a radial distribution network. Our objective is to minimize the expected voltage regulation error, while guaranteeing the robust satisfaction of distribution system voltage magnitude and PV inverter capacity constraints in real-time. We provide a method to compute a robust decentralized controller via the solution of a finite-dimensional conic program. The resulting trajectories of PV inverter reactive power injections and nodal voltage magnitudes are guaranteed to be feasible for any realization of the system disturbance under the proposed control policy.

### 4 - Failure Localization in Power Systems via Tree Partitions

Alessandro Zocca, California Institute of Technology, 1200 E. California Blv, MC 305-16, Pasadena, CA, 91125, United States, Linqi Guo, Chen Liang, Steven Low, Adam Wierman

Cascading failures in power systems propagate non-locally, making the control and mitigation of outages extremely hard. Using the emerging concept of the tree partition, we provide a complete analytical characterization of line failure localizability in transmission networks. The crucial insight is that power systems that have more and thus smaller tree partition components are less vulnerable to large-scale outages. Furthermore, our characterization suggests that by switching off only a negligible portion of transmission lines we can have a significantly better control of cascading failures without significantly increase line congestion across the network.

**Multi-armed Bandits and Reinforcement Learning**

Sponsored: Applied Probability

Sponsored Session

Chair: Shipra Agrawal, Columbia University, New York, NY, 10027, United States

**1 - Deep Exploration in Reinforcement Learning via Randomized Value Functions**

Daniel Russo, Columbia University

We propose the use of randomized value functions to guide systematic exploration in reinforcement learning. This offers an elegant means for synthesizing statistically and computationally efficient exploration with common RL algorithms like temporal-difference learning, which produce parameterized value function estimates. We present several RL algorithms that leverage randomized value functions and demonstrate their efficacy through computational studies. We also prove a regret bound that establishes statistical efficiency with a tabular representation.

**2 - Partition Identification using Multi-armed Bandit Methods with Applications to Financial Risk**Sandeep Juneja, Tata Institute of Fundamental Research,  
Homi Bhabha Road, Mumbai, Maharashtra, 400005, India,  
Subhashini Krishnasamy

Given a vector of probability distributions, each of which can be sampled independently, we identify the partition to which this vector belongs from a finitely partitioned universe using Bandit methods. We develop complexity bounds on expected number of samples needed for correct identification with high probability. Distributions are parametrized, and partitions primarily correspond to these parameters lying in half spaces, or more general convex sets or their complements. We propose algorithms that can match the lower bounds asymptotically with decreasing probability of error. Few applications associated with nested simulation and its applications to finance are discussed.

**3 - Bandits with Delayed Aggregated Anonymous Feedback**Shipra Agrawal, Columbia University, Industrial Engr and OR,  
423 S. W. Mudd Building, New York, NY, 10027, United States,  
Randy Jia

We study a variant of the stochastic K-armed bandit problem, which we call “bandits with delayed, aggregated anonymous feedback”. In this problem, when the player pulls an arm, a reward is generated, however it is not immediately observed. Instead, at the end of each round the player observes only the sum of a number of previously generated rewards which happen to arrive in the given round due to stochastic delays. We provide an algorithm that matches the worst case regret of the non-anonymous problem exactly when the delays are bounded, and up to logarithmic factors or an additive variance term for unbounded delays.

**4 - Near Optimal Policies for Dynamic Assortment Planning under MNL Models**Xi Chen, New York University, 44 W. 4th St, NYU KMC Room  
8-50, New York, NY, 10012, United States, Yining Wang,  
Yuan Zhou

In this talk, we consider the dynamic assortment selection problem under an uncapacitated multinomial-logit (MNL) model. Since all the utility parameters of customers are unknown, the seller needs to simultaneously learn customers’ choice behavior and make dynamic decisions on assortments based on the current knowledge. By carefully analyzing a revenue potential function, we proposed an efficient trisection algorithm that achieves an item-independent regret bound of  $O(\sqrt{T \log \log T})$ , which matches information theoretical lower bounds up to iterated logarithmic terms. We also provide experimental results to demonstrate the effectiveness of the proposed method.

**Judgements and Forecasts**

Sponsored: Decision Analysis

Sponsored Session

Chair: Asa Palley, Indiana University, Bloomington, IN, 47405, United States

**1 - Incentive-Compatible Forecasting Competitions**Jens Witkowski, Frankfurt School of Finance & Management,  
Adickesallee 32-34, Frankfurt, 60322, Germany, Rupert Freeman,  
Jennifer W. Vaughan, David M. Pennock, Andreas Krause

We consider the design of forecasting competitions in which multiple forecasters make predictions about one or more independent events and compete for a single prize. Our primary objective is to incentivize forecasters to report truthfully, so that forecasts are informative and forecasters need not spend any cognitive effort

strategizing about reports. Proper scoring rules incentivize truthful reporting if all forecasters are paid according to their scores. However, incentives become distorted if only the best-scoring forecaster wins a prize. We introduce a truthful forecaster selection mechanism, and lower-bound the probability that our mechanism selects the most accurate forecaster.

**2 - The Effectiveness of Trimmed Prediction Polls in Time Series Forecasting Involving Structural Breaks**Shijith Kumar PM, PhD Candidate, IE Business School, Calle  
Maria De Molina, 12, Madrid, 280006, Spain, Matthias Seifert,  
Yun Shin Lee

Forecast combination literature emphasizes the need for detailed studies on aggregation and trimming. We introduce simple trimming rules to aggregate judgmental time series forecasts with structural breaks. While the extant literature explores aggregation of forecasts in stable environments, we focus on environments characterized by fundamental regime shifts. In an empirical study, we find that forecasters are sensitive to structural shifts in time series and are systematically biased depending on the direction of these shifts, making static trimming less applicable. We propose trimming approaches to factor in these biases to aggregate opinion pools under such unstable environments.

**3 - Aggregating Information from a Single Set of Predictions**

Ville Satopaa, INSEAD, 140 Avenue Daumesnil, Paris, 75012, France

Even though aggregating multiple predictions typically outperforms the average individual prediction, there is no consensus about the right way to do this. Optimally, an aggregator would use all the information in the predictions. Aggregation is particularly challenging when there is only one prediction per forecaster. In this work, we develop methodology for such a “one-shot” environment. Our aggregator relies on Bayesian statistics and produces a posterior distribution of the consensus aggregate. We illustrate the methodology on real-world and synthetic forecasting data.

**4 - Sport Obermeyer Revisited: From Points to Probabilities**Asa Palley, Indiana University, 1275 E. 10th St, Bloomington, IN,  
47405, United States, Casey Lichtendahl,  
Yael S. Grushka-Cockayne

We develop a procedure that a decision maker can use to estimate a predictive distribution for a variable of interest using only a single point estimate from each of a number of different experts, without having to elicit complete distributions. Given past collections of judgments and realizations, we propose a Bayesian method that can be used to estimate a probability distribution for the variable of interest using the mean and variance of the new collection of judgments. We examine the accuracy of the procedure with sets of real judgments about economic variables in the U.S. and Europe, finding that it provides comparable performance to the linear opinion pool of subjective probability distributions.

**Behavioral Decision Analysis with Mortality and Health Outcomes**

Sponsored: Decision Analysis

Sponsored Session

Chair: Jeffery L. Guyse, California State Polytechnic University-  
Pomona, Pomona, CA, 91768, United StatesCo-Chair: L. Robin Keller, University of California, Irvine, University of  
California-Irvine, Irvine, CA, 92697-3125, United States**1 - Valuing Sequences of Lives Lost or Saved Over Time: Preference for Uniform Sequences**Jeffery L. Guyse, Professor, California State Polytechnic University-  
Pomona, 3801 West Temple Avenue, Pomona, CA, 91768,  
United States, L. Robin Keller, Candice Huynh

We present our within-subject survey using subjective ratings for sequences of lives lost or saved over time, with factors embedded for anomalies. The prediction results for the standard discounting model (SDM) are analyzed. A model by Loewenstein & Prelec (L&P) for valuation of sequences was then fit to the survey data and compared to the best fits of the SDM. In all cases, the L&P model performed better than the SDM at predicting the individual normalized ratings for these sequences. We conclude that preferences for uniform sequences should be considered in policy making, rather than presuming people have a preference for declining sequences of mortality outcomes.

## 2 - Lives Saved vs. Lives Lost in Survey Research: Investigating Methodological Consistency

Candice Huynh, California State Polytechnic University, Pomona, College of Business, TOM, 3801 W. Temple Ave, Pomona, CA, 91768, United States, Jeffery L. Guyse, L. Robin Keller

Seven different elicitation procedures are employed in a between-subjects experiment over hypothetical scenarios involving lives either being saved or lost over time. Inspired by a study by Frederick (2003) which included lives being saved in 6 of the 7 procedures (choice, matching, total, sequence, equity, & context) and lives lost in just one of the cases (rating), we incorporate a completely balanced and symmetrical design with both lives saved and lives lost for all 7 methodologies. The effect on the survey responses due to the outcome being saved or lost along with the contextual effect of the questionnaire design itself are both analyzed for each of the 7 elicitation procedures employed.

## 3 - Psychophysics of Terror Attack Consequences

Matthew Baucum, University of Southern California, 12540 Braddock Drive, Apt 105, Los Angeles, CA, 90066, United States, Heather Rosoff, Richard S. John

We conceptualize public perception of the consequences of severe biological and radiological terror attacks along three dimensions: size of spatial area impacted, length of time of impact, and fatalities. We conducted an experiment in which respondents (n=384) read a vivid scenario about either a biological or radiological terror attack, varying in terms of spatial area impacted, length of time of impact, and fatalities. We develop psychophysical curves for all 3 consequence dimensions in terms of perceived attack severity, perceived risk, and reported fear. These curves are markedly non-linear, and in some cases, non-monotonic.

## 4 - The Effects of Assigning Buddies on Social Support in Online Communities

Ali Esmaeeli, University of California, Irvine, 1914 Verano Place, Irvine, CA, 92617, United States, Cornelia Pechmann

We look at the effects of assigning buddies on the social support that participants receive in an online community. We show that an active buddy provides more social support than another active community member. We also show that an inactive buddy doesn't decrease a person's engagement with others in the community. We develop four continuous and quantitative tie-strength measures to evaluate the level of participants' engagement with others in online communities. These measures are quite general and can be used to evaluate tie-strength in other online communities.

## Simulation Optimization I

Sponsored: Simulation

Sponsored Session

Chair: Wie Xie, RPI

### 1 - An Envelope Procedure for Ranking and Selection Problems

Shane Henderson, Cornell University, Ithaca, NY, 14853, United States, Sijia Ma

We present the envelope procedure for solving ranking and selection problems, aka exploratory bandit problems. We assume that each system (or arm) can be repeatedly sampled independently, and returns a subGaussian random variable. We prove that the envelope procedure returns a selected system that is within a given distance (in mean) of the best system with given probability. We also present a complexity analysis and computational results showing that the envelope procedure has impressive empirical performance under a specific sampling rule.

### 2 - Distance Correlation Screening for Hierarchically Structured Data

Ilya Ryzhov, University of Maryland, College Park, MD, 20742, United States, Yimei Fan, Yuan Liao

In many applications of business and marketing analytics, common characteristics of products and customers are represented as categorical variables, and each category can be split up into multiple subcategories at a lower level of the hierarchy. Hundreds of thousands of binary variables may be used to model the hierarchy, which makes it very useful to screen out large numbers of irrelevant or insignificant variables. We propose a new dynamic screening method that screens out large parts of the hierarchy at higher levels, greatly reducing the computational burden of screening and producing much more powerful predictive models. This approach may be useful in other areas, such as simulation analytics.

## 3 - A Metamodel-assisted Framework for Two-stage Optimization via Simulation

Wei Xie, Rensselaer Polytechnic Institute, 110 8th Street, CII, Room 5207, Troy, NY, 12180, United States, Yuan Yi

For the discrete two-stage optimization with the unknown response obtained from simulation, we introduce a metamodel-assisted framework that can efficiently employ the simulation resource to iteratively solve for the optimal first- and second-stage decisions. At each visited first-stage decision, we develop a local metamodel to solve a set of deterministic recourse problems simultaneously. Then, we construct a global metamodel accounting for the finite sampling error from SAA and the second-stage optimality gap. Assisted by this global-local metamodel, we propose a simulation optimization approach that can efficiently guide the search for the optimal first- and second-stage decisions.

## Emerging Topics in Energy Systems Integration

Emerging Topic: Energy and Climate

Emerging Topic Session

Chair: Dharik Mallapragada, ExxonMobil Corporate Strategic Research, ExxonMobil Corporate Strategic Research, Annandale, NJ, United States

### 1 - Evaluating Tradeoffs in Modeling Approaches for Electric Power Systems Analysis

Nidhi Santen, Electric Power Research Institute, Palo Alto, CA, United States, John Bistline

Throughout electric power systems analysis, simplifying assumptions and approaches are required to make models computationally tractable while still representing salient features of the system. The objective of this research is to test and examine the benefits of alternate modeling approaches in four key areas: temporal resolution, spatial resolution, representation of end use, and representation of uncertainty. We calculate and examine potential impacts of using simplified methodologies in these areas via a set of exercises using the U.S. long-range electric generation capacity planning model, US-REGEN.

### 2 - Emerging Topics in Energy Systems Integration Vehicle Electrification

Matteo Muratori, National Renewable Energy Laboratory

From an energy perspective, transportation is the least diversified demand sector, and offers numerous untapped opportunities for electrification over the next decades. While petroleum is still the major fuel used in transportation, adoption of electric vehicles in the light-duty vehicle market is increasing and electrification of other sub-sectors is gaining more interest. Vehicle electrification is creating new connections between the transportation and the electric sectors and coordinated charging is the greatest near-term opportunity for synergistic integration of electric vehicles in the power system and exploit vehicle flexibility to support grid operation.

### 3 - Impact of Model Resolution on Scenario Outcomes for Electricity Sector System Expansion

Dharik Mallapragada, ExxonMobil Research and Engineering, 1545 Route 22 East, Annandale, NJ, 08801, United States, Dimitri Papageorgiou, Aranya Venkatesh

Power sector capacity expansion models (CEMs) assess how techno-economic and policy drivers impact the cost-optimal generation capacity mix and their utilization over decadal time scales. Here, we evaluate the impact of incorporating operational detail in a CEM on the resulting outputs for various Texas grid scenarios. In general, we find that a traditional CEM with aggregated time blocks, overstates solar capacity and understates wind and natural gas capacity compared to an alternate CEM with chronological time-representation of grid operations. The findings imply the need for embedding sufficient temporal resolution and chronology in CEMs and broadly multi-sector energy-economic models

### 4 - The Role of Firm Low-carbon Electricity Resources in Deep Decarbonization of Power Generation

Nestor A. Sepulveda, Massachusetts Institute of Technology, Cambridge, MA, 02142, United States

We use a detailed power system investment and operations model to investigate the role of firm low-carbon resources in decarbonizing power generation in combination with variable renewable resources, energy storage, demand flexibility, and long-distance transmission interconnections. To increase the robustness of our results, we evaluate nearly 1000 cases covering a range of emissions limits, regional differences in demand and renewable resource potential, and a wide range of technology and cost uncertainties.

**Joint Session ENRE/Practice Curated: Applications of Conic Optimization for Energy Systems**Sponsored: Energy, Natural Res & the Environment/Electricity  
Sponsored Session

Chair: Ramtin Madani, The University of Texas at Arlington, Arlington, TX, 76015, United States

**1 - Multiplier-based Observer Design for Large-scale Lipschitz Systems**

Ming Jin, UC Berkeley, Cory 406, Berkeley, CA, 94720, United States

Observer design for nonlinear systems with incomplete state observations is of practical significance. To this end, this study presents a multiplier-based approach that is capable of determining an asymptotically stable observer for a large class of highly nonlinear and large-scale systems. Both the present and the state-of-the-art methods are evaluated in a benchmark example and a case study on the dynamic power system state estimation, where the proposed approach exhibits an imperative trade-off between non-conservatism and computational tractability, establishing its viability for real-world large-scale nonlinear systems.

**2 - Sequential Convex Relaxation for Optimal Power Flow and Unit Commitment Problems**

Ramtin Madani, The University of Texas at Arlington, Arlington, TX, 76015, United States, Fariba Zohrizadeh, Mohsen Kheirandishfard, Adnan Nasir, Edward Quarm

This talk is concerned with the optimal power flow (OPF) and unit commitment (UC) problems. We propose a novel convex relaxation, which transforms non-convex AC power flow equations into convex quadratic inequalities. Additionally, we propose a penalization technique which guarantees the recovery of feasible solutions for the original non-convex problem, under certain assumptions. The proposed penalized convex relaxation scheme can be used sequentially in order to find feasible and near-globally optimal solutions. By solving a few rounds of penalized convex relaxation, fully feasible solutions are obtained for challenging benchmark test cases with as many as 13659 buses.

**3 - Convex Relaxation of Bilinear Matrix Inequalities with Applications to Optimal Control Synthesis**

Mohsen Kheirandishfard, The University of Texas at Arlington, Arlington, TX, United States, Fariba Zohrizadeh, Muhammad Adil, Ramtin Madani

This talk is concerned with the problem of minimizing a linear objective function subject to a bilinear matrix inequality (BMI) constraint. We introduce a family of convex relaxations which transform BMI optimization problems into polynomial-time solvable surrogates. The efficacy of the proposed convex relaxation methods are demonstrated on benchmark instance of optimal control synthesis problems.

**4 - A Mixed-integer Programming Solution to AC Optimal Transmission Switching for Load Shed Prevention**

William Eric Brown, Texas A&amp;M University, College Station, TX, United States, Erick Moreno-Centeno

Optimal transmission switching (OTS) has garnered recent consideration for its value in leveraging the flexibility of the power grid. However, solving the AC-OTS problem remains quite difficult in practice. We propose a mixed-integer linear programming (MILP) model for the AC-OTS to maximize post-contingency load shed prevention (LSP). Unlike the widely-used DC-OTS, which is based on the standard DC linearizations (i.e., the DCOPF), our model produces LSP values which are highly correlated with the ACOPF. In thorough computational tests, our approach identifies the AC optimal switch in over 92% of studied instances.

Chair: Feng Pan, Pacific Northwest National Laboratory, Richland, WA, 99352, United States

Co-Chair: Yonghong Chen, Midcontinent ISO, 720 City Center Drive, Carmel, IN, 46032, United States

**1 - Heuristics for Unit Commitment Models**

Zonghao Gu, Gurobi Optimization, Houston, TX, United States, Edward Rothberg

When solving unit commitment MIP models, the majority of the optimality gap in the early part of the search process is due to the quality of the initial feasible

solutions. This presentation will consider a number of heuristic schemes for producing better solutions quickly. We'll present computational results for the most effective approaches.

**2 - Develop Smart Heuristics to Generate Hints for Solving Security Constrained Unit Commitment**

Yonghong Chen, Midwest ISO, 720 City Center Drive, Carmel, IN, 46032, United States

This presentation discusses using problem specific smart heuristics to generate hints to speed up the process to solve security constrained unit commitment. These heuristics can generate hints to reduce large number of variables and constraints. Using parallel computing to improve the hints will also be discussed.

**3 - HIPPO - A HPC Solver for Security Constrained Unit Commitment Problem**

Feng Pan, Pacific Northwest National Laboratory, 902 Battelle Boulevard, Richland, WA, 99352, United States, Jesse Holzer, Yonghong Chen, Edward Rothberg, Jie Wan, Ralf Elbert

HIPPO is a software library for solving the security constrained unit commitment (SCUC) problem. The goal of HIPPO is to reduce the solution time for solving SCUC in ISO/RTO day-ahead energy markets. The team is developing a concurrent optimization solver consisting of several algorithmic approaches such as branch-and-bound, decomposition methods and market based heuristics. These algorithms are implemented to Leverage high-performance computing clusters to further improve the algorithm performance. This talk will provide an overview of the HIPPO project, funded by ARPA-E, and the HIPPO software which includes SCUC models, algorithms and their performance.

**4 - Performance Comparison of Security Constrained Unit Commitment Formulations**

Yanan Yu, University of Florida, 321 University Village, Apt 3, Gainesville, FL, 32603, United States, Yongpei Guan

Following a significant expansion of power systems, the large-scale security constrained unit commitment (SCUC) has been an important and challenging problem in recent years. Several formulations have been developed in existing literature, characterizing SCUC problems in various aspects and resulting in diverse computational efficiency. In this presentation, we aim to find the key factors to improve the tightness of SCUC formulation by performance comparison. The relationship of decision variables in alternative formulations are derived and their tightness is analyzed. A suggested formulation is given at last.

**1 - Compressor Optimization in Gas Networks**

Pascal Van Hentenryck, University of Michigan, 1813 IOE Building, 1205 Beal Avenue, Ann Arbor, MI, 48108-2117, United States

The talk presents an optimization approach to the optimal control of compressors in gas networks. The optimization model captures the gas dynamics in these networks and is shown to be applicable to medium-sized networks, while producing results that have been verified by state-of-the-art simulations.

**2 - The Effects of Possible Tax Credit Policy Withdrawal on Timing and Size of Green Investment**

Roel Nagy, Norwegian University of Science &amp; Technology, Trondheim, Norway

This paper analyses the effect of policy uncertainty on investment timing and investment size of a renewable energy project, and the interaction between both. We find that increasing the probability of withdrawal increases the incentive to invest now and decreases the optimal investment size. A firm that invests at the timing threshold value invests at larger scale when the policy is not in effect than when it is in effect. An investor maximising social welfare has the same timing as the profit-maximizing monopolist, but invests at twice the investment size.

**3 - Optimizing the Operations and Design of Concentrating Solar Power for Day Ahead Markets**

Michael J. Wagner, National Renewable Energy Laboratory, 15013 Denver West Pkwy, MS-RSF033, Golden, CO, 80401, United States

Concentrating solar power (CSP) systems include thermal storage, which can be dispatched on demand to a power cycle to produce electricity during desirable times of the day. Developers of CSP plan new facilities that will operate in a range of international markets, each having unique characteristics that often variably incentivize power production on a diurnal or seasonal basis. A CSP plant can successfully exploit market features, given an holistic dispatch scheduling program and favorable design characteristics. We present final results from a multi-year project that has developed techniques and software for concurrently optimizing CSP plant design, dispatch, and operations.

**4 - The Value of Turning-point Detection for Optimal Investment**

Lars Sendstad, Norway, Michail Dimitriou

Understanding the evolution of business cycles is key for investment in renewable energy, since alternative energy technologies are associated with periods of economic growth whose duration depends on disruptive innovations and market saturation. We develop a regime-switching, real options model that facilitates time-varying transition probabilities in order to capture the evolution of economic indicators, and utilize a numerical approach to approximate the value of the investment opportunity. Results indicate that, ignoring the evolution of transition probabilities can result in severe valuation errors.

Tabu and Scatter Search: Principles and Practice**

Emerging Topic: Practice Curated Track

Emerging Topic Session

Chair: Rong Pan, Arizona State University, School of Computing Informatics & Decision Sys, P.O. Box 878809, Tempe, AZ, 85287-8809, United States

**1 - Tabu and Scatter Search: Principles and Practice**

Manuel Laguna, University of Colorado, Boulder, CO, United States

This tutorial focuses on the metaheuristics known as tabu search and scatter search. Tabu search has dramatically changed our ability to solve a host of problems in applied science, business, and engineering. The adaptive memory designs of tabu search have provided useful alternatives and supplements to the types of memory embodied in other metaheuristic approaches. We also explore the evolutionary approach called scatter search, which originated from strategies for creating composite decision rules and surrogate constraints. Numerous studies have demonstrated the practical advantages of this approach for solving a diverse array of optimization. Scatter search contrasts with other evolutionary procedures, such as genetic algorithms, by providing unifying principles for joining solutions based on generalized path constructions and by utilizing strategic designs where other approaches resort to randomization. Additional advantages are provided by intensification and diversification mechanisms that exploit adaptive memory, drawing on foundations that link scatter search to tabu search. We show connections between tabu search and scatter search by demonstrating how they can be applied to many optimization problems found in practice. This tutorial also discusses the search strategy called path relinking, relevant to both tabu and scatter search. Features added to both tabu and scatter search by extension of their basic philosophy are captured in the path relinking framework. From a spatial orientation, the process of generating linear combinations of a set of reference solutions (as typically done in scatter search) may be characterized as generating paths between and beyond these solutions, where solutions on such paths also serve as sources for generating additional paths. This leads to a broader conception of the meaning of creating combinations of solutions. By natural extension, such combinations may be conceived to arise by generating paths between and beyond selected solutions in the neighborhood space. Finally, we highlight key ideas and research issues associated with tabu search, scatter search, and path relinking that offer promise of yielding future advances.

**Environment and Sustainability**

Sponsored: Energy, Natural Res &amp; the Environment Environment &amp; Sustainability

Sponsored Session

Chair: Sandra D. Eksiöglu, Clemson University, Clemson, SC, 29634, United States

**1 - A Stochastic Biomass Blending Problem**

Berkay Gulcan, Clemson University, Clemson, SC

Blending biomass of different physical or chemical properties provides an opportunity to passively adjust the quality of the feedstock to meet the specifications of the conversion platform. We propose a chance constraint optimization model to identify the mix of biomass to optimize the performance of the Thermochemical conversion process. Chance constraints ensure that process requirements are met most of the time, despite the stochastic nature of biomass availability and quality. Our numerical analyses compare process performance under centralized and decentralized decision making framework.

**2 - Gender-based Selection Strategy for Improving Response in Genomic Selection**

Guiping Hu, Iowa State University, 3014 Black Engineering, Ames, IA, 50011, United States, Megan Wellner, Saba Moeinazade, Lizhi Wang

Genomic selection is a technique that breeders use to select plants or animals to mate and produce new generations of species. We propose a gender-based selection strategy, which was inspired by how two genders of wild animals take different roles in fighting for food and caring for their offspring. Our selection approach selects individuals with the highest short-term achievement as male, and then select individuals that are the most complementary to the male. We will present simulation results that compare the performance of the new approach against the state-of-the-art approaches in the literature.

**3 - Economic Evaluation of Biofuel Production in Hot Spots Identified for Hydroclimatic Sustainability**

Nathan Parker, Assistant Professor, Arizona State University, 800 South Cady Mall, Tempe, AZ, 85281, United States, Nazli Uludere Aragon

The sustainability of the spatial configuration of bioenergy crop production in the US is evaluated for economic and hydroclimatic impacts using a location-allocation model for biofuel industry linked to results of hydroclimatic model and a crop growth model. Converting existing land uses to bioenergy crops can reduce near-surface temperatures but pose a risk of excessive water withdrawals. A system that provides local cooling without a reduction in soil moisture that can support a biofuel industry is found in two regions of the country.

**Planning Models in the Petrochemicals Sector**

Sponsored: Energy, Natural Res &amp; the Environment/Natural Resources Petrochemicals

Sponsored Session

Chair: Ajit Gopalakrishnan, Air Liquide, Newark, DE, 19702, United States

**1 - Pooling Problems under Perfect and Imperfect Competition**

Dimitri Papageorgiou, ExxonMobil Research &amp; Engineering, 1545 Route 22 East, Annandale, NJ, 08886, United States, Francisco Trespalacios, Stuart Harwood

We investigate pooling problems in which multiple players vie with one another to maximize individual profit in a competitive market. Each player controls a processing network involving intermediate tanks (or pools) where raw materials are blended together before being further combined into final products. Each player then solves a pure or mixed-integer bilinear optimization problem whose profit is influenced by other players. We present several bi-level formulations and numerical results of a novel decomposition algorithm.

**2 - A Large-scale MILP for Shale Gas Development Planning**

Nathan Blandino, EQT Corporation, 625 Liberty Avenue, Suite 1700, Pittsburgh, PA, 15222, United States, Markus Gustav Drouven

No abstract available

**3 - An Integrated International Oil and Gas Supply Model**

Tuncay Ugur Alparslan, U.S. Department of Energy, Washington, DC, 20009, United States

To improve its analytic capabilities, The U.S. Energy Information Administration (EIA) is currently upgrading its primary modeling tool for its projections for international energy markets, which is used to produce the annual International Energy Outlook (IEO), which provides valuable information to policy makers and other stakeholders. These efforts include simulating the global hydrocarbon supply via a new upstream integrated resource model, a new refining model, and a logistics network model. Combined, these three make up the new Global Hydrocarbon Supply Model (GHySMo). Scenario analysis using preliminary results from the integrated model will be the focus of this talk.

**4 - The New Role of Norwegian Gas in Europe**

Asgeir Tomasgard, Norwegian University of Science and Technology, Dept. of Industrial Economics, Alfred getz vei 3, Trondheim, 7491, Norway, Vegard Skonseng Bjerketvedt, Rudolf Gerardus Egging

The European energy system is in a restructuring process where large investments in intermittent renewable power generation are made. The volume of gas exported from the Norwegian continental shelf is foreseen to decrease. The changes in capacity and demand may open new commercial opportunities. Short-term and long-term uncertainties will affect how to maximize the value of Norwegian gas and contribute to the restructuring of the green energy system. We will use multi-horizon stochastic programming to analyze solutions related to capacity services based on Norwegian natural gas exports.

**Behavioral Aspects of Project Management**

Emerging Topic: Behavioral Aspects of OR

Emerging Topic Session

Chair: Lin Wang, PhD, Chinese Academy of Sciences, Beijing, China

**1 - Modeling Human Behaviors in Project Management: A Systematic Review**

Lin Wang, Chinese Academy of Sciences, Beijing, 100190, China

To successfully implement projects, the significant role of “humans cannot be ignored. Stakeholders (project managers, senior managers, etc.), who make vital decisions alongside the project life cycle, are often influenced by behavioral biases and inducing great losses. These losses are observed as the project escalation phenomenon in the project management (PM) literature for decades, while some behavioral decision-making models have been built by operational research (OR) experts. This paper makes a systematic review of the literature originating from both communities, and discusses the why, the what and the how of the behavioral modeling to facilitate wise project decisions.

**2 - Pricing Strategies Based on Consumers' Shopping Preference for Sales Channels**

JieYu Lei, Northwestern Polytechnical University, Xi'an, Shaanxi, China, Ada Che

E-commerce brings two new sales channels: online direct channel(ODC) and online retail channel(ORC) into market, which help consumers no longer stick to traditional offline channel (TOC) to buy what they need. In this paper, we mainly focus on how manufacturers make their pricing strategies when they adopt two or three channels to sell their products. According to the Stackelberg game theory, we design a sale model considering consumers' preference for different channels and calculate the optimal pricing strategies of manufacturers and retailers. The result shows that the optimal price of a product in ODC is generally higher than that of the same product in ORC and TOC.

**3 - Human Capital, Technological Progress and Structural Unemployment**

Chao Li, Shandong University, 180 Wenhuxi Road, Weihai, 264209, China

Technology progress makes old skills abundant, eliminate relevant job opportunities and create new job vacancies at the same time, thus threatening a rise in structural unemployment. The simulation results demonstrate that the quantity of structural unemployment brought about by technological progress is determined by the inequality of human capital. The more severe inequality of human capital in the labor force, the more people with lower human capital whose old skills will be replaced by new technologies, which are developed by those with higher human capital. Therefore, technology progress may not necessarily cause high structural unemployment.

**4 - Network of Factors Influencing Green Buildings Performance from Perspectives of Stakeholders**

Du Qiang, Chang'an University, School of Economics and Management, Middle-Section of Nan'er Huan Road, Xi'an, Shaanxi, 710064, China, Bai Libiao, Huang ning, Wang Hailing

To accelerate the process and improve the efficiency of promoting green buildings in China, this paper filtrate 28 green building influence factors from 2-perspective of life cycle and stakeholders. And a questionnaire survey of 20 green building experts was used in social network for recognize quantitatively the critical influence factors. This paper filled the gap of previous research on green building that rarely measure the relationship between different influence factors in the project life cycle. Final, remarks include policy recommendations for promotion green building in China and suggestions for future research.

**5 - Project Managers' Paradoxical Leader Behavior in Construction Project Teams: Effects on Team Adaptation and Project Performance**

Wenqian Guo, Tianjin University, Building 25A, Tianjin University, No.92, Weijin Road, Nankai District, Tianjin, Tianjin, 300072, China

Research on paradoxical leader behavior developed in the organizational field, has not been given adequate attention to the area of construction project management. Using a paradoxical lens, the empirical analysis of a survey of 187 Chinese general contractors clearly indicates that there is a positive relationship between project managers' paradoxical leader behavior and construction project performance. Moreover, this relationship is mediated by team adaptation. The findings have significant theoretical and managerial implications for effective construction project management.

**Managing Risk in Complex Projects**

Emerging Topic: Project Management and Scheduling, in Memory of Joe Leung,

Emerging Topic Session

Chair: Gary Mitchell, University of Portland, Pamplin School of Business, Portland, OR, 97203, United States

**1 - Improving Outsourcing Project Estimation**

Richard Kraude, University of Buffalo, Buffalo, NY, United States, Enno Siemsen, Sriram Narayanan

Outsourcing is common, unfortunately, so too are delays in outsourced projects. Selecting outsource partners that will meet deadlines requires accurate estimation of the effort it will take to complete them. We conduct a behavior experiment to test how project planning differs for external estimates and how to improve them.

**2 - Measuring a Project's Schedule Performance: Earned Duration and Beyond**

Mikhail Gordon, University of Pittsburgh, Pittsburgh, PA, 15224, United States, Tim Lowe, Richard Wendell

This paper gives some new results on Earned Duration, including a characterization of how scheduling metrics based on Earned Duration behave in late-finishing and early-finishing projects, and an explanation with examples on why it is susceptible to giving false negatives and false positives in measuring a project's scheduling performance. The paper then notes how Critical Path methodology, when used appropriately, can by itself effectively assess and communicate schedule status of a project.

**3 - Do Incentive Contracts Coordinate Decentralized Projects?**

Theodore D. Klastorin, University of Washington, ISOM Department, Box 353226, Seattle, WA, 98195-3226, United States, Shi Chen, Michael Wagner

We consider a serial decentralized project where a client subcontracts the work to an independent contractor. Using a Stackelberg game, we analyze a general class of incentive contracts and show that setting the due date to zero defines an optimal contract for the client. Furthermore, we show that this contract coordinates the project under certain conditions.

**4 - Optimizing a New Product Development Project**

Gary Mitchell, University of Portland, Pamplin School of Business, Portland, OR, 97203, United States, Theodore Klastorin

An innovator firm is planning to start a new product development project consisting of  $n$  sequential stages or subprojects and learns of a rumor that an unknown competitor may enter the market with a competing product. Wishing to maximize the expected benefits of the new product, the innovator firm must decide how to respond to this potential competitive threat. We consider the optimal product introduction timing and the time-cost tradeoffs associated with accelerated project costs and market potential.

**5 - Robust Management Optimization of a Portfolio of Interdependent Projects**

Marcus V. Poggi, Prof, PUC-Rio - Pontificia Universidade Catolica do Rio de Janeiro, Rua M. S. Vicente 225, Rio de Janeiro, 22591-900, Brazil, Carlos Raoni Mendes, Bruno Flach

Determining optimal activity execution modes and risk mitigation plans for a portfolio of interdependent projects subject to multiple sources of uncertainty are objects of this work. We model the uncertain environment as an adversary that selects worst-case combinations of risks for any action. Next, we present a robust optimization model and its reformulation scheme. The resulting model is solved by a cut-generation. Experiments over instances derived from PSPLIB are reported. They show how important integrated resource allocation decisions is when dealing with portfolios of interdependent projects. They also highlight the effectiveness and computational feasibility of the method.

North Bldg 231C

### Social Media and Information Warfare

Emerging Topic: Social Media Analytics

Emerging Topic Session

Chair: Tauhid Zaman, Ph.D., MIT, Cambridge, MA, 02139, United States

#### 1 - Detecting Influence Campaigns in Social Networks using the Ising Model

Nicolas Guenon des Mesnards, MIT, Boston, MA, United States, Tauhid Zaman

Recent news about Russian propaganda bots influencing elections has given the bot detection problem new importance. This problem can be modeled using the Ising model from statistical physics. This allows for joint detection of multiple bots. We show that the problem reduces to a max-flow problem, allowing for an efficient solution. We find that our bot-detection algorithm is able to find bots more accurately than existing state of the art methods. Our analysis of the bot tweets suggests that they are engaged in coordinated influence campaigns.

#### 2 - Time Varying Opinion Dynamics with Stubborn Agents

David S. Hunter, Massachusetts Institute of Technology, Cambridge, MA, 02139, United States

We propose a social network opinion dynamics model where individuals grow more stubborn with time. We are able to prove several results on the convergence of the opinions. Depending upon how fast individuals become stubborn, the opinions may never converge, converge in mean, or converge in probability. We provide a precise characterization of these different convergence conditions. We also find that when the opinions converge, the equilibrium opinions are given by a linear system which has a form similar to Ohm's Law from circuit theory.

#### 3 - Optimizing Influence Campaigns with Stubborn Agents

Tauhid Zaman, MIT, MA, United States

Often there is a need to run an influence campaign in a social network. This can be done using "stubborn agents who shift the opinions of non-stubborn people. We use an Ohm's Law equilibrium condition for the opinions as the basis for an integer program for the optimal placement of the agents. We prove that this problem is submodular, allowing for accurate greedy solutions. Using several simulated and real network topologies, we show that a small number of agents can have a strong influence on the population.

## ■ MB53

### Matching Theory I

Sponsored: Auction and Marketing Design

Sponsored Session

Chair: Thayer Morrill, North Carolina State University, Raleigh, NC, 27695, United States

#### 1 - Obvious Manipulations

Thayer Morrill, North Carolina State University, Campus Box 8110, Raleigh, NC, 27695, United States, Peter Troyan

Game theory is based on the idea that if an agent has the incentive to deviate, then she will do so. However, it is clear that not all incentives to deviate are the same. How much higher of a payoff does the agent realize from deviating? Does a deviation expose the agent to more risk? Does it require a great deal of information to know whether or not a deviation will be profitable? For some mechanisms there is clear evidence that agents are adept at identifying opportunities for manipulation in practice, while for others, though opportunities for manipulation exist, they are observed much less frequently. This paper seeks a simple and tractable method for determining when a mechanism is easy to manipulate.

#### 2 - Efficient and Pretty Fair Course Assignment with Quotas

Stefan Waldherr, Technische Universität München, Boltzmannstr 3, Room 01.10.054, Munich, 85748, Germany, Martin Bichler, Alexander Hammerl, Thayer Morrill

We focus on course assignment problems with minimum and maximum quotas. It is well known that even without minimum quotas there does not exist a strategyproof mechanism that always selects an efficient and fair assignment. While the extended seats TTC mechanism (ESTTC, i.e. TTC incorporating minimum quotas) satisfies strategyproofness and efficiency for minimum quotas, it is very unfair and leads to many instances of justified envy. In this talk, we present extensions to ESTTC which satisfy weak fairness axioms. Further, we leverage field data from a large-scale course assignment application where we can show a significant reduction of justified envy when applying our mechanisms.

#### 3 - Revenue from Matching Platforms

James Schummer, Northwestern University, 2211 Campus Dr, Evanston, IL, 60208, United States, Philip Marx

We consider matching platforms on which agents form pairs. The platform commits to a stable matching mechanism, charging fees to both sides. Agents on the short side of such markets capture more value than those on the long side (Ashlagi et al. 2017). Nevertheless we show that the platform does not price discriminate between the sides based on their relative sizes. We demonstrate that the cost of committing to stability vanishes in large markets. While preference correlation leads the platform to bias its prices in imbalanced markets, we show that the direction of price bias depends on the type of correlation; these effects are absent from models of two-sided markets without capacity constraints.

#### 4 - On Finding Stable and Efficient Solutions for the Team Formation Problem

Robert Day, University of Connecticut, 2100 Hillside Road U-1041, Storrs, CT, 06269-1041, United States, Hoda Atef Yekta, David Bergman

We study a mathematical-programming approach to team formation, focused on the interplay between two of the most common objectives considered in the related literature: economic efficiency (i.e., the maximization of social welfare) and game-theoretic stability (e.g., finding a core solution when one exists). With a weighted objective across these two goals, the problem is modeled as a bi-level binary optimization problem, and transformed into a single-level, exponentially sized binary integer program. We then devise a branch-cut-and-price algorithm and demonstrate its efficacy through an extensive set of simulations, with favorable comparisons to other algorithms from the literature.

### Opportunities and New Directions for Behavioral OM

Sponsored: Behavioral Operations Management

Sponsored Session

Chair: Anyan Qi, The University of Texas at Dallas, Richardson, TX, 75080, United States

Co-Chair: Ruth Beer, Indiana University, Kelley School of Business, Indiana University, Kelley School of Business, Bloomington, IN, 47404-5180, United States

#### 1 - Opportunities for Behavioral Research within Supply Chain Management

Tava Olsen, University of Auckland, ISOM, Business School, University of Auckland, Auckland, 1142, New Zealand

This talk examines opportunities for behavioral research within supply chain management (broadly defined). In particular, I will discuss models and empirical anomalies that could benefit from behavioral research (in terms of lab experiments, behaviorally inspired modelling, or empirical research). The talk concludes with a discussion my perception of the role for behavioral research going forward.

#### 2 - Consumer Behavior in Pricing Applications

Georgia Perakis, Massachusetts Institute of Technology, Sloan School of Management, MIT, 100 Main Street Rm E62-565, Cambridge, MA, 02142-1347, United States

In recent years, there has been increasing interest in incorporating behavioral phenomena in Operations Management applications. In particular, in this talk, I will discuss some recent work on pricing applications where amending the traditional models to include consumer behavior (such as memory and anchoring effects) leads to interesting new insights.

#### 3 - Queueing Systems with (MIS)behaving Servers and Customers

Mor Armony, New York University, 44 West 4th Street #8-62, New York, NY, 10012, United States

Traditional queueing theory has assumed that customer arrival times and service requirement as well as server service speed are exogenously determined. This assumption makes sense for systems with non-human customers and servers. In practice, in service systems that involve humans as customers and / or servers, behavioral effects may lead to violation of these assumptions. Specifically, both customers and servers may respond to incentives related to social comparisons, sense of ownership, and fatigue, to name a few. These behaviors can dramatically change the performance and optimal control of queueing systems. We survey recent literature and present opportunities for further research.

**Advancing Diversity of Women in STEM**

Sponsored: Women in OR/MS (WORMS)

Sponsored Session

Chair: Sudharshana A. Apte, Altria Client Services, Richmond, VA, 23221, United States

**1 - Four Things Women in Data Science Can Learn from*****Game of Thrones***

Jennifer Priestley, Kennesaw State University, Kennesaw, GA, United States

Studies consistently find that women are underrepresented in most computational disciplines - particularly in Analytics and Data Science. And although events and organizations that encourage girls K-12 to learn to code have increased over the last few years, the number of college-age women in computational disciplines has not increased. Nor has the proportion of women in analytical leadership positions. In this talk, one of the few female directors of a Ph.D. in Data Science will provide perspective on how the discipline can attract (and retain) more female talent. These points will be framed through the popular HBO Series Game of Thrones.

**2 - Unintended Consequences of Increasing Female Engineers' Representation in Managerial Roles**

Teresa Cadrador, University of Illinois at Urbana Champaign, Champaign, IL, United States

Engineering remains one of the most highly and persistently sex segregated occupations in the US. Though the extant literature submits that women's increased access to managerial positions in male-dominated occupations should represent an important strategy for addressing sex segregation, my recent research suggests that women's representation in managerial roles in engineering may promote the very sex segregation it is attempting to mitigate. I will present the results of two field studies which highlight how and why female engineers' movement into managerial roles fosters a form of intra-occupational sex segregation with unintended (and largely negative) consequences for women.

**3 - Advancing Diversity: Ideas for Faculty Searches**

Karen Smilowitz, Northwestern University, Industrial Engineering Management Scienc, 2145 Sheridan Road RM D239, Evanston, IL, 60208, United States

In this talk, I will present related research, tips and lessons learned to advance diversity in STEM through more structured faculty searches.

**HAS Distinguished Scholar Lecture Sanjay Mehrotra**

Sponsored: Health Applications

Sponsored Session

Chair: Ebru Korular Bish, Virginia Tech, Blacksburg, VA, 24060, United States

Co-Chair: Tinglong Dai, Johns Hopkins University, Johns Hopkins University, Baltimore, MD, 21202, United States

**1 - Big Data Analytics and Operations Research Modeling: Broader Implications of Lessons Learned from a Journey towards Influencing Policy Change in Organ Transplant**

Sanjay Mehrotra, Northwestern University, Dept of I. E. / M. S. C246 Tech Inst, 2145 Sheridan Road, Evanston, IL, 60208-3119, United States

As health applications scientists we excel in model development and establishing their properties. We will reverse this order. We will start with data and its analysis to establish the problem. We will next search for natural evidence to direct model development. We will need to establish our credibility among stake holders. Only now we can develop optimization models that leverage OR insights. But, they have to outperform an existing proposal through dominance on multiple metrics. It is now time to give up optimality, to help increase solution acceptability. Insights will lead us to developing novel multi-objective ambiguous optimization methodologies. This will be done using organ transplant as a case study. The newly developed methodologies and modeling paradigms have wide applications.

**Disease Modeling and Decision-support Tools for Medical Decision Making**

Sponsored: Health Applications

Sponsored Session

Chair: Ethan Mark, Georgia Tech, Atlanta, GA, 30363, United States

Co-Chair: Pinar Keskinocak, Georgia Institute of Technology, Atlanta, GA, 30332, United States

**1 - An Empirical Analysis of the Opioid Prescription Epidemic**

Alireza Boloori, Arizona State University, Tempe, AZ, 85283, United States, Soroush Saghaian, Stephen Traub

Opioid epidemic has been largely attributed to the overprescription of opioid painkillers. As a result, many medical guidelines have recently urged healthcare providers to lessen opioid prescriptions in their medical practices. This, however, could negatively affect those patients who suffer from acute or chronic pain symptoms. Utilizing commercial insurance claims and encounters data, we first analyze the trade-off between the opioid epidemic and pain management. Based on our results, we then provide recommendations for both policymakers and healthcare providers.

**2 - Predictive Modeling of Multiple Chronic Conditions Development**

Adel Alaeddini, University of Texas at San Antonio, Department of Mechanical Engineering, One UTSA Circle, San Antonio, TX, 78249, United States

Development of multiple chronic conditions follows a complex process, influenced by several factors including the inter-relationship of the existing conditions, patient-level risk factors, etc. Using a large retrospective dataset of patient population, we build a machine learning model to explore the patterns of multiple chronic conditions development.

**3 - Computer-aided Diagnostic Models for Breast Cancer Screening and Diagnosis**

Oguzhan Alagoz, University of Wisconsin-Madison, 3242 Mechanical Engineering Building, 1513 University Avenue, Madison, WI, 53706, United States

Mammography is used for early breast cancer screening & diagnosis whereas mammography interpretation a difficult task due to similarities between early signs of breast cancer and normal structures in images. We have developed computer-aided diagnostic models and tested them using real-life data from private mammography databases. In this presentation, we describe our experiences, list the limitations of the existing CADx models, and provide possible future research directions.

**4 - Leveraging TCGA Gene Expression Data to Build Predictive Models for Cancer Drug Response**

Toyya Pujol, Georgia Institute of Technology, Atlanta, GA, 30318, United States, Evan Clayton, Peng Qiu

Personalized oncology promises to increase the success rate of cancer drug therapy by using molecular tumor profiles to determine the optimal therapeutic for an individual. Here, we build machine learning models using gene expression data directly from patients' primary tumor tissues to predict whether a patient will respond positively or negatively to a given drug. We show our models predict, with up to 86% accuracy, whether a patient will be a responder or not, and discuss how our findings may aid oncologists with making critical treatment decisions.

**5 - Using Machine Learning and Simulation to Compare Increased Organ Transplant Survival to Waiting for a Non-Increased Risk Organ**

Ethan Mark, Georgia Tech, 213 16th Street, NW, Apartment 4, Atlanta, GA, 30363, United States

### Improving Healthcare Accessibility and Performance

Sponsored: Health Applications

Sponsored Session

Chair: Yong-Hong Kuo, The University of Hong Kong, Pokfulam Road, Hong Kong

#### 1 - Location Model with Patient Choices and Care Facility Attractiveness

Taesik Lee, KAIST, 291 Daehak-ro, Yuseong-gu, Daejeon, 305-701, Korea, Republic of, Kyosang Hwang

Addressing health care needs of medically underserved areas is an important public health task. One solution is to establish care capacities in the underserved areas, and naturally this involves a location decision. To maximize the effectiveness of the investment, it is important for a location model to consider patients' choice behavior to reflect future, expected use of new capacities. We present a location model with patient choice behavior in which care facilities' attributes are integrated as decision variables. In addition to location decisions, the model determines the attributes of new facilities, providing additional levers to improve accessibility in the medically underserved areas.

#### 2 - Physician Staffing and Shift Scheduling at Emergency Departments with Time Varying Productivity

Alireza Sabouri, Haskayne School of Business, University of Calgary, 2500 University Dr. NW, SH132, Calgary, AB, T2N 1N4, Canada, Negar Ganjoughighi, Marco Bijvank

Productivity of servers in service systems can decrease during a shift. This variable productivity alongside the stochastic nature of number of arrivals to the system, create a mismatch between demand and the number of customers that can be served by the scheduled servers during a particular period of time. In this study, we propose a two-step stochastic formulation for the staffing and shift scheduling problem with the objective of minimizing this mismatch. Numerical experiments are performed with data from a Canadian emergency department. The results show that the schedule generated by our formulation results in lower mismatch. We then evaluate the schedules by a simulation model.

#### 3 - Simulation Analytics of Hospital Emergency Department Operations

Yong-Hong Kuo, Assistant Professor, The University of Hong Kong, Dept. of Industrial and Manu. Sys. Eng., The University of Hong Kong, Pokfulam Road, Hong Kong, Janny M. Y. Leung, Colin Graham

This talk presents our work which uses simulation to analyze patient flows in a hospital emergency department (ED) in Hong Kong. This simulation approach provides a tool for the operations manager in the ED to assess the impact of changes in the system on the daily operations. We will discuss how simulation can be integrated into an optimization algorithm to aid decision-making. We will also present insights into managing ED operations derived from the simulation experiments.

#### 4 - Appointment Scheduling with No-shows and Multiple Types of Patients

Jingyao Huang, PhD Student, The University of Texas at Austin, 2110 Speedway, Austin, TX 78705, Austin, TX, 78705, United States, Douglas Morrice, Diwakar Gupta

We consider an appointment scheduling problem with heterogeneous patients under no-shows. We have two types of patients. One is the regular patient who visits the clinic in person and has no-show behavior. The other is Virtual Medicine (VM) patient who receives service via e-visit and has a time window, within which they'll be called and served. We first study a static model of assigning VM patients given regular patients' schedule to maximize the expected profit. We partially characterize the optimal schedule and then extend the model to the sequential scheduling problem with random service time. Finally, we propose a heuristic to solve the problem quickly and effectively.

## ■ MB59

### Incentives for Optimal Treatment

Sponsored: Health Applications

Sponsored Session

Chair: Greg Zaric, Ivey Business School, London, ON, N6G 0N1, Canada

Co-Chair: Greg Critchley, Ivey Business School, London, ON, N6L0B2, Canada

#### 1 - Incentives for Optimal Coordination in Multi-payer Health Care Systems

Gregory Critchley, Western University-Ivey Business School, 10 Blodale Circle, Delaware, ON, N0L1E0, Canada, Lauren Cipriano, Greg Zaric, Jeremy D. Goldhaber-Fiebert

Multi-payer health care systems are common. For example, in the United States, many individuals are covered under private or employer-sponsored health plans prior to age 65 and are thereafter covered under Medicare. We model a multi-payer health care system using a Markov decision process and show that the penultimate payer, within a patient's lifetime, will prescribe treatment sub-optimally. We find that there exists a coordinating transfer payment between payers that results in a socially optimal treatment plan. Using the hepatitis C virus in a numerical example, we quantify the impact of a non-coordinated multi-payer health care system.

#### 2 - Sounding the Alarm on Opioids

Margret V. Bjarnadottir, University of Maryland, 4353 Van Munching Hall, College Park, MD, 20742-0001, United States, David Anderson, Ritu Agarwal, Kenyon Crowley, Kislaya Prasad, Alan Nelson

The ongoing opioid epidemic is a serious public health issue. In our paper, we investigate the feasibility of early detection of chronic opioid use and build advanced machine learning models that can be incorporated into clinical decision support systems, potentially minimizing adverse events associated with chronic opioid use and dependency.

#### 3 - Appointment Access in Family Medicine Clinic

Vera Tilson, University of Rochester, 3-343 Carol Simon Hall, W. E. Simon Graduate School of Business, Rochester, NY, 14627, United States, Ryan Spurr

We discuss a scheduling approach to improve access in a family medicine clinic.

#### 4 - Personalized Risk Management Strategies for Women at High Risk of Developing Breast Cancer and the Role of Adherence

Caglar Caglayan, Georgia Institute of Technology, 755 Ferst Drive NW, Atlanta, GA, 30332, United States, Turgay Ayer, Kalyan Pasupathy, Sandhya Pruthi

Women with BRCA 1/2 gene mutations or family history are at higher risk for breast cancer. The risk management interventions for high-risk women include intensified screening, preventive surgery (e.g., mastectomy) and risk-reducing medications (i.e., chemoprevention). Individual factors such as breast density and adherence behavior play a critical role at identifying and tailoring the optimal risk-management strategies for individuals at high-risk. In this work, we study breast cancer risk management problem with a comprehensive simulation model and identify optimal personalized strategies for high-risk individuals considering key patient characteristics and adherence behavior.

### Managing Cost and Quality in Healthcare

Sponsored: Health Applications

Sponsored Session

Chair: Ozlem Yildiz, University of Virginia, Darden School of Business, United States

#### 1 - Fair Machine Learning with Health Data

Mahbod Olfat, PhD Student, University of California-Berkeley, 1433 Dwight Way, Unit C, Berkeley, CA, 94702, United States, Anil Aswani

The explosion of big data in health care has given warrant for concern about proliferation of bias and inefficient delivery of health care through machine learning methods. While researchers have begun to study this problem for supervised learning problems, it has been less well-explored under the paradigm of unsupervised learning. In this talk, we discuss fairness in the context of dimensionality reduction via principal component analysis (PCA). We present a definition of fairness and develop a convex SDP program that can achieve it. We conclude by showing how our approach can be used to perform a fair (with respect to age) clustering of health data that may be used to set health insurance rates.

#### 2 - Does Mandatory Overtime Law Improve Quality? Staffing Decisions and Operational Flexibility of Nursing Homes

Susan F. Lu, Purdue University, Krannert 441, West Lafayette, IN, 47907, United States, Lauren Lu

During the 2000s, over a dozen U.S. states passed laws that prohibit healthcare employers from mandating overtime for nurses. Using a nationwide panel data set from 2004 to 2012, we find that these mandatory overtime laws reduced the service quality of nursing homes, as measured by an increase in deficiency citations. This outcome can be explained by two undesirable changes in the staffing hours of registered nurses: decreased hours of permanent nurses and increased hours of contract nurses per resident day.

### 3 - Bundled Payments, Fee-for-service, and Competition: Implications on Quality and System Performance

Zheng Han, University of Kansas, Lawrence, KS, 66049,  
United States, Mazhar Arkan, Suman Mallik

We study the quality competition between two hospitals where one under the fee-for-service (FFS), while the other under the bundled payment (BP). The demand, the costs, and the probability of successfully treating a patient depends on the hospital's chosen quality. Under such a setting, we develop a game theoretic model to answer the following questions. Is BP (FFS) payment scheme always associated with high (low) equilibrium quality? What factors affect the equilibrium outcomes and how? What insights can a policymaker (i.e., an insurer) obtain from the equilibrium quality outcomes?

### 4 - Scheduling Smarter and Working Harder: The Key to Reducing Turnover

Kevin Mayo, Indiana University, 1275 E. 10th St, Bloomington,  
IN, 47405, United States, Eric Webb, Kurt M. Bretthauer,  
George Ball

Turnover rates among nurse aides in skilled nursing facilities is extremely high and likely to get worse as demand outpaces supply. Such turnover rates have significant negative effects on patient health outcomes and various costs associated with turnover. We examine the scheduling characteristics of 6,634 part time nurse aides and 5,305 turnovers to determine how scheduling policies affect turnover. We identify the impacts of the amount, variation, and type of scheduling that all significantly influence the likelihood of turnover, and the differential effects in high or low workload environments. Using these insights, managers can better schedule their nurse aides to reduce turnover.

### Stochastic Models in Healthcare

Sponsored: Health Applications

Sponsored Session

Chair: Oguzhan Alagoz, University of Wisconsin-Madison,  
Madison, WI, 53706, United States

Co-Chair: Ali Hjaar, Wisconsin-Madison, Wisconsin-Madison, WI,  
United States

### 1 - Optimizing Hospital Resources to Improve Care Delivery -An Application to Bed Capacity

Eva Lee, Georgia Tech, Industrial & Systems Engineering, Ctr for  
Operations Research in Medicine, Atlanta, GA, 30332-0205,  
United States

We consider the problem of partitioning clinical services in hospitals into groups with the goal of efficiently allocating existing inpatient beds. We derive a 2-stage approach stochastic approach to address the 3-fold problem: 1) how many groups of services to form; 2) how many beds to allocate to each group; and 3) how to partition services among the groups. Three full-scale examples will be presented to demonstrate the flexibility and diverse application of our framework with managerial insights for different utility optimization goals and queueing systems.

### 2 - Optimizing Breast Cancer Screening using Partially Observable Markov Decision Processes

Ali Hajjar, University of Wisconsin-Madison, 1513 University  
Avenue, 3233 Mechanical Engineering Building, Madison, WI,  
53706, United States, Oguzhan Alagoz

Breast cancer, the leading cause of cancer death for women, can be detected at earlier stages through mammography screening. Therefore, We formulate a finite-horizon, partially observable Markov decision process (POMDP) model for this problem.

### 3 - Optimal Defibrillator Deployment versus Actual Deployment

Timothy Chan, University of Toronto, Mechanical and Industrial  
Engineering, 5 Kings College Road, Toronto, ON, M5S 3G8,  
Canada, Christopher Sun

Public defibrillators, which are located throughout cities worldwide, can be used to resuscitate cardiac arrest victims by bystanders with no training. However, location decisions to date are not data-driven. In this talk, we present a head-to-head comparison of optimal defibrillator locations against actual defibrillator locations using nine years of real data. At every decision epoch, the optimization model can only make decisions based on past data. On out-of-sample, future cardiac arrests, the optimization model improves spatiotemporal coverage, a measure of spatial proximity to cardiac arrests and temporal accessibility of the defibrillator, by 50-100% compared to actual location decisions.

### 4 - A Data-driven Stochastic Programming Approach to the Outpatient Colonoscopy Scheduling Problem

Karmel Shehadeh, University of Michigan, 1205 Beal Avenue,  
Ann Arbor, MI, 48105, United States, Amy Cohn

We present a data-driven stochastic programming approach to optimize scheduling templates for stochastic colonoscopy procedures. Particular attention is paid to the underlying impact of pre-colonoscopy bowel preparation on variability in colonoscopy duration and the competing schedule metrics, including patient delays, clinic overtime, and colonoscopy procedure outcomes. A case study based on an outpatient procedure center (OPC) at a large medical center is used to draw some useful managerial insights for OPC managers.

### Decision Making and Data Mining

Sponsored: Data Mining

Sponsored Session

Chair: Michael Lash, University of Iowa, Iowa City, IA

### 1 - Hybrid Decision Making: When Interpretable Models Collaborate with Black-box Models

Tong Wang, University of Iowa, Pappajohn Business Build,  
21 East Market Street, Iowa City, IA, 52245, United States

Interpretable machine learning has received increasing interest especially in domains where humans are involved in the decision-making process. However, the possible loss of the task performance for gaining interpretability is often inevitable. We propose a novel framework for building a Hybrid Decision Model that integrates an interpretable model with any black-box model to make better decisions. We design a principled objective function that considers predictive accuracy, model interpretability, and data explainability. Experiments show that hybrid models do not necessarily trade accuracy for explainability and provide higher flexibility in model designing.

### 2 - ELM-SOM: A Continuous Self-Organizing Map for Visualization

Renjie Hu, University of Iowa, 1505 W. Benton Street, Iowa City,  
IA, 52246, United States, Venous Roshdibenam, Hans J. Johnson,  
Emil Eirola, Anton Akusok, Yoan Miche, Kaj-Mikael Björk,  
Amaury Lendasse

This paper presents a novel dimensionality reduction technique: ELM-SOM. This technique preserves the intrinsic quality of Self-Organizing Maps (SOM): it is nonlinear and suitable for big data. It also brings continuity to the projection using two Extreme Learning Machine (ELM) models, the first one to perform the dimensionality reduction and the second one to perform the reconstruction. ELM-SOM is tested successfully on six diverse datasets. Regarding reconstruction error, ELM-SOM is comparable to SOM while bringing continuity.

### 3 - Text Mining of Online Reviews using Deep Learning Techniques

Asil Oztekin, University of Massachusetts Lowell, 333 1st Street,  
Unit 210, Lowell, MA, 01850-2580, United States

In this study, we used deep learning techniques to analyze user-generated content, particularly online text reviews of travelers who describe their experience of airports and suggest a recommendation for other travelers. By performing aspect-oriented sentiment analysis on the user reviews, we develop a holistic predictive approach. The study reveals that aspect-oriented sentiment scores significantly improve the predictive power for the recommendation decision of the user. Recurrent Neural Network based deep learning approach performed superior to other machine learning models in predicting customer recommendations. This research has methodological, application-based, and managerial implications.

### Joint Session DM/AI/Practice Curated: From Data to Algorithms: How Ride-sharing Platforms Improve Rider and Driver Experiences?

Sponsored: Data Mining

Sponsored Session

Chair: Helin Zhu, UBER

Co-Chair: Peter Frazier, Cornell University, School of Operations Research, and Information Engineering, Ithaca, NY, 14853, United States

#### 1 - Driver Preferences at Uber: Welfare, Flexibility, and Pricing

Peter Frazier, Cornell University, School of Operations Research, and Information Engineering, Ithaca, NY, 14853, United States

The Uber platform lets drivers set preferences for trips going to a destination through its Driver Destination feature. This feature lets drivers avoid deadheading when they need to go home, but also creates gaming opportunities by letting drivers select lucrative long trips. Moreover, when many drivers use this feature, their reduced flexibility causes riders going to unpopular destinations to wait longer on pickups for drivers coming from further away. We study the impact on welfare of this and other similar preference-setting features in two-sided markets. We show that they can decrease welfare when launched without discretion, but improve welfare when combined with appropriate pricing.

#### 2 - Dynamic Pricing and Matching in Ride-hailing Platforms

Helin Zhu, Marketplace Optimization, Uber, 1455 Market Street, 4th Floor, San Francisco, CA, 94103, United States, Chiwei Yan, Dawn Woodard, Nikita Korolko

Advanced matching and dynamic pricing algorithms are the two key levers in ride-hailing platforms. We demonstrate via a stylized model, calibrated with real data, that the synergy of these two levers can bring significantly more benefits. Specifically, we study a novel matching mechanism called dynamic waiting. We show that pricing and waiting could be jointly optimized in reducing rider and driving waiting times, lowering price volatility, and increasing trip volume and welfare.

#### 3 - Estimating Primary Demand in Bike-sharing Systems

Chong Yang Goh, Massachusetts Institute of Technology-ORC, Cambridge, MA, 02139-4910, United States, Chiwei Yan, Patrick Jaillet

We consider the problem of estimating the primary or first-choice demand for a bike-sharing service using trip and inventory data. To account for choice substitutions, we propose a rank-based demand model that treats each observed trip as the best available option in a latent ranking over origin-destination pairs. We then solve a high dimensional estimation problem using algorithms that (i) find sparse representations of the parameters efficiently, and (ii) constrain trip substitutions spatially according to the bike-share network. Our method is effective in recovering the primary demand and computationally tractable on a city scale, as we demonstrate on a bike-sharing service in Boston.

#### 1 - Reinforce Learning with Counterpetition Strategy in Hotelling Model

Xiaoya Xu, Assistant Professor, Guangdong University Of Finance & Economics, 21 Luntou Road, Guangzhou 510320, Guangdong, P.R. China, Guangzhou, 510320, China

The combination of reinforce learning and game theory is exceptional serviceable for solving complexity problems, we adapt this methodology to the cooperation game in hotelling model. Assuming customers apply their potential game in each stage for maximizing their optimal revenue. Using the reinforce learning, customers can automatically choosing their optimal strategy systematically .

#### 2 - Improving Demand Forecast Accuracy through Partial Aggregation

Vladimir Kovtun, Assistant Professor, Yeshiva University, 500 W. 186th Street, New York, NY, 10033, United States, Avi H. Giloni, Sridhar Seshadri, Hurvich Clifford

We consider a single firm (retailer) that observes demand streams coming from many distinct consumer populations. We assume that each demand stream follows an Autoregressive Moving Average (ARMA) process. We show with

examples that by grouping similar ARMA demand streams together and forecasting several partial-aggregate streams the retailer is able to drastically improve its forecast accuracy when compared to grouping all consumer streams together and forecasting a single aggregate ARMA stream. Furthermore we show that little is lost when compared to forecasting all demand streams separately.

#### 3 - Spatial Patterns and Socioeconomic Dimensions of Short-term Shared Accommodations: The Case of Airbnb in Los Angeles and New York City

Avijit Sarkar, Professor, University of Redlands, 1200 E. Colton Avenue, Redlands, CA, 92373, United States, Mehrdad Koohikamali, James B. Pick

This study examines spatiotemporal aspects and socioeconomic dimensions of shared accommodations within the broader context of the sharing economy. Specifically, we examine how socioeconomic attributes of Airbnb hosts moderated by hosts' attitudes towards trust and greener consumption influence participation in the sharing economy. Spatial bias in sharing economy participation rates is examined and policy implications for the supply side of shared accommodations are discussed along with generalizability of results for two major U.S. cities - New York City, NY and Los Angeles CA.

#### 4 - Cognitive Learning with Application to Supply Chains

Seho Kee, Arizona State University, Tempe, AZ, 85044, United States, Ghazal Shams, Mani Janakiram, Mark A. Wilkinson, George Runger

The evolving data-rich environment has enabled making data-driven business decisions. Rather than traditional approaches, more automated, adaptive, and intelligent systems can be developed to expand upon the capabilities of human decision makers. A cognitive computing approach is presented to learn and improve human decision-making in a dynamic, context-aware decision support platform. The proposed system is applied to a real-world use case in supply chain.

#### 5 - Sourcing Model Optimization using a Linear Model in Multi-echelon Distribution Network

Prashant Kaldindi Verma, FleetPride, Inc., 600 E. Las Colinas Blvd #400,, Irving, TX, 75039, United States, Mohit Arora, Homarjun Agrahari, Brian Steinmiller, Ziyu Li

The SKU sourcing policy can have significant impact on the transportation and inventory holding costs. We developed and implemented an optimization model that explicitly deals with vendor contracts, varying pack sizes and demand. The model takes into account the cost of transportation to each location and handling cost specific to location. We will present mathematical model, and financial impact it has had on the organization.

Chair: Xu Sun, Columbia University, New York City, NY, 10027, United States

#### 1 - Shepherding the Herd

Ville Satopaa, INSEAD, 140 Avenue Daumesnil, Paris, 75012, France, Jussi Keppo

We analyze multiple agents who forecast an underlying dynamic state based on a stream of public and private signals. Each agent minimizes a convex combination of her forecasting error and deviation from the other agents' forecasts. As a result, the agents exhibit herding behavior - a bias that has been well-recognized in the literature. We first derive and analyze the agents' optimal forecast under different levels of herding. This extends the Kalman filter to applications where herding is an important part of the process. After that we solve a dynamic strategy that allows a social planner to influence the agents' forecasting and this way raise welfare through disclosure of public information.

#### 2 - Determining Optimal Treatment Allocations for Online Experiments with a Fixed Number of Rounds

Balaji PitchaiKannu, Research Scholar, IIT Madras, 236, Bhadra Hostel, IIT Madras, IIT Madras, CHENNAI, 600036, India, Nandan Sudarsanam

In this study, we determine the optimal treatment allocation for experiments that are conducted in batches, in a live setting with a finite horizon. Unlike the traditional online learning problems seen in the multi-armed Bandit setup, our problem statement requires that the entire trial horizon is exhausted in a fixed set of rounds. In this environment, we determine the batch size as well as the ratio of treatments to units for each round. Our optimization seeks to minimize expected cumulative regret, a common metric in online learning. We use a Bayesian framework to model the theoretical means of the alternatives and the noise in the system as Gaussian distributions.

**3 - Predicting and Managing Sustainability**

Kemal Gursoy, Professor, Rutgers University, 100 Rockefeller Road,  
Room 5146, Piscataway, NJ, 08854, United States

In order to survive we must learn how to predict and manage the change in our environment and ourselves. This brings an immense challenge of collecting facts and extracting sufficient information from this incoming stream of big data. In this work, we identify some significant challenges in this process and present an adaptive method for managing sustainability.

**4 - Many-server Service Systems with Autoregressive Inputs**

Xu Sun, Columbia University, New York City, NY, 10027,  
United States

Motivated by recent studies revealing the presence of significant autocorrelation and overdispersion in arrival data at large call centers, we study a class of queueing systems where customers arrive according to a doubly stochastic Poisson point process whose intensities are driven by a time-dependent Cox-Ingersoll-Ross (CIR) process. The nonnegativity and autoregressive feature of the CIR process makes it a good candidate for modeling temporary dips and surges in arrivals. We study asymptotic performances such as the queue length and customer delays. The results acknowledge the presence of autoregressive structure in arrivals and produce operational insights into staffing decisions.

**1 - A Prediction Model for Adverse Events in Hospitalized Patients**

Yu-Kai Lin, PhD, Georgia State University, Atlanta, GA,  
United States, Xiao Fang

Inadequate patient safety is a serious problem in current medical practice. Medical errors cause adverse events (AEs) among patients and lead to increased hospital stays, medical costs, and risk of death. This study develops a novel in-hospital AE prediction method to improve patient safety. We evaluate the predictive performance and practical utility of the proposed method using real-world inpatient data. Our results suggest that the proposed model can better predict and prevent in-hospital AEs than alternative methods.

**2 - Study for Out-of-hospital Days in Chinese Cancer Patients**

Luwen Huangfu, 1549 N. Santa Rita, Tucson, AZ, 85719,  
United States

Cancer readmission time interval, or Out-of-Hospital Days (OHD) between two consecutive hospital admissions, has been widely adopted as an important measure of healthcare service. However, there is a paucity of models that focus on OHD and associated risk factors. We aim to utilize OHD that is more than 30 days as the result of cancer patient's personal and medical conditions and treatment costs. We analyze a sample of 635,261 cancer inpatients Electronic Health Records (EHR) from 190 hospitals in China. Using hierarchical linear regression, we show that age, marital status, previous admissions and whether the treating hospital is in the same province as the patient, are significant factors in OHD.

**3 - Predicting High Cost Patients at Point of Admission using  
Network Science**

Karthik Srinivasan, University of Arizona, Tucson, AZ, 85721,  
United States, Sudha Ram, Faiz Currim

Data mining models for high-cost patient encounter prediction at the point-of-admission (HPEPP) in inpatient wards are scarce in literature due to lack of availability of relevant features at such an early stage of treatment. We explore a disease co-occurrence network (DCN) for community formation and structural properties to create new input features for HPEPP models. We propose community membership and high-cost propensity scores as two network based features for HPEPP modeling. We find that our proposed set of features improve performance of prediction models. HPEPP model using our feature set has the potential to reduce overall health care expenditure in US.

**Consumer Behavior & Firm Strategies in e-Platforms**

Sponsored: Information Systems

Sponsored Session

Chair: Gang Wang, University of Delaware

**1 - Impact of Contest Structure on Crowdsourcing Performance  
and Outcome**

Yuan Jin, University of Connecticut, 19A Hillside Circle, Storrs, CT,  
06268, United States, Shun-Yang Lee, Sulin Ba, Jan Stallaert

A crowdsourcing project can be conducted in either a sequential contest or a simultaneous contest. A sequential contest launches multiple sub-contests, each of which focuses on one task of the project. In contrast, a simultaneous contest requires contestants to finish all the tasks in one contest. The sequential structure can build the final solution by integrating knowledge from contestants with different skills, while the simultaneous structure maintains independence of contestants' solution search process. We conduct a controlled experiment to compare the two structures, and find that generally the sequential structure provides better contestant performance and contest outcomes.

**2 - Enhancing the "Call For Bids" to Improve Matching Efficiency in  
Online Labor Markets: Evidence from Freelancer.com**

Xue Guo, Temple University, Fox School of Business, 1801 North  
Broad Street, Philadelphia, PA, 19122, United States, Jing Gong,  
Paul A. Pavlou

To improve matching efficiency in online labor markets, we seek to enhance the "Call for Bids (CFB)" that helps service providers to understand the project requirements by reducing description uncertainty about the requested services. In this study, we first explore three dimensions of description uncertainty in the CFB: codifiability, flexibility, and outcome standards. Second, we examine the role of these dimensions in matching efficiency between the employer and service provider. Third, we explore the mediating role of bid characteristics (i.e., number of bids, average quality of bids, average price of bids) in the matching process. Theoretical and practical contributions are discussed.

**3 - How Much Monitoring is Optimal in Online Labor Markets –  
A Signaling Perspective**

Zhenhua Wu, PhD, Nanjing University, China

In this paper, we build a theoretical model to investigate the online labor market. We assume that: 1) There is an online monitoring system which could perfectly reveal online worker's effort level but imperfectly reveal productivity; 2) The online worker wants to signal his ability to market and build a reputation as a worker with high productivity, and the firm wants to maximize its profit by selecting an appropriate monitoring intensity. We show that the appearance of an online monitoring system could help the worker successfully signal his ability through the hourly wage or the effort level which cannot be obtained without the monitoring system. Furthermore, the intervening of the firm with a positive monitoring intensity could facilitate the worker to separate himself on the market. However, the monitoring system would distort the labor supply by achieving an effort level more than the case of complete information. Besides, we characterize separating equilibria where the high-productivity worker chooses lower hourly wage than the low-productivity one. We also find that there is a substitutional effect between the firm's monitoring intensity and the worker's effort level. Several policy and empirical implications are generated from our equilibrium predictions.

**4 - Role of Reference Points in the Goal-directed Platform:  
A Randomized Field Experiment**

Qinglai He, Arizona State University, Tempe, AZ, United States

Goal-directed platforms have seen tremendous development. Assisting users in effectively and efficiently attaining their goal is the key to both users' and goal-directed platforms' success. In this study, we focus on the role of reference points in individuals' goal pursuit in the goal-directed platforms. We propose that highlighting alternative reference points in the push notification has a positive effect on individuals' goal pursuit, and users' activeness moderates such effect. We collaborated with a leading education start-up to conduct a large-scale randomized field experiment. Based on our preliminary results, we discuss our findings and plans for future work.

**5 - Impact of Online Retail on Movement of Long Tail Products:  
An Empirical Study**

Samayita Guha, Temple University, PA, United States,  
Rakesh Reddy Mallipeddi, Subodha Kumar

Retailers have now started to pay attention to long tail products that individually have low demand but in aggregate can combine to create higher demand than few best-selling products. In this study, we propose an econometric model to examine the behavior of long-tail products using data from a large retailer.

### Topics in Scheduling and Parallel Computing

Sponsored: Computing

Sponsored Session

Chair: Oleg Shylo, University of Tennessee, Knoxville, TN, 37996, United States

#### 1 - Supporting an Additional Dimension of Parallelism in PEBBL 2.0

Jonathan Eckstein, Rutgers University, New Brunswick, NJ, United States

We consider some large-scale optimization applications which require branch-and-bound algorithms, but the processing of even a single subproblem requires significant parallelism. This talk describes enhancements to the PEBBL parallel branch-and-bound class library designed to support such applications.

Applications using these enhancements may simultaneously exploit two different kinds of parallelism, one within subproblems and another across multiple subproblems. We also discuss other changes to PEBBL for the 2.0 release.

#### 2 - A Constraint Based Snowplow Optimization Framework

Joris Kinable, Eindhoven University of Technology, De Lismortel 62, Eindhoven, 5612 AR, Netherlands, Willem van Hoeve, Stephen F. Smith

Snow plow optimization is a complex process in which routes for a fleet of vehicles have to be determined, while adhering to vehicle operating restrictions, resource utilization and replenishment constraints. We present an optimization framework for a real-world snow plow optimization problem in Pittsburgh, USA. Feasible routes and schedules are calculated using heuristics and a Constraint Programming approach. Commercial GIS data is used as the underlying data source. Evaluations are performed against commercial snow plow optimization software. In addition, pilot tests with actual vehicles are being conducted.

#### 3 - Team of Teams: Optimal Communication Structures for Concurrent Solvers

Oleg Shylo, University of Tennessee, 523 John D. Tickle Engineering Building, 851 Neyland Drive, Knoxville, TN, 37996, United States, Andrii Berdnikov

The focus is on the teams of concurrent optimization solvers that can attain high levels of parallelism required by extreme-scale computing. To explore theoretical properties of communication and its impact on computational performance, we model communication between individual solvers by stochastic processes. These theoretical constructs enable efficient evaluation of communication topologies without empirical testing, and are used to define a class of scalable communication design problems.

#### 4 - A State-Space Decomposition Algorithm for the Integrated Last-Mile Transportation Problem

David Bergman, University of Connecticut, Storrs, CT, 02451, United States, Arvind U. Raghunathan, John Hooker, Thiago Serra, Shingo Kobori

In this talk we discuss a state-space decomposition algorithm for the integrated last-mile transportation problem, which consists of the joint scheduling of passengers in a mass transportation system and limited-capacity last-mile delivery vehicles. The algorithm results in orders-of-magnitude performance gains over previously introduced integer programming models.

### Recent Advances in Non-convex Optimization

Sponsored: Computing

Sponsored Session

Chair: Andres Gomez, University of Pittsburgh, Pittsburgh, PA, 15217, United States

#### 1 - Cuts for Polynomial Optimization

Chen Chen, The Ohio State University, Columbus, OH, United States, Daniel Bienstock, Gonzalo Munoz

We introduce intersection cuts for polynomial optimization via maximal S-free sets (termed outer-product-free sets). Such cuts can be used to generate improved convex relaxations. We also discuss implementation of these cuts in MINLP branch-and-cut software.

#### 2 - Optimality-based Domain Reduction for Inequality-constrained NLP and MINLP Problems

Carlos Nohra, Carnegie Mellon University, Pittsburgh, PA, United States, Yi Zhang, Nikolaos Sahinidis, Gang Rong

We propose novel optimality conditions for general inequality-constrained NLP and MINLP problems, which fully exploit the monotonicity of objective and constraints. Three reduction algorithms are developed separately for unconstrained, one-constraint, and multi-constraint problems. Through forward and backward bound propagation of subgradients with respect to each decision variable, the reduction procedures are developed and integrated with the global solver BARON. Significant memory and CPU time reductions are observed for many problems.

#### 3 - Continuing Work on Polynomial Optimization

Daniel Bienstock, Columbia University, Dept of IEOR, 342 Mudd, New York, NY, 10027, United States

We present continuing work on polynomial optimization problems, including cuts and approximate discretization. If time permits we will include a discussion on diagnosing infeasibility.

#### 4 - A Center Cut Algorithm for Quickly Obtaining Feasible Solutions and Solving Convex Mixed Integer Nonlinear Programs

David E. Bernal, Carnegie Mellon University, 5000 Forbes Avenue, Doherty Hall office 3116, Pittsburgh, PA, 15213, United States, Jan P. Kronqvist, Andreas Lundell, Tapio Westerlund, Ignacio E. Grossmann

We present a center-cut algorithm for convex mixed-integer nonlinear programs that can be used as a primal heuristic or as a deterministic solution strategy. The trial solutions are chosen at the analytical center of the linear approximation of the nonlinear constraints subject to the original integrality constraints, with the idea that this trial solution is likely to be feasible. At this solution, the linear approximation is refined. The procedure is repeated iteratively, leading to convergence to a feasible solution. Proofs for the finite convergence of the algorithm are provided, and computational results show that the algorithm quickly finds feasible solutions to convex MINLPs.

Emerging Topic Session

Chair: Patricia Neri, SAS Institute, Inc., 104 Grandtree Ct., Cary, NC, 27519, United States

#### 1 - Primal-Dual Algorithms for Order Fulfillment at Urban Outfitters, Inc.

Vivek Farias, MIT, 100 Main Street, Cambridge, MA, 02142, United States, John M. Andrews, Aryan Khojandi, Chad Yan

We formulate the omni-channel fulfillment problem as an online optimization problem. We propose a novel algorithm for this problem based on the primal-dual schema. Our algorithm is robust: it does not require explicit demand forecasts. This is an important practical advantage in the apparel-retail setting where demand is volatile and unpredictable. We provide a performance analysis establishing that our algorithm admits optimal performance guarantees in the face of adversarial demand. We describe a large-scale implementation of our algorithm at Urban Outfitters, Inc. This implementation processes on average eighteen thousand customer orders a day, and as many as one hundred thousand orders on peak demand days. We estimate conservatively that the system has saved at least six million dollars annually relative to an incumbent industry standard fulfillment optimization implementation. This saving is achieved through optimal order-fulfillment decisions that simultaneously increase turn and lower shipping costs.

#### 2 - Centralized Admissions for Engineering Colleges in India

Yash Kanoria, Columbia Business School, 404 Uris Hall, New York, NY, 10027, United States, Surender Baswana, Partha Pratim Chakrabarti, Sharat Chandran, Utkarsh Patange

We designed and implemented a new joint seat allocation process for over 500 programs across 80 engineering colleges in India, including the Indian Institutes of Technology (IITs). Our Deferred Acceptance-based process overcomes a number of challenges. The joint seat allocation process has been successfully running since 2015, with a 70% reduction in vacancies at the IITs. Particular concerns have been (i) allocative efficiency and reducing vacancies due to students accepting a seat but then withdrawing or not reporting for classes, (ii) transparency, integrity and fairness, (iii) logistical simplicity for both candidates and institutes, and (iv) the incentive structure for candidates.

### Innovations in Healthcare Delivery

Sponsored: Health Applications

Sponsored Session

Chair: Alex Mills, Kelley School of Business, Indiana University Bloomington, Bloomington, IN, 47405, United States

#### 1 - Healthcare Payment Model Impact on Hospital Readmissions

Jon M. Stauffer, Assistant Professor, Texas A&M University, 4217 TAMU, College Station, TX, 77843, United States, Jonathan Helm, Kurt M. Bretthauer

We examine how pay-for-performance (P4P) reimbursement plans, such as bundled payments and the Hospital Readmission Reduction Program (HRRP) impact the motivation for providers to reduce readmissions. Results show that P4P plans do motivate extra readmission reduction effort, but that misalignments can occur between the provider's efforts and the minimum total system cost effort. We also find there is only a small window when the bundled payment price is large enough to motivate all providers to reduce readmissions, but not so

large as to over-motivate a smaller provider to perform effort exceeding the minimum total system cost effort.

#### 2 - Managing Patient Panels with Nonphysician Providers

Hessam Bavafa, Wisconsin School of Business, 4284C Grainger Hall, 975 University Avenue, Madison, WI, 53706, United States, Sergei Savin, Christian Terwiesch

In recent years, the drive to contain health care costs has increased scrutiny of the traditional mode of delivering primary care where a patient is treated only by his primary care physician. In particular, greater reliance on non-physician providers has been suggested as a lower-cost alternative to the traditional set-up. We study the overall impact of non-physician providers on the physician's expected daily compensation and patients' expected health.

#### 3 - The Business of Healthcare: Physician Integration in Bundled Payments

Turgay Ayer, Georgia Institute of Technology, School of Industrial and Systems Engineering, Groseclose 417, Atlanta, GA, 30332, United States, Jan Vlachy, Mehmet U.S. Ayvaci

Under the prevailing fee-for-service payments, incentives of hospitals and physicians are misaligned, leading to large inefficiencies. Bundled payments unify payments to the hospital and physicians and are expected to encourage care coordination and reduce costs. However, as hospitals differ in their relationships with physicians in influencing care level of physician integration, it remains unclear what spectrum of physician integration will facilitate bundling. We study (1) the impact of the level of integration between the hospital and physicians in the uptake of bundled payments, (2) the consequences of bundling with respect to overall care quality and costs/savings.

#### 4 - Estimated Time to Discharge Building the ETA for Hospitals

Jean Pauphilet, MIT, Cambridge, MA, 02139, United States, Dimitris Bertsimas

Number of beds, whose availability is driven by patient discharges, is one of the most critical resources in any hospital. As a result, accurate prediction of time-to-discharge could significantly improve daily operations. In this work, we combine advanced machine learning methods with expertise and insights from medical staff, social workers and operations to compute personalized Time-to-Discharge estimates for each individual inpatient. To that end, we also build a predictive model to anticipate discharge destination as well. Joint work with BIDMC, Boston, MA.

### Exact Approaches and Approximations in Multiobjective Optimization

Sponsored: Multiple Criteria Decision Making

Sponsored Session

Chair: Serpil Sayin, Koc University, Istanbul, 34450, Turkey

#### 1 - An Algorithm for Solving Bi-objective Integer Programming Problems

Ozlem Karsu, Bilkent University, Bilkent University, Ankara, 06800, Turkey, Firdevs Ulus, Saliha Dogan

We propose an objective-space based algorithm to solve bi-objective integer programming problems, where we assume that the set of all nondominated points are included within a bounded set. In each iteration of the algorithm a single Benson-type (weighted Chebyshev) scalarization is solved. The computational experiments demonstrate the satisfactory performance of the algorithm.

#### 2 - Tractability of Convex Vector Optimization Problems in the Sense of Polyhedral Approximations

Firdevs Ulus, Bilkent University, Industrial Engineering Department, Bilkent, Ankara, 06800, Turkey

A recent solution concept for convex vector optimization problems (CVOPs) which is motivated from a set optimization point of view consists of finitely many efficient solutions that generate polyhedral inner and outer approximations to the Pareto frontier. A CVOP with compact feasible region is known to be bounded and there exists a solution of this sense to it. However, it is not known if it is possible to generate polyhedral inner and outer approximations to the Pareto frontier of a CVOP if the feasible region is not compact. This study shows that not all CVOPs are tractable in that sense and gives a characterization of tractable problems in terms of the well known weighted sum scalarization problems.

### 3 - Experiments with Two Relaxations for Multiobjective Integer Linear Programs

Serpil Sayin, Koc University, College of Admin Sciences and Economics, Rumeli Feneri Yolu Sariyer, Istanbul, 34450, Turkey

We study two relaxations of multiobjective integer linear programs. The first one is the result of an LP relaxation of the feasible set. This leads to a formulation that can be solved as a multiobjective linear programming (MOLP) problem. The second one is a convex hull relaxation of the problem in the outcome space. This relaxation makes it possible to relate extreme supported nondominated solutions of the original problem and the nondominated set of the relaxed problem. We then conduct some preliminary experiments to evaluate the information delivered by the relaxations for some different problem types.

### 4 - MSEA 2.0: A Multi-stage Exact Algorithm for Multi-objective Pure Integer Linear Programming in Julia

Aritra Pal, Sr Operations Research Specialist, BNSF Railway Company, 6301 Sabbatical Street, Apt 938, Fort Worth, TX, 76131, United States, Hadi Charkhgard

We present a new exact method for multi-objective pure integer linear programming, the so-called Multi-Stage Exact Algorithm (MSEA). The method combines several existing exact and approximate algorithms in the literature, either to compute the entire efficient set or to compute the minimum of a linear function over the entire efficient set of any multi-objective pure integer linear program. The proposed method supports execution on multiple processors and is available as an open source Julia package (MSEA.jl), in GitHub. Another desirable feature of the package is that users can easily customize the package to develop their own custom-built exact solvers for their specific problems.

### Quantitative Methods Supporting Operational Decisions

Sponsored: Military and Security

Sponsored Session

Chair: William Caballero, Air Force Institute of Technology, WPAFB, OH, 45424, United States

#### 1 - Drone-aided Border Surveillance with an Electrification Line Battery Charging System

Seon Jin Kim, University of Houston, 422 Cypress Vista, Houston, TX, 77094, United States, Gino J. Lim

Mobile and fixed border surveillance systems are often used to enhance the comprehensive situational awareness along the U.S. border lines. Drawbacks of such systems include limited operating capability, blind spots, and physical fatigue of field agents. The use of drones is an ideal way to overcome these issues in border patrol activities. Therefore, we present a drone-aided border surveillance system with E-line battery charging systems to wirelessly charge drones during the flight to extend flight duration. For operational purposes, an optimization model and solution algorithm to schedule drone flights for the proposed system.

#### 2 - A Multi-objective Trilevel Optimization Model for Integrated Air Defense System Penetration

Brian J. Lunday, Air Force Institute of Technology, 2950 Hobson Way, Department of Operational Sciences, WPAFB, OH, 45433, United States, Aaron M. Lessin, Raymond R. Hill

We present a trilevel math programming formulation in which an intruder identifies subsets of a defender's air defense batteries to respectively destroy and degrade, subject to budget constraints; a defender subsequently adjusts their array of defensive assets subject to certain time and movement limitations; and the intruder selects a penetration path. Within this framework, the intruder and defender respectively seek to minimize and maximize the expected exposure time of the intruding aircraft to engagements. We present a reformulation to a bilevel program, customized heuristics, and the results of heuristic performance on synthetic-but-representative scenarios.

#### 3 - Approximate Dynamic Programming for Military Medical Evacuation Dispatching Policies

Phillip Rolland Jenkins, Air Force Institute of Technology, WPAFB, OH, 45424, United States, Matthew J.D. Robbins, Brian J. Lunday

Military medical planners must consider how aeromedical evacuation (MEDEVAC) assets will be dispatched prior to engaging in combat operations. We formulate a Markov decision process model to examine the MEDEVAC dispatching problem. We develop and test two distinct approximate dynamic programming (ADP) solution techniques. The first technique utilizes least-squares temporal differences (LSTD) learning, whereas the second technique leverages neural network (NN) learning. A notional planning scenario is examined to determine the efficacy of our ADP solution techniques. Results indicate that the NN policies substantially outperform both the LSTD and currently practiced policies.

### 4 - Solving the Heterogeneous Multi-stage Weapon Target Assignment Problem with Adaptive Dynamic Programming

Darryl K. Ahner, United States Army, 135 Eastwick Court, Dayton, OH, 45440-3647, United States, Alexander Gill Kline, Carl R. Parson

The weapon target assignment (WTA) problem seeks, within an air defense context, to assign interceptors (weapons) to incoming missiles (targets) to maximize the probability of destroying the missiles. In the Dynamic WTA (DWTA), there is knowledge of targets that pose an immediate threat and it is known, to a probability distribution, how many and what type of targets will follow in a subsequent stage. This paper develops a real-time, near optimal solution technique for the heterogeneous DWTA which utilizes the CAVE Algorithm. Further, it compares the results to an optimal Markov Decision Process for smaller problem instances and a baseline policy for larger problem instances.

### Data-driven Approaches for Smart Manufacturing System Analysis, Monitoring, and Control

Emerging Topic: Design and Control of Manufacturing Systems

Emerging Topic Session

Chair: Xiaoning Jin, Northeastern University, Boston, MA, 02115, United States

Co-Chair: Weihong Guo, Rutgers, The State University of New Jersey, Rutgers, Piscataway, NJ, 08854, United States

#### 1 - Process Variation Modeling and Monitoring for Interconnected Additive Manufacturing using Cloud Data

Hui Wang, PhD, Florida State University, FL, United States, Jie Ren, Arriana Nwodu, Tarik Dickens

Additive manufacturing (AM) has its flexibility of creating a high variety of products with complex structures. However, due to frequent changes in production demands, AM processes usually do not have sufficient data to establish a baseline for effective quality monitoring and process control. This talk envisions a solution by using an inter-connected AM environment based on cloud platforms, by which production data from multiple AM processes can be shared and exchanged with each other to jointly learn AM process variations. A case study demonstrates that the proposed algorithm.

#### 2 - NARNET-based Degradation Analysis under Time-Varying Operating Conditions

Xiaoning Jin, PhD, Northeastern University, Boston, MA, United States, Anqi He

We present a new prognostic modeling method based on nonlinear autoregressive neural network (NARNET) for computing remaining useful life (RUL) of degraded systems under dynamic operating conditions. Our approach consists of two processes: (1) an offline training process for modeling the degradation and failure zones using run-to-failure sensor measurements; (2) an online remaining useful life (RUL) prediction algorithm. The operating conditions are forecasted by a NARNET model based on the unit's operating history. We show that the prognostic model provides more accurate RUL prediction, demonstrated with an aircraft turbine engine degradation dataset.

#### 3 - Image Analytics for Prognostics and Health Monitoring in Advanced Manufacturing System

Shenghan Guo, Rutgers, The State University of New Jersey, Piscataway, NJ, United States, Weihong Guo

Automatic sensing devices and computer systems have been widely adopted by the automotive manufacturing industry, which is able to record machine status and process parameters nonstop. The objective of this study is to explore and exploit the large amounts of recorded data to facilitate system prognostics and health monitoring. The proposed method represents machine status sequences in moving-window images and then extracts features using texture analysis. Classification results show that the proposed method can effectively distinguish between normal and abnormal processes. A case study on a critical asset from an automotive manufacturing plant is provided.

**Disaster Preparedness, Response, and Recovery**

Sponsored: Public Sector OR

Sponsored Session

Chair: Pinar Keskinocak, Georgia Institute of Technology, Georgia Institute of Technology, Atlanta, GA, 30332, United States

Co-Chair: Seyma Guven Kocak, Georgia Institute of Technology, Atlanta, GA

**1 - Inequity-averse Shelter Location for Disaster Preparedness**

Sibel Salman, Koc University, Rumeli Feneri Yolu, Istanbul, 34450, Turkey, Mahdi Mostajabdaveh, Walter J. Gutjahr

We address selecting capacitated shelter locations in preparation for disasters under demand uncertainty and random transportation network disruptions by an inequity-averse approach. We develop a 2-stage stochastic programming model to minimize a linear combination of efficiency and inequity measures. Moreover, a service level is imposed by a chance constraint. We develop a tailored genetic algorithm (GA) to solve this problem for large real-life and benchmark instances. Our computational results show that the GA outperforms Cplex in terms of run time and solution quality. We derive insights from a case involving an earthquake-prone district of Istanbul.

**2 - The Post-disaster Debris Clearance Problem with Resource Allocation and Learning**

Seyma Guven-Kocak, Georgia Institute of Technology, 5211 Denmeade Dr, Atlanta, GA, 30345, United States, Pinar Keskinocak

In the aftermath of a disaster, debris needs to be cleared quickly and efficiently in order to continue critical response operations. Motivated by the debris clearance operations, this work addresses a problem of establishing connectivity on a disrupted network with inherent uncertainty and learning. Since the information on the clearance times of the roads only becomes available after the network is explored, this problem possesses exploitation / exploration trade-off. Considering learning and exploration / exploitation trade-off, we develop various exact and approximate solution methods in order to optimize the benefit accrued over time by connecting critical points in the network.

**3 - Time Synchronization Issues in Emergency Response**

Jordan Srour, Assistant Professor of Operations Management, Lebanese American University, Adnan Kassar School of Business, P.O. Box 13-5053, Beirut, 1102 2801, Lebanon

In any city - smart or not - emergency response is a critical service. In smart cities, the use of technology to manage access to and dispatching of emergency vehicles is particularly important. However, when a system must manage processes spanning multiple computers, clock drift becomes a prominent issue. In a case study with an existing emergency response provider, we show how analytics can be used to determine the impact and source of clock drift. We also show the impact that system design techniques can have in remedying this issue.

**4 - A Stochastic Integer Programming Framework for Large Scale Patient Evacuation under a Forecasted Disaster**

Kyoung Eric Kim, University of Texas-Austin, Austin, TX, United States, Erhan Kutanoglu, John Hasenbein

A major humanitarian challenge of a forecasted disaster such as a hurricane is to decide whether or not the patients in hospitals and nursing homes in the affected area should be evacuated. We propose a comprehensive modeling and methodological framework for large scale patient evacuation when an area is faced with such a disaster. We integrate a scenario generation scheme that uses updated hurricane forecasts and a scenario-based stochastic integer program to make decisions on resource allocation (for staging area locations, ambulances/ambuses, and sending and receiving staff) and patient movements. Real-world data from Southeast Texas region is used in our computational study.

**5 - Scheduling Staff for the FEMA National Response Coordination Center**

Erica L. Gralla, George Washington University, 800 22nd st NW, Rm 2680, Washington, DC, 20052, United States, Kai Friessecke, Shelby Grumer, Jillian D'Arrigo, Hernan Abeledo, Joseph Barbera

The Federal Emergency Management Agency's National Response Coordination Center coordinates federal support for response to major disasters. Producing staff schedules for the center is a challenge, since most staff have other commitments, and each position requires specific qualifications. We describe a scheduling approach that efficiently rosters qualified personnel and minimizes the violation of staff preferences, including days off, manager preferences, and others. Results show which preferences are hard to satisfy and provide recommended roster sizes and cross-training requirements.

## ■ MB78

West Bldg 213B

**Joint Session SOLA/PSOR/Practice Curated: Public Sector Location Applications**

Sponsored: Location Analysis

Sponsored Session

Chair: Rajan Batta, University at Buffalo (SUNY), Buffalo, NY, 14260, United States

**1 - Prepositioning of Supplies in Domain of Natural Disasters****Logistics: A Systematic Review of Operations Research and Management Science Papers**

Monir Sabbaghtorkan, University at Buffalo (SUNY), Amherst, NH, United States, Rajan Batta, Qing He

Prepositioning of supplies is an efficient way to improve the post-disaster relief efforts. In this paper, we explore and review OR/MS papers related to this topic to find the gaps and give directions to future researchers in this area. The classifications that are used in this paper are as follow. Authors affiliation, journals contribution, number of papers over the years and type of disaster considered by papers. Moreover, we would present the mathematical model features for each paper, like objective function, decision variables, constraints, solution methodology and etc.

**2 - Responding to Medical and Fire Emergencies on a Disrupted Network**

Gina Galindo, Universidad del Norte, KM5 Antigua via a Puerto Colombia, Puerto Colombia, Colombia, Juliette Garc a

Events such as heavy rains or extreme snowfall may disrupt roads and affect the response times of critical services such as fire and medical emergencies. This research develops a methodology for effectively allocating medical and fire emergencies to available facilities on a disrupted network. The methodology was applied to a case study in Barranquilla, Colombia. Based on the results, we recommend potential site for locating additional fire and medical facilities.

**3 - A Stochastic Programming Model for Emergency Supply Planning Considering Traffic Congestion**

Xiaofeng Nie, Texas A&M University, College Station, TX, United States, Qingyi Wang

Traffic congestion delays emergency supply after disasters, but it is seldom considered in the emergency logistics literature. To fill this gap, we propose a traffic congestion incorporated two-stage stochastic programming model that facilitates the planning of supplies pre-positioning and post-disaster transportation. The corresponding mixed-integer nonlinear program is efficiently solved with a generalized Benders decomposition algorithm. A case study on a hurricane threat in the southeastern U.S. shows the superiority of our model and provides managerial insights.

**4 - A Bi-Level Combined Facility Location and Network Design Problem in Hazardous Materials Transportation**

Xufei Liu, University of South Florida, Tampa, FL, United States, Changhyun Kwon

In this paper, we consider a bi-level optimization problem for hazardous materials transportation to determine facility locations and network design. The leader intends to minimize the total cost of facility costs and exposure risk by restricting the shipment and anticipates the reaction of the followers who want to minimize the transportation costs by choosing the shortest path for shipments. Considering the uncertainty of the number of trucks and exposure risk, we formulate a robust bi-level combined facility location-network design model and propose a cutting plane algorithm.

**Monday, 12:30PM - 2:30PM****Monday Poster Session**

Exhibit Hall Poster

**Monday Poster Session**

Poster Session

Chair: Neng Fan, University of Arizona, 1127 E. James E. Rogers Way, P. O. Box 210020, Tucson, AZ, 85721, United States

Co-Chair: Junming Yin, University of Arizona, Management Information Systems Department, McClelland Hall, Room 430BB, Tucson, AZ, 85721, United States

Co-Chair: Burcu B. Keskin, University of Alabama, 4138 Meretta Lane, Tuscaloosa, AL, 35406, United States

**1 - Comparative Analysis of the Machine Learning and Statistical Classifiers**

Ivan Belik, Assistant Professor, Norwegian School of Economics, Helleveien 30, Bergen, 5045, Norway

Since machine learning - statistics gap has experienced an outstanding reduction in the last years, machine learning methods have been applied for classification purposes as an alternative to purely statistical methods. In the given research we analyze machine learning and statistical techniques for the classification purposes and compare the efficiency and classification accuracy of those techniques. Specifically, we build the Na ve Bayes Classifier, based on the Bayesian Statistics concept, and the Artificial Neural Network classifier, based on the functional aspects of the biological neural networks. We are running the given competing paradigms over the variety of real-world datasets.

**2 - Dynamic Cloud Resource Optimization of B2C E-commerce Process Using Deep Reinforcement Learning**

Ming Gao, Associate Professor, Dongbei University of Finance & Economics, China, Jianshan Street 217, Shahekou District, Dalian, 116030, China

Current research on the optimization of cloud resources deployment for e-commerce platform is less based on the business process level and real world scenarios. In order to dynamically optimize the cloud resources for specific service scenarios of e-commerce transaction process, this paper analyzes the characteristics of the B2C e-commerce transaction scenario from published real world transaction history data, and apply the deep reinforcement learning algorithm to generate cloud resource realtime optimization strategies. Our work provides a reference solution for e-commerce companies to bridge the gap between business process goals and cloud resources efficiency.

**3 - Recent Approaches to Creating and Analyzing Big Data in Technology Management and Commercialization**

Clovia Hamilton, Assistant Professor of Management, Winthrop University, 701 Oakland Avenue, 310 Thurmond Building, Rock Hill, SC, 29733, United States

This is a study of three (3) technological advances related to Big Data: web scraping, natural language processing and machine learning. This research identifies ways in which these advances can become more relevant and useful to empirical researchers in the field of technology and innovation management. This research provides a brief look at some applications of these advances in research studies, and engenders a broader discussion around the relevance and impact of these advances to research in technology and innovation management. In particular, making use of these advances in empirical research related to technology commercialization was researched and is discussed.

**4 - Benchmarking Stream Processing Frameworks**

Giselle van Dongen, Ghent University, Ghent, Belgium, Dirk Van den Poel

Due to the increasing interest in real-time processing, many stream processing frameworks were developed. However, no clear guidelines have been established for choosing a framework and designing efficient processing pipelines. We fill this gap by establishing a benchmark methodology for fine-grained benchmarking of common operations on multiple metrics: latency, peak throughput, sustainable throughput, memory usage and cpu utilization. We implemented this benchmark for four popular stream processing frameworks: Spark, Storm, Flink and Kafka Streams.

**5 - A Two-stage SMAA-DEA Model for Supply Chain Evaluation and Rank**

Sheng Ang, University of Science and Technology of China, 96 Jinzhai Road, Hefei, China, Yunxia Zhu, Feng Yang

We integrate stochastic multi-criteria acceptability analysis technique (SMAA) and data envelopment analysis (DEA) methodology and propose a two-stage SMAA-DEA model for supply chain rank and efficiency evaluation with stochastic criteria values. Our study extends network DEA to address uncertain or stochastic measures. The developed model can be considered as an MCDM method with a two-stage additive DEA value function. An empirical study of 27 supply chains evaluation is presented to illustrate the proposed models.

**6 - Multivariate Stochastic Approximation versus Design of Experiments for Learning Vector Quantization Hyperparameter Tuning**

Trevor Bihl, Air Force Research Laboratory, 209 George Wythe Way, Beavercreek, OH, 45434, United States, Daniel Steeneck

The Generalized Relevance Learning Vector Quantization-Improved (GRLVQI), a Kohonen neural network classifier, is very accurate in the identification of communication devices in robust security applications. However, GRLVQI, like neural networks in general, has multiple hyperparameters which have been tuned via ad hoc and experiential methods. Herein, the authors consider two approaches to finding optimal GRLVQI hyperparameters: 1) factorial experimental design and 2) stochastic approximation. The results show that stochastic approximation has an improvement in accuracy over factorial designs while not constraining the design space.

**7 - Machine Learning to Establish Confidence in Project Due Date Setting**

Yu Xia, Associate Professor, College of William and Mary, Mason School of Business, 101 Ukrop Way, Williamsburg, VA, 23185, United States, Jie Ding

Erroneous setting of project due date can cause huge waste of resources. In project management, various postulated models are used to forecast project due date. However, project due date is influenced by many supply chain factors and some unexpected events. It is difficult to decide whether a postulated model is well-specified or not since they usually involve complex settings with nontrivial likelihood functions or vague priors on their parameters. In this paper, we works on establishing a quantitative index for confidence level of a due date setting. We also gather results from multiple models and come up with a self-learning self-adjusting final result to tackle the task.

**8 - Atmospheric Monitoring Using Nano-satellites**

Jean-Pierre Ibitokun, Graduate Student, University of Arkansas at Little Rock, EIT South University Avenue, Little Rock, AR, 72204, United States, Yupo Chan, Edmond Wilson, Po-Hao Adam Huang

Global warming concerns have led to environmental monitoring of our planet. The GOES satellite, a multi-billion platform, has been a key player in atmospheric sensing and weather forecast. We propose to use a constellation of CubeSat's, or nano-satellites, to perform a similar function at a much lower cost. Signals from an onboard spectrometer will map atmospheric water vapor concentrations, CO<sub>2</sub>, oxides of nitrogen, hydroxyl radicals and ozone concentrations, and recording solar spectra to establish trends between solar flux and atmospheric water vapor concentrations. This is to be validated against the patterns discerned from the GOES data using signal and image processing.

**9 - Transforming Organizations Through the Use of Metadata**

Christy W. Goodnight, University of South Alabama, Mobile, AL, United States

This poster examines the effect of the organizational structure of data of all types on a new process called the metadata transformational process. Adding a layer of metadata to all the data collected within our organization allows for us to use this knowledge in new and innovative ways that has the potential to transform the way we not only do business, but also the way our society functions. Thus, organizations that go through a metadata transformation will enable knowledge sharing which has the potential to facilitate innovation across the globe.

**10 - Estimating Youden Index Under the Multivariate ROC Curve in the Presence of Missing Mass Malignant and Benign Biomarker Data**

Lakmali Weerasena, University of Tennessee Chattanooga, 615 McCallie Ave, Chattanooga, TN, 37403, United States

Multivariate Youden index (J) and its corresponding optimal cut-point (c\*) have become the most effective and efficient approach in multi-biomarker mass data analysis to distinguish diseased from the healthy in this digitized era. However, the existing statistical classical approach does not produce exact solutions in the presence of nuisance parameters and missing and group mass data. This proposed novel high-performing computational-based generalized Variable Method is an alternative procedure to produce exact statistical inferential results for J and c\* in the presence of such constraints.

**11 - Vehicle Flow Control Using Reinforcement Learning on Manufacturing Environment**

Younkook Kang, Seoul National University, Seoul, Korea, Republic of, Sungzoon Cho

Automated Material Handling System (AMHS) which is responsible for movements between equipment is becoming an important factor of manufacturing competitiveness in semiconductor industry environment. In order to control traffic, traffic congestion should be reflected as a cost but it is hard to find proper cost. Our study focuses on setting traffic cost to maximize throughput at a key area. We suggest a method to adjust routing cost using reinforcement learning. It can help adapting traffic pattern changes without human interference. In the end, it can contribute improving manufacturing productivity.

**12 - Sequencing and Line Balance Interaction in Multi-worker Mixed-model Assembly Lines**

Mary Beth Kurz, Clemson University, 110 Freeman Hall, Clemson, SC, 29634-0920, United States

Mixed-model assembly requires line balancing and sequencing. The line balance and sequence may induce work overload. Given a fixed line balance, a sequence can be adjusted to minimize work overload: a skip policy allows a utility worker to take over a workpiece that will cause overload while the normal worker works on the next workpiece and swimming allows a worker to move into adjacent stations. Large products are assembled at stations with one or more workers per station. We address sequencing with skips and swims in a multi-worker mixed-model assembly line.

**13 - A Cellular Manufacturing Implementation in Microwave Manufacturing**

Okan Karatay, Production Manager, Aselsan, Konya Yolu 8. Km, Ogulbey Mah. 3051. Sok. No:3, Ankara, 06830, Turkey, Yuce Cinar Baysal

Nowadays, one of the effective ways of dealing with manufacturing drawbacks in a high mix low volume environment is the CM. In this study, we first propose a manufacturing cell that is designed to replace the traditional job shop layout of the Microwave manufacturing company. Secondly, we focus on the scheduling that creates the continuous flow and provides the line balance. Moreover, we mention the human aspect of this implementation which is as critical as technical ones. Thirdly, we evaluate the performance of the CM with the conventional production layout by using the company's KPI. After analyzing the outcomes of the implementation, the benefits associated with cellular manufacturing are listed.

**14 - A Bayesian Stochastic Frontier Model for Productivity Index**

Jessie Nouri, UWM, Milwaukee, WI, United States

Stochastic Frontier Model (SFM) is a linear regression with covariates and a random effect term which captures variation of production across various firms. This research develops a semi-parametric Bayesian SFM for predicting the productivity index across production lines of a major firm. The distribution of efficiencies is modelled through a Dirichlet process prior.

**15 - The Relation of Product Variety and Structure to Subassembly Inventory**

Jeonghan Ko, Ajou University; University of Michigan, Ann Arbor, MI, 48109, United States, Kunju Kim

This research elaborates the relationship between product variety and the safety inventory of subassemblies thorough multi-stage assembly. We identifies the optimal locations to hold subassemblies along the assembly steps to minimize the total subassembly inventory levels on the condition of little component commonality. In particular, we show that different product structure will lead to different levels and optimal locations for subassembly inventory.

**15B - Real-time Health Monitoring of Wiring Systems for Smart Manufacturing**

Daeil Kwon, Professor, UNIST, Ulsan, 44919, Korea, Republic of, Jinwoo Lee, Namhun Kim

In manufacturing facilities, wiring systems transmit and receive signals to communicate between modules and systems. Stress conditions may degrade the performance of wiring systems, causing intermittent faults, interlocking, and eventually facility downtime. Timely maintenance of wiring systems is required to ensure the reliability and availability of manufacturing facilities. This presentation discusses a non-destructive method to allow for condition-based maintenance of wiring systems. Experimental results demonstrate the proposed method can serve as a real-time health indicator of wiring systems, and can be used for proactive maintenance planning toward near zero downtime.

**16 - What Effects do Owner-operator Incur as a Result of Negotiating Behavior for Freight Transportation**

Shervin Espahbod, Wilfrid Laurier University, Waterloo, ON, Canada

The main approach to be a self-employed in trucking industry is to purchase or lease a truck as an independent trucker. The self-employed driver can receive direct orders or subcontract for a transportation firm. Although there is a substantial potential profit for self-employed carriers, the trucking industry is an extremely competitive and uncertain market. The person with the lowest amount of bid, is the winner of the spot market auction. By cutting their profits and putting lowest bids, self-employed drivers win bids from far distance, while closer corporate truckers are unable to win the bid. This study will examine the results of the inefficiency from this behavior.

**17 - Do Attractive People Make a Better Deal Investigation of Social Factors in Supply Chain Management**

Lyudmyla Starostyuk, PhD Candidate, The University of Texas at Arlington, 701 S. West Street, Arlington, TX, 76019, United States, Chen Kay-Yut, Prater Edmund L

Although it is well known that people form impressions of others based on their appearance, little is known about the role of facial character judgments in contracting. We study the role of social factors such as trustworthiness, attractiveness, and dominance in better pricing in a supply chain contract game. The experimental study shows that the female supplier who is confident in her attractiveness sells products to the male buyer for the higher average price while the male supplier does the opposite. The trustworthy looking female receives more expensive offers from the male supplier but sells products cheaper to the female buyer as well as the dominant female does.

**18 - The Importance of Referent Power in Team Mental Models**

Shihao Ge, Research Assistant, University of Washington Bothell, 18115 Campus Way NE, Bothell, WA, 98011, United States, Deanna Kennedy

Being on the same page by forming team mental models is important for project success. This takes communication, however, the communicator may help or hinder the development of team mental models. Herein, we look at how relationships and behaviors of the communicator on other team members and how that may impact mental model formation.

**19 - Predicting Hurricane Landfall from the Atlantic on United States Territories Using Historical Advisory Data**

Obe J. Joseph, SUNY University at Buffalo, Buffalo, NY, United States

The objective of this study is to create a landing deviation model. The study involves collecting and tabulating advisory text data from 1998 to 2017, from the National Hurricane Center. It analyzes the distribution of the distance deviation between the forecasted landfall and the true landing, given the number of hours before landfall.

**20 - Natural Disaster Damage Loss Prediction Using Social Media Data: The Study Case of Hurricane Irma**

Ling Lin, University of Buffalo, 319 Kaymar Dr, Buffalo, NY, 14228, United States, Qing He, Rajan Batta

Our research presents an aggregated disaster loss prediction model by examining Hurricane Irma's Tweet data and users' demographic information through implementing sentiment and linear regression analyses. Sentiment scores were utilized as new input variables along with other factors in regression model to predict various types of disaster damage losses. The results show the potential power of social media data in predicting both the number of damaged units and the damage loss in dollars.

**21 - Optimization of Information Coverage Using Social Media During Natural Disasters**

Bairong Wang, PhD, University at Buffalo (SUNY), Buffalo, NY, 14226, United States, Rajan Batta

One of the challenging problems for social media crisis sensing is collecting enough useful data from social media. This study aims at designing and optimizing an information coverage strategy within local areas when a disaster event occurs. A bi-level information coverage model is designed to model the situations where information is collected from different local areas for crisis sensing. This model includes an upper-level model that optimizes the resources allocating among different local areas and a correspondingly lower-level model that optimizes the positioning of computing resources to maximize the weighted coverage. Test results of the model prove a sound performance of the model.

**22 - Using Real-time Operational Data to Increase Labor Productivity in Retail**

Pablo Jofr, Universidad de Chile, Beaucheff 851, Santiago, 8370456, Chile, Marcelo Olivares, Andres I. Musalem

This research is focused on developing models to support dynamic systems that can reassign labor to different activities. This work utilizes data from a pilot study in a store of a home improvement retail chain in the U.S. Security cameras were used to track the number of customers and employees on different sections. We use these operational data to measure - in real time - the demand for services in a specific store department, and the service capacity. This information can be linked to point of sales data, to measure the effect of the number of employees on the sales of specific departments. All this provide information for a dynamic labor allocation system in order to prioritize where to allocate employees.

**23 - Strategies with Incomplete Information for Interactions Between Sectors in Concession Period Length of a PPP Project**

Zhouyang Lyu, Hohai University, Nanjing, 211100, China

This work studies the intention of private sector investment under tenuous rules of law (Incomplete Information) and associated with concession period length. First, a static game model was created to analyze the tactical concession length, indicating 60% of the legal maximum length. Then, to analyze private investment promotion, another model was created to investigate the influences of the investment ratio. Results from the models show: 1) "zero concession is negated; 2) only under extreme risk the private sector's motivation will be influenced, but with limitation.

#### 24 - Difference-of-convex (DC) Functions offer a Unified Framework for High-dimensional Sparse Estimation

Shanshan Cao, PHD Student, Georgia Institute of Technology,  
500 Tech Parkway, Atlanta, GA, 303320435, United States,  
Xiaoming Huo

Under the linear regression framework, we study the variable selection problem when the underlying parameter is sparse. With difference-of-convex (DC) penalties, which includes most existing non-convex penalties, such as SCAD, MCP, etc, we consider the directional-stationary solutions. We show that under mild conditions, a certain subset of d-stationary solutions have the ideal statistical properties: asymptotic estimation consistency, model selection consistency, and efficiency. This work shows that DC is a nice framework to offer a unified approach to the existing works when non-convex penalty is involved. Our theoretical results bridge the communities of optimization and statistics.

#### 25 - Decentralized Mixed Integer Programming Theory and Application Innetworked Microgrids Planning

Masoud Barati, University of Pittsburgh, Benedum Hall  
3700 O'Hara Street, Pittsburgh, PA, 15261, United States

A method for formulating and solving a networked microgrid planning problem is performed. Several forces are motivating the development of decentralized microgrid operations, including growing interest in decentralized control frameworks. The method extends the alternating direction method of multipliers (ADMM) along with several refinements to mitigate traps in local optimality that result from the nonconvexity of networked microgrid planning. The scalability observed so far suggests that this method is a practical option for use with large networks and may provide a significant benefit for computational speed.

#### 26 - Learning the Best Metaheuristic Parameters Set for Car-passenger Matching Problem in on Demand Mobility Services

Arslan Ali Syed, Bavarian Motor Works, Schroefelhofstr 12,  
Muenchen, 81375, Germany, Klaus Bogenberger

Metaheuristics provide good suboptimal solution to an optimization problem in a reasonable time, but extensive effort is required to select a good set of parameters to obtain reasonable performance. In this work we propose that a neural network could be trained that takes specific features of the problem instance and outputs the best parameters for a specific metaheuristic algorithm. We extract various features for car-passenger matching problem to train a neural network that depending on problem instance returns the best metaheuristic parameters set.

#### 27 - Dynamic Car-passenger Matching Based on Tabu Search Metaheuristics

Marvin Erdmann, PhD, BMW, Munich, Germany

On Demand Mobility is a concept that would lead to an enhanced use of shared mobility services. To avoid a decline of convenience for the costumers my work's focus is the realization of a Metaheuristic which matches requests and vehicles in order to find a near-to-optimal solution for the system.

#### 28 - A Variable Neighbourhood Descent Heuristic for Conformational Search Using a Quantum Annealer

Brad Woods, 1QBit, 4436 Nanaimo St., Vancouver, BC, V5N5J3,  
Canada, Dominic Marchand, Moslem Noori, Gili Rosenberg,  
Austin Roberts

Discovering the low-energy conformations of a molecule is of great interest to computational chemists with potential applications in ab-initio materials design and drug discovery. In this paper, we propose a variable neighbourhood search heuristic for the conformational search problem. Using the structure of the molecule, neighbourhoods are chosen to allow for efficient optimization, and also allowing the application of a quantum annealer for this step of the iteration. The proposed method can adapt to the size and topology of the available quantum annealer chip through careful definition of neighbourhoods, making it scalable with respect to future hardware specifications.

#### 29 - M-estimator for Robust Regression Revisited: Robustness and Tractability Tradeoffs

Ruizhi Zhang, Georgia Institute of Technology, Georgia Institute of Technology, Atlanta, GA, United States

We investigate two important properties of M-estimator, robustness and tractability, in linear regression when the data are contaminated by outliers. Specifically, robustness means the statistical property that the estimator should always be close to the true parameters regardless of the distribution of the outliers, whereas tractability means the computational property that the estimator can be computed efficiently even though the objective function of the M-estimator can be non-convex. By learning the landscape of the empirical risk, we show under mild conditions, many M-estimators enjoy robustness and tractability properties simultaneously when the percentage of outliers is small.

#### 30 - High Dimensional Global Optimization via Optimization of Communicating Low Dimensional Complimentary Subspaces

Logan Michael Mathesen, Arizona State University, 699 S. Mill Ave, Tempe, AZ, 85281, United States, Giulia Pedrielli

Global optimization suffers the curse of dimensionality. High dimensional search is dominated by the assumption of low effective dimensionality, where few dimensions impact function value, with sophisticated algorithms searching for and exploiting a projection, or creating random embeddings.

We avoid assuming low effective dimensionality and high dimensional modeling by optimizing sets of complimentary subspaces (that collectively exhaust the full space). Enabling intelligent information sharing amongst subspace optimizations, guiding one another to new optimal global projection locations.

#### 31 - Multi-attribute Diffusion Models for Cross-sectional Networks

Brennan Antone, Northwestern University, 2145 Sheridan Road,  
Evanston, IL, 60208, United States, Alina Lungescu,  
Noshir Contractor

We propose a statistical model for stochastic diffusion processes involving the simultaneous spread of multiple attributes based on patterns of social connections and interaction frequency. We apply this model to the spread of contraception use in rural Kenya. Our model showed the spread of contraception use was dependent upon the diffusion of different beliefs (attitude towards contraception use, subjective norms, perceived behavioral control) throughout the population, the most influential of which was attitude towards contraception use. We discuss how data-driven optimization, using posterior distributions obtained from our model, can be applied to plan social interventions.

#### 32 - Recent Advances on Solving Generalizations of the Single Item Capacitated Lot-sizing Problem

Kartik G. Kulkarni, Virginia Tech, 1215 J, Progress Street NW,  
Blacksburg, VA, 24060, United States, Manish Bansal

In this talk, we present our recent advances on solving a generalization of the classical single-item economic lot-sizing problem where the total production capacity in each period can be the summation of some binary multiples of several capacity modules of different sizes. We also develop a new algorithm for the lot-sizing problem with piecewise concave production costs and concave holding costs. Finally, we present results of our computational experiments performed on the aforementioned problems.

#### 33 - Different Decompositions in Random Coefficient and Mixed Integer Programming

Kaichen Hsu, National Tsinghua University, No. 101, Section 2,  
Kuang-Fu Road, Hsinchu, Taiwan 30013, R.O.C., Hsinchu, Taiwan

Decompositions are the approach to solving large-scale optimization programs. This approach decomposes the original optimization problem into the master problem and the subproblem. Then the master problem and the subproblem can be solved more efficiently on an iterative basis. We have an original problem which is to estimate a BLP-type random coefficients discrete choice model, a popular utility function used in economics in recent 20 years, formulated as a constrained optimization with mixed integer variables. This study attempts to solve this model more efficiently by various decompositions.

#### 34 - A Trilevel Optimization Model for Resilient Transportation Network Design

Mohammad Rahdar, Assistant Professor, St. Ambrose University,  
Davenport, IA, United States, Lizhi Wang, Guiping Hu

We propose a trilevel optimization model for transportation network design, which improves the resiliency of the network against uncertain disruptions. The middle and bottom levels are the network interdiction problem, in which we identify the worst-case scenario disruptions that could lead to a maximal cost to the transportation system. The top level takes the system perspective, which designs the optimal strategy to expand the existing transportation network so that it confronts the worst-case scenario disruptions in the most resilient manner. We also designed an iterative algorithm to solve the trilevel optimization model.

#### 35 - Optimal Placement of a Small Order in a Diffusive Limit Order Book

Hyoeun Lee, 725 S. Wright St, Champaign, IL, 61820,  
United States, J. Figueroa-Lopez, R. Pasupathy

We study the optimal placement problem of a stock trader who wishes to clear his/her inventory by a predetermined time horizon by using a limit order or a market order. For a diffusive market, we characterize the optimal limit order placement policy and analyze its behavior under different market conditions. In particular, we show that, in the presence of a negative drift, there exists a critical time horizon such that, for any time horizon longer than the critical time horizon, there exists an optimal placement, which, contrary to earlier works, is different from one that is placed infinitesimally close to the best ask, such as the best bid and second best bid. We also propose a simple method to approximate the critical time horizon and the optimal order placement.

#### 36 - Integration of Variable Micro-grid Energy to Attain Carbon Neutral Manufacturing: A Machine Learning Approach

Fei Sun, Texas State University, Austin, TX, 78750, United States,  
Tongdan Jin, Clara Novoa

This study aims to formulate a stochastic model that minimizes one-time investment and operation costs when variable renewable generators and hybrid energy storage systems are integrated into large manufacturing facilities. Various design constraints are considered, including zero carbon footprint, reliability of power supply, and battery state of charge. The objective function is a mixed integer linear programming (MILP) model. The results can provide a reference for the capacity optimization of wind, solar and energy storage systems. The variation of microgrid costs for time of use rate and battery's depth of discharge levels are analyzed as well.

**37 - Research on Baoji'S Titanium Industry Chain Patent Navigation Based on Social Network Analysis Method**

Hongru Yan, Northwestern Polytechnical University, Xi'an China, China

Patent right is the industrial intellectual property right which can best reflect the innovation level of science and technology. This paper collected and retrieved the patent information of Baoji titanium industry from 2012 to 2016 and used patent centrality analysis and patentee centrality analysis to clarify the research highlight of this field and relationship between main patentees. Finally, conclusions and recommendations have been given from 4 aspects, which contains focusing on the downstream development of Baoji titanium industry chain, facilitating the high-end extension of Baoji titanium industry chain and so on.

**38 - Stochastic Corrective Risk-based Optimal Power Flow**

Thanh To, Clemson University, Clemson, SC, 29631, United States

We propose a model that quantifies and controls the total system line overflow caused by contingencies via means of Conditional Value-at-Risk (CVaR) constraint. We then incorporate the wind uncertainty into our model and perform computational experiments.

**39 - A Case Study on Condition-based Maintenance through Machine Learning on Sensor Data**

Bram Steurtewagen, Ghent University, Steenweg Deinze 124a, Nazareth, 9810, Belgium

In the petrochemical industry, we encounter a vast landscape of sensor data that is not being used to its full potential. This data, enabled by the increase in processing power and analytical frameworks over the years, can be utilized to create predictive models and perform root cause analysis where before these domains lacked statistical and numerical input. This case study aims to implement Industry 4.0 standards by leveraging analytical techniques on real sensor data for predicting machinery failures and identifying possible causes of breakdowns. The research shows that this approach can match plant operator instincts while also providing new insights and a more fine-tuned triggering process.

**40 - Optimal Planning of the Joint Placement of Photovoltaic Panels and Green Roofs Under Climate Change Uncertainty**

Mohammad Ramshani, University of Tennessee, Knoxville, TN, 37920, United States, Anahita Khojandi, Xueping Li, Olufemi A. Omitaomu

Photovoltaic (PV) panels directly convert sunlight into electricity; but, sunlight also heats the panels, negatively impacting their efficiency. Green roofs are vegetative layers grown on rooftops, mainly to provide added insulation on the roof to save energy. Green roofs also cool near-surface air temperature. Hence, the joint installation of PV panels and green roofs may potentially lead to higher efficiency of PV panels in certain climates. We develop a two-stage stochastic programming model to optimally place PV panels and green roofs under climate change uncertainty to maximize the overall profit from energy generated and saved.

**41 - Integrating Multimodal Transport into Bioethanol Supply Chain Design Under Supply and Demand Uncertainties**

Yong Shin Park, St. Edward's University, Austin, TX, United States, Yuan Xu

A mixed integer two-stage stochastic optimization model was developed that integrates multimodal transport into the lignocellulosic-based bioethanol supply chain in an uncertain decision environment. The goal was to maximize the expected profit to support strategic and tactical decision planning. A case study based on North Dakota state in the U.S. was tested to explore the potential of multimodal transport for bioethanol supply chain. The model captures the challenges with supplying biomass to a biorefinery and shipping biofuel to demand centers under supply and demand uncertainty. Sensitivity analyses was performed to gain managerial insights on how profit changes due to uncertainties.

**42 - Deviations Between the Chinese and International Gold Price: Role of Fundamentals, Contagion and Financial Shocks**

Zhicheng Liang, HKU, Hong Kong, Hong Kong, Junwei Wang

China has been both the world's largest gold producer and consumer since 2013. With the second largest exchange-traded market in the world, however, China's gold price frequently diverges from international gold price. This study explores the impact of fundamentals, contagion and financial shocks on the price gap using an extended GARCH model. The empirical study shows that the exchange rate of renminbi plays an important role in moving the price gap. The global contagion factors associate more with the level than the volatility of the price gap. For financial shocks, policy shocks do not present significant influence on the price gap, but black swan events do.

**43 - Robust Portfolio Optimization with Options**

Hedieh Ashrafi, Southern Methodist University, EMIS, PO Box 750123, Dallas, TX, 75275-0123, United States, Aurelie Thiele

We consider the problem of maximizing the worst-case return of a portfolio when the manager can invest in stocks as well as European options on those stocks, and the stock returns are modeled using an uncertainty set approach. We present theoretical results regarding the structure of the optimal allocation as well as numerical results comparing our approach to several benchmarks, showing that our approach performs well in practice.

**44 - A Machine Learning Approach to Optimize Risk Prediction and Binary Classification for Medical Diagnosis**

Minmin Zhang, University of Michigan, Ann Arbor, MI, 48105, United States, Zheng Zhang, Brian T. Denton

We present a new continuous optimization model which maximizes the accuracy of classification and prediction respectively in different risk regions. We show that the cost function is continuously differentiable under appropriate parameters. Our proposed model offers improvements over common approaches such as regression and Lasso on the basis of true positive and true negative classification rates and calibration measured by the Brier Score in different risk regions. We illustrate our approach based on real data in the context of medical diagnosis.

**45 - Improving Non-monotonicity Issues in Predicting Survival Probability of Transplant Patients**

Hamidreza Ahady Dolatsara, Auburn University, Auburn, AL, 36830, United States, Fadel Mounir Megahed, Ying-Ju Tessa Chen, Richard Seseck, John Evans, Ashish Gupta

This study describes non-monotonic issues in predicting survival probabilities of transplant patients over a time horizon. Survival estimates of patients receiving heart transplants over a consecutive time horizon are evaluated. Various non-monotonicity issues are first investigated. Isotonic regression is adopted to resolve these issues. Prediction performance of before and after utilizing isotonic regression is finally analyzed.

**45B - Competitive Pricing of Sea and Rail Transport Based on the Selection of Shippers**

WeiDong Dai, School of Transportation and Logistic, Southwest Jiaotong University, Chengdu 611755, Sichuan, China, Chengdu, China

Railway pricing is vital to the development railway. To a certain degree, the partaking rate is determined by price. It is important to establish tariffs reasonably. This essay introduces the factors that customers will consider when choosing means of transportation, and constructs a generalized cost function. Then, we use logit model to determine the market share rate of various means of transport, and we build a game model based on the revenue maximization of various means of transport. Finally, we use Chengdu-European Express Railway and a shipping company as an example to analyze to obtain the equilibrium freight rates and sharing rates of Chengdu-European Express Railway and shipping company.

**46 - Automatic Surrogate Modeling for Complex Engineering Systems**

Reza Alizadeh, University of Oklahoma, Norman, OK, United States

There are three major selection steps in surrogate modeling, including the surrogate type, metrics and test problems. From the critical evaluation of the literature, we identified two main gaps: 1) The multiple surrogate always composed by KRG, RSM and RBNN. No research studied whether there is any other types of multi-surrogate can perform better; 2) Although many comparison works have done, there are no ruled-based knowledge generated to guide others to select a better surrogate model for their problem. Results show that Multi-surrogates has the highest accuracy and robustness. Also, the generated rules are inputs for a knowledge-based platform to make the surrogate modeling process automated.

**47 - Online Learning for Stochastic Game with Risk Preferences**

Wenjie Huang, National University of Singapore, Singapore, Singapore, Pham Viet Hai, William Haskell

In this work, we study the stochastic games considering risk preferences of different players. We show the existence of risk-aware Markov perfect equilibrium and develop a reinforcement learning type algorithm to solve the equilibrium online. Our algorithm is based on solving stochastic saddle-point problem for risk estimation and doing Nash Q-learning for finding the equilibrium. We show that our game model covers wide class of risk measures and we derive the almost sure convergence and computational complexity result for our algorithm.

**48 - Optimization of Preferred Boarding Groups by Markov Chains**

Viacheslav V. Kalashnikov, Professor & Researcher, Tecnologico de Monterrey, (ITESM), Campus Monterrey, Ave Eugenio Garza Sada 2501 Sur, Monterrey, Nuevo Leon, 64849, Mexico, Edgar Camacho-Esparza, Nataliya Kalashnykova, Vladik Kreinovich

Examine a bilevel optimization problem, in which the upper-level is an airline's management governing the price and proportion of preferred boarding passes (PBP) available. Passengers seek the equilibrium at the lower level of the model by maximizing their payoff functions thus generating a Markov chain's transition matrix. The steady-state probabilities of the Markov chain are used at the upper level as the powers of the pertinent classes into which the set of passengers is partitioned. The existence of solutions has been established and simple numerical experiments made. As a result, some practical recommendations concerning the optimal portions of PBPs and their price can be developed.

**49 - An ALNS Algorithm for the Port Scheduling Problem**

Erik Orm Hellsten, DTU, Boulevarden 14, 75, Lyngby, 2800, Denmark

The problem of routing vessels within larger ports was developed together with industry and modelled as a routing open shop problem with additional constraints. High quality solutions, to instances with up to 12 terminals and 30 vessels, were generated using an ALNS algorithm. The problem is strongly NP-hard, and to our knowledge, there exists no previous studies of it.

**50 - Towards Bridging the Gap Between Business Model Innovation and Practice Using Hypergraph Based Modeling**

Mahei Manhai Li, University of Kassel, Pfannkuchstrasse 1, Kassel, 34121, Germany, Sissy-Josefina Ernst, Christoph Peters, Christoph Peters, Jan Marco Leimeister, Jan Marco Leimeister

A hypergraph-based modeling of businesses bridges the gap between business model innovations and its implementation into enterprise solutions. By formalizing resources, actors, activities (processes) and functions into one model, their relationships are clearly defined, while encompassing both the data and processual structure. A database-based graphical tool supports system analysts and decision makers to structure and analyze their business model and corresponding value proposition. This model can thus be used for future implementations.

**51 - The Use of FPGAs for High Performance Discrete Simulation**

Ed Ramsden, Murata Power Solutions, Attleboro, MA, 02703, United States

While discrete-event/discrete-time simulations are normally run on general purpose computers, there are cases in which specialized hardware can be used to increase runtime performance by orders of magnitude. This paper presents an example of such a specialized processor designed around a Field-Programmable Gate Array (FPGA). The processor in this example models passenger boarding of an aircraft.

**52 - Improved Placement of Drinking Water Treatment System Infrastructure to Meet Conflicting System Objectives**

Sara Schwetschenau, Carnegie Mellon University, 129 Baker Hall 5000 Forbes Ave, Pittsburgh, PA, 15213, United States, Jeanne VanBriesen, Jared L. Cohon

Drinking water systems are modified over time to meet changing regulatory and urban requirements. Planning for expensive and long-lived water infrastructure is a complex decision problem. Here, a multi-objective optimization model is combined with a water quality simulation model to evaluate the location and size of drinking water system improvements.

**53 - Understand The Relations of Regional Freight Transport Structure and Carbon Emissions**

Dandan Li, Southwest Jiaotong University, Chengdu, 610031, China, Mi Gan, Mingfei Wang

Aims on comprehensively study the economic and environmental impact of freight structure. In this paper, the economic effect and environmental effect are respectively measured by economic output value per unit freight turnover and carbon emissions per unit freight turnover based on the panel data model. Our results indicate the economic output value per unit turnover, carbon emissions per unit turnover, and carbon emission intensity remarkably varies by transportation modes and regions, point out how to optimize the regional freight structure accordingly.

**54 - Spatialtemporal Evolution and Influencing Factors of Inland Port's Hinterland**

Ronghui Xie, Southwest Jiaotong University, Chengdu, 610031, China, Mi Gan, Qinglan Huang

As the implementation of Belt and Road Initiative, the strategic position of inland port in international trade has been significantly improved. However, few papers can be found exploring the evolution of hinterland of inland port among the previous studies. This paper intends to depict spatial-temporal features to catch space-time evolution that how hinterland's attraction in inland port develops. Furthermore, this paper aims to propound some optimal suggestions to promote regional development in inland areas through analyzing the macroeconomic policies to find crucial factors influencing the evolution of hinterland.

**55 - Evaluation of Regional Logistics Development Level by Multisource Data**

Xinyuan Li, Southwest Jiaotong University, Chengdu, 610031, China, Mi Gan, Fadong zhang

Based on multi-source data, this paper studies the development level of logistics industry and the spatial structure of logistics network in Sichuan Province. At first, factor analysis is used to analyze the economic and trade level, logistics market size, logistics infrastructure construction and information level. Then, based on the data of road freight O2O platform, the spatial distribution of freight resources is presented through data visualization method. Finally, comprehensively analyze the relationship between the logistics competition level of each city and state and the spatial distribution of freight resources.

**56 - Spatiotemporal Distribution Analysis of Carbon Emissions and Energy Efficiency Driving Factors of China Railway Cold Chain Logistics**

Mingfei Wang, Southwest Jiaotong University, Chengdu, 610031, China, Mi Gan, Dandan Li, Qian Zhang

Based on the traditional carbon emissions formula of the transportation industry, this paper designs a carbon emission formula for railway cold chain transportation(RCCT), and calculates the carbon emissions of China's RCCT from the provincial level using the waybill data from 2014 to 2016. Then, the SBM model and TOBIT model are employed to estimate the energy efficiency and the driving factors of energy efficiency of China's RCCT. The results give out a detailed Spatiotemporal Distribution Characteristics of china's RCCT, and show that urbanization level, railway cold chain construction level and industrial structure are positive factors to improve the energy efficiency of RCCT.

**57 - Solving the Rich Train Timetabling Problem with Complex Constraints Model Reformulation for Dual Decomposition**

Yongxiang Zhang, Southwest Jiaotong University, Chengdu, 610031, China, Qiyuan Peng, Xuesong Zhou, Yu Yao

We introduce the rich train timetabling problems (RTTP) that extends the scope of the standard train timetabling problem by incorporating multiple complicating constraints. We develop a modeling framework to prebuild those complex "rich constraints as state transition relationships into a well-structured hyper-network, so that the resulting optimization model can be nicely reformulated as multi-commodity network flow models with capacity constraints. A novel dual decomposition method is adopted to handle the reformulated network flow optimization problem. Numerical experiments are conducted to demonstrate the advantages of the proposed reformulation method and solution algorithms.

**58 - Study on the Government Subsidies and Exit Mechanism for China Railway Express Based on the Tripartite Game**

Qisheng Zhang, Southwest Jiaotong University, Chengdu, China, Yinying Tang, Yang Ge

CHINA RAILWAY Express has an important place and the great prospects in "The Belt and Road Strategy. However, due to the start-up phase, it is now faced with the problem of subsidy for increasing competition. From the perspective of government, the reasonable setting of financial subsidies is considered, through the Tripartite Game between the government, the company and the shipper; On the basis of incentive mechanism design and freight volume forecast, the rational subsidy method and exit plan are studied, in order to achieve sustainable development.

**59 - The Investigation and Analysis on Inter-city Passenger Rail Travel – A Case Study on Chengyu Region from China**

ZiShuai Pang, Southwest Jiaotong University, Chengdu, China, Liwen Wang, Shihang Zhang, Anjun Li, Dian Wang, Qiyuan Peng, Siyu Tao

Based on the intercity rail trip chain survey in Chengyu region in China, several problems has been found in the whole travel, such as long railway waiting time, multi-security checking, inconsistent ticket system, and long transfer distance. The aims are to identify the problems in the inter-city trip chain, and propose corresponding improvements base on scenario analysis. It can achieve the aim that reducing the travel link, saving the intercity rail travel time and gaining economic benefits. The combination scenario 7 could reduce the total travel time by 42.29 minutes, decrease time ratio of inner-city travel to 37.2%, along with economic benefits achieved 30.64 million yuan per year.

**60 - Analysis and Calculation for Subway Network Capacity Base on Simulation**

Feifan Jia, PhD Candidate, Beijing Jiaotong University, Beijing, China, Haiying Li, Xi Jiang, Lingyun Meng

The analysis and calculation of subway network capacity is one of the core issues of network operation. From the perspective of passenger demand and service level, we built a conceptual model of subway network capacity calculation problem. A method to calculate network capacity based on pressure test and simulation experiment was designed. And we studied the problems of service level determination and passenger loading in the algorithm and gave the steps of the algorithm. Taking Beijing subway network for example, the network capacities under different service level in peak hours were calculated. Finally, we analyzed where the bottlenecks of Beijing way network are.

**61 - Study on Optimization of China-EU Regional Supply Organization Based on Spatial Arrangement**

Xuqiang Li, Southwest Jiaotong University, Chengdu, China, YinYing Tang, qisheng zhu

In order to effectively and uniformly integrate the China railway express that have been successively implemented in various regions, this paper uses the method of the division of the traffic zone to divide the supply-state space of each region to a certain extent, and then adopts the method of fuzzy cluster analysis to supply the goods according to the relevant indexes. The district conducts analysis and integration, and analyzes the evolutionary results and impacts after its integration, and finally determines a more reasonable goods organization and the operation plan of railway freight trains. Key words: Traffic Zone; State Space; Fuzzy Cluster; Evolutionary

**62 - Analysis on the Competition Between Inland Ports Under Carbon Emission Constraints**

Qinglan Huang, Southwest Jiaotong University, Chengdu, 610031, China, Mi Gan, Ronghui Xie

With the progress of One Belt And One Road strategy, the construction of inland ports has become more and more popular, and the competition between them has become increasingly fierce. But reducing carbon dioxide emissions is one of the most important tasks of the 21st-century society. Therefore, this paper establishes a Hotlin model to describe the competitive relationship between the two inland ports, then respectively analyze the competition when one port price increasing or both inland ports price increasing under the limitation of the cap and cap-and-trade carbon emissions policy. For enterprises and the government, it also provides a basis for decision-making.

**63 - Data Driven Equilibrium Pricing and Ordering in a Multi Leaders One Follower Game**

Yong Ge Yang, National Tsing Hua University, Phoenix Arizona, Hsin Chu, 30071, Taiwan

This study constructs a multi-leader-one-follower game-theoretic model of supply chain. We consider three roles in a supply chain, which are one supplier, multiple retailers, and aggregate consumer. Retailers will be the leaders. Consumer play as the follower. Leaders keep conjecturing about the demand of followers. Retailers face the uncertain demand. We investigate the Nash equilibrium of the price competition between retailers with pricing and ordering decisions. We embed this game to a data-driven algorithm with censored demand.

**64 - Vertical Information Acquisition and Horizontal Information Sharing Strategy in a Supply Chain**

Jianghua Wu, Renmin University of China, School of Business, Beijing, 100872, China, Fan Jiang

We study the vertical information acquisition and horizontal information sharing strategy in a two-echelon supply chain, which consists of one upstream manufacturer and two downstream retailers. The study shows that retailers have no incentives to share information with manufacturer voluntarily, and we identify conditions under which full information acquisition can be achieved as long as with information acquisition the total supply chain is better off. Moreover, we show that market variation, boundary equilibrium and the competition mode (Cournot or Bertrand) in the downstream play a significant role in determining whether the competing retailers will share information with each other.

**65 - Delivering Big and Bulky Items Quickly**

Melissa Quinton, University of Arkansas, Fayetteville, AR, United States, Olivier Kwizera, Yue Wang, Joseph Geunes, Sarah G. Nurre

One factor influencing the shift from retail store to online shopping is the availability of quick and cheap shipping. Notably, Amazon prime members receive small to medium sized items in 2 days for free. We examine the necessary supply chain design for quickly delivering big and bulky items, such as appliances and furniture. For different big and bulky segments and delivery services, we determine where and how much inventory should be held to enable guaranteed committed delivery times. We present the trade-off analysis between cost and delivery time by geographic region and demand level.

**66 - Conjoint Analysis on the Use of Crowd Sourcing Model in Last Mile Delivery for CEP Services**

Mingwei Guo, North Dakota State University, UGPTI, Fargo, ND, 58105, United States, mingweigu@live.com

Last mile delivery Crowd-sourcing model would effectively improve the efficiency and mitigate the cost for CEP service providers, but actual market response may differ from our numerical results. From a customer perspective, the quality of the delivery service contains not only time and accuracy, but also the overall experience and level of convenience. If hybrid model is to be used by those customers, the quality and satisfaction of the service may be influenced by the change of staff. This study is designed to evaluate and estimate the direct and indirect impact on customer experience if hybrid models/scenarios are utilized by CEP service providers.

**67 - The Conflict Free UGV Routing in an Autonomous Warehouse**

Mona Issabakhsh, University of Miami, South Miami, FL, 33143, United States, Seokgi Lee

High labor manufacturing costs have brought a significant amount of attention to smart robotic warehouse management systems, where tasks are done by autonomous unmanned ground vehicles (UGVs). We present a mathematical UGV routing model with battery recharge schedules, which prevents multiple UGV collisions while minimizing costs of routing and energy consumption.

**68 - How Calculative are Managers when Evaluating Signals: An Empirical Examination of Signaling Theory in Trust Formation in a Supply Chain**

Pook Carson, Associate Professor, Salt Lake Community College, Salt Lake City, UT, 84123, United States

Formal models in the management sciences assume a calculative worldview. We experimentally examine how calculative managers are when trusting a supply chain partner. We distinguish between fully-calculative, non-calculative, and signaling/credibility models. The results show that interpretations are influenced by credibility which overwhelms the effect of history. Partner replaceability decreases trust from credible signals as attributions are made to external market

incentives not type. Participants do not distinguish between costly past behavior and bonds as signals. Managers are calculative, but less forward-looking than strong-form calculative approaches suggest.

**69 - Using Board Game in Supply Chain Management Classes**

Ziping Wang, Morgan State University, Baltimore, MD, United States

This poster discusses the invention of an instructional board game in supply chain management (patent pending). Data from controlled experiments are studied to show the performance of the board game in supply chain management learning.

**70 - Component Procurement and End-product Assembly with Demand and Supply Uncertainty, Using Spreadsheet Based Optimization Models.**

Ramesh Bollapragada, Professor, San Francisco State University, San Francisco, CA, 94132, United States

This paper presents the planning and coordination of component procurement and end-product assembly in a supply chain. Using linear programming models in the framework of Excel spreadsheets, we identify the effect of problem parameters on performance measures such as: inventory, shortage costs, trade-offs involving the total expected costs, the quantity of each component, and end-product to produce in a time horizon. We show through our experimentation that the highest cost drivers are product shortage costs and shared component ordering costs. Further, we show that the component inventory and purchasing decisions are sensitive to lead time increases.

**71 - The Spatial Structure Relative Research Between the Development of Regional Industries and the Logistics Demand in Sichuan Province of China**

Xiaozhen Deng, Southwest Jiaotong University, Chengdu, China, Si Chen, Mi Gan

With the evolution of regional industrial structure, the regional logistics demands generate new industrial correlation characteristics of spatial distribution, which are influenced by the spatial and temporal distribution characteristics of the industries. And those characteristics have important reference value for regional industrial layout and allocation of logistics facilities. With 21 cities as the study area and the three industries and the logistics demands of each cities data as data sources. The methods of spatial auto-correlation and regression analysis are used to do spatial and temporal characteristics correlation analysis between logistics demand and regional Industrial.

**Exhibit Hall Poster Competition  
Monday Poster Competition**

Competition Poster Session

Chair: Neng Fan, University of Arizona, 1127 E. James E. Rogers Way, P. O. Box 210020, Tucson, AZ, 85721, United States

Co-Chair: Junming Yin, University of Arizona, Management Information Systems Department, McClelland Hall, Room 430BB, Tucson, AZ, 85721, United States

Co-Chair: Burcu B. Keskin, University of Alabama, 4138 Meretta Lane, Tuscaloosa, AL, 35406, United States

**1 - IoT and Connected Vehicle Analytics for Intelligent Air Quality Management**

Oleg Gusikhin, Ford Motor Company, Research & Innovation Center, Dearborn, MI, 48121, United States, Omar Makke

Air quality is an increasing concern as urban areas continue to grow. For automotive industry, protecting vehicle occupants from pollution is a critical area of competitive advantage. This work illustrates how advancements in IoT sensors, connected vehicles technology and analytics enable intelligent cabin air quality management and optimized filter maintenance.

**2 - Directed Exploration in PAC Model-free Reinforcement Learning**

Min-hwan Oh, Columbia University, New York, NY, 10027, United States, Garud N. Iyengar

One of the fundamental challenges in Reinforcement learning (RL) is how to balance exploration and exploitation. We study an exploration method for model-free RL that generalizes the counter-based exploration bonus methods and takes into account long term exploratory value of actions rather than a single step look-ahead. We propose a model-free RL method that modifies Delayed Q-learning and utilizes the long-term exploration bonus with provable efficiency. We show that our proposed method finds a near-optimal policy in polynomial time (PAC-MDP), and also provide experimental evidence that our proposed algorithm is an efficient exploration method.

### 3 - Identifying and Visualizing Uncommon Customer Response on Machine Learning

Seung Wan Seo, Korea University, Seoul, Korea, Republic of.,  
Deokseong Seo, Myungjun Jang, Jaeyun Jung, Pilsung Kang

Detecting and visualizing uncommon but notable opinions from a large amount of Voice of Customers (VOC) data, is an important procedure in response to customer complaints. In this study, we propose a framework for identifying uncommon but significant responses and frequently used words in them based on distributed document representation, local outlier factor, and TF-IDF methods. We also propose a result visualization procedure that can provide useful information to vehicle engineers. This uncommon response detection and visualization framework can accelerate the efficiency and effectiveness of a large amount of VOC data analytics.

### 4 - Deep Learning Based Damage Detection on Post-hurricane Satellite Imagery

Quoc Dung Cao, University of Washington, Seattle, WA, 98105-0002, United States

After a hurricane, damage assessment is critical to emergency managers and first responders. To improve the efficiency and accuracy of damage assessment, instead of using windshield survey, we propose to automatically detect damaged buildings using image classification algorithms. The method is applied to the case study of 2017 Hurricane Harvey.

### 5 - A Systematic Architecture Definition Methodology for Engineering Prognostic and Health Management System

Rui Li, Delft University of Technology, Delft, Netherlands,  
Wim J.C. Verhagen, Richard Curran

Prognostics and health management (PHM) has become a crucial research in many engineering fields, enabling fault diagnostics, prognostics remaining useful lifetime and health management. However, the characteristics of PHM architecture methodology have not been dealt with in depth. To fill the gaps, this research defines a systematic architecture definition methodology for engineering a PHM system.

### 6 - Optimal Inventory Distribution Strategy for Relief Supply Considering Information Uncertainty after a Major Disaster

Riki Kawase, Kobe University, Nada, Kobe, Hyogo, Japan

Humanitarian supply chain management plays an important role in addressing major disasters. However, timely supply was impossible because of mismatching of the needs and the bottleneck of the last mile. Now, two types of plans have been proposed: (1) Direct distribution and (2) Kanban system, but no mathematical analysis has been done. Our research conducts mathematical analysis on these empirical proposals. Specifically, we find the optimal strategy of the inventory distribution problem using the optimal control theory. We analyze the optimal control and clarify the effectiveness of proposal (1). Additionally, numerical example shows that updating information can make the system worse.

### 7 - Optimal Switching Sequence for Switched Linear Systems

Zeyang Wu, University of Minnesota, Minneapolis, MN, 55414-2922, United States, Qie He

We study a mixed-integer nonlinear optimization problem. This problem has many applications in operations research and control, yet a moderate-sized instance is challenging to solve to optimality for state-of-the-art optimization software. We propose a simple exact algorithm for this problem. Our algorithm runs in polynomial time when oligo-vertex property, a concept we introduce in this paper for a set of matrices, is satisfied. We derive several sufficient conditions for a set of matrices to have the oligo-vertex property. Numerical results demonstrate the clear advantage of our algorithm in solving large-sized instances of the problem over one state-of-the-art global solver.

### 8 - Integrating Vehicle Routing and Scheduling to Optimize Foster Care Visitations

Caroline M. Johnston, Worcester Polytechnic Institute, Worcester, MA, 01609, United States, Shima Azizi, Katherine Dunphy, Renata Konrad, Andrew C. Trapp

We have partnered with a county in New York State that oversees approximately 100 foster care cases, each requiring the transportation of children to weekly/bi-weekly meetings with biological parents and case workers at an assigned meeting time. The current driver/case worker assignment system is executed manually in a cumbersome manner. We model this problem using combinatorial optimization concepts such as the Dial-A-Ride and team orienteering problems with the goal of maximizing the throughput of cases seen per week. Our goal is to create a decision-support tool to recommend weekly driver/case worker assignments to facilitate this scheduling process, increasing the quality of this system.

### 9 - Virus Spread Over Networks

Philip Pare, University of Illinois at Urbana Champaign, Urbana, IL, 61801, United States, Carolyn Beck, Angelia Nedich, Tamer Basar

Virus models over non-trivial networks are commonly motivated by biological, computer, and human contact networks. Developing spread models over networks that can be analyzed and validated can help develop efficient mitigation techniques. Previous study of spread models has been done, however, learning the spread parameters of such models has not yet been explored, and the models have not been validated by real data. We present several analysis results, employ John Snow's seminal work on cholera epidemics in London in the 1850's to validate a network-dependent susceptible-infected-susceptible (SIS) model, and present a control heuristic for mitigating the spread of an epidemic.

### 10 - The Reliable Facility Location Model Considering Dependent Supporting Structure

Prakash Jamar Kattel, Ohio University, Athens, OH, 45701, United States, Felipe Aros-Vera

This research develops a mathematical optimization-based framework to determine the optimal location of a critical facility in interconnected networks. This is important since the failure of a single facility in a network might produce cascading failures in interdependent Critical infrastructures and produce negative social and economic impacts.

### 11 - Optimization of Food Pantry Locations to Address Food Scarcity in Toledo

Ece Sancı, University of Michigan, Ann Arbor, MI, 48105, United States, Sharanya Chandran, Jie Ma, Emily Morris, Jeremy Pasteris

Food for Thought (FFT) is a nonprofit organization working in downtown Toledo and surrounding areas. FFT works to alleviate food scarcity among food insecure households. In this study, we propose an optimization model to help FFT determine optimal timing and locations for their pantry deployment.

### 12 - Mixed Strategy Nash Equilibrium (NE) for Flight-frequencies Competition in Airlines Market

Chun-Han Wang, National Tsing Hua University, Hsinchu, Taiwan  
Yu-Ching Lee, Yue Dai

In airlines market, each company competes on flight-frequencies and airport time slots to pursue higher profits. We construct equilibrium programming models to compute the exact NE flight-frequencies, including basic model where each airline acts as a player and alliance model where each alliance acts as a player. It is known that there may not exist a pure strategy NE. Therefore, mixed strategy NE is formulated instead. We anticipate to get existence result, expected total profits for each player, and a suggested percentage of code-share flights of each airline within an alliance.

### 13 - Learning and Analysis of Precedence Network Based on Coupon Subset Collection Problem

Xiaotian Xie, University of Illinois at Urbana Champaign, Urbana, IL, 61801, United States, Vincent Hoff, Carolyn Beck

We infer manufacturing precedence relationships using process data, where sequenced subassembly tasks are viewed as nodes, and edges represent precedence constraints between tasks. Given subassembly begin and end times, we identify precedence relationships to analyze differences in planned versus implemented processes. Contributions include inference algorithms and corresponding sample complexity analyses.

### 14 - Niche Centrality and Compression in Competitive Organizational Networks

Brian Aronson, Duke University, Durham, NC, 27705, United States

Organizations compete across many dimensions and at varying intensities, resulting in complex structures of competition. Prior work finds that organizations' survival chances are influenced by population dynamics across broadly-defined organizational niches; however, less is known about patterns of competition within such niches. This paper constructs a new model for studying competitive organizational networks and hypothesizes two structural mechanisms that influence organizations' survival chances: Niche centrality and compression.

### 15 - Equitable Pricing of Episodes of Care in a Cluster-based Bundled Payment System

Bikram Partap Singh, M.S. Candidate, Rochester Institute of Technology, Rochester, NY, 14623, United States, Ruben A. Proaño

This study proposes a systemic approach to simultaneously price multiple episodes of care under a cluster-based bundle payment framework. We present a multi-criteria optimization model that makes highly expensive episodes of care more affordable by reallocating revenue expectations among less expensive clusters of encounters for different episodes of care.

**16 - Evaluation of Primary Care Delivery with E-visits**

Aditya Mahadev Prakash, University of Florida, 473 Weil Hall,  
Gainesville, FL, 32608, United States, Xiang Zhong

E-visit is a messaging service offered by physicians through patient portals. Offering e-visit entails a horizontal substitution of office visits for a segment of patients. A key problem for an institution that provides both services is to optimally allocate resources that improves patients' care-access, profitably. A queuing model with non-homogenous arrival rates is developed. Service capacity regions that improve accessibility and conditions for profitability are identified. Under high traffic, based on patient segmentation, medical institutions can equip their e-visit services with an optimal amount of resources to ensure an economical outcome while providing care to more patients.

**17 - Optimal Integration of Desensitization Protocols into Kidney Paired Donation Programs**

Fatemeh Karami, University of Louisville, Louisville, KY, 40292,  
United States, Mehdi Nayeypour, Monica Gentili, Naoru Koizumi,  
Keith Melancon

Blood type (ABO) incompatibility and antibody to donor human leukocyte antigen (HLA) remain the most significant barriers in transplantation. While pre-transplant desensitization can be administered to overcome such incompatibilities between living donors and their kidney recipients, desensitization alone is likely to fail for those pairs with significant incompatibilities. For these pairs, desensitization can be administered in combination with Kidney Paired Donor (KPD) exchange, the system that allows incompatible pairs to exchange donors with other incompatible pairs to improve donor-recipient compatibilities.

**18 - Spare Parts Estimation Using Cox Modeling**

Alejandro Najera-Acosta, Graduate Student, New Mexico State  
University, Las Cruces, NM, 88001, United States, Delia J. Valles-  
Rosales

In a competitive production environment, only those companies that consider all aspects of processes or systems performance remain competitive. Management of spare components is a key feature for the performance of maintenance activities. Spare parts constitute an essential element in all industries, they are designed for a specific use, its useful life is random, and its propagation is difficult to determine. Therefore, spare parts inventories are established to allow rapid replacement of failed parts and ensure a continuity of the operations. An approach through Cox Model is proposed for its estimation to improve accuracy in the inventory management of spare parts.

**19 - Optimal Placement of Actuators for Composite Fuselage Shape Control**

Juan Du, Peking University, College of Engineering, Beijing,  
100871, China, Xiaowei Yue, Jeffrey H. Hunt, Jianjun Shi

Actuator placement is critical and challenging for shape control due to dimensional variabilities of composite fuselages. Current practice is non-optimal and low efficient. We propose an optimal actuator placement methodology for efficient composite fuselage shape control by developing a sparse learning model and corresponding estimation algorithm. The case study shows that our proposed method achieves the optimal actuator placement for shape adjustments of the composite fuselage.

**Computationally Tractable Methods for Stochastic Optimization**

Sponsored: Optimization/Optimization Under Uncertainty

Sponsored Session

Chair: Sarah M. Ryan, Iowa State University, Ames, IA, 50011-2164,  
United States

**1 - New Approaches for Solving Two-stage Stochastic Mixed-integer Programs with Continuous Recourse**

Siavash Tabrizian, Southern Methodist University, Dallas, TX,  
75206, United States, Harsha Gangammanavar, Halit Uster

In this talk we present enhancements to the L-shaped method to solve large-scale two-stage stochastic mixed-integer programs with continuous recourse. We apply sampling techniques within optimization to achieve computational improvement. We demonstrate these results on classical problems in the literature.

**2 - Robust Optimization for Linear Gaussian Processes**

Georgios Kotsalis, ISyE Ga Tech, Atlanta, GA, 30309-5413,  
United States, Guanghui Lan

We provide a computationally tractable procedure of affine policies for the constrained multistage robust optimization problem as it pertains to linear models that are subject to quadratic constraints, while being affected by uncertain

external disturbances and Gaussian noise. We derive our results under the general assumption that the external disturbances lie within some nominal range expressed as the intersection of ellipsoids centered at the origin. A particular class of problems that falls under the scope of our investigations are mass-transportation problems requiring the optimal steering of a linear stochastic system to a finite probability distribution.

**3 - Observational Data-Based Quality Assessment of Scenario Generation for Stochastic Programs**

Sarah M. Ryan, Iowa State University, 3004 Black Engineering,  
Industrial & Manufacturing Systems Eng, Ames, IA, 50011-2164,  
United States, Didem Sari Ay

The quality of stochastic program solutions depends on the quality of scenarios employed to obtain them. Given a set of historical instances, an appealing way to assess scenario generation is to conduct a backtest of the scenario generation and solution procedure, in which the cost of the optimized first-stage solution is assessed using the observed values of the uncertain parameters. Such a study may be very demanding computationally. We propose alternative approaches using past instances that do not require solving deterministic equivalents. Instead, we assess the quality of scenario sets by applying reliability metrics to the optimal costs of single-scenario subproblems.

North Bldg 121B

**Robust Optimization**

Sponsored: Optimization/Optimization Under Uncertainty

Sponsored Session

Chair: Michael R. Wagner, University of Washington, Seattle, WA,  
98195, United States

**1 - Robust Monitoring on Social Networks with a Application to Suicide Prevention**

Aida Rahmattalabi, University of Southern California, Los Angeles,  
CA, United States

We consider the problem of selecting "gatekeepers," with uncertain availabilities, to train as monitors capable of recognizing warning signs of suicide among their peers in a social network. We formulate the problem as a two-stage robust optimization problem that aims to maximize the worst-case number of covered nodes. We propose a practically tractable approximation scheme based on the K-adaptability idea. We demonstrate the effectiveness of our proposed approach on various network instances. In particular, we perform a case study on a real social network of college students. Finally, we illustrate how our solution can be used to inform gatekeeper training on college campuses.

**2 - Pricing Service Level Guarantees in Cloud Computing**

Chaithanya Bandi, Kellogg School of Management, Northwestern  
University, 2211 Campus Dr, Room 4169, Evanston, IL, 60208,  
United States

We consider the problem of pricing service level agreements in Cloud computing systems. We leverage tools from Robust Queueing theory and multi-stage optimization to compute the prices.

**3 - A Robust Multi-period Newsvendor Model with Inventory Balance Constraints**

Saumya Sinha, University of Washington, Box 353925, University  
of Washington, Seattle, WA, 98195, United States,  
Michael R. Wagner, Archis Ghatge

We present a robust newsvendor model that accounts for revenue in addition to the various cost parameters, thereby leading to a profit maximization problem under inventory balance constraints. We provide closed-form expressions for the optimal order quantities. This calls for the solution of the so-called inner problems, which are also solved analytically for a large class of commonly occurring uncertainty sets.

**4 - A Robust Optimization Approach to Crowdsourcing Last-mile Deliveries**

Soraya Fatehi, University of Washington, Michael G. Foster School  
of Business, University of Washington, 358 Mackenzie Hall,  
Seattle, WA, 98195-3200, United States

We propose and analyze a robust optimization model for crowdsourcing last-mile deliveries via independent drivers. In this context, our model minimizes the worst-case delivery cost of a firm, subject to delivering all customer orders on-time, with high probability. We derive the optimal proportion of packages to assign to the crowd, the optimal number of packages per driver, the optimal crowdsourced delivery area, and the optimal crowd workforce. We show that, if the crowd-delivery system is designed optimally, then the firm can significantly benefit from crowdsourcing last-mile deliveries, especially for fast same-day deliveries.

### Innovation Contests

Sponsored: Technology, Innovation Management & Entrepreneurship

Sponsored Session

Chair: Ersin Korpeoglu, University College London, London, E14 5AA, United Kingdom

#### 1 - Parallel Innovation Contests

C Gizem Korpeoglu, University College London, Gower Street, London, WC1E 6BT, United Kingdom, Ersin Korpeoglu, Isa Emin Hafalir

We study innovation contests where multiple organizers seek solutions from agents, and the quality of an agent's solution depends on her effort and uncertainty. We find that when uncertainty is sufficiently large, organizers benefit from agents' entry to multiple contests. An organizer's profit is unimodal in the number of contests, and the optimal number of contests increases with uncertainty. Thus, practitioners who seek innovative (resp., low-novelty) solutions may benefit from running multiple parallel contests and from encouraging (resp., discouraging) agents' entry to multiple contests.

#### 2 - Dueling Crowdsourcing Contests

Konstantinos Stouras, University of Virginia, The Darden School, 100 Darden Boulevard, Charlottesville, VA, 22903, United States, Sanjiv Erat, Kenneth Lichtendahl

Solvers' participation and effort decisions in a contest are not only affected by its design, but they also depend on the design of any competing contests that run in parallel. We provide a theoretical analysis of the equilibrium budget allocation in a game played among competing innovation contests.

#### 3 - When to Involve Inhouse Suppliers in Procurement Contests

Zhi Chen, INSEAD, 1 Ayer Rajah Avenue, Singapore, Singapore, Jochen Schlapp, Jurgen Mihm

In many purchasing projects, suppliers compete by performing some custom product or technology development regardless of whether they win the project or not. In practice, two competition structures are observed in such procurement contests: (i) all participants are external suppliers; or (ii) one of the suppliers is (partially) owned by the buyer (e.g., through a joint venture). In this study, we analyze when either of these structures is optimal for a buyer seeking a custom innovation.

#### 4 - Optimal Duration of Innovation Contests

Ersin Korpeoglu, University College London, 1 Canada Square, London, E14 5AA, United Kingdom, C. Gizem Korpeoglu, Sidika Tunc

We study optimal duration and award scheme of an innovation contest where an organizer elicits innovative solutions from agents. Each agent exerts costly effort to improve her solution and faces an output uncertainty. We find that optimal contest duration may increase with novelty and sophistication of solutions that organizer seeks. We show that an organizer with moderate or high urgency in obtaining solutions may adopt winner-take-all award scheme, while an organizer with low urgency may give multiple awards. This may explain why many contests on platforms give multiple awards. Consistent with empirical evidence, we show that optimal duration and optimal total award are positively correlated.

### Joint Session Integer Programming/OR Frontiers: Machine Learning and Discrete Optimization III

Sponsored: Optimization/Integer and Discrete Optimization

Sponsored Session

Chair: Sebastian Pokutta, Georgia Institute of Technology, Atlanta, GA, 30332-0205, United States

Co-Chair: Alfredo Torricco, Georgia Institute of Technology, Atlanta, GA, United States

#### 1 - Distributionally Robust Submodular Maximization

Matthew Staib, MIT, Bryan Wilder, Stefanie Jegelka

Submodular functions have wide applications, but we often lack direct access to the underlying function  $f$ . We focus on stochastic functions given as an expectation of functions over a distribution  $P$ . In practice, we have only finite samples  $f_i$  from  $P$ . The standard approach indirectly optimizes  $f$  by maximizing  $\sum f_i$ , ignoring generalization to  $P$ . We achieve better performance on the true function  $f$  by showing how to perform distributionally robust optimization (DRO) for submodular functions. We give efficient algorithms backed by theoretical guarantees that leverage new contributions to DRO. Our empirical evidence shows DRO improves generalization to the unknown stochastic submodular function.

#### 2 - The Benefits of Stochastic Proximal Steps

Sebastien Martin, Massachusetts Institute of Technology, Cambridge, MA, 02139, United States, Patrick Jaillet, Dimitris Bertsimas

The stochastic proximal point algorithm for convex optimization is an alternative to stochastic gradient steps that solves a convex optimization problem at each step instead of simply computing a gradient. We investigate in this work the type of optimization problems for which this algorithm is competitive with stochastic gradient descent, with a focus on the tractability of applications in machine learning. In particular, we study the impact of mini-batching and of proximal step approximations.

#### 3 - The Online Saddle Point Problem with Applications to Constrained Online Convex Optimization

Adrian Rivera, Georgia Institute of Technology, Atlanta, GA, United States, He Wang, Huan Xu

Online Convex Optimization (OCO) is a very powerful framework for sequential decision making with plenty of applications in optimization, game theory and machine learning. We generalize the framework of OCO in two ways. First, we explicitly introduce another player into the setting by considering convex-concave games, the goal of the players is to find a sequence of actions such that they are both guaranteed performance close to that of the Nash equilibrium of the sum of the games. We provide an algorithm to solve this problem. Second, we demonstrate the algorithm can be used to solve a variant of OCO where the decisions a player has made in the past affect what it can do now.

#### 4 - Learning Combinatorial Optimization Algorithms Over Graphs

Elias B. Khalil, Georgia Tech, 1062 Hemphill Avenue NW, Atlanta, GA, 30318, United States, Hanjun Dai, Yuyu Zhang, Bistra Dilkina, Le Song

The design of good heuristics for NP-hard combinatorial problems often requires significant specialized knowledge and trial-and-error. Can we automate this challenging, tedious process, and learn the algorithms instead? In many real-world applications, the same optimization problem is solved on a regular basis, with only slight changes in the data. We propose a unique combination of reinforcement learning and graph embedding to address this challenge. The learned greedy policy behaves like a meta-algorithm that incrementally constructs a solution. Our framework is versatile and has been successfully used to solve instances from Minimum Vertex Cover, Max Cut and Traveling Salesman problems.

### Conic Optimization in Machine Learning II

Sponsored: Optimization/Linear and Conic Optimization

Sponsored Session

Chair: Somayeh Moazeni, Stevens Institute of Technology, Hoboken, NJ, 07030, United States

#### 1 - Conic Optimization in Sequential Learning

Somayeh Moazeni, Stevens Institute of Technology, Babbio Center, 1 Castle Point Terrace on Hudson, Hoboken, NJ, 07030, United States

Sequential optimal learning is a sequential decision problem with an exploration-exploitation trade-off. Building on dynamic Bayesian learning and given a learning budget, the procedure identifies effective design elements. This talk discusses conic optimization approaches to solve this problem under a general class of response models with point processes. We show that this optimization problem can be solved by a sequence of linear optimization problems. This approximation is capable to offer close to optimal solutions and significantly reduces the computational time for high-dimensional feature spaces.

#### 2 - Maximizing the Probability of an Arrival Count in Point-process Intensity Control

Boris Defourny, Lehigh University, Industrial and Systems Engineering, 200 W. Packer Ave, Bethlehem, PA, 18015, United States

We consider the maximization of the probability of attaining a prescribed count of arrivals generated by a point process, by controlling its intensity. We show that the optimal intensity control law has switching times that are affine in the arrival count, and find closed-form expressions for the policy parameters.

### 3 - Non-convex Sparse Sample Average Approximations: Properties of D-stationary Solutions

Miju Ahn, Southern Methodist University, Dallas, TX, United States

In sparse learning, sample average approximation involving non-convex sparsity functions is a method that is widely used in practice. We introduce a unified difference-of-convex formulation and study properties of the directional stationary solutions. The solution kind is compared to a vector which is possibly the global optimum of an underlying expectation minimization problem. We provide a bound for the distance between the two solutions, a bound on the difference between their model outcomes, and a result showing inclusion relationships among their support sets.

### Joint Session OPT/Practice Curated: Pyomo: Recent Developments and Applications

Sponsored: Optimization/Computational Optimization and Software Sponsored Session

Chair: John Sirola, Sandia National Laboratories, Albuquerque, NM, 87185, United States

#### 1 - Pyomo.GDP: An Integrated Ecosystem for Generalized Disjunctive Programming Modeling and Optimization

Qi Chen, Carnegie Mellon University, 5000 Forbes Avenue, Department of Chemical Engineering, Pittsburgh, PA, 15213, United States, David Bernal, John Sirola, Ignacio E. Grossmann

In this work, we present new capabilities in Pyomo.GDP. Generalized Disjunctive Programs (GDPs) allow high-level description of optimization problems involving both discrete and continuous decision variables. For difficult problems, we must move beyond classical reformulation approaches. Pyomo.GDP offers automated application of advanced techniques such as disjunctive “basic steps and procedural reformulations. We also introduce a new direct solver for Pyomo.GDP models, GDPopt, which implements the logic-based outer approximation decomposition algorithm. We demonstrate the application of these tools on a set of GDP test problems.

#### 2 - Pyomo.dae: A Framework for Modeling and Solving Dynamic Optimization Problems

Bethany Nicholson, Sandia National Laboratories, P.O. Box 5800, MS 1326, Albuquerque, NM, 87185, United States, John Sirola

Dynamic optimization problems include differential equations as constraints. These problems can be tough to implement and solve because they must be reformulated before being sent to standard optimization solvers. Pyomo.dae is a Pyomo extension for representing differential equations in an optimization modeling context. It includes implementations of several discretization schemes that will automatically convert differential equations to algebraic equations, making the model compatible with generic optimization solvers. In this talk we describe the capabilities of Pyomo.dae and demonstrate the concise model implementations of several complex dynamic optimization problems.

#### 3 - The IDAES Framework: Process Modeling and Optimization in Pyomo

John Sirola, Sandia National Laboratories, P.O. Box 5800, MS 1326, Albuquerque, NM, 87185, Qi Chen, Ignacio E. Grossmann

A cornerstone of the Institute for the Design of Advanced Energy Systems (IDAES) is a modeling and algorithmic framework that addresses the capability gap between state-of-the-art process simulators and general-purpose algebraic modeling languages. The framework, built on Pyomo, provides an extensible process modeling environment that supports optimization-based synthesis, design, control, and uncertainty quantification. This presentation will show how Pyomo was extended into the PSE domain and highlight several case studies.

#### 4 - Mixed-integer Nonlinear Decomposition Toolbox for Pyomo (MindtPy)

David E. Bernal, Carnegie Mellon University, 5000 Forbes Ave., Pittsburgh, PA, 15213, United States, Felicity Gong, Qi Chen, Ignacio E. Grossmann

This work describes a software toolbox developed in Pyomo, a modeling and optimization application in Python, where decomposition methods for solving mixed-integer nonlinear programs (MINLP) are implemented. Decomposition methods for MINLP rely on the iterative solution of mixed-integer linear programs and nonlinear programming; which have had a steady and considerable improvement in the last years. Several decomposition methods, together with recent algorithmic improvements such as primal heuristics and quadratic cuts, are available in MindtPy. We illustrate the application of this toolbox on a set of convex MINLP problems of varying sizes and degrees of difficulty.

### Modeling, Optimizing, and Controlling Interdependent Networks

Sponsored: Optimization/Network Optimization Sponsored Session

Chair: Andres D. Gonzalez, PhD, University of Oklahoma, 202 Boyd St, Room 116b, Norman, OK, 73019, United States

#### 1 - Bayesian Hierarchical Models for Decentralized Decision-making across Interdependent Network Restoration

Hesam Talebiyan, Rice University, 6100 Main Street, MS-318, Houston, TX, 77005, United States, Leonardo Duenas-Orsorio

We propose tractable algorithms and models offering probabilistic decentralization for the realistic decision-making processes guiding the restoration of interdependent networks. We explore Bayesian Hierarchical (BH) models to embed the decision-makers’ judgment calls that guide a formal D-INDP formulation. We demonstrate our models with idealistic as well as real-world interdependent networks.

#### 2 - A Probabilistic Network Flow Approach to the Resilience Analysis of Interdependent Infrastructure Systems

Jin-Zhu Yu, Vanderbilt University, Nashville, TN, United States, Hiba Baroud

Resilience models of interdependent infrastructure systems often consider static interdependent linkages across systems, ignoring their dynamic nature and corresponding uncertainty. This study proposes a probabilistic network flow-based approach to modelling the resilience of interdependent infrastructures systems under epistemic uncertainty due to the lack of data on historical events, systems properties, and social factors. The proposed approach is illustrated using a case study of the water and power distribution systems serving Shelby County in Tennessee.

#### 3 - A Compositional Approach for Modeling and Control of Layered Networks

Siavash Alemzadeh, University of Washington, Seattle, WA, United States, Mehran Mesbahi

The analysis of large-scale networks often require the availability of models for the interactions amongst network agents. However, characterizing accurate real-world models of these interactions pose challenges due to inherent complexities. For certain classes of networks, the layering structure allows a compositional approach for modeling. We present a factorization methodology to find mathematical models and determine performance guarantees on layered networks with model uncertainties. This is viable either with the knowledge of the system parameters or through a data-driven process. Examples are provided to verify the presented methodology on modeling real-world problems.

#### 4 - Optimum Evacuation Flows during Probabilistic Network Events

Pitu B. Mirchandani, Arizona State University, School of Computing, Informatics and, Decision System, Tempe, AZ, 85287, Gita Ketut

During catastrophic events, established infrastructures are often damaged and networks become decapitated temporally and spatially. The impacts of cascading disconnectivity, particularly in transportation network, affect the performance of the other connected networks as their operations rely upon the current state of the transportation network. We propose a network flow optimization model for a spatial-temporal damaged network to determine the optimal evacuation flow from multiple origins to multiple destinations competing over the same capacitated network.

### Joint Session OPT/Practice Curated: Network Optimization in Power Systems

Sponsored: Optimization/Network Optimization

Sponsored Session

Chair: Adolfo Raphael Escobedo, Arizona State University, Tempe, AZ, 85287-8809

#### 1 - Optimal Portfolio of Power Flow Control Technologies: Topology and Impedance Control

Mostafa Sahraei-Ardakani, University of Utah, 50 South Central Campus Drive, #2110 Merrill Engineering Building, Salt Lake City, UT, 84112, United States

High congestion costs demand for more efficient utilization of the transmission system. Topology and impedance control are two technologies that enable such efficiency gains, through controlling the power flows. As the system operators begin to utilize these tools, it is essential to understand the interdependence between them. This talk presents simulation results that suggest a strong interdependence between topology and impedance control. It is, thus, essential to acknowledge this interdependence, both at the planning and operation stage. Failure to do so will lead to economic inefficiencies that can be avoided through appropriate co-optimization.

#### 2 - Strategic Behavior of Self-scheduling Distributed Energy Resources in Energy and Reserve Co-optimizing Markets

Fatma Selin Yanikara, Boston University, 15 St Marys Street, Room 140, Boston, MA, 02215, United States, Michael C. Caramanis

We study the participation of distribution network connected, self-scheduling Distributed Energy Resources (DERs), such as EVs and wind farms, in energy and reserve markets. Important issues that arise when DERs self-schedule are existence and uniqueness of equilibrium, and strategic behavior. We study the distributed market clearing with self-scheduling DERs in game theory context and characterize the Nash equilibrium under various information availability cases: DERs are either (i) price takers or (ii) have access to local information and can explicitly calculate locational prices. Information aware DERs engage in a Nash game since they know how their own and others' actions impact prices.

#### 3 - Spatiotemporal Marginal Costs in Optimal Operational Planning of Distribution Networks

Panagiotis Andrianesis, Boston University, Boston, MA, United States, Michael C. Caramanis

The rapid growth of Distributed Energy Resources (DERs) presents a major challenge together with a still unexploited opportunity for a radical transformation of the distribution grid. We employ a distribution grid representation that captures the salient features and costs of distribution assets, as well as the complex DER preferences and capabilities, and enables the discovery of short-term dynamic locational marginal costs. We discuss the inherent difficulties of the operational planning optimization problem, and we present results from actual distribution feeders.

#### 4 - Bus-angle Difference Valid Inequalities and Algorithms for DC Power Transmission Expansion Planning

Kyle Skolfield, Arizona State University, Phoenix, AZ, United States, Laura M. Escobar, Adolfo Raphael Escobedo, Ruben Romero

To meet rising demand for electricity under limited budgets, it is necessary to determine the best Transmission Expansion Planning strategies. This problem can be modeled as a large-scale MIP whose solution is intractable. To enable efficient search of the solution space, we derive a class of angular valid inequalities (AVIs) to be incorporated as cutting planes in the root node of the branch-and-bound tree. We design a data-driven scheme guided by solutions to various relaxation models to select the most effective AVIs. We test this scheme's effectiveness via benchmark instances.

## ■ MC09

### Methods for Large Scale Nonlinear and Stochastic Optimization I

Sponsored: Optimization/Nonlinear Programming

Sponsored Session

Chair: Albert Solomon Berahas, Evanston, IL, 60208, United States

Co-Chair: Francisco Jara-Moroni, Northwestern University, Evanston, IL, 60208, United States

#### 1 - Gauss-newton Methods for Deep Neural Networks

Yi Ren, Columbia University, 331 Mudd Bldg, I. E.O.R. Department, New York, NY, 10027-6699, United States,

Donald Goldfarb

We present several practical Gauss-Newton (Levenberg-Marquardt) methods for solving nonconvex optimization problems that arise in training deep neural networks involving enormous numbers of variables. Numerical results are presented to demonstrate the effectiveness of our proposed methods.

#### 2 - Atomic SGD: Communication-efficient Learning via Atomic Sparsification

Zachary Charles, UW-Madison, 1415 Engineering Drive, Madison, WI, 53703, United States, Dimitris Papailiopoulos

Distributed implementations of mini-batch SGD are often beset by communication bottlenecks attributed to the large gradients that are communicated between compute nodes. One possible remedy is to sparsify these gradients. We show that such a sparsification can be applied to any atomic decomposition of the gradient, e.g., element-wise, spectral-wise, etc. Given a sparsity budget, we find a closed-form expression for the sparsification scheme that minimizes variance, which controls convergence. We show that methods like QSGD and TernGrad are special cases of our method, and argue that spectral sparsification of gradients can lead to significantly less communication costs compared to QSGD.

#### 3 - Analysis of Scaled Memoryless BFGS on a Class of Nonsmooth Convex Functions

Azam Asl, 251 Mercer St., New York, NY, 10012, United States, Michael Overton

L-BFGS can be used with or without "scaling"; the use of scaling is normally recommended. In this paper we analyze L-BFGS with one update with scaling on the nonsmooth function,  $f(x) = \alpha \sqrt[n]{\sum_{i=1}^n x_i^2} + \sum_{i=2}^n x_i^2$ , in the limit the the absolute value of the normalized search direction generated by this method converges to a constant vector, and if  $\alpha$  is larger than a quantity dependent only on the Armijo parameter, then the iterates converge to a non-optimal point  $\bar{x}$  with  $\bar{x}^T \nabla f(\bar{x}) = 0$ , although  $f$  is unbounded below.

#### 4 - A Stochastic Trust Region Method

Rui Shi, Lehigh University, Bethlehem, PA, United States

In this talk, we present a new stochastic trust region method, deemed TRish, for solving stochastic and finite-sum minimization problems. We motivate our approach by illustrating how it can be derived from a trust region methodology. However, we also illustrate how a direct adaptation of a trust region methodology might fail to lead to general convergence guarantees. Hence, our approach involves a modified update scheme, which we prove possesses convergence guarantees that are similar to those for a traditional stochastic gradient (SG) method. We also present numerical results showing that TRish can outperform SG when solving convex and nonconvex machine learning test problems.

## ■ MC10

### Online Platforms and Operations Management

Sponsored: Manufacturing & Service Oper Mgmt

Sponsored Session

Chair: Eunae Yoo, University of Tennessee, 5416 W Cindy Place, Tempe, AZ, 85226, United States

#### 1 - The Wisdom of Crowds in Operations: Forecasting using Prediction Markets

Ruomeng Cui, Emory University, 1935 Ridgmont Lane, Decatur, GA, 30033, United States, Achal Bassamboo, Antonio Moreno

Prediction is challenging when historical information is not available, such as forecasting demand of a new product. One approach that can be applied in such situations is to crowdsource opinions from employees and the public. We focus on a widely-adopted class of crowd-based forecasting tools—prediction markets. These are virtual markets created to aggregate crowds' opinions and operate in a way similar to stock markets. We partnered with Cultivate Labs. Using information extracted from employees and public crowds, we show that prediction markets produce well-calibrated forecasting results. In addition, we run several field experiments to study the conditions under which groups work well.

#### 2 - Managing Service Systems in Presence of Social Networks

Gad Allon, University of Pennsylvania, 3730 Walnut Street, Philadelphia, PA, 19104, United States, Dennis Zhang

We study a service system with the presence of a social network. In our model, firms can differentiate resource allocations among customers, and customers learn the service qualities from the social network. We study the interplay among network structure, customer characteristics, and information structure, and characterize the optimal policy. We further calibrate our model with data from Yelp.com and quantify the value of social network knowledge empirically.

### 3 - Social Media for Disaster Management: A Study of Hurricane Sandy

Lu Yan, Indiana University, 1309 E. 10th St, Bu 570c,  
Bloomington, IN, 47401, United States, Alfonso Pedraza Martinez

In this research, we use Facebook data from five benchmark organizations that responded to Hurricane Sandy, 2012 and study the social conversation between relief organizations and social media users at different disaster stages. By analyzing all the organizations' posts and users' comments, we find that informational support is most effective during disaster response. Yet, there is a mismatch between the actionable information that organizations post and the one that users are interested in. Thus, besides posting actionable information directed to the victims, organizations should post more information targeting potential donors and volunteers.

### 4 - Predicting Drug Recalls using Social Media Data

Hyunwoo Park, The Ohio State University, 2100 Neil Ave, 632  
Fisher Hall, Columbus, OH, 43210, United States, George Ball,  
Hessam Bavafa, Christian Blanco

Pharmaceutical quality is a topic of chief concern, and regulators are tasked with reviewing data on an ongoing basis so they can issue recalls when problems are identified. Given the potential harms at stake, there is great interest in improving the algorithms by which quality issues are identified. In our paper, we use a big data approach using text analysis of social media data to predict drug quality risks, i.e., the likelihood of drug recalls. Our approach leverages sentiment analysis combined with reviewer characteristics to show how social media data can aid quality management.

### 5 - Scalability of Follower Bases on Social Media Platforms for Humanitarian Operations

Eunae Yoo, University of Tennessee, Knoxville, TN, United States,  
Elliot Rabinovich, Bin Gu

For humanitarian organizations, increasing the scale of their follower bases on social media platforms is important to efficiently distribute information. With more followers, organizations can directly reach more users and communicate with a larger audience. Our study evaluates the drivers of the expansion of humanitarian organizations' follower bases in times of normalcy and emergency. We formulate a structural model to examine when users decide to follow an organization and estimate the model using Twitter data from before and after a recent earthquake. Among our results, we find that the type of content and the frequency of content release affect users' decisions to follow humanitarians.

## ■ MC11

North Bldg 125B

### Joint Session MSOM/Practice Curated: Empirical Studies in Operations

Sponsored: Manufacturing & Service Oper Mgmt/IFORM

Sponsored Session

Chair: William Schmidt, Cornell University, Ithaca, NY, 14850, United States

#### 1 - Supply Networks: Does Industry Matter

Manpreet Singh Hora, Georgia Institute of Technology, Scheller  
College of Business, 800 West Peachtree Steet NW, Atlanta, GA,  
30308, United States, Marcus Bellamy, Soumen Ghosh

We demonstrate differences in supply networks of focal firms in three different industries. In this study, we highlight the extent to which the industry context plays in terms of the network structural characteristics and firm performance, where the characteristics of an average representative firm in each industry vary considerably.

#### 2 - Global Supply Chains and Cross-border Financing

Jing Wu, City University of Hong Kong, Department of  
Management Sciences, Rm 7-233, Lau Ming Wai Academic  
Building, Hong Kong, Hong Kong, Yu Zhang

Financial globalization is still far from complete four decades after the end of the Bretton Woods System largely due to transaction costs and informational frictions. In this study, we ask if global supply-chain relationships help firms access cross-border financing in the international capital markets. Comparing two firms that are otherwise similar, we observe the firm that has formed global supply-chain relationship(s) to have more cross-border financing after the supply chain formation. This result is supported empirically by all major financing vehicles, including stock cross-listing, bond issuance, bank loans, and M&A deals.

### 3 - Discrimination in Global Sourcing: Field Experiments on Alibaba

Ruomeng Cui, Emory University, 1935 Ridgmont Lane, Decatur,  
GA, 30033, United States, Jingyun Li, Meng Li, lili Yu

Past research has found discrimination in Business-to-Customer online marketplaces. However, there has been little study on suppliers' discrimination behavior on B2B platforms in the context of global sourcing. We investigate whether price and racial discrimination of suppliers against retailers exists in B2B marketplaces across countries. We conducted two field experiments on Alibaba.com, one of the largest global procurement platforms in the world. Further, we investigate the mechanism behind and explore negotiation tactics to mitigate discrimination.

### 4 - Demand Volatility in Supply Chain Networks

William Schmidt, Cornell University, 314 Sage Hall, Ithaca, NY,  
14850, United States, Nikolay Osadchiy, Jing Wu

Demand volatility can adversely impact the firm's ability to match its supply with its demand, resulting in higher operational costs. As demand propagates upstream in a supply chain, its volatility can be amplified due to the bullwhip effect. We empirically examine this phenomenon in the context of a supply chain network and shed light on how firms may strategically mitigate its consequences.

### Analytics for Food Safety in Global Supply Chains

Sponsored: Manufacturing & Service Oper Mgmt

Sponsored Session

Chair: Yanchong Zheng, Massachusetts Institute of Technology,  
Cambridge, MA, 02139, United States

#### 1 - Contextualizing Food Safety in China with Respect to the Supply Chain

Nicholas J. Renegar, Massachusetts Institute of Technology,  
Cambridge, MA, 02139, United States

We consider the problem of food safety from the regulator's perspective. What risk drivers lead to adulteration in food, and how should regulators determine which companies to test? We hypothesize that thinking of companies in terms of the agricultural supply chain can help to 1) identify the risky layers in the supply chain, and 2) identify the risky companies. Working with a large database of food safety tests collected from the Chinese FDA websites, we find supporting evidence for how this approach can help regulators, and we also find evidence that this approach is not currently being used in creating regulatory policy.

#### 2 - Systemic Risk Management of Food Supply Chains

Qi Yang, Massachusetts Institute of Technology, Cambridge, MA,  
United States

Due to China's dispersed agricultural supply chain, regulatory agencies have complicated decisions with regard to the focus of their testing. Some examples include how to allocate resources, and how to coordinate between the various regulatory agencies. Using data collected on China FDA food safety tests, along with data describing the farms and wholesale markets in Zhejiang, we used supply chain analytics to explore these questions. Our work with this data has already yielded several insights to identify key risk drivers in the supply chain and to determine the optimal allocation of testing resources.

#### 3 - Governance and Quality Control in China

Yanchong Zheng, Massachusetts Institute of Technology, Sloan  
School of Management, 100 Main Street, E62-578, Cambridge,  
MA, 02139, United States, Yasheng Huang, Shujing Wang

We empirically study how China's governance strength is associated with food safety risks across different regions. We develop a set of multifaceted measures of city-level governance based on objective, factual data, as opposed to basing on perceptual data in the most widely used governance indicators in social sciences. We leverage a unique dataset of domestic food sampling conducted by national-, provincial-, and city-level food regulators in China to examine the association. Our results highlight the different channels through which governance impacts food safety risks at a granular level.

#### 4 - Food Insecurity Analytics: Improving Chronic Disease Control via Food Pantries in USA

Luffina Huang, Georgia Institute of Technology, Atlanta, GA,  
United States, Mario Wijaya, Keith Woh, I. Tang Lo

This paper explored an unprecedented insight into the way of connecting food insecurity with the prevalence of two chronic diseases, obesity and diabetes, in U.S. via machine learning algorithms and data visualization geographically. While food banks are striving against food insecurity, large numbers of people in need cannot benefit due to improper ingredients in donated food for chronic-diseases patients. This paper showed food pantries provided limited help in control of food insecurity with chronic disease factors, and the most critical, proposed novel views in improving this problem.

### Healthcare Operations II

Sponsored: Manufacturing & Service Oper Mgmt/Healthcare Operations

Sponsored Session

Chair: Susan F. Lu, Purdue University, West Lafayette, IN, 47907, United States

#### 1 - Managing with Targets in Healthcare: The Case of 4-hour Emergency Department Target

Basak Bebitoglu, London Business School, London, United Kingdom, Nicos Savva, Tolga Tezcan

The UK government has instigated a rule in 2010 where 95% of the patients should be seen, admitted or discharged within four hours in emergency departments. This caused a large proportion of patients (15.69%) to be processed in the last 20 minutes to the target. Therefore, this paper intends to understand the unintended consequences of this arbitrary 4-hour target with the final intention of creating a queuing model to generate counterfactuals. We fit Cox proportional hazards model using patient level data from over half million visits at a UK hospital emergency department. The results indicate that as the target gets closer, it creates a speed-up effect on patient treatment times.

#### 2 - Unintended Consequences of Hospital Regulation: The Case of the Hospital Readmissions Reduction Program

Christopher J. Chen, London Business School, Regent's Park, London, NW14SA, United Kingdom, Nicos Savva

We study the impact of the Hospital Readmissions Reduction Program on admissions decisions. Exploiting variation in hospitals' financial exposure to the program, we show that hospitals tried to reduce readmission rates by increasing the number of patients that were classified as admitted for "observation, which avoided potential penalties associated with a regular admissions.

#### 3 - Distance, Quality or Relationship? Inter-hospital Transfer of Heart Attack Patients

Susan F. Lu, Purdue University, Krannert 441, West Lafayette, IN, 47907, United States, Lauren Xiaoyuan Lu

We empirically investigate the pattern of where heart attack patients are transferred between hospitals. Using 2011 Florida State Emergency Department and Inpatient Databases, we demonstrate the relative importance of three key factors in determining transfer destinations: hospital relationship, distance, and quality. Our conditional logit analysis shows that the relationship of being affiliated with the same multihospital system plays a dominant role in the choice of transfer destinations, compared to distance and quality.

#### 4 - Dynamic Appointment Scheduling of Base and Surge Capacity

Benjamin Grant, Kellogg School of Management, 1881 Oak Avenue, # 1307W, Evanston, IL, 60201, United States

We study dynamic stochastic appointment scheduling when delaying appointments increases the risk of incurring costly failures, such as readmissions in health care or engine failures in preventative maintenance. When near-term base appointment capacity is full, the scheduler faces a trade-off between delaying an appointment at the risk of costly failures versus the additional cost of scheduling the appointment sooner using surge capacity.

### Economic Models in Service Environment

Sponsored: Manufacturing & Service Oper Mgmt/Service Operations

Sponsored Session

Chair: Noam Shamir, Tel Aviv University, Tel Aviv, 49504, Israel

#### 1 - Worker Flexibility Training and Production Autonomy

Evan Barlow, Weber State University, Goddard School of Business & Economics, 1337 Edvalson St, Ogden, UT, 84408, United States, Gad Allon, Achal Bassambo

We explore the interaction between worker production autonomy and workers' decisions on training to become flexible resources. Research on flexible resources is prevalent in the operations management literature. Human resources, however, are decision makers and have rights to decide on their own skill sets. Many firms have given workers some production autonomy to choose how to use the skills they possess. We show how workers' training decisions are affected by the identity of the production and training decision makers.

#### 2 - Sample Boxes for Retail Products: Bundling Experience Goods to Leverage Consumer Uncertainty

Alireza Yazdani, University of Oregon, Eugene, OR, United States, Eren Basar Cil, Michael Pangburn

Consumers often try a few varieties of an experience product before they establish their shopping routine. Sample boxes create value through helping consumers resolve their valuation uncertainties of these varieties earlier and at a lower cost. In this paper, we study how firms and consumers share this added value under different market scenarios. We show that when a firm offers a sample box, consumers obtain higher net expected surplus while the firm's expected profit may decrease. We find that the firm can reverse the adverse effects of selling sample boxes by introducing an optimally specified future-credit.

#### 3 - Economics of Autonomous Vehicles: Formulation and Analysis of Optimal Policies

Mehdi Nourinejad, University of Toronto, Toronto, ON, L4B4G6, Canada, Opher Baron, Oded Berman

Autonomous vehicles are predicted to enter the consumer market in less than a decade. However, there is no consensus on whether their presence will have a positive impact on users and society. The skeptics of automation foresee increased congestion, whereas the advocates envision smoother traffic with shorter travel times. In this paper, we study the automation controversy using supply-demand analysis. We show that a sound judgment of automation relies on the occurrence of three possible cases for which full, null, or partial automation is recommended. Moreover, although traffic increases with automation, the travel times may decrease in certain cases.

#### 4 - Pricing Strategy and Collusion in a Market with Delay Sensitivity

Noam Shamir, Tel Aviv University, Haim Levanon, Tel Aviv, 49504, Liron Navner

In this paper, we study price collusion between two firms providing service to delay-sensitive customers using a discounted repeated game. The equilibrium is fully characterized along with specific conditions for the minimal discount factor that enables collusion. The effect of service value on the firm's revenue and ability to collude is further analyzed.

## ■ MC15

### Consideration Sets in Choice Modeling

Sponsored: Manufacturing & Service Oper Mgmt/Service Operations

Sponsored Session

Chair: Gustavo J. Vulcano, Universidad Torcuato di Tella, Buenos Aires, 1428, Argentina

#### 1 - Estimation and Assortment Optimization for a Random Consideration Set Model

Anran Li, the Hong Kong University of Science and Technology, Department of IEDA, Room 5568, The HKUST, Mudd 345, Sai Kung, NY, 10027, Hong Kong

Manzini and Mariotti (2014) propose a consideration set based choice model that postulates a full preference ordering as well as exogenous attention probabilities from which consideration sets are formed. The model assumes that consumers select the highest ranked product in their consideration set and the heterogeneity among choices are due to randomness in the consideration sets formation process. While Manzini and Mariotti focus on rationalizing this choice model, we look at its operations applicability by looking into the parameter estimation and assortment optimization problems.

#### 2 - Inferring Competition Sets from Sales Transactions Data

Dmitry Mitrofanov, Stern School of Business, NYU, 44 West 4th Street, 8th Floor, New York, NY, 10012, United States, Gustavo J. Vulcano, Srikanth Jagabathula

We study the General Consideration Set (GCS) choice model to infer competition sets from sales transactions data. The primary question we address is whether the GCS model is identifiable. We provide necessary and sufficient conditions to assess if the sales data was generated by the model, and provide the arguments of how to infer the preference order and the probability distribution function over consideration sets from the observed choice frequencies. Our empirical results show that GCS choice model provides a very competitive choice prediction performance in comparison with state-of-the-art benchmarks, while providing the insights about competition sets.

#### 3 - Consumer Choice Models with Consideration Set

Ruxian Wang, Johns Hopkins University, Carey Business School, 100 International Dr, Baltimore, MD, 21202, United States

We study the two stage consider-then-choose model under which a consumer first forms her consideration set and chooses one within it. We investigate the operations management problems and develop efficient algorithms to estimate the new choice model.

#### 4 - Near-optimal Ranking and Display Algorithms under Multinomial Logit Preferences

Mohammed Ali Aouad, London Business School, London, United Kingdom

We study the display optimization problem, that seeks to compute an optimal ranking over distinct items (ads, products, etc.) that are displayed to a heterogeneous audience. Each customer considers a subset of the items assigned to the most favorable locations, before picking one alternative through Multinomial Logit choice probabilities. Our main contribution is to derive a polynomial-time approximation scheme for the display optimization model, thereby improving on the best-known constant-factor approximation. We develop an approximate dynamic programming formulation based on a surprisingly compact state space representation of assignment decisions.

### ■ MC16

North Bldg 127B

#### Socially Responsible Operations

Sponsored: Manufacturing & Service Oper Mgmt/Sustainable Operations

Sponsored Session

Chair: Leon Valdes, University of Pittsburgh, Pittsburgh, PA, 15260, United States

#### 1 - Job Design and Work Allocation for Volunteers in Nonprofit Organizations

Deishin Lee, Boston College, 140 Commonwealth Ave., Fulton Hall 344, Chestnut Hill, MA, 02467, United States, Joy Field, Tingliang Huang

The intent of this study is to understand how operational processes can be designed and managed to accommodate and leverage the distinct characteristics of non-profit organizations to maximize their performance. We first construct an analytical model and then use data from food banks to test the findings of our model.

#### 2 - Curtailing the Improper Waste Disposal: Evidence from California and Florida

Suvrat Dhanorkar, Pennsylvania State University, 466 Business Building, University Park, PA, 16802, United States, Suresh Muthulingam

We exploit the development of electronic waste legislation and related infrastructure to study the impact on waste in the electronic industry. We find evidence for the presence of a virtuous cycle where there is lower electronic waste disposal, curb in electronic related manufacturing waste, and reduction of electronic consumption. Our results point out the essential factors that curtail the improper disposal of waste.

#### 3 - Supply Risk Mitigation via Supplier Diversification and Improvement: An Experimental Evaluation

Basak Kalkanci, Georgia Institute of Technology, Atlanta, GA, 30339, United States

Firms are increasingly exposed to risks stemming from their suppliers such as health/safety violations or supplier failures. We use lab experiments to evaluate two sourcing strategies developed for supplier risk mitigation: dual sourcing and single sourcing with supplier improvement. With dual sourcing, human buyers do not diversify orders effectively and exhibit quantity hedging behavior. We propose and empirically validate a theory of order allocation error minimization to explain this phenomenon. In contrast, human buyers use supplier improvement relatively successfully, despite being subject to supplier selection errors.

#### 4 - Sustainable or Not? Role of Valuation Uncertainty and Operational Flexibility in Product Line Design

Weiqing Zhang, Washington University in St. Louis, One Brookings Drive, Saint Louis, MO, 63130, United States, Lingxiu Dong, Iva Petrova Rashkova

The purpose of the paper aims at exploring a big food company's optimal strategy structures when selling products incorporated with both sustainable and conventional quality dimensions to a market that has heterogeneous segments. By taking the features such as coupled cost structure, operational flexibility and consumer's volatile preferences into consideration, we find out the interplay of cannibalization and product upgrade effect determines the company's optimal strategies. Further, interesting implications such as wastes and consumer welfare can be explained.

#### Information Management in Supply Chains

Sponsored: Manufacturing & Service Oper Mgmt/Supply Chain

Sponsored Session

Chair: Shilu Tong, The Chinese University of Hong Kong, Shenzhen, 2001, Long Xiang Blvg, CUHK Shenzhen, Shenzhen, 518172, China

#### 1 - Sharing Manufacturer's Demand Information under Linear Wholesale Price

Yunjie Wang, Renmin University of China, Zhongguancun Street, Beijing, 100080, China, Albert Y. Ha, Shilu Tong

We study the incentive for a manufacturer to share private demand information with two retailers who compete on price and service effort under a linear wholesale price contract. Without information sharing, the wholesale price may be distorted upward or downward due to a signaling effect. Information sharing allows the manufacturer to alleviate the signaling effect and influence downstream competition. We derive conditions under which the manufacturer shares information with none, one or both of the retailers. We also conduct sensitivity analysis to investigate the impact of some parametric changes on the information sharing equilibrium outcome as well as the firms' profits.

#### 2 - Incentives for Information Transparency under Vertical Information Asymmetry

Hongyan Xu, Chongqing University, School of Economics & Business Admin, Chongqing, 400030, China, He Huang, De Liu, Sammi Yu Tang

This paper studies the incentives for horizontal information transparency between competing downstream firms when upstream suppliers possess private information. Our findings enrich the understanding of horizontal information sharing under vertical information asymmetry and provide novel insights for managers to handle two-dimensional information asymmetry.

#### 3 - Quality Score Information Sharing in Reverse Auctions

Hedayat Alibeiki, California State University San Marcos, San Marcos, CA, United States, Mehmet Gumus

In this paper, we focus on the buyer-determined (price-plus format) reverse auctions, where the buyers use quality scores (QS) to evaluate their suppliers in terms of the non-price attributes. Analyzing the informational and strategic effects of QS in a reverse auction setting, we evaluate whether or not it is beneficial for the buyer to share relative QS information with the suppliers.

#### 4 - Information Sharing, Pricing Timing and Platform Selection

Yulan Wang, Hong Kong Polytechnic University, Department of Logistics and Maritime Studies, Faculty of Business, Kowloon, Hong Kong, Yanli Tang, Baozhuang Niu

In this study, we explore the information sharing decisions of two platforms, and the supplier's platform selection decision by studying a four-stage game under two pricing timing scenarios. We show that it is never in the best interest of the supplier to direct sell on the hybrid platform under the late pricing, whereas under the early pricing, the supplier may prefer direct selling on the hybrid platform; and the chosen platform shares its information with the supplier voluntarily. Interestingly, the supplier direct selling on the agency platform may benefit the hybrid platform under the late pricing. Moreover, the pricing timing preference of the supplier and the hybrid platform may be aligned.

### Revenue Management in Uncertain Environments

Sponsored: Revenue Management & Pricing

Sponsored Session

Chair: Omar Besbes, Columbia University, New York, NY, 10027, United States

#### 1 - Personalized Dynamic Pricing with Machine Learning

N. Bora Keskin, Duke University, Fuqua School of Business, 100 Fuqua Drive, Durham, NC, 27708-0120, United States, Gah-Yi Ban

Motivated by online retail applications, we consider a seller who offers personalized prices to individual customers. The seller initially does not know the impact of individual customer characteristics on demand, but can learn about this relationship via sales observations. We construct and analyze near-optimal policies that balance the learn-and-earn tradeoff in this setting.

#### 2 - Stein Shrinkage for Stochastic Optimization

Vishal Gupta, USC Marshall School of Business, 3670 Trousdale Parkway, Los Angeles, CA, 90026, United States, Nathan Gahlin

Inspired by Stein's phenomenon in statistics, we propose a new shrinkage algorithm for solving many data-driven stochastic optimization problems simultaneously. Our procedure pools data across problems. Perhaps surprisingly, as the number of problems increases, our method outperforms methods that decouple the problems, even when the problems are unrelated and data are drawn independently. Unlike the Stein phenomenon in statistics, our method does not require strong distributional assumptions and applies to general constrained optimization problems.

#### 3 - Less Can Be More in Price Experimentation; The Uncertain Demand Case

Divya Singhvi, MIT, 516 University Avenue, Ithaca, NY, 14850, United States, Georgia Perakis

We consider a dynamic pricing problem where the retailer has no knowledge of the demand curve and there is a cost on price experimentation. The retailer seeks to efficiently learn the demand curve and keep the cost of price experimentation low. We propose an optimistic-pessimistic approach for price experimenting and learning which is simple and mimics industry practice. We provide bounds on the number of price experiments needed to achieve a threshold revenue level. We show that with few price experiments (aka 4) we can be within 18% of the optimal unknown price.

#### 4 - Prior-independent Optimal Auctions

Amine Allouah, Columbia University, New York, NY, 10027, United States, Omar Besbes

In this work, we study the design of optimal prior-independent selling mechanisms. In particular, the seller faces buyers whose values are drawn from an unknown distribution, and only knows that the distribution belongs to a particular class of distributions. We analyze a maximin setting in which the seller attempts to optimize the worst-case fraction of revenues compared to those of an oracle with knowledge of the distribution. We first characterize the structure of optimal mechanisms. Leveraging such structure, we then establish tight lower and upper bounds on performance, leading to a crisp characterization of optimal performance for a spectrum of families of distributions.

### Joint Session RMP/Practice Curated: Marketplace Analytics

Sponsored: Revenue Management & Pricing

Sponsored Session

Chair: Wedad Elmaghraby

Co-Chair: Chris Parker, Pennsylvania State University, University Park, PA

#### 1 - Should I Pay for this Purchase or Redeem Points? Effects of Loyalty Program Design on Consumer Decisions to Redeem Points

So Yeon Chun, Georgetown University, Arlington, VA, 22202-7416, United States, Rebecca Hamilton

In many loyalty programs, customers earn points for their purchases, which they can later exchange for additional products and services. In a sense, points function as a currency that consumers can spend instead of money. However, we uncover systematic differences in the way consumers spend points compared with money. We first propose a conceptual model of the consumer's choice to redeem points or use money for a specific purchase, and then we conduct a series of studies to investigate the impact of program design characteristics on consumers'

choices. By linking the design characteristics to specific mechanisms, we provide insight into how program managers can influence consumers' decision.

#### 2 - How do Price Promotions Affect Customer Behavior on Retailing Platforms? Evidence from a Large Randomized Experiment on Alibaba

Dennis Zhang, Washington University in St. Louis, University City, MO, 63124, United States, Hengchen Dai, Lingxiu Dong

We study how a promotion strategy—offering customers a discount for products in their shopping cart—affects customer behavior in the short and long term on a retailing platform. We conducted a randomized field experiment involving more than 100 million customers and 11,000 retailers with Alibaba Group, the world's largest retailing platform. We randomly assigned eligible customers to either receive promotions for products in their shopping cart or not. In the short term, our promotion program doubled the sales of promoted products. In the long term, we causally document unintended consequences of this promotion program during the month following our treatment period.

#### 3 - Underrepresented Minorities and LGBT in the Sharing Economy: Bias and Financial Incentives in Ridesharing Platforms

Christopher Dalton Parker, Pennsylvania State University, 411 Business Building, University Park, PA, 16802, United States, Jorge Mejia

Operational transparency can be good for business. However, it may also enable biased behavior if those with information about customers can choose not to provide a service for the customer. We explore this through a field experiment on a major ridesharing platform which recently changed the timing of information provided to drivers in order to reduce bias. We find significant bias still exists against URM and LGBT individuals. However, dynamic pricing moderates the effects. Policy implications will be discussed.

#### 4 - Clearing Matching Markets Efficiently: Informative Signals and Match Recommendations

Yash Kanoria, Columbia Business School, 404 Uris Hall, New York, NY, 10027, United States, Itai Ashlagi, Peng Shi, Mark Braverman

We study how to reduce congestion in two-sided matching markets with private preferences. We measure congestion by the number of bits of information that agents must (i) learn about their own preferences, and (ii) communicate with others, before obtaining their final match. Previous results by Segal (2007) and Gonczarowski et al. (2015) suggest that a high level of congestion is inevitable under arbitrary preferences before the market can clear with a stable matching. We show that when the unobservable component of agent preferences satisfies certain natural assumptions, it is possible to recommend potential matches and encourage informative signals such that the market reaches a stable matching with a low level of congestion. The main idea is to only recommend partners with whom the agent has a non-negligible chance of both liking and being liked by.

### Game Theory and Networks

Sponsored: Revenue Management & Pricing

Sponsored Session

Chair: Francesca Parise, MIT, Cambridge, MA, 02141, United States

Co-Chair: Asuman Ozdaglar, Massachusetts Institute of Technology, Cambridge, MA, 02139, United States

#### 1 - Path to Stochastic Stability: Comparative Analysis of Stochastic Learning Dynamics in Games

Hassan Jaleel, KAUST, Jeddah, Saudi Arabia, Jeff S. Shamma

Stochastic stability (SS) analysis can accurately explain the long-term behavior of stochastic learning dynamics. However, this solution concept does not explain the transient behavior of these dynamics. Consequently, we cannot distinguish between different learning rules with the same steady state using SS analysis. We develop a framework for the comparative analysis of stochastic learning dynamics with different update rules that lead to a same steady-state behavior. We propose multiple criteria to quantify the differences in the short and medium-run behaviors of these dynamics. We apply these criteria to compare Log-Linear Learning and Metropolis Learning and gain valuable insights.

#### 2 - A Variational Inequality Framework for Network Games: Existence, Uniqueness, Convergence and Sensitivity Analysis

Francesca Parise, Massachusetts Institute of Technology, Cambridge, MA, United States, Asuman Ozdaglar

We provide a unified variational inequality framework for the study of fundamental properties of the Nash equilibrium in network games. We identify several conditions on the underlying network (in terms of spectral norm, infinity norm and minimum eigenvalue of its adjacency matrix) that guarantee existence, uniqueness, convergence and continuity of equilibrium in general network games with multidimensional and possibly constrained strategy sets. We delineate the relations between these conditions and characterize classes of networks that satisfy each of these conditions.

### 3 - Online Platform Designs under Networked Cournot Competition

John Pang, California Institute of Technology, Pasadena, CA,  
United States, Weixuan Lin, Eilyan Bitar, Adam Wierman

We analyze designs of networked Cournot platform markets, considering (i) open access platform with transparent interactions to all participants, (ii) controlled allocation platform distributing aggregate productions efficiently, and (iii) discriminatory access platform allowing efficient interactions. We show that open access retains 2/3 of the optimal social welfare under anarchy while a controlled allocation platform optimizing social welfare can lead to anticipatory curtailment of production and inefficiency. Lastly, designing the network can lead to a 3/4 rate of optimal social welfare. We also introduce search cost, revealing the potential realistic inefficiency of open access.

### 4 - A Supply Chain Network Game Theory Model of Cybersecurity Investments with Nonlinear Budget Constraints

Anna B. Nagurney, University of Massachusetts Amherst, Isenberg School of Management, Dept of Operations & Information Mgmt, Amherst, MA, 01003, United States, Patrizia Daniele, Shivani Shukla

In this paper, we develop a supply chain network game theory model consisting of retailers and demand markets with retailers competing noncooperatively in order to maximize their expected profits by determining their optimal product transactions as well as cybersecurity investments subject to nonlinear budget constraints that include the cybersecurity investment cost functions. We provide alternative variational inequality formulations of the governing Nash equilibrium conditions, conduct Lagrange analysis, and apply the proposed algorithm to compute solutions to a spectrum of numerical supply chain network cybersecurity investment examples.

### 5 - Social Learning in a Dynamic Environment

Nir Hak, Harvard University, Cambridge, MA, 02138,  
United States, Krishna Dasaratha, Benjamin Golub

Agents learn about a moving state using private signals and past actions of their neighbors in a network. Can learning keep up with the changing environment? If private signals are sufficiently diverse and degrees sufficiently large, then Bayesian learning does very well, but not otherwise. Non-Bayesian learning rules do much worse, in contrast to environments with a fixed state. Stationary equilibria of Bayesian learning are characterized by linear rules reminiscent of the simple DeGroot heuristic. The resulting tractability can facilitate structural estimation of equilibrium learning models and testing against behavioral alternatives, as well as the analysis of welfare and influence.

### Strategic Environments and Incomplete Information

Sponsored: Revenue Management & Pricing

Sponsored Session

Chair: Yonatan Gur, Stanford University, Stanford, CA, 94305, United States

Co-Chair: Daniela Saban, Stanford, New York, NY, 10027, United States

### 1 - Procurement in a Strategic Environment

Gregory Macnamara, Stanford University, Stanford, CA,  
United States, Daniela Saban, Yonatan Gur

We study a dynamic game of incomplete information that models the interactions between a Principal ("Buyer"), who demands the same good or service repeatedly over time, and an Agent ("Seller"), who has private information. We characterize the effect that the strategic environment has on the Buyer's ability to learn.

### 2 - Manufacturer Encroachment in a Non-exclusive Reselling Channel

Parshuram Sambhajirao Hotkar, Doctoral Student,  
University of Texas at Austin, Austin, TX, 78751, United States,  
Stephen M. Gilbert

We consider the implications of a manufacturer operating a direct channel to encroach upon the market of a non-exclusive reseller. Although non-exclusive resellers are common in practice, most existing studies of encroachment ignore the possibility of competing manufacturers selling through the same reseller. As we show, the presence of competing manufacturers has dramatic implications for how / when a direct channel should be used and who benefits from it.

### 3 - Team Decision Making in Operations Management

Jiawei Li, PhD Candidate, Stephen M. Ross School of Business,  
701 Tappan St, Ann Arbor, MI, 48109, United States,  
Stephen Leider, Damian Beil

Existing behavioral OM literature has primarily studied individual decision makers. However, the behavioral economics literature suggests that teams may make better decisions in tactical settings, and may be more strategic and self-interested. We conduct a laboratory experiment and find that teams actually

perform worse than individuals when making Newsvendor decisions, exhibiting a stronger pull-to-center bias. In an information sharing game teams are less trustworthy when sharing information, but just as trusting when receiving information. Chat analyses are used to study the team decision-making process.

### 4 - Learning to Rank an Assortment of Products

Shreyas Sekar, Harvard University, Cambridge, MA, United States,  
Kris Ferreira

We consider the product ranking challenge that online retailers face when their customers typically do not have a good idea of the product assortment offered. These customers form an impression of the assortment after looking only at products ranked in the initial positions, and then decide whether they want to continue browsing all products or leave the site. We propose an online algorithm that learns consumer preferences and converges to the optimal full-information ranking.

### Financial Services Award Session

Sponsored: Finance

Sponsored Session

Chair: Agostino Capponi, Columbia University, 500 W 120th street,  
New York, NY, 10027, United States

### 1 - Addressing Systemic Risk Using Contingent Convertible Debt – A Network Analysis

Lu Yueliang, UNC Charlotte, Charlotte, NC, USA.

We construct a balance sheet based network model to study the interconnectedness of US banking system. After a simulation analysis of the buffer effect of contingent convertible (CoCo) debt in controlling contagion in the banking network under a theoretically motivated model, we use 13-F filings made to the US Securities and Exchange Commission (SED) to calibrate the theoretical model. While CoCo debt with dual-trigger is not so efficient as a single trigger design in reducing individual bank failures, the former is more effective at protecting the surviving banks, which leads to improved stability from the perspective of the banking system. We claim that the different designs of CoCo triggers result in trade-offs for addressing systemic risk, which may be evaluated in a network model.

### 2 - Beating the Curse of Dimensionality in Options Pricing and Optimal Stopping

Yilun Chen, David Goldberg, Cornell University, Ithaca, NY, USA.

The fundamental problem of pricing high-dimensional path-dependent options is central to applied probability and financial engineering, yet has remained open for the better part of a century. Modern approaches, often relying on approximate dynamic programming and/or the martingale duality theory for optimal stopping, either have limited rigorous performance guarantees, or have guarantees which scale poorly and/or require previous knowledge of good basis functions. A key difficulty is that many approaches rely on computing nested conditional expectations, where the depth of nesting scales with the time horizon.

### 3 - Demand-Side Story of the Great Recession

Marco Zhang, The University of Chicago Booth School of Business,  
Chicago, IL, USA.

Using novel data on private pension plans' investment allocations and returns, we find that the skewed interest for pension fund managers led to the increased investments in Mortgage-Backed Security (MBS) in the years preceding the Great Recession, especially for large pension plans with actuarial value over \$10 billion. Such pension plans control much more investments per plan (they only represent less than 6% in our data but their aggregated investments is about 50% more than the remaining 94% combined) and are more likely to be under-funded (almost 64% of these plans are under-funded, compared to about 6% under-funded for the remaining plans). The skewed interest, together with the size of the investments the fund managers control, created both the will and the ability to dominate the MBS market. We find in our data that US private pension funds alone, which generally are much smaller compared to US public pension plans, put over \$1 trillion in MBS-related investments in 2007 when the entire MBS market was about \$9 trillion. The significant demand from the pension plans shifted the demand curve in the mortgage securitization market during the years prior to the Great Recession, which is supported by our observation of the concurrent increase of the quantity and the relative price for the MBS during the period. While there exists plenty literature studying the causes of the Great Recession from the supply-side, we are among the first to investigate and provide evidence of the roles pension plans played from the demand-side that contributed to the Great Recession.

#### 4 - Algorithmic Trading with Partial Information: A Mean Field Game Approach

Philippe Casgrain, Sevastian Jaimungal, University of Toronto, Toronto, ON, Canada.

Financial markets are often driven by latent factors which traders cannot observe. Here, we address an algorithmic trading problem with collections of heterogeneous agents who aim to perform statistical arbitrage, where all agents filter the latent states of the world, and their trading actions have permanent and temporary price impact. This leads to a large stochastic game with heterogeneous agents. We solve the stochastic game by investigating its mean-field game (MFG) limit, with sub-populations of heterogeneous agents, and, using a convex analysis approach, we show that the solution is characterized by a vector-valued forward-backward stochastic differential equation (FBSDE). We demonstrate that the FBSDE admits a unique solution, obtain it in closed-form, and characterize the optimal behaviour of the agents in the MFG equilibrium. Moreover, we prove the MFG equilibrium provides an  $\epsilon$ -Nash equilibrium for the finite player game. We conclude by illustrating the behaviour of agents using the optimal MFG strategy through simulated examples.

#### 5 - Dynamic Mean-Risk Asset Allocation and Myopic Strategies: A Universal Portfolio Rule

Zhaoli Jiang, The Chinese University of Hong Kong, Hong Kong, China, Xue Dong He

In a market that consists of multiple stocks and one risk-free asset whose expected return rates and volatility are deterministic, we study a continuous-time mean-risk portfolio selection problem in which an agent is subject to a constraint that the expectation of her terminal wealth must exceed a target and minimizes the risk of her investment, which can be the variance or tail risk of her terminal wealth. Setting the target to be proportion to the agent's current wealth, we derive the equilibrium policy in closed form, and this policy is myopic and does not depend on the risk measure used by the agent nor on the agent's evaluation period. For another two targets, one that is the risk-free payoff of the agent's current wealth plus a premium and the other that is a weighted average of the risk-free payoff of the agent's current wealth and a pre-determined target, we also derive the equilibrium policy in closed form when the agent measures risk by the variance of her terminal wealth.

#### 1 - Role of Trust in Peer-to-peer Sharing Economy

Jagan Jacob, University of Rochester, Simon Business School, 4-349 Carol Simon Hall, Rochester, NY, 14627, United States

In online-based sharing-economy platforms such as Airbnb and Uber, trust between users is critical. If there are some "bad users who are discourteous with improper behavior, some risk-averse users may leave the platform. Stricter screening and entry requirements can reduce the probability of "bad users entering the platform. But, it also negatively affects the entry decisions of "good users, because of high entry-costs. How easy should it be for new users to sign-up to use the platform? What degree of background checking and screening procedure should the platform employ? I try to answer these questions using population dynamics models used in Ecology.

#### 2 - Multiproduct Dynamic Upgrades

Xiao Zhang, The University of Texas at Dallas, 800 W. Campbell Rd., SM 30, Richardson, TX, 75080, United States, Metin Cakanyildirim, Ozalp Ozer

Upgrades in travel industry are often static and offered either at the booking time or at the check-in time. In this paper, we study dynamically-offered upgrades by a multi-product firm via notifications (e.g., emails) between the booking and the check-in times. We investigate a general multi-level upgrade policy in which a customer may be upgraded to any better products and a restrictive single-level upgrade policy which is less computationally intensive. Both policies have clean structures and are easy to implement. We also identify intuitive monotonicity properties for the optimal single-level upgrade policy.

#### 3 - Demand Throttling for Bandwidth Preservation

Varun Gupta, Penn State-Erie, The Behrend College, 5101 Jordan Rd, Burke 281, Erie, PA, 16563, United States, Sandun Perera

Demand throttling is a commonly observed phenomenon for online service providers, who maintain their demand below a certain threshold to avoid any potential server crashes and to preserve their bandwidth. Using a generalized demand model based on Brownian motion, we analytically show that the optimal throttling policy resembles the  $(s,S)$  policy which is a well-known and commonly used inventory policy. Next, we provide numerical analysis and comparative statics of the analytical results. Finally, we discuss the managerial insights for bandwidth throttling policies in practice for online service providers.

#### 4 - Online Order Fulfillment with Central and Local Warehouses when Facing Strategic Customers

Chao Liang, Cheung Kong Graduate School of Business, Main Campus, Oriental Plaza 2/F, Tower E2, 1 East Chang An Ave., Beijing, 100738, China, Yuxin Chen

The e-tailer faces the problem of where to and how to allocate the inventory. If it keeps the inventory in suburban area (and thus far away from the customers), then it can enjoy a low warehouse renting cost but the shipping cost would be high. If it puts the inventory close to the customers, then it can save the shipping cost but the warehouse renting cost would be high. Another option is to keep inventory in both local and remote places. We study the e-tailer's inventory allocation decision when customers are strategic.

#### 1 - Tier Pricing Optimization the Revolving Fund Problem

Ruben A. Proano, Associate Professor, Rochester Institute of Technology, Kate Gleason College of Engineering, 81 Lomb Memorial Drive, Rochester, NY, 14623, United States, Galo Eduardo Mosquera

We use a three-stage optimization process to study alternative configurations of the Pan-American Health Organization Revolving Fund (RF), which is a single-tier group procurement mechanism used to buy vaccines for countries in the Americas. We propose an innovative approach to determine willingness-to-pay among vaccine buyers, and study the optimal number of tier prices that maximize affordability and profit, and the potential impact of large countries in the continent procuring vaccines independently.

#### 2 - Two-dimensional Extended Warranties for Price-sensitive Customers

Amitava Mitra, Professor, Auburn University, College of Business, Lower Building Suite 419, Auburn, AL, 36849-5266, United States

Products, such as, automobiles, have warranty policies that incorporate two dimensions, namely time since purchase of the product and usage based on accumulated mileage. While an initial warranty is offered during purchase of the product, options exist to renew the warranty in the event of no failure during the initial warranty. Here we consider extended warranty policies where the propensity to extend the warranty is influenced by the product price, relative to a threshold value. The decision variables include the warranty time and usage limit in the original and extended policies, the product price, and the premium to be charged for extending the warranty.

#### 3 - Improving Affordability in a Coordinated Non-cooperative Vaccine Market through Configuration of Group Buying Membership

Bruno Alves Maciel, Rochester Institute of Technology, 59-6 Colony Manor Drive, Rochester, NY, 14623, United States, Ruben Proano, Galo Eduardo Mosquera

We discuss the effect of allocating different countries into multiple vaccine purchasing groups whose procurement decisions are optimized by coordinating entities. These entities maximize savings for group members while offering profitability to vaccine producers. The vaccine purchasing groups form a hypothetical non-cooperative coordinated vaccine market. Coordinating entities choose their procurement plans via a two-stage optimization problem optimizing procurement decisions and pricing strategies. This study quantifies how group composition affects optimal procurement policies that incentivize higher affordability and profit in the vaccine market.

#### 4 - Service Systems with Rationally Inattentive Customers

Caner Canyakmaz, Postdoctoral Researcher, ESMT European School of Management and Technology, Schlossplatz 1, Berlin, 10178, Germany, Tamer Boyaci

Many service systems are partially visible such that customers are not always able to discern precise queue lengths upon arrival. This stems mainly from potential information frictions due to environment and/or cognitive capabilities of customers. We analyze rational queueing behavior under limited customer attention through rational inattention framework. Customers optimize their information acquisition process trading-off the benefits of better information against its cost. We characterize equilibrium strategies and investigate the effect of information cost on throughput and social revenue.

### Train Design and Service Planning

Sponsored: Railway Applications

Sponsored Session

Chair: Seyed Mohamad Nourbakhsh, BNSF

#### 1 - Simulating Railcar Transit under Different Operating Strategies

Tzu-Yu Chang, University of Illinois at Urbana Champaign, Urbana, IL, United States, Darkhan Mussanov

This research investigates how railway classification yard operating strategies and train schedule flexibility affect the average railcar transit time across a network. Simulation results suggest that, for all the three operating strategies studied, transit time increases as the level of schedule flexibility increases. Depending on the specific traffic and blocking scenario, different operating strategies result in the shortest average railcar transit time. The resulting trends may help railway practitioners in formulating more robust train and yard operating plans.

#### 2 - An Integrated Train Service Plan Optimization Model with Variable Demand

Xuesong Zhou, Arizona State University, Tempe, AZ, United States, Lingyun Meng

A well designed train timetable should fully utilize the limited resources to maximize operators' profits and passenger travel demand satisfaction. This talk explains an integrated demand/service/resource optimization model for managing the above-mentioned three key decision elements. By using a Lagrangian relaxation solution framework to recognize the dual costs of both passenger travel demand and limited resources of track and rolling stock, we decompose the formulation into a novel team-based train service search sub-problem for

maximizing the profit of operators. Numerical experiments are conducted to examine the effectiveness of the dual and primal solution search algorithms.

#### 3 - Optimization Models for Block Re-design Problem

Chinmoy Mohapatra, BNSF Railways, Arlington, TX, United States, Anantaram Balakrishnan

Railroads develop blocking plans to consolidate shipments into groups (or blocks) at intermediate yards so as to minimize the total handling costs and transit miles of all shipments. We model the blocking problem as a network design problem with maximum degree and node flow constraints, and consider restrictions based on material types. We discuss modeling and algorithmic enhancements to effectively solve this large-scale integer program, and present computational results for actual problem instances.

#### 4 - Trade-off Between Efficiency and Equity under Time Dependent Passenger Demand in Railway Timetabling

Dewei Li, Beijing Jiaotong University, Beijing, China, Tianyu Zhang, Xinlei Dong

The aim of this paper is to analyze and to improve the efficiency and transportation equity of urban railway timetable. A MIP model is proposed in which the train operation constraints and train capacity constraints are taken into account, an adaptive large neighbor algorithm is designed to solve this problem. The feasibility of the model and algorithm is verified by the Changing line of Beijing Metro. A sensitivity analysis on the weight of efficiency and equity in objective function illustrates that different weight can cause different result in the aspect equity and efficiency.

#### 5 - Visualizing the Effects of Maintenance on Train and Yard Performance

Trefor Williams, Rutgers University, Piscataway, NJ, United States, John F. Betak

Using actual data from a railroad in the United States, graph network visualizations have been constructed to better understand the linkages between the location of maintenance activities such as rail replacement and surfacing with delays to through freights and missed switching deliveries to customers. This analysis also includes the use of text mining to identify typical maintenance problems, major problems and accident locations from the railroads maintenance records. We will demonstrate how these visualizations can be used to identify critical areas in the railroad's track network where delays are frequently caused by maintenance activities.

### Innovations in Last-Mile Urban Package Delivery

Sponsored: TSL/Urban Transportation

Sponsored Session

Chair: Bo Zou, University of Illinois, IL, 60607, United State

#### 1 - Same-day Delivery Using In-store Customer with Store Transfers

Alp Arslan, Rotterdam School of Management, Pannekoekstraat 58C, Rotterdam, 3011LJ, Netherlands, Niels Agatz

This paper considers a system in which in-store customers can make deliveries on their way to home. They may deliver directly to the home of an online customer or transfer the package at another store after which another in-store customer makes the final delivery. To examine the potential of such store transfers, we present an optimization approach to match delivery tasks and in-store customers in real-time.

#### 2 - Integrated Modeling of Crowdsourced Urban Delivery with Rebalancing Consideration

Bo Zou, University of Illinois, 2073 Engineering Research Facility, 842 W. Taylor Street, Chicago, IL, 60607, United States

This research investigates using crowdsourcing for urban delivery. We focus on a specific type of crowdsourcing that deals with delivering shipments from spatially distributed locations such as restaurants, and retail, grocery, and drug stores to customers who are also spatially distributed, within a guaranteed time. We consider not only assigning shipments dynamically to compatible crowdsources to allow for time-guaranteed delivery, but also strategically repositioning crowdsources at the same time so that crowdsourcing supply can be better matched spatially with shipment demands.

#### 3 - Designing Electronic Marketplaces for Transportation Services

Arim Park, Rutgers University, Newark, NJ, 07102, United States, Yao Zhao, Soohyun Cho, Seongtae Kim

On-demand matching services for commercial transportation needs have only recently entered the market in South Korea, with early players like Uber Freight and Convoy seeking new ways to solve inefficiencies in the transportation sector. With this in mind, we would like to design an efficient mechanism for facilitating the growth of an electronic market of transportation services (trucking) in Korea. To this end, we would first conduct empirical studies to identify the preferences of both customers and carriers (truckload freight carriers). We provide meaningful guidance in the matching process between shippers and carriers in e-marketplace.

#### 4 - A Last Mile Delivery Paradigm using Microhubs with Crowdshipping

Jane Lin, University of Illinois-Chicago, 842 W. Taylor Street (M/C 246), Chicago, IL, 60607, United States, Sudheer Ballare

This study investigates the feasibility of a delivery paradigm in microhubs with crowdshipping. Performance was evaluated by comparing with the traditional Hub-and-Spoke paradigm in terms of vehicle miles traveled, numbers of trucks and crowdshippers dispatched, fuel consumption, and total daily operating cost. The study also investigates the effect of key operational parameters such as network size, customer demand density, crowdshipper payment and penalty rate on the performance of M+C. It is found that M+C generally outperforms H+C with the economy of scale. It is also found that higher penalty rate increases the attractiveness of the proposed M+C delivery paradigm.

#### 5 - Uncertainty at Scale: The Technician Routing Problem with Hard Time-Windows, Time-Dependent Travel, and Stochastic Service Times

Ishai Menache, Microsoft, Cambridge, MA, United States

We revisit the VRP for field services. Our goal is to account for inherent uncertainty in work-duration or travel-time. To that end, we introduce risk as an additional measure. Risk quantifies the probability of “bad outcomes in the schedule; for example, missing a work-order time-window. We design efficient algorithms for estimating the risk. Based on that, we design and evaluate a scalable optimization framework, which allows operators to choose the sweet point of risk vs. expected performance, akin to portfolio management.

#### Recent Advances in Facility Location and Supply Chain Design

Sponsored: TSL/Facility Logistics

Sponsored Session

Chair: Lian Qi, Rutgers University, Piscataway, NJ, 08854, United States

#### 1 - Two-stage Stochastic Programming of Facility Location Problem with Endogenous Uncertainty

Mengnan Chen, University of Central Florida, Orlando, FL, United States, Qipeng Zheng

Our study aims to improve hospital efficiency by allocating the hospital resource (physician and clinic), as well as matching the patient preference to maximize the patients' satisfaction. We use the two-stage stochastic programming to model the physician/clinic facility location and patient assignment problem, where the patient preference is considered as the endogenous uncertainty. To solve this model, we design the hybrid heuristic algorithm, that the Tabu Search (TS) and Large Neighborhood Search (LNS) are used to solve the facility location problem, and Sample Average Approximation (SAA) is used to handle the exponential increasing scenario size of patient assignment problem.

#### 2 - On Retail Chain Store Location Decisions

Dincer Konur, Missouri University of Science and Technology, 206 Emse, 600 W. 14th Street, Rolla, MO, 65401, United States

This paper studies store location decisions of a retail chain. The located stores will be competing for the demand in the end consumer market. The retail chain can prefer centralized or decentralized approach for determining the store locations. In the case of decentralized approach, the stores will engage in a competitive facility location game. We analyze the location decisions under each approach. Numerical studies are conducted to demonstrate the effects of different approaches and parameters on the outcome of the store location decisions.

#### 3 - Product Geographical Distribution under Recall Risk

Ying Rong, Shanghai Jiao Tong University, No. 1 Lane 9, Yunwushan Road, Shanghai, 200051, China, Long He, Zuo-Jun Max Shen

When product recalls happen, companies not only have to incur additional logistics costs but also suffer from damaged reputation. In this paper, we discuss how to alleviate the consequences of product recalls in the perspective of (outbound) product geographical distribution strategy in joint with (inbound) sourcing decision.

#### 4 - Locating Distribution Centers in a Collaborative Logistics Network

Chase Rainwater, University of Arkansas, 4207 Bell Engineering Center, Fayetteville, AR, 72701, United States

Researchers worldwide have concluded that meeting a shift towards smaller, fast-moving, unit loads calls for a new paradigm for future logistics systems. A potential cornerstone of a proposed new paradigm is collaboration and, in particular, horizontal collaboration. The vision embraces advancing technologies and is consistent with the issues challenges addressed by Industry 4.0. This talk focuses specifically on the design of a collaborative supply chain network as it relates to the location of shared distribution centers and warehouse. The impact of horizontal collaboration on the design choices made to construct such network are specifically discussed.

#### New Mobility Services

Sponsored: TSL/Intelligent Transportation Systems (ITS)

Sponsored Session

Chair: Roksana Asadi, Stony Brook University, 100 Nicolls Rd, Stony Brook, NY, 11794, United States

#### 1 - Ridesharing and Self-parking with Autonomous Vehicles:

##### A Novel Multimodal Ridesharing and Parking User Equilibrium

Bo Zou, Assistant Professor, University of Illinois at Chicago, 2073 Engineering Research Facility, 842 W. Taylor Street, Chicago, IL, 60607, United States, Mohamadhossein Noruzoliaee

This study explores the impacts of Autonomous Vehicles (AVs) on transportation system equilibrium focusing on ridesharing with shared AVs and self-parking with private AVs. A Stackelberg game is developed where a profit-maximizing Transportation Network Company (TNC) chooses shared AV fleet size, sets fare rates, and decides on fleet allocation/relocation. The associated system equilibrium is formulated as a novel Multimodal Ridesharing and Parking User Equilibrium (MRPUE) problem, which determines market share of AV in a mixed autonomous/human driving environment.

#### 2 - User and System Optimal Matching for Dynamic Ride Sharing Systems

Pramesh Kumar, University of Minnesota, Minneapolis, MN, 55414, United States, Alireza Khani

This research develops an optimization model for matching riders with drivers in a ride sharing problem with dynamic travel times. The objective is to reduce travel delay and schedule deviation, and multiple rider matching is allowed. In addition to the system optimal model, a user optimal model is presented in which users cannot improve their match unilaterally.

#### 3 - A Modeling Framework for the Integrated Vehicle-drone Routing Problem

Aline Karak, PhD Student, Southern Methodist University, Amesbury, Dallas, TX, 75206, United States, Khaled Abdelghany

We present a mathematical formulation for the integrated vehicle-drone routing problem in the context of pick-up and delivery services. An efficient heuristic-based solution methodology that captures the cost trade-off and operational characteristics of the two modes is presented. The methodology introduces a multi modal version of the classical Clarke and Wright algorithm. The results of a set of experiments are presented, which compare the solution performance against drone-driven and vehicle-driven solutions.

#### 4 - Joint Optimization of Electric Power Distribution and Electric Vehicle Charging Infrastructure Design under Network Traffic Equilibrium

Roksana Asadi, Graduate Student, Stony brook university, 100 Nicolls Rd, Stony Brook, NY, 11794, United States, Leila Hajibabai

This study investigates an integrated plan for the power distribution network (PDN) design and electric vehicle (EV) charging station deployment in urban transportation networks with the underlying traffic flows. The problem is characterized by a bi-level model structure with PDN design and facility location decisions in the upper level and traffic equilibrium in the lower level. The objective is to minimize the total cost due to PDN operation, charging facility deployment, and transportation. The problem is converted into a single-level model based on the Karush-Kuhn-Tucker conditions and solved using a column and constraint generation algorithm.

**Intermodal Transportation and Ports**

Sponsored: TSL/Freight Transportation &amp; Logistics

Sponsored Session

Chair: Rob A. Zuidwijk, Erasmus University-Rotterdam, 3000 DR, Netherlands

**1 - Transportation Network Resilience, Supply Chain Resilience and Economic Impacts**

John F. Betak, Managing Member, Collaborative Solutions LLC, Dept. of Information, Risk &amp; Operations Mgmt, McCombs School of Business, The University of Texas-Austin, David R. Fletcher

We discuss relationships between supply chain approaches to resiliency, risk management and public sector activities involving risk-based transportation asset management and resilience management by: 1) public sector infrastructure decisions impacting certain supply chain systems and networks, including military materiel supply chains; and 2) incorporating specific reliability and resilience requirements of these supply chains into public investment decision-making processes. We show how the interconnected decisions impact international Intermodal container movements in the supply chain. Alternative modeling approaches are explored and research recommendations are offered.

**2 - A Comprehensive Overview of Hinterland Transport as a System of Interacting Actors: A Supply Chain Perspective**

Volkan Gumuskaya, PhD Candidate, Eindhoven University of Technology, Eindhoven, Netherlands, Willem van Jaarsveld, Remco Dijkman, Albert Veenstra, Paul Grefen

Hinterland transport is the total of import and export activities between a port and its hinterland, involving physical and planning processes, which are characterized by the interaction of actors and the contractual relationships. In practice, the actors act according to their own goals resulting in coordination issues and system wide inefficiencies. These inefficiencies emerge in the form of a lack of information exchange and a lack of collaboration leading to operational problems. To address these problems and enhance future research directions, we create a comprehensive overview of the hinterland transport focusing on the interaction of the actors and identify the coordination issues.

**3 - Enhancing Resilience through Port Collaboration in Maritime Freight Networks**

Wenjie Li, George Mason University, Fairfax, VA, 22030, United States, Ali Asadabadi, Elise Miller-Hooks

Reliable port services are key to the performance of maritime freight transport systems that are vulnerable to disaster events of anthropogenic or natural cause. Strategies involving capacity expansion and protective cross-port investments, as well as collaborations that enable capacity sharing between ports, are proposed. These strategies aim to reduce the impact of such disruptive events on goods movements through maritime freight transport networks. This collaborative port protection and investment problem is formulated as a bi-level program with multiple players (leaders) in the upper level and a common liner shipping problem (the followers) in the lower level.

**4 - Planning of Heterogeneous Capacity in Intermodal Networks with Uncertain Demand**

Hobbs White, Erasmus University Rotterdam, Rotterdam, Netherlands, Bart Wiegman, Rob A. Zuidwijk

Faced with uncertain demand, an intermodal network operator must source transportation capacity from a pool of carriers and service providers, heterogeneous in characteristics such as mode and availability. The operator will seek to hedge against the risks of inefficient asset utilization and costly recourse by selecting optimally from a set of potential agreements with capacity suppliers, given ranges of duration, lead-time, and levels of purchase commitment. To support interpretation, we extend the formulation of this network design problem as a minimum cost stochastic program by studying an analytically tractable approach centered on a multidimensional newsvendor model.

**5 - A Parametric Analysis of Collaborative Hinterland Container Transport**

Alberto Giudici, Erasmus University Rotterdam, Rotterdam, Netherlands, Tao Lu, Clemens Thielen, Rob A. Zuidwijk

Evidence from practice shows that the goal of improving service quality of port-to-door container transport can motivate operators to cooperate. Once cost savings are generated by sharing orders or transport capacity, companies will selfishly bargain for the cost allocation. Following Nash Program, we consider the Shapley value as the resulting non-cooperative cost allocation and test its coalition rationality. Basing the cooperative game on a parametric min-cost flow problem, we analytically study the dependency of the Shapley value and core on penalty costs for late deliveries. Our results show that when the amount of orders shared is close to the total capacity pooled, cooperation is stable.

**Joint Session ORAM/QSR/Practice Curated: Advancements in Spatial Data Analytics Methods for Manufacturing Quality Control**

Emerging Topic: OR and Advanced Manufacturing

Emerging Topic Session

Chair: Mohammed Shafae, University of Arizona, Tucson, AZ, 24061, United States

Co-Chair: Wenmeng Tian, Mississippi State University, Mississippi State, MS, 39762, United States

**1 - Spatial Statistics and Scan Statistics for SPC: A Comparison**

Romina Dastoorian, Western Michigan University, Kalamazoo, MI, 49009, United States, Lee Wells

Modern manufacturing systems contain numerous high-density spatial data-sets that are obtained from advanced measurement technologies. Statistical Process Control (SPC) techniques that have been developed for these data-sets can be separated into two primary categories, namely spatial statistics and scan statistics. Unfortunately, the performances of proposed SPC techniques developed within these two areas are rarely (if ever) been compared. In response, this work presents a fair and balanced simulation-based performance comparison between several spatial statistics and scan statistics SPC approaches across a variety of process shift scenarios for image data.

**2 - Layer-wise Anomaly Detection for Spatially-correlated Thermal Images in Laser-based Additive Manufacturing**

Ahmed Aziz Ezzat, Texas A&amp;M University, College Station, TX, United States

We propose a layer-wise anomaly detection method for laser-based additive manufacturing as a step towards enabling real-time process control. Using in-process thermal images, process anomalies are signaled through a multi-step data-driven procedure that includes segmentation, spatial modeling, and classification analysis. We validate the proposed method using a case study on a commercial laser powder bed fusion system instrumented with a dual-wavelength imaging pyrometer for capturing the thermal signature during fabrication.

**3 - Scene Understanding and Obstacle Detection for Off-road Autonomous Driving Based on Real-time LiDAR Sensing**

Wenmeng Tian, Mississippi State University, P.O. Box 9542, Mississippi State, MS, 39762, United States

Scene understanding and autonomous navigation methodologies have been developing rapidly with the help of machine learning and artificial intelligence technologies. Moreover, advanced sensing techniques such as LiDAR systems can generate high volume of point cloud data for scene understanding. In this work, we propose a novel scene understanding and obstacle detection method based on a modified version of the Adaptive Generalized Likelihood Ratio (AGLR) method, originally proposed for surface inspection in manufacturing applications. A case study based on a LiDAR simulator is used to illustrate the effectiveness of the proposed approach.

**4 - Generalized Heterogeneous Recurrence Analysis of Spatial Data**

Cheng-Bang Chen, The Pennsylvania State University, State College, PA, 16801, United States, Hui Yang, Soundar Kumara

Prior research has shown that the heterogeneous recurrence method is effective in the characterization and quantification of heterogeneous recurrence behaviors in the temporal data. With the use of fractal representation, recurrence patterns are investigated in multiple scales. However, very little has been done to investigate heterogeneous recurrence behaviors in spatial data. This research extends the heterogeneous recurrence analysis to the high dimensional spatial data. We develop a novel structure to define the heterogeneous states, then provide a new fractal representation. Our method provides a novel platform for monitoring and control of dynamic recurrences of spatial data.

#### 1 - Optimization Modeling Tools from LINDO Systems

Mark A. Wiley, LINDO Systems Inc, 1415 No Dayton Street, Chicago, IL, 60622, United States, Gautler Laude

Exceptional ease of use, wide range of capabilities, and flexibility have made LINDO software the tool of choice for thousands of Operations Research professionals across nearly every industry for over 30 years. LINDO offers solvers to cover all your optimization needs. The Linear Programming solvers handle million variable/constraint problems fast and reliably. The Quadratic/SOCP/Barrier solver efficiently handles quadratically constrained problems. The Integer solver works fast and reliably with LP, QP and NLP models. The Global NLP solver finds the guaranteed global optimum of nonconvex models. The Stochastic Programming solver has a full range of capabilities for planning under uncertainty. Get the tools you need to get up and running quickly. LINDO provides a set of intuitive interfaces to suit your modeling preference. What's Best! is an add-in to Excel that you can use to quickly build models that managers can use and understand. LINDO has a full featured modeling language for expressing complex models clearly and concisely, and it has links to Excel and databases that make data handling easy. LINDO API is a callable library that allows you to seamlessly embed the solvers into your own applications. Pick the best tool for the job based upon who will build the application, who will use it, and where the data reside. Technical support at LINDO is responsive and thorough - whether you have questions about the software or need some modeling advice. Get started today. Visit our booth or [www.lindo.com](http://www.lindo.com) to get more information and pick up full capacity evaluation licenses.

#### 2 - End-to-End FICO Register Xpress Insight Tutorial: From Data to Decisions for Non-Technical Business Users

James T. Williams, FICO, 2665 Long Lake Rd, Building C, Roseville, MN, 55113, United States

You have a team with a great analytics background. They have developed advanced analytical tools using Python, R, or with your current traditional optimization solver. They have derived crucial insights from your data, and they've figured out how your decisions shape your customers' behaviors. Now it's time to put these critical analytical insights in the hands of your non-technical business users. In this tutorial, we will cover how FICO's Optimization Suite (including Xpress Mosel, Xpress Workbench, and Xpress Insight) makes it possible to embed your analytic models in business user-friendly applications. Learn how you can supercharge your analytic models with simulation, optimization, reporting, what-if analysis, and agile extensibility for your ever-changing business.

### AAS Best Student Presentation Competition III

Sponsored: Aviation Applications

Sponsored Session

Chair: Susan Hotle, Virginia Polytechnic Institute and State University

#### 1 - An Approximate Dynamic Programming Approach for Aircraft Maintenance Scheduling Optimization

Qichen Deng, Delft University of Technology, Kluyverweg 1, Delft, 2629 HS, Netherlands

We propose an approximate dynamic programming approach to optimize the maintenance check for a fleet of heterogeneous aircraft. It is the first time to optimize long-term aircraft maintenance schedule considering different check types (A-/C-/D-checks), merging different check types (A-check into C-check and D-check into C-check), maintenance intervals of different aircraft usage parameters (flight hours, cycles and calendar days) and uncertainty of maintenance elapsed time. The goal is to maximize aircraft availability, reduce maintenance costs, and minimize the unused flight hours of fleet in 3-5 year planning horizon and the decision variables are the start dates of each check.

#### 2 - A Variable Neighborhood Search Approach for the Flight-to-Gate Reassignment Problem

Moschoula Pternea, University of Maryland, College Park, MD, 20740, United States

The reallocation of flights to gates in case of schedule disruptions is a key airport recovery operation. Especially in hub airports, disruptions affect connecting passengers by causing failed connections or lost baggage. At the same time, introducing passenger transfers in mathematical programming models makes the problem intractable. In this context, we develop a Variable Neighborhood Search approach to generate near-optimal solutions with the objective to minimize

additional schedule disturbances, as well as passenger and baggage misconnections. Our preliminary experiments indicate that our metaheuristic approach shows promising results in terms of both solution quality and time.

#### 3 - Strategic Behaviors in Airport Capacity Allocation Mechanisms

Weilong Wang, Carnegie Mellon University, Pittsburgh, PA, United States

We develop an original bi-level game-theoretic approach to identify opportunities for strategic behaviors by non-atomistic users (e.g. airlines) in non-monetary mechanisms for infrastructure (e.g. airport) capacity allocation. We show that gaming opportunities are limited under a primary mechanism, where capacity is allocated to individual flights. In contrast, airlines may have strong gaming opportunities in a secondary mechanism, where capacity is allocated to airlines who may then swap their own flights. We present computational results comparing the overall performance of both mechanisms.

#### 4 - Investigating Autonomous Air Operations Centers for On-Demand Mobility Networks

Victoria Nneji, Duke University, Durham, NC, United States

On-Demand Mobility (ODM) in aviation has gained popularity in recent years, with several manufacturers proposing vehicles for air taxis. However, less attention has been placed on how the networked fleets would be managed. Through the development of concepts of operations for remote management of vehicles, this research presents preliminary requirements for ODM centers. This effort identified key requirements related to vehicle safety for these futuristic concepts. Further, this work introduces a model of human-system performance in these centers. With this tool, people making strategic decisions can prototype concepts of operations to better plan for staffing and design of the centers.

### Airline Schedule Design

Sponsored: Aviation Applications

Sponsored Session

Chair: Keji Wei, Dartmouth College, Hanover, New Hampshire

#### 1 - Effects of Enterprise Bargaining and Agreement Clauses on Operating Cost of Airline Ground Crew Scheduling

Cheng-Lung Wu, UNSW Sydney, School of Aviation, Kensington, NSW 2052, Australia,, Shao Xuan Lim

Collective enterprise bargaining empowers airlines to negotiate labour conditions but it is not always clear how labour conditions affect costs. In this study, integer programming models are used to generate check-in staff rosters by considering individual roster conditions. Results showed that the shorter the shift length, the lower the rostering cost, saving around 30% by reducing shift length from 8 to 4 hours. With a ratio of 37% full-time staff in the workforce, there is a further 4.5% reduction in rostering cost. Cost saving can be redirected to employees as wage rises and improve job security.

#### 2 - Airline Timetable Development and Fleet Assignment Incorporating Passenger Choice

Keji Wei, Dartmouth College, Thayer School of Engineering at Dartmouth, 14 Engineering Dr., Hanover, NH, 03755, United States, Vikrant Vaze, Alexandre Jacquillat

We introduce an original integrated optimization approach to comprehensive timetabling and fleet assignment under endogenous passenger choice. An original multi-phase solution approach and several acceleration heuristics are proposed. Our solution approach significantly outperforms direct implementation using a commercial solver. Computational results using a major airline's network suggest that our overall modeling and computational approach results in significant profit improvements within a realistic computational budget. We present several extensions for strategic decision-making.

#### 3 - An Assessment of the Potential Benefits of Dynamic Airline Scheduling

Ahmet Esat Hızir, PhD Student, Massachusetts Institute of Technology, Cambridge, MA, United States, Vikrant Vaze, Cynthia Barnhart

The commonly used approach to airline schedule design does not enable airlines to effectively adapt to changes in passenger demand and airspace system capacity. This study investigates the potential benefits of a dynamic scheduling approach in which flight frequencies, schedules and aircraft types are finalized closer to the day of operations based on the most current demand information. Our integrated schedule design and fleet assignment model satisfies the passenger demand without inconveniencing passengers, to evaluate the maximum possible benefits of a dynamic scheduling strategy.

**4 - A New Strategic Airline Fleet and Pricing Optimization Model**

Xiaodong Luo, Sabre Holdings Inc, 3150 Sabre Drive, Southlake, TX, 76092, United States

We study a new integrated airline fleet assignment model when itinerary prices are also subject to change. Both fleet assignment models with complex passenger mix behavior as well pricing optimization models are well studied in the literature, but they are rarely studied simultaneously. We will use a combination of nonlinear optimization, heuristics and integer programming techniques to reduce computational time while still obtain close to optimal solutions. We will use discrete event simulation based on real airline data to demonstrate the power of our approach.

**Joint Session APS/ENRE: Applied Probability and Power Systems**

Sponsored: Applied Probability

Sponsored Session

Chair: Bert Zwart, Eindhoven, 5629RD, Netherlands

Co-Chair: Foekje Sloothak, Eindhoven University of Technology, Eindhoven, 5612 AZ, Netherlands

**1 - Battery Swapping Stations for Electric Vehicles: A Queueing Perspective**

Foekje Sloothak, Eindhoven University of Technology, Den Dolech 2, Eindhoven, 5612 AZ, Netherlands

Although there has been an increasing penetration of EVs in the last decade, the adoption of this technology remains slow, partly due to issues with long battery charging times. We consider the concept of battery swapping stations where EV users can quickly exchange their (almost) depleted batteries by full batteries. We take a queueing perspective by modeling this framework as a closed system operating under the QED policy. This policy yields favorable effects: EV users experience low waiting times, while battery swapping stations do not needlessly keep many spare batteries. Moreover, we show state-space collapse when EV users are inclined to swap their batteries at the station that is least loaded.

**2 - Stochastic Networks for Electric Vehicle Charging**

Angelos Aveklouris, Eindhoven University of Technology, P.O. Box 513, Eindhoven, 5600 MB, Netherlands, Maria Vlasiov, Bert Zwart

We analyze a stochastic system that models the performance of electric vehicle charging. The model takes into account the stochastic behavior of electric vehicles and the physical constraints in a low-voltage distribution grid. We model this as a class of resource-sharing networks and characterize the performance of the system by a fluid approximation.

**3 - Chance-constrained AC Optimal Power Flow**

Line Roald, Assistant Professor, University of Wisconsin-Madison, 1645D 16th Street, Los Alamos, NM, 87544, United States

Renewable electricity generation increase uncertainty in power system operation and necessitates new methods for planning and operation. We adopt a chance-constrained AC optimal power flow formulation, which guarantees constraint satisfaction with a pre-defined probability. Obtaining solutions for this problem is challenging due to the AC power flow equations, a set of non-linear, non-convex equality constraints that must be satisfied with high probability. We discuss two different solution approaches based on partial linearization and polynomial chaos expansion, discuss their respective drawbacks and advantages, and show numerical results for different IEEE test cases.

**APS Session Title VII**

Sponsored: Applied Probability

Sponsored Session

Chair: Bo Zhang

Co-Chair: Gauri Joshi, Carnegie Mellon University

**1 - Fast Distributed Machine Learning in the Presence of Slow and Stale Updates**

Gauri Joshi, Carnegie Mellon University, 5000 Forbes Avenue, Pittsburgh, PA, 15213, United States

Stochastic Gradient Descent when distributed across multiple nodes, suffers from delays due to slow or straggling nodes. Asynchronous methods can alleviate stragglers, but cause gradient staleness that can adversely affect convergence. We present a theoretical characterization of the speed-up offered by asynchronous methods by analyzing the trade-off between the error in the trained model and the wall-clock training runtime. Our runtime analysis considers random straggler

delays, which helps us design and compare distributed SGD algorithms that strike a balance between stragglers and staleness. We also present a novel learning rate schedule to compensate for gradient staleness.

**2 - Asynchronous Algorithms Faster Iterations Same Quality**

Robert Hannah, UCLA, Wotao Yin

In this talk, we discuss recent results on the performance of asynchronous optimization algorithms. Using renewal theory we analyze how subproblem and computing power heterogeneity, random delays, and other factors lead to asynchronous algorithms completing faster iterations. In particular, under a standard model, random delays lead to a slowdown by a factor of  $\ln(p)$ , when the number of computing nodes  $p$  is sufficiently large. We then present results that show that a number of asynchronous algorithms need essentially the same number of iterations as their traditional counterparts to converge to a solution. And hence we conclude asynchronous algorithms will dominate traditional ones at scale.

**3 - On the Loss Surface of Neural Networks for Binary Classification**

R Srikant, University of Illinois, Coord Science Lab & Dept of ECE, University of Illinois, Urbana, IL, 61801, United States

Deep neural networks used for classification problems are trained so that their parameters achieve a local minimum of an appropriate loss function. The loss function is typically intended to approximate the classification error in training samples. In this talk, we will show that approximations of widely-used neural network architectures have the property that every local minimum of a surrogate loss function is a global minimum, and further achieves the global minimum of the training error. Joint work with Shiyu Liang, Ruoyu Sun, and Jason Lee.

Sponsored Session

Chair: Pieere L'Ecuier, Universite de Montreal, C.P. 6128, Succ Centre-Ville, Montreal, QC, H3C 3J7, Canada

Co-Chair: Guido Lagos, Universidad de Chile, Santiago, 8370213, Chile

**1 - A Concentration Phenomenon for Network Reliability under Dependent Failures**

Guido Lagos, Universidad de Chile, Jose Miguel Carrera 439, depto 802, Santiago, 8370213, Chile

Guido Lagos, Universidad Adolfo Ibanez, Santiago, Chile, Javiera Barrera

We consider the reliability of a network where link failures are correlated, where we define the reliability at a given time instant as the probability of, at that time, there being at least  $k$  fixed links working. Our main contribution is a concentration result of a non-trivial scaling regime for the reliability of the network, as the time and size of network scales. Our results allow to study the common-cause failure models on networks in a realistic, relevant, yet practical, fashion: it allows to capture correlated components in the network; it allows to estimate and give error bounds for the failure probabilities of the system; and at same time only needs to specify a reduced family of parameters.

**2 - Efficient Monte Carlo Estimation of Network Reliability Metrics with the Standard Estimator**

Gerardo Rubino, INRIA, Campus de Beaulieu, Rennes, 35042, France

We consider the network reliability problem, in a static context. Estimating the system reliability using the standard or crude approach is a trivial task. It becomes a hard problem when dealing with a rare event situation (that is, when the system reliability is close to one), because the standard approach is quickly useless. In this presentation we will describe a way of using the standard estimator in an efficient way, in the case of rare events. One interest of this idea is that it allows, in a direct way, estimating all kinds of metrics without changing the method, and also to estimate sensitivities. The talk will be illustrated with some realistic examples of networks.

**3 - Large Deviations of Multivariate Gaussian Extrema**

Harsha Honnappa, Purdue University, 315 N. Grant Street, West Lafayette, IN, 47906, United States, Raghu Pasupathy, Prateek Jaiswal

We present a large deviations (LD) analysis of multivariate Gaussian extreme value random vectors. Our analysis contrasts with classic extreme value theory, which focuses on the 'nominal' behavior of extreme values. We demonstrate that the LD behavior of the multivariate Gaussian extremes is Frechet-like. Furthermore, we identify the "dominating point" at which the extreme values enter convex regions of interest in the range of the extreme value random vectors. Finally, we discuss applications of the LD results to reliability problems.

**4 - Designing Resilient Power System under Natural Hazards**

Tomas Ignacio Lagos, Universidad de Chile, 2017 - Pozuelo, Vitacura, Santiago, 7640031, Chile

We propose an assessment framework to measure the energy-not-supplied of the Chilean electricity grid conditional to high-impact-low-probability hazards events, such as earthquakes. Then, we use an Optimization via Simulation approach for designing the best investment set on the system in terms of resilience. The simulator contains historical earthquake data, fragility curves of the network components, and a unit commitment model. We compare the results with traditional reliability-based methods and prove that these do not provide resiliency to the system. Finally, we show approximation methods that allow to improve the robustness to deliver optimal solutions using the heuristic.

**Decision Making Under Uncertainty**

Sponsored: Decision Analysis

Sponsored Session

Chair: Youngsoo Kim, PhD, University of Alabama, Tuscaloosa, AL, United States

**1 - An Interactive Bayesian Method for Multicriteria Sorting Problems**

Canan Ulu, Georgetown University, McDonough School of Business, Operations and Information Management Area, Washington, DC, 20057, United States

We present a method that interactively places alternatives into preference categories (e.g. most, somewhat and least preferred). We assume the decision maker has a linear value function and her responses are prone to error. In each step of the algorithm, we ask the decision maker to place an alternative in a category and using this information, we update our estimate of her value function via MCMC. We compare our method to other algorithms in the literature that assume away response errors.

**2 - The When and How of Delegated Search**

Sasa Zorc, INSEAD, 1 Ayer Rajah Avenue, PhD Office, Singapore, 138676, Singapore, Iliia Tsetlin, Sameer Hasija

We consider the decisions of whether and how to outsource a search process (e.g., headhunting, search for investment opportunities). We model it in the dynamic principal-agent framework. The optimal contract is shown to have a purchase rights structure: the agent is paid a retainer plus a bonus if the principal accepts the search outcome. The size of this bonus can be defined a priori and is decreasing in time. The decision of whether to outsource or no can be reduced to the principal's preferences over the quality-speed tradeoff, with quality preference leading to optimality of in-house search.

**3 - Dual Reoptimization based Approximate Dynamic Programming Policies**

Danial Mohseni-Taheri, College of Business, University of Illinois at Chicago, 601 S. Morgan St., Chicago, IL, 60607, United States, Selvaprabu Nadarajah, Alessio Trivella

Markov decisions processes (MDPs) with continuous endogenous and exogenous state and action spaces that are all high dimensional arise in operations applications. An example is the dynamic procurement of renewable power using multiple contracts under uncertain power prices and demand. The information relaxation and duality approach (IRD) can be used to obtain a lower bound on the optimal policy value of such MDPs, but approximate dynamic programming methods for computing operating policies are limited. We present a dual reoptimization method for extracting a feasible policy from IRD in this setting, guarantees on this policy, and numerical results on a renewable procurement application.

**4 - Strategic Investment in Shared Suppliers with Quality Deterioration**

Youngsoo Kim, University of Alabama, Tuscaloosa, AL, United States, Dharma Kwon, Anupam Agrawal

Firms often invest in their suppliers to improve their quality, but these suppliers are often shared by other firms who also consider investing in them. Motivated by this, we study a game of investment where one firm can free-ride on the other's investment. Facing a continued deterioration in the supplier's quality, each firm repeatedly decides when to invest in the supplier's quality. We find that the repetitive nature of the investment induces inefficient delays in investment. We then compare the inefficient equilibrium to the first-best and estimate the resulting efficiency loss by using primary data, concluding that coordination among the firms can potentially save substantial amount of money.

**5 - Protecting the Downside While Minding the Upside: Comparing Robustness Approaches in a Product Line Design Problem**

Tan Wang, University of Texas at Austin, Austin, TX, United States, Genaro J. Gutierrez

Robustness approaches are useful when decisions must be made before uncertainties resolve. Two major approaches to robustness are: 1) maximizing the value of the worst outcome and 2) minimizing the ex-post regret of the decision made. We examine performance tradeoffs between the two approaches in the product line design problem, and we construct an efficient frontier for robust designs obtained by both approaches. Our findings indicate that it is possible to find robust designs that mitigate downside risk while limiting ex-post opportunity losses.

**1 - Examining Impacts of Clinical Practice Variation on Operational Performance**

Seokjun Youn, Texas A&M University, 320M Wehner Building, 4217 Texas A&M University, College Station, TX, 77840-4217, United States, Gregory R. Heim, Subodha Kumar, Chelliah Sriskandarajah

Motivated by bundled payment policies that aim to reduce practice variation, this study examines whether and how lower variation in clinical practice relates to hospital operational performance. We further delve into the granular level of practice variation, such as the under-ordering risk of laboratory/radiology tests, to suggest actionable improvement plans. Using six-year inpatient data from NY and FL, we find that hospitals with higher practice variation tend to spend more resource for patient treatment. We also shed light on the intervening impacts of hospital quality evaluations on the relationship and deliver policy implications.

**2 - Determinants of Health Information Exchange Use on Different Stages of Postadoption**

Xiang Wan, University of Florida, Gainesville, FL, United States, Emre M. Demirezen, Anuj Kumar

The full potential of the benefits of health information exchanges (HIEs) cannot be realized until HIEs are used by physicians regularly. Few studies have focused on HIE postadoption phenomena and little is known about how different factors affect the continued HIE use. We empirically examine the effect of physician workload and disease complexity on HIE use at three different stages after physicians' first use: namely initial use, moderate use, and heavy use. We find that the relationship between physician workload (or disease complexity) and continued HIE use behavior depends on the specific stage the provider is at. Our contribution to the literature and practice is on several fronts.

**3 - Empowering Patients can Increase Digital Divide: The Effects of Patient Portals on Kidney Allocation**

YeongIn Kim, University of Texas-Dallas, Richardson, TX, 75080, United States, Mehmet Ayyaci, Srinivasan Raghunathan, Bekir Tanriover

The recent healthcare reform promotes the use of information technology, such as patient portals, to provide patients better access to information sources. Motivated by the kidney transplant decision, we empirically analyze the impact of the patient portals on outcomes including time to deceased-donor transplant. We show that, overall, the adoption of a patient portal is positively associated with the probability of receiving a deceased-donor kidney. However, the impact is less for minority groups who have limited access to transplant service, which may imply further service divide in kidney transplant.

**1 - Rare-event Simulation for Electric Power Distribution Networks**

Chang-Han Rhee, Centrum Wiskunde and Informatica, Jakoba Mulderplein 164, Amsterdam, 1018 MZ, Netherlands, Bert Zwart, Nick Vasmel

We investigate a rare-event simulation problem for the electric power distribution network. We reformulate the non-linear problem described by the power flow equation into a simulation problem of a Markov chain. Building on this formulation, we propose variance reduction methods for the simulation estimation of voltage drop probability.

**2 - The Population Dynamics Algorithm**

Mariana Olvera-Cravioto, University of California, Berkeley, 4125 Etcheverry Hall, Berkeley, CA, 94720, United States

This talk will focus on the convergence of the population dynamics algorithm, which produces sample pools of random variables having a distribution that closely approximates that of the special endogenous solution to a variety of branching stochastic fixed-point equations often encountered in the analysis of random graphs. Specifically, we show its convergence in the Wasserstein metric of order  $p$  ( $p \geq 1$ ) and prove the consistency of estimators based on the sample pool produced by the algorithm.

**3 - Risk-averse Set Covering Problems**

Hao-Hsiang Wu, University of Washington, 5000 25th Avenue NE, Seattle, WA, 98105, United States, Simge Kucukyavuz

We consider probabilistic set covering problems under conditional value-at-risk. Suppose that we have an oracle that computes the risk efficiently for a given solution. Using this oracle, we propose methods for solving the risk-averse set covering problem exactly. We give valid inequalities that strengthen the formulation. We report our computational experience with the proposed methods on a probabilistic set covering problem that admits an efficient risk oracle.

**Energy and Climate 8: Urban Energy Systems Modeling, Control, and Grid Interactions**

Emerging Topic: Energy and Climate

Emerging Topic Session

Chair: Thomas Deetjen, Carnegie Mellon University, Austin, TX, 78701, United States

**1 - Using Optimization to Identify Decarbonization Pathways for Cities and Districts**

Ashreeta Prasanna, Empa Swiss Federal Laboratories

Decarbonization of the energy supply system of a city is an extremely complex process. Planning for centralized and distributed energy provision over a longer time frame involves consideration of the objectives of several stakeholders, potential technology improvement over time, impact of local and national policy, and age of the existing building and technology stock. Using a case study, we show how all these aspects can be considered within a multi-stage optimization model to identify optimal pathways for decarbonization of a city.

**2 - Scout Software for National Building Energy Efficiency Impact Assessment**

Jared Langevin, Lawrence Berkeley National Laboratory

Scout is an open-source software program developed by the U.S. Department of Energy's Building Technologies Office (BTO) that estimates the energy, carbon, and operating cost impacts of energy conservation measures (ECMs) on U.S. residential and commercial buildings across both long- and short-term time horizons. In this work, Scout's core analysis capabilities are described, including building technology stock-and-flow dynamics and the adoption logic used to compete ECMs that apply to the same segments of baseline energy use. Recent extensions of Scout to time-sensitive valuations of energy efficiency are also discussed.

**3 - Smart Charging Management of Shared Autonomous Electric Vehicles and Implications for the Grid**

T. Donna Chen, Assistant Professor, University of Virginia, P.O. Box 400742, Charlottesville, VA, 22904, United States, Zhuoyi Zhang

As shared autonomous electric vehicle (SAEV) fleets roll out to the market, fleet charging will significantly impact energy demand. Existing EV smart charging (SC) research focus on privately-owned EVs (utilized for 5% of the day, on

average), but such strategies cannot apply to fleet managed SAEVs (continually in-service). This research proposes a SAEV SC framework to shift electricity demand away from peak use hours (price-based SC) or towards hours with high renewable generation (generation-based SC). A case study from Puget Sound region integrates the regional travel demand model, real-time energy prices, and regional renewable generation data.

**4 - Statistical Approaches to Large-scale Building Modeling and Grid Applications**

Eric Wilson, National Renewable Energy Laboratory, Golden, CO, United States

This presentation will provide an overview of the data sources and methodology behind ResStock, a highly granular bottom-up engineering model that represents national, regional, and local housing stocks using hundreds of thousands of sub-hourly building energy models. Several real-world applications of ResStock will be discussed, including how ResStock is being used by cities to answer their most pressing questions about electrification, resilience, and achieving 100% renewable energy goals.

## ■ MC44

North Bldg 227C

**Time-Varying Optimization and Learning in Power Systems**

Sponsored: Energy, Natural Res &amp; the Environment/Electricity

Sponsored Session

Chair: Steven Low, California Institute of Technology, Pasadena, CA, United States

Co-Chair: Yujie Tang, California Institute of Technology, Pasadena, CA, 91125, United States

**1 - Feedback-based Power System Optimization with Time-varying Constraints**

Adrian Robert Hauswirth, ETH Zurich, Physikstrasse 3, Zurich, 8055, Switzerland, Saverio Bolognani, Gabriela Hug, Florian Dörfler

We study continuous-time, non-smooth dynamical systems which arise in the context of time-varying non-convex optimization, as for example the feedback-based optimization of power systems. We generalize the notion of projected dynamical systems to time-varying domains and derive conditions for the existence of solutions. These requirements relate to the time-varying nature and constraint qualifications for the optimization problem as well as the structure of the feedback control. To illustrate the necessity and usefulness of such a framework, we consider a simple yet insightful power system example, and discuss the implications of the proposed conditions for feedback optimization schemes.

**2 - Asynchronous and Distributed Tracking of Time-varying Fixed Points**

Andrey Bernstein, Senior Scientist, National Renewable Energy Laboratory, Golden, CO, United States

We develop an algorithmic framework for tracking fixed points of time-varying contraction mappings. Analytical results for the tracking error are established for the cases where: (i) the underlying map changes at each step of the algorithm; (ii) only an imperfect information of the map is available; and, (iii) the algorithm is implemented in a distributed fashion, with communication delays and packet drops leading to asynchronous algorithmic updates. The analytical results are applicable to several classes of problems, including time-varying contraction mappings emerging from online and asynchronous implementations of gradient-based methods for time-varying convex programs.

**3 - An Optimal and Distributed Feedback Voltage Control under Limited Reactive Power**

Guannan Qu, Harvard University, 33 Oxford Street, Room 336, Cambridge, MA, 02138, United States, Na Li

In this talk, we propose a distributed voltage control in power distribution networks through reactive power compensation. The proposed control can (i) operate in a distributed fashion where each bus makes its decision based on local voltage measurements and communication with neighbors, (ii) always satisfy the reactive power capacity constraint, (iii) drive the voltage magnitude into an acceptable range, and (iv) minimize an operational cost. We will also present the underlying methodology behind the voltage control, a variant of primal-dual gradient algorithm (dynamics) that have geometric convergence rate (exponential stability) guarantee, which may be of independent interest.

#### 4 - Data-driven Voltage Control in Distribution Networks

Jiafan Yu, Stanford University, Stanford, CA, United States

Traditional approaches to reactive power management in distribution networks have focused on designing stable and near-optimal centralized or distributed control schemes under the assumption that network physics constraints are completely known. In this talk, we explore an alternative approach that learns a control procedure by observing streams of measurements from the system. We show that a simple batch learning and optimal control procedure attains comparable performance to existing approaches without requiring any prior knowledge of the network and give some analytical guarantees. We then show how the procedure can be utilized to construct an online learning process for the problem.

North Bldg 228A

#### Game Theory and Electricity Market

Sponsored: Energy, Natural Res & the Environment/Electricity

Sponsored Session

Chair: Luce Brotcorne, INRIA, Villeneuve D'Ascq, 59650, France

#### 1 - Unit Commitment under Market Equilibrium Constraints

Bernard Fortz, Université libre de Bruxelles, Brussels, Belgium,  
Luce Brotcorne, Fabio D'Andreagiovanni, Jérôme De Boeck

We consider an extension of the Unit Commitment problem with a second level of decisions ensuring that the produced quantities are cleared at market equilibrium. In their simplest form, market equilibrium constraints are equivalent to the first-order optimality conditions of a linear program. The UC in contrast is usually a mixed-integer nonlinear program (MINLP), that is linearized and solved with traditional Mixed Integer (linear) Programming (MIP) solvers. Taking a similar approach, we are faced to a bilevel optimization problem where the first level is a MIP and the second level linear.

#### 2 - A Bilevel Optimization Formulation of Priority Service Pricing

Anthony Papavasiliou, Université Catholique de Louvain, Center  
for Operations Research and Econometrie, Voie du Roman Pays 34,  
Louvain la Neuve, 1348, Belgium, Yuting Mou, Philippe Chevalier

Priority service pricing is a promising approach for mobilizing residential demand response, by offering electricity as a service with various levels of reliability. The proper pricing guarantees consumers self-select a level of reliability that corresponds to the reliability that the system can offer. However, traditional theory for menu design is based on numerous stringent assumptions. In addition, the objective of the menu design is to maximize social welfare, while the profit requirement is not accounted for. We design a priority service menu as the solution to a Stackelberg game modelled as a bi-level optimization problem. The approach is illustrated on the Belgian power market.

#### 3 - Increasing Electric Vehicle Adoption via Strategic Siting of Charging Station

Martim Joyce-Moniz, Polytechnique Montreal, Montreal, QC,  
Canada, Miguel Anjos, Bernard Gendron

Governments everywhere have started setting ambitious goals for electric vehicle (EV) adoption for the next few decades. One important obstacle to massive EV adoption, however, is the lack of a reliable, wide-reaching network of publicly-available charging stations that allows drivers to charge their EV both along their daily commutes and longer travels. We present a multi-period optimization framework for the siting and sizing of fast charging stations over large landscapes, which incorporates evidence-based demand dynamics reflecting how new infrastructure impacts EV adoption growth.

#### 4 - A Bilevel Framework for Optimal Price-Setting of Time-and-level-of-use Tariff

Miguel F. Anjos, Polytechnique Montreal, Montreal, QC, Canada,  
Mathieu Besançon, Luce Brotcorne, Juan A. Gomez-Herrera

The Time and Level of Use is an energy tariff for Demand Response, designed for residential users and providing suppliers with guarantee on the consumption. We formulate the supplier decision as a bilevel, biobjective problem optimizing for both financial loss and guarantee. A decomposition method is proposed, related to the epsilon-constraint and optimal value transformation. It allows for the computation of an exact solution by finding optimality candidates and then eliminating dominated ones. The method is effectively applied to experimental consumption data.

#### Energy Markets II

Sponsored: Energy, Natural Res & the Environment/Energy

Sponsored Session

Chair: Seyedamirabbas Mousavian, Clarkson University, NY, 13699-5790, United States

Co-Chair: Felipe A. Feijoo, I

#### 1 - Deep Neural Network Ensemble Structures for Multi-step Forecasting of Ocean Wave Elevation and WEC Power Output

Mohammad Pirhooshayan, Lehigh University, Bethlehem, PA, 18015, United States, Lawrence V. Snyder

There exists an undeniable interest toward utilizing ocean energy as a renewable energy source. This research focuses on the Multiple step ahead prediction of ocean wave heights and power via innovative structure of Deep Neural Networks. An ensemble of Bidirectional Long short Term Memory (BLSTM) Networks is proposed to capture both long and short dependencies of the large historical data. Several optimization algorithms such as ADAM and RMSProp, SGD, etc., are considered to optimize the network. The results indicate that the proposed model is more accurate in compare with conventional forecasting methods such as Support Vector Regression (SVR) or SARIMA.

#### 2 - Green Investment under Policy Uncertainty and Bayesian Learning

Verena Hagspiel, Norwegian University of Science and Technology, Trondheim, Norway, Jacco J.J. Thijssen, Peder Dalby, Gisle Gillerhaugen, Tord Leth-Olsen

This paper examines how investment behavior is affected by updating a subjective belief on the timing of a subsidy revision. We analyze a scenario where a retroactive downward adjustment of fixed feed-in tariffs (FIT) is expected through a regime-switching model. We find that investors are less likely to invest when the arrival rate of a policy change increases, and prefer a lower FIT with a long expected lifespan. If electricity is sold in a free market after retraction we find that if policy uncertainty is high, an increase in the FIT will be less effective at accelerating investment. However, if policy risk is low, FIT schemes can significantly accelerate investment, even in highly volatile markets.

#### 3 - Quantifying the Effect of Natural Gas Price Uncertainty on Economic Dispatch Cost Uncertainty with Estimated Correlated Uncertainties

Dan Hu, Iowa State University, Ames, IA, 50010, United States, Sarah M. Ryan

In competitive electricity markets, vulnerability in gas supply to electricity generators creates a risk of high electricity prices. We propose a daily economic dispatch model that accounts for natural gas availability and cost from both contracts and the spot market. With probabilistic correlated inputs estimated from historical data for electricity demand and gas spot prices, we use Monte Carlo simulation to generate the resulting distributions of electricity dispatch cost both with and without gas price uncertainty. The effect of gas price uncertainty is assessed in terms of distance between the distributions and the effect of gas availability is addressed through sensitivity analysis.

#### 4 - Toward a Synthetic Model for Distribution System Restoration and Crew Dispatch

Bo Chen, Argonne National Laboratory, Lemont, IL, United States

Distribution service restoration (DSR) is critical for improving the resilience and reliability of modern distribution systems. Restoring electricity service to affected customers requires multiple crews with different skill sets to perform multiple tasks that are procedurally interdependent. We introduce a synthetic model that integrates both a service restoration model and crew dispatch model based on a universal routing model considering the switching sequence for safely operating remotely/manually operated switches, and dispatch solutions for crews with different skill sets.

### A Guide to Optimization Based Multi-Period Planning

Emerging Topic Session

Chair: Esma S. Gel, Arizona State University, School of Computing, Informatics and, Decision Systems Engineering, Tempe, AZ, 85287-8809, United States

#### 1 - A Guide to Optimization Based Multi-Period Planning

Linus Schrage, LINDO Systems, Chicago, IL, 60637, United States

Many organizations use multi-period planning models that involve optimization to decide things like the best production or investment levels in multiple periods into the future. There are a wide variety of features a user would like to have in such models. How those features are represented affects both the usefulness of the results and the solvability of these models as you add more periods to the model, or add more products, or in general, increase the detail. This tutorial describes how to best represent some important features that are common to most long range planning models. (a) Planning horizon length. (b) Ending conditions. The final period of the planning model frequently needs special treatment. In some situations you may be able to actually use an infinite horizon plan. (c) Period length. (d) Uncertainty. What is the best way of representing it? Variance, downside risk, Value-at-Risk, a utility function of some sort? (e) "Nervousness" and "sliding scheduling". Most planning models are used in a "rolling or "sliding fashion, e.g., solve a 12 period model this month, implement the first period, and then next month slide things forward and repeat. When this is done, "nervousness may be a problem, i.e., the plan made in February for what to do in June may differ substantially from what the plan published in January suggested for June. (f) Changeover, startup and shutdown costs. (g) Precedence constraints. (h) Scarce resource constraints. (i) Taxes. These can be important in some planning models. How these are properly calculated, or at least approximated, in an optimization model can be a challenge in the presence of features such as depreciation and choice of FIFO vs. LIFO inventory valuation. (j) Nonlinearities.

### Modeling Sustainability and Energy

Sponsored: Energy, Natural Res & the Environment Environment & Sustainability

Sponsored Session

Chair: Zana Cranmer, Bentley University, 175 Forest Street, Waltham, MA, 02452, United States

#### 1 - Effect of Nuclear Waste Management Costs on the Economic Viability of Nuclear Energy as a Low Carbon Energy Option

Robert Barron, Western New England University, Lawrence, KS, 66047, United States, Mary C. Hill

We consider how a more realistic treatment of the nuclear waste disposal than has been used in previous studies could affect the viability of nuclear power in the context of integrated assessments of climate change. Our results suggest that the optimism reflected in previous works is fragile: More realistic nuclear waste management cost models and uncertainty-appropriate inter-generational discount rates produce many more scenarios in which nuclear waste management costs are higher than previously assumed, and nuclear energy's economic attractiveness as a low carbon energy option is lower than earlier works suggested.

#### 2 - Competition Between Subsistence and Organized Retailers

Jiwen Ge, Postdoc, Tuck Business School, Woodbury 005, 100 Tuck Mall, Hanover, NH, 03755, United States, Brian Tomlin, Jan C. Fransoo

Subsistence retailers are independent small stores through which store owners provide for their family's subsistence needs. We study the competition between subsistence retailers and an organized retailer in an emerging market setting. For a model without consideration of the supplying manufacturer, we show the entry of the organized retailer could be detrimental to subsistence retailers. However, if we include the manufacturer in our analysis, we show that he is incentivized to set a favorable price so that subsistence retailers can survive sustainably.

#### 3 - Look-ahead Selection Strategy for Genomic Selection: Optimizing selection and Pairing Strategies with a Time-dependent Approach

Guiping Hu, Iowa State University, 3014 Black Engineering, Ames, IA, 50011, United States, Saba Moeiniazade, Lizhi Wang, Patrick Schnable

Genomic selection (GS) techniques allow breeders to make decisions with the genotypic data at an early stage. A major limitation of existing GS approaches is

the tradeoff between short-term genetic gains and long-term growth potential. Our contribution is to define a new look-ahead metric for assessing a selection decision, which evaluates the probability to achieve both genetic diversity and breeding deadline. Moreover, we propose a heuristic algorithm to find an optimal selection decision with respect to the new metric. Our new selection method is outperforming the other selection methods in the literature.

#### 4 - Spatially General Probabilistic Prediction Model for Wind Power Output

Kristen Schell, Postdoctoral Research Fellow, Polytechnique Montreal, 2900 Edouard Montpetit Blvd, Montreal, QC, H3T 1J4, Canada, Andrea Staid, Seth Guikema

Government incentives, such as production tax credits, have successfully spurred investment in wind power. Yet, this wind power is increasingly curtailed - deemed unusable by the power system - at astonishing rates. This reality highlights a knowledge gap in how to site wind farms that best contribute to power system resource adequacy. Using meteorological and historical wind power output data from several wind farms across different terrains, we develop a probabilistic prediction model for wind power output. This model gives the cumulative distribution function of predicted power output at any location, allowing system planners to prioritize wind farm development in high-producing locations.

#### 5 - The Drivers of Renewable Energy Innovation; An Empirical Analysis

Saeedeh Anvari, Postdoctoral Researcher, Darden School of Business, 136 University Gardens, Charlottesville, VA, 22903, United States, Michael J. Lenox

In this paper, we analyze the drivers of renewable energy innovation with the goal of discerning what drives both the rate and direction of innovative activity. We focus on public sector financing, private sector investments, and policy support for innovation as potential important drivers. Empirically, we measure innovation, using patents, across different economic regions in the US leveraging differences in regional ecosystems to tease out the impact of specific drivers.

### Big Data Analytics for Higher Education Industry

Contributed Session

Chair: Roger R. Gung, University of Phoenix, 3842 E. Windsong Dr., Phoenix, AZ, 85048, United States

#### 1 - Analytics Framework for Higher Education Industry

Roger R. Gung, Sr. Director, Business Analytics & Operations Rese, University of Phoenix, 4025 S. Riverpoint Parkway, Phoenix, AZ, 85048, United States

We present an end-to-end analytics framework for adult learning/higher education industry that covers solution methods with using big data analytics for the management of marketing, enrollment service, learning platform, academic performance and institutional finance.

#### 2 - Improve Academic Performance by Optimizing Faculty Assignment

Mei Duanmu, University of Phoenix, 4025 S. Riverpoint Parkway, Phoenix, AZ, United States, Jianhua Duanmu, Roger Gung

It is difficult to evaluate teachers' effectiveness in the educational industry, due to the non-random assignment of students to teachers. The performance for some teachers are overestimated/underestimated, because they teach the good/bad students. In order to filter out the impact of student quality difference, we developed the mixed effects model using student attributes as fixed effect and teacher impact as random effect. Separate models are developed for hundreds of courses in University of Phoenix. Based on the model outputs, teachers are then ranked by their effectiveness from top to down, which are used to guide the teacher assignment for future course sessions. Compared to random assignment, we see significant and consistent improvements in student performance by assigning teachers based on their rankings.

#### 3 - Hadoop Big Data System for eCampus and Educational Analytics

Jixiang Fang, University of Phoenix, Phoenix, AZ, United States, Jianhua Huang, Roger Gung

Big data is a technique to build a data platform for collecting and managing large volume or high dimensional data. Nowadays, many companies begin to increase their information technology investment in the big data field. A well-designed big data system is reliable for data mining and decision making. Hadoop system is a popular big data framework for storing data and running applications such as statistical programming software. This data system at the University of Phoenix (UOP) has been developed in the past 8 years by the data team and it is used to collect and synchronize the data of student learning activities and faculty teaching activities that were posted on the eCampus platform. In this presentation, the big data system at UOP will be an example to illustrate the procedure for using big data.

#### 4 - Big Data and Institutional Research with a Focus on Job Monitoring and Education Program Transformation

Grace Lin, Asia University and Chinese Medical University, Asia University, Taichung, 110, Taiwan, Weiting Chen, K. H. Chen, M.D. Chen, Y. J. Chung, C. T. Lee, Brick Tsai, Y. L. Tsai, Jeffrey Tsai, Tingying Young, YiJianian Zheng

The rapid changing business environment and technologies have led to a shortage of talents. Education Institutions often fail to adapt their education programs fast enough to meet the changing industry talent needs. The objective of this research is to develop a job monitoring and education model to understand up-to-date talent and skill needs and to identify gaps between talent needs and the education programs to facilitate the intuitions' course/program transformation and students' personal development plans. In this talk, we will report our system design and analysis based on data from our university's education system and Taiwan's job market. We will also discuss current gaps and our recommendations

#### 5 - A New Model for Supply Chain Finance

Grace Lin, Asia University and Chinese Medical University, Asia University, Taipei, 110, Taiwan, K. H. Chen, Brick Tsai

It's been extremely challenging for SMB to get financial support due to the lack of credit rating information and mechanism. In this research, we propose to leverage Supply Chain network information as well as advanced NLP, multi-source learning and stochastic network modeling, analysis and optimization to better assess SMB's crediting rating and risks and to provide financial services either through loan, P2P or crowd sourcing as needed. In this talk, we will present the analysis framework and discuss some preliminary analysis using realistic data.

### ■ MC50

North Bldg 231A

#### Behavioral Aspects Through the Lens of System Perspectives

Emerging Topic: Behavioral Aspects of OR

Emerging Topic Session

Chair: Martin Kunc, University of Warwick, Coventry, CV4 7AL, United Kingdom

##### 1 - How Big Data Can Contribute to System Dynamics Modeling

Hamed Kianmehr, State University of New York at Binghamton, Binghamton, NY, 13905, United States, Nasim S. Sabounchi, Lina Begdache

Our objective in this research is to use big data techniques to enhance system dynamics (SD) modeling regarding the relationship between diet and mood. We apply our approach to study the relationship between diet and mood. We estimate the parameters of the system dynamics model by applying some big data techniques on a large data set. Then, we feed the calibration parameters in SD models with the new estimations using big data analytics. Mixing these two different techniques based on longitudinal data provides more insights to develop more accuracy in SD models. Big data techniques and SD models can contribute to bringing more evidence to investigate the causal relationships between nutrition and mood.

##### 2 - Supply Management and Supply Risk

Burcu Tan, Assistant Professor, University of New Mexico, Albuquerque, NM, 87106, United States, Gokce Esenduran, John Gray

In this paper, we examine whether, when, and how common supply chain risk management practices relate to realized supply risk. We employ system dynamics modeling with realistic parameters to illustrate situations where certain practices can inadvertently increase supply risk.

##### 3 - Behaviour Based Pricing in Sharing Economy

Mojtaba Araghi, Lazaridis School of Business and Economics, Wilfrid Laurier University, 75 University Ave W, Waterloo, ON, N2L 3C5, Canada, Tina Arabian, Hamid Noori

In sharing economy and servicizing business models, where firms sell the functionality of a product rather than the product itself, customers have less incentives to consider the long term economical and environmental impacts of their usage behaviours. Implementing new technologies, such as Internet of Things (IOT), firms now can track how well customers are using the shared product. This study introduces a behavior-based pricing that consider the behaviour of customers in addition to their amount of usage. We determine conditions under which adopting behaviour based pricing is more profitable and environmentally superior to the traditional pricing models.

#### Production Planning and Scheduling in Operations

Emerging Topic: Project Management and Scheduling, in Memory of Joe Leung,

Emerging Topic Session

Chair: Chelliah Sriskandarajah, Texas A&M University, College Station, TX, 77843-4217, United States

Co-Chair: Yunxia Zhu, University of Nebraska-Lincoln, Lincoln, NE, United States

##### 1 - Optimal Stocking for Substitutable Products

Vashkar Ghosh, University of Florida, P.O. Box 117169 356 Stuzin, Dis Dept Warrington College of Bus, Gainesville, FL, 32611-7169, United States, Anand Paul

We study the optimal stocking of product variants of a retailer facing random product demand. Each customer who arrives has a preferred first-choice product variant, but will exercise a second-choice in the event that the first-choice variant is not available. We find the structural form of the optimal stocking quantities in a single period as well as over an infinite horizon, and show that it differs systematically from the 'naive' news-vendor solution.

##### 2 - Optimal Structure of Joint Inventory-Pricing Management with Dual Suppliers

Houmin Yan, City University of Hong Kong, Dept of Management Sciences, Kowloon Tang, Hong Kong

Abstract not available.

##### 3 - Three-machine Open Shop with a Bottleneck Machine Revisited

Inna Drobouchevitch, Korea University Business School, Seoul, Korea, Republic of

We consider the three-machine open shop scheduling problem to minimize the makespan. In the model, each job consists of two operations, one of which is to be processed on the bottleneck machine, the same for all jobs. A new linear-time algorithm to find an optimal non-preemptive schedule is developed. The suggested algorithm considerably simplifies the only previously known method as it straightforwardly exploits the structure of the problem and its key components to yield an optimal solution.

##### 4 - Cross-dock Terminal Scheduling

Yunxia Zhu, University of Nebraska-Lincoln, Lincoln, NE, United States, Harry Neil Geismar, Chelliah Sriskandarajah, Inna Drobouchevitch

We study various scheduling problems encountered in cross-dock terminals. The typical objective is to minimize the total time spent to perform unloading and loading for a planning horizon. We also study other objective functions under various cross-dock terminal environments (e.g., with no-wait processing and with the presence of temporary storage).

##### 5 - An Optimization Framework for Influencers in Social Media

Rakesh Reddy Mallipeddi, Texas A&M University, 320 Wehner - 4217, Mays Business School, Dept of Info&Operations, College Station, TX, 77843-4217, United States, Subodha Kumar, Chelliah Sriskandarajah, Yunxia Zhu

Influencer marketing, which involves hiring influential users of social media, is being increasingly employed by firms to market their products. In this study, we propose a data-driven analytical framework to answer the following questions from the perspective of a firm: (i) how many influencers to hire, (ii) whom to hire, (iii) how to schedule and sequence the content by multiple influencers. A pilot study conducted using data collected from Twitter demonstrates that our framework consistently outperforms the current industry practice of selecting influencers based on the reach of influencers by 10%-90%.

### Social Influence in Shared Mobility

Emerging Topic: Social Media Analytics

Emerging Topic Session

Chair: Arif Mohaimin Sadri, Florida International University, Miami, FL, 33174, United States

#### 1 - Exploring the Effects of Social Resources on Leisure Activity and Autonomous Vehicle Intention

Michael Maness, University of South Florida

This presentation showcases results from a survey exploring the relationships between leisure activity variety and frequency and individuals' access to social resources. This includes general measures of social resource access, the position generator, and specific measures of social resource access, the resource generator. Additionally, the survey explores autonomous vehicle usage intention and its relation with access to information through interpersonal networks.

#### 2 - Social Influence during Emergency Evacuations: Evidence from On-line and Off-line Social Networks

Arif Mohaimin Sadri, Florida International University, Miami, FL, United States

Social networks serve the purpose of transmitting warning messages by disseminating information about an impending threat. Individuals having more social connections can be expected to receive more warning information. This study uses both ego-centric personal networks (off-line) and Twitter (on-line) data to understand social influence on evacuation responses during Hurricane Sandy.

North Bldg 232A

### Matching Theory II

Sponsored: Auction and Marketing Design

Sponsored Session

Chair: Umut Dur, NCSU, Raleigh, NC, 27695, United States

#### 1 - School Assignment with Siblings

William Phan, North Carolina State University, Raleigh, NC, United States, Thayer Morrill, Umut Dur

We study the problem of school assignment with siblings. Existing mechanisms used in centralized assignment do not formally account for such issues. As such, school districts implement ad hoc protocols that may result in instability and mismatched siblings. First, we propose a new notion of stability that takes into consideration the existence of siblings. Second, using the many-to-many matching with contracts framework, we propose a new mechanism that satisfies our proposed stability property and is strategy-proof. Using data from Wake County School District, we run a counterfactual analysis and show how our mechanism improves upon previous years' assignments.

#### 2 - Efficient and Incentive Compatible Liver Exchange

M. Utku Unver, Boston College, 140 Commonwealth Avenue, Chestnut Hill, MA, 02467, United States, Haluk Ergin, Tayfun Sonmez

Living-donor liver transplantation is widespread in parts of the world and living-donor liver exchange has already been practiced in several countries to overcome blood-type incompatibilities. A living donor can donate either his smaller left lobe or larger right lobe, although the latter is substantially riskier. Despite the elevated risk, right-lobe donation is often utilized due to size compatibility requirements. We model liver exchange as a market design problem, focusing on the logistically simpler two-way exchanges. We introduce an individually rational, Pareto-efficient, and incentive-compatible mechanism that truthfully elicits the right-lobe donation willingness of donors.

#### 3 - Strategy-proof Size Improvement: Is It Possible?

Umut Dur, NCSU, 2801 Founders Drive, 4102 Nelson Hall, Raleigh, NC, 27695, United States, Oguz Afacan

In object allocation problems, we say that a mechanism size-wise dominates another mechanism if the latter never allocates more objects than the former does, while the converse is true for some problem. Our main result shows that no individually rational and strategy-proof mechanism size-wise dominates a non-wasteful, truncation-invariant, and extension-responding mechanism. We also show that whenever the number of agents does not exceed the total number of object copies, no group strategy-proof and efficient mechanism, such as top trading cycles mechanism, is size-wise dominated by an individually rational, weakly population-monotonic, and strategy-proof mechanism.

#### 4 - Assigning Course Schedules: About Preference Elicitation, Fairness, and Truthfulness

Martin Bichler, Technische Universität München, Department of Informatics, Boltzmannstr. 3, Munich, 85748, Germany, Soeren Merting

Course assignment is a wide-spread problem in education. Often students have preferences for bundles of course seats or course schedules over the week, which need to be considered. Bundled Probabilistic Serial (BPS) is a randomized mechanism satisfying ordinal efficiency, envy-freeness, and weak strategy-proofness. We report a first application of BPS in a large-scale course assignment application at the Technical University of Munich. In particular we focus on preference elicitation, which is challenging due to the combinatorial explosion of packages.

### Joint Session BOM/Practice Curated: Experimental Supply Chain Management

Sponsored: Behavioral Operations Management

Sponsored Session

Chair: Andrew M. Davis, Cornell University, Cornell University, Ithaca, NY, 14853, United States

#### 1 - Private Information and Endogenous Matching in Supply Chains: Theory and Experiments

Kyle Hyndman, University of Texas at Dallas, 800 W. Campbell Rd, SM31, Richardson, TX, 75080, United States, Andrew M. Davis

We investigate a supply chain setting where a supplier's cost may be private information (but they may disclose it) and buyers and suppliers may endogenously match into pairs. After forming pairs, the two parties engage in a dynamic bargaining setting. Suppliers always make less than theory predicts, whether their cost is known or private information. This effect is especially pronounced under private information for high cost suppliers, because buyers make more aggressive bargaining offers in such a setting. Thus, contrary to theory, a second result is that higher cost suppliers actually benefit from disclosing their private costs, in an effort to achieve a more favorable outcome while bargaining.

#### 2 - The Commitment Conundrum of Inventory Sharing

Shan Li, City University of New York, Baruch College, 55 Lexington Avenue, New York, NY, 10010, United States, Kay-Yut Chen

In this paper, we take a behavioral lens to study the impact of different transfer price contracting schemes and inventory sharing schemes on local decision making of decentralized retailers, constructing a behavioral model, incorporating bounded rationality, fairness, and psychological pain of excess supply to explain the findings.

#### 3 - Is Simplicity the Ultimate Sophistication? Wholesale Pricing vs. Non-linear Pricing

Behrooz Pourghannad, University of Minnesota, Minneapolis, MN, United States, Guangwen Kong, Tony H. Cui

This paper studies a manufacturer's choice of contract when facing a boundedly rational retailer. In a supply chain with a fully rational retailer a wholesale price contract cannot perform better than buy-back and revenue sharing contracts. When the retailer is boundedly rational, we find that a wholesale price contract can dominate both buy-back and revenue sharing contracts. We characterize the condition under which a wholesale price contract is the optimal choice of the manufacturer. Our findings are supported by laboratory experiments in which human suppliers choose a contract to offer to computerized boundedly rational retailers.

#### 4 - Auctions, Efficient Coordination, and Strategic Complementarities

James Fan, Naval Postgraduate School, Monterey, CA, United States, Anthony Kwasnica

Do auctions always lead to efficient production outcomes? We examine this question in a team coordination game, and we find that the degree of coordination as a result of an auction is sensitive to the degree of strategic complementarity. Our results are examined in relationship to the behavioral learning model proposed by Crawford and Broseta (1998).

### Navigating NSF: Funding Opportunities at NSF

Emerging Topic: NSF

Emerging Topic Session

Chair: Georgia-Ann Klutke, National Science Foundation, Arlington, VA, 22230, United States

#### 1 - Navigating NSF: Funding Opportunities at NSF

Georgia-Ann Klutke, National Science Foundation, National Science Foundation, Arlington, VA, 22230, United States

The National Science Foundation (NSF) offers a number of funding opportunities for investigators working in the fields of industrial engineering and operation research, both within the disciplinary programs in Engineering and other directorates, and through cross-cutting initiatives that are foundation-wide. This presentation will describe opportunities that are relevant to the Industrial and Operations Engineering communities, with particular emphasis on the Operations Engineering program in the Division of Civil, Mechanical & Manufacturing Innovation. The talk will also briefly describe guidelines for proposal preparation and NSF's Intellectual Merit and Broader Impacts criteria. Question-and-answer session will follow the presentation.

### HAS Distinguished Scholar Lecture

Margaret L. Brandeau

Sponsored: Health Applications

Sponsored Session

Chair: Ebru Korular Bish, Virginia Tech, Blacksburg, VA, 24060, United States

Co-Chair: Tinglong Dai, Johns Hopkins University, Baltimore, MD, 21202, United States

#### 1 - What Should We do About the Opioid Epidemic? Models to Support Good Decisions

Margaret L. Brandeau, Stanford University, Management Science and Engineering, 475 Via Ortega, Stanford, CA, 94305-4026, United States

The US is currently experiencing an epidemic of drug abuse caused by prescription opioids and illegal opioid use, including heroin. In addition to crime and social problems, rising levels of drug abuse have led to a sharp increase in overdose deaths as well as significant outbreaks of infectious diseases such as HIV and hepatitis C. How should we deploy limited public health resources to help solve this complex public health problem? This talk describes models used to support decision making regarding the control of drug abuse — and associated diseases such as HIV and hepatitis C — in the US. We conclude with discussion of key areas for further research.

### Joint Session HAS/AI: Deep Learning in Healthcare

Sponsored: Health Applications

Sponsored Session

Chair: Gordon Gao, MD, United States

#### 1 - A Deep Learning Architecture for Psychometric Natural Language Processing

Jingjing Li, PhD, University of Virginia, Charlottesville, VA, United States, Ahmed Abbasi, Faizan Ahmad, Hsinchun Chen

We propose a novel deep learning architecture -PyNDA- to extract psychometric dimensions from user-generated texts in a timely and unobtrusive manner. PyNDA contains a representation embedding, a demographic embedding, a structural equation model encoder, and a multitask learning mechanism designed to address the unique challenges associated with extracting sophisticated and user-centric psychometric dimensions. Our experiments on three real-world datasets encompassing eleven psychometric dimensions, including trust, anxiety, and literacy, show that PyNDA markedly outperforms traditional feature-based classifiers as well as the state-of-the-art deep learning architectures.

#### 2 - Deep-learning-based Approach for Precise Health Cost Prediction

Weiguang Wang, University of Maryland, 3330 B. Van Munching Hall, College Park, MD, 20742, United States, Margret V. Bjarnadóttir, Guodong (Gordon) Gao

Healthcare cost predictions have multiple applications, however precisely predicting healthcare costs at the individual patient level remains a challenge in the machine learning domain. In this study, long short-term memory based recurrent neural network is proposed to incorporate the sequential healthcare cost information for more accurate healthcare cost predictions. We compare the performance of our deep learning approach with multiple traditional machine learning methods. Among all the methods, deep learning shows the best performance. Finally, the performance of deep learning is explained using subgroup analyses and pattern extraction.

#### 3 - Automated Depression Detection Using Multimedia Data

Guohou Shan, University of Maryland-Baltimore County, Baltimore, MD, 21250, United States, Lina Zhou, Dongsong Zhang

Depression is a major mental health problem. Automated depression detection has been explored with social media content; however, it has been rarely studied using multimedia data such as audio and video. This research aims to improve automatic depression detection by incorporating new predictive features and by identifying fine-grained indicative content.

### Incentives in Healthcare

Sponsored: Health Applications

Sponsored Session

Chair: Burhaneddin Sandikci, University of Chicago, Chicago, IL, 60637, United States

#### 1 - Expanding the Donor Pool: The Use of Marginal Organs for Transplantation

Sait Tunc, University of Chicago, McGiffert House 4th Floor, 5751 S. Woodlawn Avenue, Chicago, IL, 60637, United States, Burhaneddin Sandikci, Bekir Tanriover

Transplantation emerged as the standard treatment for organ failure. Despite the growing shortage for donor organs as demand outpaces supply, a significant fraction of organs harvested for transplantation are rejected and discarded. As a viable option to alleviate the burden of shortages, we study the use of marginal organs for transplantation through a queueing-theoretic framework. We investigate socially efficient and equilibrium utilizations of donor organs, and discuss incentive mechanisms that help increase the utilization of marginal organs while also improving overall social welfare.

#### 2 - Contracts to Improve Vaccine Effectiveness and Availability

Taylor Corcoran, UCLA Anderson School of Management, 110 Westwood Plaza, Los Angeles, CA, 90024, United States, Fernanda Bravo, Elisa Long

Two key players in vaccine markets are pharmaceutical companies, who develop and manufacture vaccines, and global health organizations (GHOs), who procure vaccines for low- and middle-income countries. The payment that pharmaceutical companies receive from GHOs depends on the quantity of vaccines produced, but is independent of their effectiveness, which may lead to the development of low quality vaccines that make it more difficult for GHOs to achieve their public health targets. To address this inefficiency, we use a game-theoretic model that incorporates disease dynamics to analyze performance-based contracts which link vaccine price and effectiveness.

#### 3 - Data Driven Incentive Design in the Medicare Shared Savings Program

Auyon Siddiq, UCLA Anderson School of Management, Los Angeles, CA, United States, Anil Aswani, Max Shen

The Medicare Shared Savings Program (MSSP) was created to control escalating Medicare spending by incentivizing providers to deliver healthcare more efficiently. We formulate the MSSP as a principal-agent model and propose a new type of contract that includes a performance-based subsidy for the provider's investment. We show that the proposed contract dominates the existing MSSP contract by producing a strictly higher expected payoff for both Medicare and the provider. We then present an estimator based on inverse optimization for estimating the parameters of the principal-agent model and the potential increase in savings under the proposed contract.

**Healthcare Operations**

Sponsored: Health Applications

Sponsored Session

Chair: Hessam Bavafa, The Wisconsin School of Business

**1 - Who Is an Efficient and Effective Physician? Evidence from Emergency Medicine**

Raha Imanirad, Harvard Business School, Boston, MA, 02472, United States, Soroush Saghaian, Stephen J. Traub

Improving the performance of the healthcare sector requires a deep understanding of the efficiency and effectiveness of care delivered by providers. Despite recent advances, fair and scientific methods of measuring efficiency and effectiveness of care delivery have proven elusive. In this study, we use evidence from care delivered by emergency physicians in conjunction with Data Envelopment Analysis (DEA), and shed light on scientific metrics that can gauge performance in terms of efficiency and effectiveness. We then carry out a Tobit analysis to identify factors related to patient, physician and peer physician characteristics that are associated with higher levels of physician performance.

**2 - Process Innovation in the Pharmaceutical Industry: Evidence from the Manufacturing of Generics**

Dimitrios Andritsos, HEC Paris, Departement MOSI, 1 Rue De La Liberation, Jouy-en-Josas, 78351, France, Ivan Lugovoi, Claire Senot

We explore the economic effects of process innovation on pharmaceutical manufacturing. Through a collaboration with expert patent attorneys we construct a unique dataset that: i) evaluates process innovation through a detailed observation of pharmaceutical manufacturers' portfolios of process patents and ii) measures key qualitative dimensions of process innovation, such as novelty, strength of protection and locus of application.

**3 - Elective Admission and Patient Discharge Policies in Hospital Environments**

Vaniitha Virudachalam, The Wharton School, 3730 Walnut Street, 500 Jon M. Huntsman Hall, Philadelphia, PA, 19104, United States, Sergei Savin, Hessam Bavafa, Lerzan E. Ormeci

We consider the problem of managing the profitability for a hospital faced with a particular reimbursement structure. We assume that the hospital can utilize two main levers: patient admissions, through the size and composition of its portfolio of elective procedures, and early discharges, which modify the patient length-of-stay distribution and relieve pressure on hospital resources. For each type of procedure, we find the optimal admission rate and discharge threshold. We characterize these values under different reimbursement structures and cost structures.

**4 - Customized Optimal Diabetes Screening Policies in Resource-restricted Settings**

Michael Hahsler, Southern Methodist University, Bobby B. Lyle School of Engineering, P.O. Box 750123, Dallas, TX, 75275, United States, Hossein Kamalzadeh, Vishal Ahuja, Michael Bowen

About 10% of the US adult population has diabetes, and almost 40% are at risk of developing diabetes. Guidelines suggest population-based screening, however, in resource-restricted settings (e.g., for safety-net providers), prioritizing whom to screen and when is essential. We combine analytics methods (hidden Markov models and predictive analytics) with partially observable Markov decision process models to derive the optimal screening policy customized to the characteristics of the provider's subpopulation. We will present results for electronic health record data from the Parkland Health & Hospital System.

Chair: Murat Kurt, Bristol-Myers Squibb, 3401 Princeton Pike, Lawrence Township, NJ, 08648, United States

Co-Chair: David L. Kaufman, University of Michigan-Dearborn, Dearborn, MI, 48126, United States

**1 - Investigating Steroid Withdrawal Strategies for Kidney Transplant Recipients**

Yann Ferrand, Clemson University, Clemson, SC, United States, Christina M. Kelton, Vibha Desai, Teresa M. Cavanaugh, Jaime Caro, Jens W. Goebel, Pamela C. Heaton

We study long-term complications associated with various steroid withdrawal

strategies for kidney transplant recipients. We develop a model calibrated with an econometric study of patient data from a national registry to simulate the long-term course of these patients, and derive patient outcomes based on the characteristics of patient population. We study the role of patient heterogeneity on health outcomes, and the relative risk of steroid withdrawal versus steroid maintenance.

**2 - Comparison of Post-transplantation Diabetes Mellitus Features and Outcomes in Kidney, Liver, and Heart Transplantation Patients**

Vidit Munshi, Harvard University, Cambridge, MA, United States, Soroush Saghaian, Curtiss Cook, Harini Chakkera

Corticosteroids and immunosuppressive agents prevent graft rejection in transplantation patients, but also bring significantly increased risk for development of impaired glucose tolerance and post-transplantation diabetes mellitus. While this tradeoff is well-known, little work exists characterizing similarities and differences in these tradeoffs across different organ transplantations, particularly from the same hospital system. We present empirical work comparing characteristics and outcomes across kidney, liver and heart transplantation patients and propose a method for modeling these patients to assess interventions and determine optimal management strategies.

**3 - Strategic Decisions of Transplant Centers under Competition**

Sait Tunc, University of Chicago, IL, United States, Burhaneddin Sandikci, Bekir Tanriover

Transplant centers in the United States are regularly evaluated for their transplant-related performance. Considering the consequences of their performance outcomes, centers strategically accept/reject offered organs. We study the equilibrium behavior of a heterogeneous set of centers in a competitive market and investigate the effect of their decisions on social welfare.

**1 - Implications of Zero Rating Programs on Consumer Welfare: A Model Based Study**

Jialin Song, University of Illinois at Urbana Champaign, 104 S. Mathews Avenue, Urbana, IL, 61801, United States, Qiong Wang

Mobile Service Providers (MSPs), such as AT&T, have introduced several zero-rating programs, allowing Content Providers (CPs) to pay for data usage on behalf of customers. However, some worry that zero-rating behavior may hurt the welfare of customers of a MSP's existing data plans. We develop a linear integer programming model and a dynamic programming solution procedure to analyze MSP's optimal offering of data plans and the impact of zero rating. We carry out numerical experiments to examine the implications of zero-rating programs with respect to the clustering algorithms to aggregate subscribers into groups, data demand and willingness to pay associated with each group and their correlation.

**2 - Clique Interdiction Attacks in Networks**

Ivana Ljubic, ESSEC Business School of Paris, 3 Av. Bernard Hirsch B.P. 50105, 3rd floor, office 315, Cergy, 95021, France

We consider a leader-follower game where the leader removes a fixed number of vertices, and the follower finds the maximum clique over the remaining network. The leader searches for the vertex removal policy that minimizes the largest remaining clique. The problem has applications in the surveillance of communication networks. We provide results concerning the problem complexity and polyhedra, combinatorial lower bounds and safe reduction techniques. We implement a useful tool for analyzing the resilience of (social) networks with respect to vertex-interdiction attacks. Networks with up to 3M edges can be analyzed and solved to optimality within short computing times.

**3 - A Flexible Natural Formulation for the Network Design Problem with Vulnerability Constraints**

Okan Arslan, HEC Montreal, Montreal, QC, Canada, Ola Jabali, Gilbert Laporte

Given a graph, a set of origin-destination (OD) pairs with communication requirements and an integer  $k$ , the network design problem with vulnerability constraints (NDPVC) is to identify a subgraph with the minimum total edge costs such that between each OD pair, there exist a hop-constrained primary path, and a hop-constrained backup path after any  $k-1$  edges of the graph fail. We develop a natural formulation based on the notion of length-bounded cuts. Experimental results show that for single edge failures, our formulation increases the number of solved benchmark instances from 61% to over 95%. Our formulation also efficiently solves the NDPVC for multi-edge failures ( $k=3$ ).

### Deep Learning Methods for Manufacturing Processes

Sponsored: Data Mining

Sponsored Session

Chair: Chitta Ranjan

Co-Chair: Kamran Paynabar, ISyE, Georgia Institute of Technology

#### 1 - Apply Deep Learning to Powder Bed Fusion Process Physics in 3D Printing

He Luan, HP Labs, HP Inc., Palo Alto, CA, United States, Sam Stodder, Jordi Roca, Jun Zeng, Qiang Huang, David Murphy, Thomas Paula

Informed by physical knowledge, the powerful learning ability of deep learning has huge potential to model and understand the complicated physical behaviors, such as fusing principles involved in powder bed fusion based 3D printing. Using HP's Multi Jet Fusion (MJF) as an example, this research demonstrates how deep learning can be applied to model and explore process physics. In first application, deep neural network models were built to predict the voxel level fusing layer thermal behavior from multiple thermal influencers. The second application models the heterogeneous material thermal diffusivity as a deep neural network, to enable both in-situ thermal prediction and better understanding.

#### 2 - Online and Active Learning-based Classifier for Non-scalable Media Data

Geet Lahoti, ISyE, Georgia Institute of Technology, 1038 Mcmillan St. NW, Atlanta, GA, 30318, United States, Chitta Ranjan, Chuck Zhang

Typically dimension reduction is performed prior to building a classification model for high-dimensional data. However, how to build a classifier for high-dimensional data when dimension reduction is not possible? Consider a problem where sheet metals are to be classified as defective or non-defective using their large images. In this situation, when the defect size is extremely small in comparison to the image, rescaling of the image often loses the defect signal. Such a problem is more pronounced in various video datasets. To address this, we develop a new approach using Active and Online Learning that uses a combination of strongly and weakly labeled data to build a defect classifier.

#### 3 - Nonlinear Profile Monitoring via Variational Autoencoder

Hao Yan, 699 S. Mill Ave, Tempe, AZ, 85281, United States

Unsupervised learning of nonlinear profiles has attracted increasing attention among researchers as well as practitioners because of its applications in process monitoring and diagnostics. However, existing unsupervised learning techniques for profile monitoring are typically based on linear models such as Principal Component Analysis, which fails to model the distribution of nonlinear profiles. We present a unified framework for nonlinear profile monitoring based on variational autoencoder, which a testing statistics can be naturally derived. We then demonstrate how this framework can be used for denoising and profile monitoring with various simulations and case studies.

#### 4 - A Novel Classification Deep Boltzmann Machine (C-DBM) for Supervised Learning

Samaneh Ebrahimi, Georgia Institute of Technology, Atlanta, GA, 30318, United States, Kamran Paynabar

The Restricted Boltzmann Machine (RBM) is a probabilistic model to model the distribution of a visible layer of features using one hidden layer. Deep Boltzmann Machines were developed as an extension of RBM with multiple hidden layers. These methods have been successfully applied for unsupervised learning. In 2009, Larochelle and Bengio proposed a new discriminative RBM for supervised learning known as Classification RBM (CRBM). Due to estimation intractability, an effective deep extension of CRBM has not been used in the literature. In this paper, we propose a new estimation approach for deep CRBM (C-DBM). Moreover, we implement this approach on a manufacturing process for validation.

### Joint Session DM/Practice Curated: Data Science and Analytics to Manage Power and Water

Sponsored: Data Mining

Sponsored Session

Chair: Durai Sundaramoorthi, Saint Louis, MO, 63130, United States

#### 1 - Time Varying Optimization and Learning in Power Systems

Jiafan Yu, Stanford University, Stanford, CA, United States, Siobhan Powell, Ram Rajagopal

Traditional approaches to reactive power management in distribution networks have focused on designing stable and near-optimal centralized or distributed

control schemes under the assumption that network physics constraints are completely known. In this talk, we explore an alternative approach that learns a control procedure by observing streams of measurements from the system. We show that a simple batch learning and optimal control procedure attains comparable performance to existing approaches without requiring any prior knowledge of the network and give some analytical guarantees. We then show how the procedure can be utilized to construct an online learning process for the problem.

#### 2 - Exploration of Machine Learning Techniques in Time Series pH Prediction in Water Distribution System

Xiushuang Li, Arizona State University, Tempe, AZ, 85281, United States, Daniella Sietta, Pitu B. Mirchandani, Treavor Boyer

Accurate prediction of the system state is extremely important in controlling water distribution system. Machine learning appears to be a great way to estimate and predict the state of the dynamic system. We explored the application of Symbolic Regression (SR), Lasso Regression (LR) and Neural Network models (NN) to predict time series pH in a small water distribution system. All three methods can achieve comparable accuracy ( $R^2 > 0.93$ ), but LR and NN models take much less time to train than SR model. LR can also filter insignificant input variables in pH prediction by forcing their coefficients to be zero. Both LR and NN can be a useful tool to build the predictive model in water distribution system control.

#### 3 - A Bayesian Forecasting Model of Electric Outages

Luis J. Novoa, James Madison University, Harrisonburg, VA, United States, Babak Zafari, Goran Vojvodic, Refik Soyer

As an aid for planning and preparation against severe weather events we propose a forecasting model for electric outages under a bayesian framework. We applied the model using real data.

### Data Science and Artificial Intelligence I

Sponsored: Data Mining

Sponsored Session

Chair: Evan Barlow, Weber State University, Goddard School of Business & Economics, 1337 Edvalson St, Ogden, UT, 84408, United States

#### 1 - Thermodynamics of Markov Decision Processes

Peeyush Kumar, University of Washington-Seattle, Seattle, WA, United States

This research introduces information theoretic methods inspired by stochastic thermodynamics for MDPs with model uncertainty. Specifically, this research models the physical aspects of information into system dynamics. I will show an explicit link between the information entropy and the stochastic dynamics of a system coupled to an environment. We analyze various sources of entropy production: due to the decision maker's uncertainty about the system-environment interaction characteristics, and the stochastic nature of system dynamics. This analysis provide a formulation that enables us to define the optimality criterion for MDPs with model uncertainty.

#### 2 - If You Can't Beat Them, Join Them: Collective Intelligence Outperforms Artificial Intelligence at Diagnosing Skin Cancer

Erik P. Duhaime, Massachusetts Institute of Technology, 100 Main Street, e62-390, Cambridge, MA, 02142, United States

A growing chorus of academics, thought leaders, and politicians warn that artificial intelligence will cause unprecedented job loss, even among highly trained knowledge workers such as doctors. At the same time, advances in information technology have enabled entirely new ways of organizing work, and research has shown that crowds of people oftentimes outperform even their most highly skilled individual members. Here, I leverage a dataset of the diagnoses of 1 state-of-the-art artificial intelligence system and 21 board-certified dermatologists in order to examine what happens when artificial intelligence is combined with - rather than compared to - human intelligence.

#### 3 - Learning Hidden Markov Models with Regulated Initialization using Multinomial Regression

Akash Gupta, Oklahoma State University, 40 South University Place, Stillwater, OK, 747075, United States, Tieming Liu, Christopher Crick, Dursun Delen

Hidden Markov Models (HMMs) are widely used for developing disease progression models. Learning parameters of HMMs using Baum-Welch (BW) algorithm with random initialization is a computationally expensive task. In this work, we propose a regulated initialization framework for BW algorithm using multinomial logistic regression that allows early convergence. The preliminary results showed improvement of 68 - 90% compared with random initializations. The proposed method facilitates the development of disease progression model with high granularity in disease states.

#### 4 - A Novel, Scalable Machine Learning Task Capable of Superhuman Artificial Intelligence

Evan Barlow, Weber State University, Goddard School of Business & Economics, 1337 Edvalson St, Ogden, UT, 84408, United States

Machines often outperform humans in executing repetitive physical tasks. Leveraging machine learning, computers can now: (i) mimic human performance in repetitive mental tasks, or (ii) exceed human performance in complicated predictive tasks. Prediction is most fitting, however, when inputs and outputs are out of decision makers' control. Large-scale prescriptive analytics using optimization is very difficult (if possible at all) for most current machine learning tasks. The machine learning task presented here promises a scalable approach to superhuman decision making. The approach has successfully been applied to prescribe optimal decisions with several large-scale sandbox datasets.

##### 1 - Automatic Diagnosis of Alzheimer's Disease Using Deep Neural Networks

Maryam Zokaeinikoo, Graduate Research Assistant, Pennsylvania State University, University Park, State College, PA, 16802, United States, Prasenjit Mitra

We propose different neural network models based on Long Short-Term Memory (LSTM) to detect the onset of Alzheimer's early in the course of the disease using textual data from both healthy subjects and patients. These models include LSTM networks, bidirectional LSTM (BLSTM), bidirectional LSTM with attention layer (Attention-BLSTM), and bidirectional LSTM with conditional random fields layer (CRF-BLSTM). Although the LSTM often requires large training datasets, our CRF-BLSTM algorithm demonstrates that even with limited training data it performs well in detecting the Alzheimer's disease. The results are validated using two methods of cross validation.

##### 2 - Computational Algorithms for Tracking Near Falls with Multiple Wearable Sensors

Alla Kammerdiner, New Mexico State University, Las Cruces, NM, United States, Razan Ayasra

A loss of balance that constitute near falls can be tracked with multiple body-worn accelerometers. We consider some new formulations for estimation and optimization problems related to tracking of near falls. We also present and analyze computational algorithms, which are used for space partitioning in statistical estimation and for solving the combinatorial optimization problems.

##### 3 - Seizure Detection Using a Hidden Markov Model Framework

Mahboubah Madadi, Louisiana Tech University, College of Engineering and Science, P.O. Box 10348, Ruston, LA, 71272, United States, Giovanni Petris, Leonidas Iasemidis

In this study, a hidden Markov models (HMM) is developed to automatically detect different brain states in epilepsy patients. The proposed HMM aims at characterizing the dynamics of intracranial electroencephalographic (iEEG) signals using important features such as generalized partial directed coherence (GPD). The iEEG signals from epilepsy patients, who underwent long-term monitoring of the brain electrical activity for subsequent surgical removal of their epileptogenic focus, were analyzed to classify a patient's state at a given point in time into one of four states: interictal (seizure-free / between seizures), pre-ictal (pre-seizure), ictal (seizure), postictal (post-seizure).

##### 4 - A Deep Learning Approach of Microarray Data Analysis in Cancer Prognosis

Sharmin Nahar Mithy, Doctoral Candidate, University of South Florida, Tampa, FL, 33612, United States, Grisselle Centeno

Research has shown that a major portion of cancers and related deaths could be prevented by applying existing knowledge about cancer treatment. In this research we present a deep learning approach for cancer gene identification. SDAE based clustering approach is applied here for feature extraction from Gene Expression Profiling and will be compared with some other methods. The performance of the extracted information will be evaluated to verify the usefulness of the new features. The extracted feature will further be utilized to predict the radio sensitivity for 48 cell line used as input in cancer treatment and patient prognosis. We expect to validate the data from 20 patients with rectal cancer.

Sponsored: Information Systems

Sponsored Session

Chair: Zaiyan Wei, Purdue University, Purdue University, West Lafayette, IN, 47907, United States

##### 1 - Is Home Sharing Making Housing Less Affordable? Evidence from a Natural Experiment on Airbnb

Wei Chen, Assistant Professor, University of Arizona, 1130 East Helen Street, Tucson, AZ, 85721, United States, Zaiyan Wei, Karen Xie

We study the impact of online home sharing on affordable housing. We leverage a "natural experiment" of a platform regulation that caps the number of properties a host can manage in some markets to estimate the impact. We find that the restriction was associated with a 3.5% decrease in local rental prices and a 1.9% decrease in housing value. The decrease can be attributed to the removal of absentee landlords' properties from Airbnb back to local markets. The price-to-rent ratio, however, increased by about 1.6%, which suggests that online home sharing is mainly a substitute for local rental markets. These findings speak to the question whether home sharing makes housing less affordable.

##### 2 - Does Political Polarization Decrease Market Efficiency: An Investigation in the Context of Online Lending

Hongchang Wang, Georgia Institute of Technology, 800 West Peachtree NW, Atlanta, GA, 30308, United States, Eric Overby

We study whether political polarization inhibits market efficiency by examining whether investors in online lending markets are less likely to lend to borrowers whose political ideology (i.e., liberal or conservative) is likely to be different from their own. We apply both a gravity model and a difference-in-differences model to find that borrowers in liberal states are more preferred than borrowers in conservative states (on average 5% more bids). In addition, borrowers are more likely to attract investors from politically similar states than investors from politically dissimilar states. We find that political distance deters online lending, with an impact of 1.8% for one standard deviation.

##### 3 - The Roles of Informed and Uninformed Backers on Crowdfunding Platforms

Aravinda Garimella, University of Washington, Foster School of Business, Mackenzie 350, Seattle, WA, 98105, United States

Backers of crowdfunding projects are heterogeneous in market knowledge, sophistication and overall informedness. We examine the roles of informed and uninformed backers on reward-based crowdfunding platforms. Using transaction-level data from a leading Chinese crowdfunding platform, we classify backers into informed and uninformed backers based on their contribution patterns. We study how uninformed backers affect fundraising dynamics and the ultimate performance of crowdfunding projects. Drawing from theoretical models of investor sentiment, we offer findings with important implications for crowdfunding platforms and entrepreneurs.

##### 4 - Is Non-persistent Social Status a More Useful Incentive Mechanism? Evidence from Yelp Elite Squad

Mingyue Zhang, Beijing Foreign Studies University, Beijing, China, Xuan Wei

Content sharing platforms such as product review websites largely depend on users' voluntary contributions. To motivate the contributions, many platforms established reputation-based incentive mechanisms. Yet most of the existing research has focused on reputations that are everlasting. In this research, we study the effect of non-persistent social status on user behavior using data from Yelp Elite Squad which is a yearly program. We design fixed effect model as well as matching method to empirically study the effect of non-persistent social status on user's behavior in both short term and long term. Our study has significant implications for business models that rely on user contributions.

##### 5 - Do You Donate Out of Altruism or Self-interest? A Case of Conditional Social Gift Exchange in Fundraising

Cenyang Yang, University of Texas at Austin, Austin, TX, 78703, United States, Shun-Yang Lee, Andrew B. Whinston

In this paper we explore the motivation, altruism or self-interest, behind donation in the context of social gift. We tease out one's altruistic motivation from the self-interest motivation by introducing different levels of recommended donation amount through a randomized experiment. The results show that people behave selfishly when a social gift is incorporated in a more altruistic context, but altruistically when it is incorporated in a more self-interest context.

#### 1 - Sensor Fusion via Statistical Hypothesis Testing for Prognosis and Condition Monitoring

Abdallah A. Chehade, University of Michigan-Dearborn, 4901 Evergreen Road, 2280 HPEC, Dearborn, MI, 48128, United States

The rapid development of sensing technologies made multiple sensors available to real-time monitor the degradation status of machine systems. However, almost no method provides a statistical metric to evaluate the quality of degradation signals for prognosis and condition monitoring. To fill this literature gap, the paper constructs a health index via a sensor fusion framework for prognosis and degradation analysis through a series of statistical hypothesis tests. The performance of the proposed is evaluated and compared to benchmark methods on a publish C-MAPPS dataset.

#### 2 - Data-Driven Sensitivity Indices for Models with Dependent Inputs using the Polynomial Chaos Expansion

Zhanlin Liu, University of Washington, Seattle, WA, United States

Variance-based sensitivity analysis characterizes how the variance of a model output is propagated from the model inputs. Conducting such analysis for models with dependent inputs requires strong assumptions in the literature. We propose data-driven sensitivity indices for models with dependent inputs using the polynomial chaos expansion where the strong assumptions are not required. Two numerical examples, in which sensitivity indices cannot be directly obtained by the existing methods, are used to validate our proposed method.

#### 3 - Sensitivity Analysis on a Network using the Polynomial Chaos Expansion

Zhanlin Liu, University of Washington, 8033A 45th Ave NE, Seattle, WA, United States

Network structures exist in various engineering applications. Conducting variance-based sensitivity analysis on a network helps to control the quality of the network output. We propose the network sensitivity indices based on the sparse network polynomial chaos expansion to measure the sensitivity indices for the controllable independent inputs to the network output. The proposed method is more computationally efficient and requires fewer observations of the inputs and the output than using the Monte Carlo method. Two manufacturing examples are implemented to validate the proposed method.

### High-Dimensional Data Analysis for System Prognostics and Performance Improvement

Sponsored: Quality, Statistics and Reliability

Sponsored Session

Chair: Xiaolei Fang, Georgia Institute of Technology, Atlanta, GA, 30329, United States

#### 1 - Reliability Analysis of Repairable Systems with Dynamic Covariate Information

Wujun Si, Wichita State University, 11316 E. Pine Meadow Ct, Wichita, KS, 67206, United States, Qingyu Yang

With the advancement of sensing technology, dynamic covariate information is often recorded simultaneously with reliability data. We propose a novel reliability model for repairable systems when dynamic covariate information is presented. A maximum likelihood estimation method is developed to estimate the model parameters. A simulation study is implemented to illustrate the developed methods, and a real world case study is conducted to demonstrate the proposed model.

#### 2 - A Prognostic Framework for Complex Engineering Systems with Multi-failure Modes

Liexiao Ding, Georgia Institute of Technology, Atlanta, GA, United States, Xiaolei Fang, Nagi Gebraeel

Many systems and subsystems usually have more than one cause of failure. Therefore, in real world applications, it is important to distinguish between these different causes of failures also known as Multi-failure Modes. To address the challenges, we develop a prognostic methodology, utilizing multi-sensor stream, to identify failure mode and then predict remaining useful life(RUL) of partially degraded systems. We propose a finite mixture of (log)-location-scale regression to model inhomogeneous sensor streams a grouped-penalized maximum likelihood estimator to perform sensor selection.

#### 3 - A Feature Ranking Method for Process Data Based on Distance Correlation

Andi Wang, Georgia Institute of Technology, H. Milton Stewart School of, Industrial and Systems Engineering, Atlanta, GA, United States, Juan Du, Xi Zhang, Jianjun Shi

In advanced manufacturing systems, multiple features are extracted from the data obtained from each working stage to characterize the process condition. Some of the features relate to the quality of the final products, and may provide valuable information on the quality of the product before inspection. Based on distance correlation metric, we propose a method that ranks the importance of the features obtained from the process based on their general dependency with the product quality. Theoretical properties of our method is studied, and a real case study in a solar cell manufacturing process validates the effectiveness of our method.

#### 4 - A Supervised Dimension Reduction-Based Prognostics Model for Applications with Incomplete Signals and Censored Failure Times

Xiaolei Fang, Georgia Institute of Technology, Atlanta, GA, 30329, United States, Kamran Paynabar, Nagi Gebraeel, Weijun Xie

The incompleteness of degradation signals and censoring of historical failure times pose significant challenges for prognostics. To address these challenges, this paper develops a novel method that combines a feature extraction term and a regression term. The first term is capable of extracting features using multi-stream incomplete signals, while the second term regresses the features against censored failure times. By simultaneously optimizing the two terms, the extracted features are guaranteed to be most informative for predicting failure times. To solve the optimization problem, a Block Prox-Linear Coordinate Descent algorithm with a global convergence property is developed.

### New Advanced Deployment Features of Modeling Languages for Optimization

Sponsored: Computing

Sponsored Session

Chair: Bjarni Kristjansson, Maximal Software Inc., Arlington, VA, 22201, United States

#### 1 - Optimizing in the Cloud - Deploying Optimization Models on the Cloud with Web Services REST API's

Bjarni Kristjansson, Maximal Software Inc., 2111 Wilson Boulevard, Suite 700, Arlington, VA, 22201, United States

Over the past decade the IT has been moving steadfastly towards utilizing software on clouds using Web Services REST API's. In this presentation we will demonstrate the new MPL REST Server, which allows optimization models to be easily deployed on the cloud. By delivering optimization through a standard REST API, which accepts data in JSON and NoSQL formats, the optimization becomes purely data-driven. Client applications can now be implemented relatively easily on different client platforms such as mobile/tablets or web sites, using just standard HTML/CSS with Javascript, or any other preferred programming language.

#### 2 - New Programming Tools and Interfaces for Deploying AMPL Models

Robert Fourer, AMPL Optimization Inc., 2521 Asbury Ave, Evanston, IL, 60201, United States, Filipe Brandão

Though fundamentally declarative in design, optimization modeling languages are invariably implemented within larger modeling systems that provide a variety of programming options. Although programming is not used to describe models, it facilitates the integration of models into broader algorithmic schemes and business applications. This presentation surveys ways in which a programming interface can be useful for development and deployment, with examples from the AMPL modeling language and system. The focus is on new APIs (application programming interfaces) for controlling AMPL from programs in Python and in R, and on new facilities for invoking Python programs from within AMPL.

#### 3 - Enhanced Model Deployment and Solution in GAMS

Steven P. Dirkse, GAMS Development Corporation, Washington, DC, United States, Fred Fiand

The new capabilities recently added to GAMS make it easier than ever to develop, solve, and deploy models in non-traditional and powerful ways. Our cross-platform GAMS Studio provides a fresh look that will be welcomed by Mac users. Our embedded Python facility opens up a wealth of possibilities and makes data movement between GAMS and Python fast and painless, while providing a seamless union of Python code in a GAMS model. Finally, we have multiple ways to solve & deploy models to take advantage of parallel computing and opportunities to solve a group of similar models with only a single model generation. In this talk, we'll introduce these capabilities and demonstrate their use with a series of examples.

#### 4 - Xpress Mosel: Using Alternative Solvers and Trends in Modeling

Susanne Heipcke, FICO, 181 Metro Dr, Ste 700, San Jose, CA, 92130, United States

The modeling and solving environment Xpress Mosel has recently been turned into free software, simultaneously opening the Mosel language to alternative Mathematical Programming solvers. We give an overview of these solver interfaces and their use. The easy deployment of Mosel models as web applications without programming by adding configuration information to the model has raised demand for interconnection with analytics tools, such as Python. Another trend, the increasing use of Mosel for non-optimization tasks, has triggered a revision of the language, introducing a host of new programming-related features.

### Joint Session ICS/Practice Curated: Retail Layout and Shelf Space Analytics

Sponsored: Computing

Sponsored Session

Chair: Ahmed Ghoniem, University of Massachusetts Amherst, Amherst, MA, 01003, United States

#### 1 - Discrete Event Simulation Model for Purchases at Temporary Displays in a Grocery Store

Alice E. Smith, Auburn University, 3301 Shelby Center, Dept of Industrial/Sys Engineering, Auburn, AL, 36849, United States, Ilknur Uludag

We develop a discrete event simulation model that evaluates impulse purchase likelihoods of product categories at temporary displays in grocery stores considering cross-category sales and customer paths. End-of aisles and islands are temporary displays for promotional, new, and high impulse products. In the simulation model, a customer shopping trip is created based on the number of purchased product categories, and a modified shortest path of the purchased products. The shopping basket data from a major grocery store chain, the impulse purchase likelihoods of product categories, and the permanent displays of product categories in a grid store layout are analyzed by the simulation.

#### 2 - Analytics for Store-wide Shelf Space Management

Bacel Maddah, American University of Beirut, Bechtel 519A, P.O. Box 11-0236 Riad El Solh, Beirut, 1107 2020, Lebanon, Ahmed Ghoniem, Tulay Flamand

We investigate how the allocation of product categories can be optimized in a fashion that guides in-store traffic and stimulates impulse buying. We develop a predictive regression model that estimates traffic densities at a shelf as a function of the shelf space allocation and the location of the shelf in the store. This traffic model is embedded within a mixed-integer nonlinear program that determines the location and the shelf space of all product categories in the store in a way that maximizes impulse buying. To overcome the computational challenges, we utilize a variable neighborhood search. We apply our analytics framework to a grocery store in Beirut with encouraging results.

#### 3 - Joint Consideration of Rack Layout and Product Allocation to Maximize Retail Impulse Purchase

Pratik J. Parikh, Wright State University, 3640 Colonel Gelnn Highway, 207 Russ Engineering Center, Dayton, OH, 45435-0001, United States, Bradley R. Guthrie

In a retail store, the configuration of racks and the placement of products on it affect what shoppers see during their shopping trip, and the eventual decision to buy. While research has shown that staple products (e.g., bread, milk) will be purchased no matter their location, the location of impulse products (e.g., candy, novelties) has a significant impact on their sales. We extend our prior research on quantifying exposure by proposing an optimization approach that determines the optimal rack orientation and curvature to maximize expected impulse profit across a variety of product location-allocation decisions.

#### 4 - Hierarchical Optimization for Retail Store Layout Design

Tulay Flamand, Colorado School of Mines, Division of Economics and Business, Engineering Hall 816 15th Street, Room 313, Golden, CO, 80401, United States, Ahmed Ghoniem, Bacel Maddah

We address a layout design problem for a retail department store by proposing a hierarchical approach. First, we formulate a mixed-integer programming model, which allocates departments to different areas of the store in a way that jointly maximizes the customers' shopping convenience and impulse buying. Using the prescribed allocation, we then propose a predictive model to form a main walkway around each department based on its traffic. Finally, we formulate a second optimization model that determines the specific location of each department category in its assigned area by considering the interplay between the category allocation, in-store traffic and impulse buying.

#### 5 - The Price-setting Newsvendor with Poisson Demand

Anna-Lena Sachs, University of Cologne, Albertus-Magnus-Platz, Cologne, 50923, Germany, Benedikt Schulte

We study the price-setting newsvendor with Poisson demand. We develop an analytical solution approach that covers a broad class of demand curves, including both linear and iso-elastic demand curves, explain how to apply our approach to more general demand functions via piece-wise linear approximation, and develop analytical and numerical insights. We characterize the behavior of the optimal price and analyze the performance gap of different price-setting heuristics. We observe instances in which a significant share of profits would be lost if the discrete nature of demand were not modeled explicitly.

#### 1 - An Event Study of Servitization: Focusing on Korean Companies

Chongwoo Park, Korea University Business School, Seoul, Korea, Republic of, Hosun Rhim

Korean economy has been grown up based on the solid manufacturing industries. As the economy gets mature servitization is regarded as a breakthrough. We examine impact of servitization to the shareholder value by measuring the stock market reaction associated with servitization announcement.

#### 2 - A WoS-based Literature Review on Newsvendor Models

Sungyong Choi, Yonsei University, College of Government and Business, 1 Yoneseidae-gil, Wonju, 26493, Korea, Republic of

The newsvendor model has been actively studied in the field of management science and operations management as a stochastic inventory optimization model. Since the seminal work of Arrow et al. (1951), some variations of the newsvendor models have also been studied in literature until now. Then, using WoS (Web of Science), we will review the previous studies on the newsvendor models focusing on some well-known review papers and try to find further research directions.

#### 3 - Forecasting Aviation Services Delay using MIT Lincoln Lab and EuroControl's Estimation Criteria

Chang Won Lee, Hanyang University, School of Business, 17 Haengdang Dong, Seoul, 133-791, Korea, Republic of, Jae Sun Jeong

This study is to forecast aviation services delay by aviation weather. This study developed a forecasting model of the delayed cost of aviation service caused by aviation weather. We use the delay reduction model by MIT Lincoln Lab and EuroControl's estimation criteria for delay cost

#### 4 - A DEA-AR Model with Weight Bounds Based on Triangular Distributions

Sangwon Eum, Korea University Business School, Seoul, Korea, Republic of, Hosun Rhim

We propose a DEA-AR model using stochastic weight bounds. For practical purpose, triangular distribution is assumed. We test the model by changing parameters of the distribution. Real data set is used for the test.

### Preference-driven Decision Aiding I

Sponsored: Multiple Criteria Decision Making

Sponsored Session

Chair: Roman Slowinski, Poznan University of Technology, 60-965, Poland

Co-Chair: Adiel Teixeira De Almeida Filho, Universidade Federal de Pernambuco, Recife-PE, 50.630-971, Brazil

#### 1 - On Rationality Conditions for Multi-attributed Choice Behavior

Pekka J. Korhonen, Aalto University School of Business, Pahkinaranta 10, Huhmari, 03150, Finland, Jyrki Wallenius, Peng Xu, Tolga Genc

This paper deals with rationality conditions for choice behavior. We explore two different types of choice settings: (1) Win-Win setting, (2) Tradeoff setting. We study the decision-maker's rationality conditions in both settings. The key underlying theoretical assumptions in our paper are increasing and concave single-dimensional utility (value) functions with decreasing marginal values and the Kahneman-Tversky Prospect Theory model of choice with loss aversion. We use an empirical experiment to illustrate our considerations.

#### 2 - Shared Decision Making (SDM): A Preference-driven Approach to Medical Decision Making

Evangelos Triantaphyllou, Louisiana State University, Dept of Computer Science, 298 Coates Hall, Baton Rouge, LA, 70803, United States, Edouard Kujawski, Juri Yanase

A unique and important type of decision making occurs when a patient and clinicians collaborate to decide the best treatment. SDM is a fast emerging preference-driven approach. It aims at determining the treatment that best meets the personal values, goals and preferences of the patient. However, some SDM approaches may be seriously defective as they rely on erroneous models.

#### 3 - Evolutionary Multiobjective Optimization Guided by Preferences Modeled with Achievement Scalarizing Function

Roman Slowinski, Professor, Poznan University of Technology, Pl. Marii Skłodowskiej-Curie 5, NIP: 777-00-03-699, Poznan, 60-965, Poland, Tomasz Sternal

A new preference-driven interactive method is proposed that organizes the evolutionary search of multiobjective space along a set of directions indicated by a preference model consistent with some preference information elicited from the Decision Maker (DM). It is compared in a computational experiment to state-of-the-art multiobjective evolutionary optimization algorithms MOEA/D and NSGA-III. Our method applies an augmented Chebyshev function as a preference model. Adjusting the model parameters relies solely on a number of pairwise comparisons of some non-dominated solutions elicited from the DM during the algorithm run.

#### 4 - A New Online Tool to Comprehensively Support Multi-Criteria Decision Aiding Processes: ElectioVis

Maximiliano Ariel López, University of Buenos Aires, Buenos Aires, Argentina, Valentina Ferretti

This research proposes the development of a new online Multi-Criteria Decision Aiding tool that is able to support expert and non-expert users. It assists the method selection phase (i.e. choosing the best tool given the characteristics of the decision opportunity under analysis) as well as the model deployment (identifying the best solution for that specific decision). The interactive support provided by the ElectioVis online decision support system bridges insights from behavioural and normative theories to allow for the development of more successful interventions and solutions.

### Joint Session MAS/Practice Curated: Analytic and Data Science Applications

Sponsored: Military and Security

Sponsored Session

Chair: Jon Alt, Naval Postgraduate School, Monterey, CA

Co-Chair: Eric Tollefson

#### 1 - Leveraging the Cloud Computing Environment to Support Decision Makers

Nathan I. Parker, TRADOC Analysis Center - Monterey, 700 Dyer Road, Room 178, Monterey, CA, 93943, United States, Jonathan Shockley

Here we use our ongoing effort to develop a cloud-hosted, browser interfaced decision support tool (DST), leveraging one of TRADOC Analysis Center's simulation models, as a starting point to discuss how cloud computing provides a unique capability to enable distributed data science applications. In addition to presenting the Logistics Battle Command DST itself, we will also discuss the underlying cloud infrastructure we employ and our development, test, and deployment pipeline.

#### 2 - Aerial Exposure Metric

James Jablonski, TRADOC Analysis Center, 1106 Leahy Rd, Monterey, CA, United States

The development of a method to calculate the level of exposure of each point in the sky in a given terrain box to points on the ground. The exposure metric can then be used to characterize the exposure of an area, to determine the optimal routing to minimize exposure in a given area, or to determine the optimal placement of air defense assets to maximize coverage in an area. The research also informs the computational costs of scaling these methods up to a larger terrain box and provides insights into future directions. A proof of principle application, developed using open source tools is provided.

#### 3 - Binary Classification with Asymmetric Error Type Control

Mathew Norton

We introduce a new formulation for binary classification with asymmetric error control inspired by the Neyman-Pearson (NP) paradigm. We propose a computationally efficient large margin classifier with the same generalization benefits as Support Vector Machines in high-dimensional feature spaces, but with fine tuned control over the amount of allowable Type I and Type II error. Our approach is based on a new characterization of uncertainty called Buffered Probability of Exceedance (bPOE) and, as consequence, often reduces to convex or linear programming.

#### 4 - A Methodological Framework for Developing a Defense Data Strategy

Kurt Klingensmith, TRAC, Monterey, CA, United States, Jon Alt

In order to lead the Army's modernization, the emerging Army Futures Command (AFC) will leverage timely, relevant, and credible analysis to inform and drive critical modernization strategies, priorities, and decisions. Achieving this requires the development and operationalization of a formal AFC Data Strategy. The Data Strategy envisions how the AFC will use data as an enterprise asset in support of modernization activities such as concept development, modernization planning, acquisition, and capability delivery. This presentation will present a systems architecting-based methodology for developing data strategies along with a framework for implementing and executing a data strategy.

### 5 - Reinforcement Learning Applications for Managing Public Sector “Use-or-Lose” Budgets

Erich Morman, Naval Postgraduate School, Monterey, CA, United States

When it comes to paying for contractor work, the private and public sectors operate under different environments. Regulatory constraints at the Department of Defense (DoD) as well as predominately throughout the public sector complicate the decision of how best to pay a contractor. In the public sector, it is often required to provide full funding for a project upfront. Furthermore, the funding provided has an expiration point whereby money that is not spent within a certain timeframe is taken away by a higher treasury or comptroller office. In this study, we look to use reinforcement learning algorithms to design efficient sequential payment strategies for contracted projects that can limit the amount of funding lost by the public sector customer.

#### 1- Opportunities and Challenges in Patient Service Personalization

Eduardo Perez, Texas State University, Roy F. Mitte Complex, 749 N. Comanche St., San Marcos, TX, 78666, United States

Patient service personalization provides new opportunities for health care systems in their pursuit of better patient outcomes and commitment to quality and safety. Much like the recent expansion of product customization, service personalization has been expanding lately due to a variety of factors including technological advances that allow for better service delivery and communication. Much of the existing research has viewed service variability as something negative that must be controlled. However, customer variability in service needs provides an opportunity to deliver more value for patients through personalization of services. This talk will examine patient service personalization and the design of systems for service customization. Starting with a review of current work, the talk will develop a framework for patient service personalization and service design, focusing on the concept of patient variability. Then the talk will include a description on how to use this concept to extract greater value from the transaction between the patient and the health care system. Based on the framework, the talk will then identify important directions for future research from both practice and academic viewpoints.

### Joint Session PSOR/Practice Curated: Transportation Issues in Smart Cities

Sponsored: Public Sector OR

Sponsored Session

Chair: Leila Hajibabai, PhD, State University of New York, Stony Brook, NY, 11794, United States

#### 1 - Integrated Signal Timing and Traffic Metering Optimization in Connected Urban Transportation Networks

Ali Hajbabaie, Washington State University, Raleigh, WA, 99164-2910, United States, Rasool Mohebifard, S.M.A. Bin Al Islam

In this paper, we proposed a distributed mathematical optimization program that dynamically optimizes the traffic signal indications at intersections and at the same time finds the optimal number of vehicles that should enter the transportation network from its boundary gates to maximize the overall network performance. The solution technique has a model distributed predictive control structure that uses the location information of connected vehicles and vehicle counts from loop detectors to estimate the system state to optimize the decision variables. The results show that the proposed algorithm outperforms several benchmark solutions and increases the network throughput by 41.8% to 43.2%.

#### 2 - A Consensus-based Trajectory Control Logic for Connected and Autonomous Vehicles in a Signal-Free Intersection

Leila Hajibabai, State University of New York at Stony Brook, Department of Civil Engineering, 2433 Computer Science, Stony Brook, NY, 11794, United States, Amir Mirheli, Mehrdad Tajalli, Ali Hajibabai

This paper presents a distributed cooperative control logic to plan conflict-free trajectories for connected and autonomous vehicles (CAVs) in signal-free intersections. The problem is formulated into CAV-level mixed-integer non-linear programs (MINLPs) that minimize each vehicle's travel time and avoid near-crash conditions. To push CAV-level solutions towards global optimality, we develop a coordination scheme that shares vehicle states on location and speed over a prediction period and incorporates such information in each CAV's respective MINLP.

#### 3 - Scheduling of Heterogeneous Connected Automated Vehicles at a General Conflict Area

Xiaopeng Li, University of South Florida, 4202 E. Fowler Avenue, ENG 207, Tampa, FL, 33620, United States, Saeid Soleimaniamiri

A mixed integer programming (MIP) model is proposed to solve the joint optimization problem that simultaneously determine scheduling and trajectories of connected autonomous vehicles at a multi-conflict point considering heterogeneous vehicle headways and values of time. A novel dynamic programming based solution approach is proposed to obtain a near optimal solution. A set of numerical examples show that the model solutions can significantly increase the capacity of the conflict point and reduce both travel time and fuel consumption.

#### 4 - Community-engaged Operations Research as a Tool to Support Diversity, Equity and Inclusion in the Profession

Michael P. Johnson, University of Massachusetts Boston, Department of Public Policy & Public Aff, 100 Morrissey Boulevard, Boston, MA, 02125-3393, United States

OR/MS/analytics faces two important questions regarding diversity, equity and inclusion. First, what has the profession done to address important diversity-related social problems? Second, what can the profession do to meet diversity, equity and inclusion goals for INFORMS? In this talk I explain the unique role that community operational research and community-based operations research can play in enabling our profession to become more welcoming to members of diverse backgrounds, and to solving important social problems for which diversity is a critical component.

### Radiation Treatment Planning Under Uncertainty

Sponsored: Public Sector OR

Sponsored Session

Chair: Gino J. Lim, University of Houston, TX, 77204, United States

Co-Chair: Azin Khabazian, University of Houston

#### 1 - Understanding Impacts of Radiobiological Parameters in Adaptive Radiation Treatment Planning under Uncertainty

Azin Khabazian, University of Houston, Houston, TX, 77057, United States, Gino J. Lim

To effectively treat a cancer patient with radiotherapy, an effective treatment strategy must be in place that considers dose delivery history and the patients' on-treatment biological changes. In this study, we seek to understand the importance of considering tumor shrinkage and proliferation during radiation treatment and how this affects the optimal prescribed dose in each fraction. We propose a stochastic sequential optimization structure under setup uncertainty of dose delivery that optimizes the dose in various fractions of an adaptive radiation therapy treatment plan by comparing the damage in tumor cells against the damage to the normal tissues volumetrically.

#### 2 - New DVH Formulation and First-order Interior-point Method for Inverse Planning

Hongcheng Liu, University of Florida, Gainesville, FL, 32611, United States

In radiotherapy treatment inverse planning, a commonly used quality measure is the dose-volume histograms (DVH). The exact mathematical formulation of DVHs involves binary variables and is therefore intrinsically nonconvex. In contrast, conventional convex surrogates for inverse planning entails non-trivial differences from an exact formulation and, thus, provide limited control over the DVHs. This work presents a new formulation that combines a novel folded concave penalty-based constraint and a new kurtosis-based criterion. Tailored to the new formulation is a first-order interior-point method. Outperformance in terms of doses-at-volume was achieved through the proposed scheme.

### 3 - Automated IMRT Treatment Planning using Expedited Constrained Hierarchical Optimization (echo): Algorithm Development and Clinical Implementation

Masoud Zarepisheh, Memorial Sloan Kettering, 485 Lexington Ave, #2039, New York, NY, 10017, United States, Linda Hong, Ying Zhou, Sovanlal Mukherjee, James G. Mechalakos, Margie A. Hunt, Joseph O. Deasy

This study automates IMRT treatment planning by formulating that as a hierarchical constrained optimization problem (also known as prioritized optimization). We introduce an idea to speed up the optimization process by sparsifying the influence matrix and then solving an extra unconstrained optimization problem to compensate for the inaccuracy caused by sparsity. The algorithm is equipped with an effective heuristic to handle DVH constraints. The algorithm has been implemented in the clinical environment and has been used to treat more than 300 patients in about 9 months.

### 4 - Optimization of Fractionated Radiotherapy Treatments under Dose Delivery Uncertainty

David Papp, North Carolina State University, Raleigh, NC, United States, Melissa R. Gaddy, Sercan Yildiz, Jan Unkelbach

Radiotherapy treatments are fractionated, meaning that the treatment is administered in several sessions, each delivering a small dose to the patient. In current clinical practice, the fractions are identical, but recent work has demonstrated that there is substantial benefit to be had from delivering different dose distributions in each fraction—a concept known as spatiotemporal fractionation. One concern about such treatments, however, is that they might be more susceptible to the various sources of uncertainty in dose delivery, such as patient positioning errors. In this talk, we investigate how the potential benefit from spatiotemporal fractionation is affected by uncertainty.

#### Keynote: Scaling Transportation Capacity in the Age of E-Commerce

Keynote Session

Chair: Georgia Perakis, Massachusetts Institute of Technology, Sloan School of Management, 100 Main Street Rm E62-565, Cambridge, MA, 02142-1347, United States

#### 1 - Scaling Transportation Capacity in the Age of E-Commerce Presenter

Russell Allgor, Amazon, Seattle, WA, United States

Even as Amazon experiences year-over-year growth in package volume, it's been able to speedup delivery times and shorten the time it takes between when an item is ordered and the moment that item arrives on a customer's doorstep. Amazon's fulfillment business - along with that of other online retailers - has increased the pressure on parcel delivery transportation capacity both in the US and overseas. Continuing to satisfy customers' needs will require more efficient use of existing networks and the creation of additional capacity for package sortation, line haul trucking, air freight, and last mile delivery. The challenge of designing a network that can meet these dynamic needs requires us to develop technical solutions implemented through design tools that incorporate the latest process innovations. There are both technical and organizational challenges in creating network design decisions, which involve inventory placement, facility operations, facility locations, network connections, and scheduling. While the technical challenges are at least partially met through solving large-scale combinatorial optimization problems, the organizational challenges require innovative mechanisms that motivate network-wide cooperation while also allowing decentralized, scalable operation.

### ■ Keynote – Monday

West Bldg 301D

#### Keynote: Stochastic Optimization, Statistical Modeling and Distributed Processing Applied to Energy Planning (IFORS Distinguished Lecture)

Keynote Session

#### 1 - Stochastic Optimization, Statistical Modeling and Distributed Processing Applied to Energy Planning

Mario Veiga Pereira, PSR, Praia de Botafogo 228, Rio de Janeiro, Brazil

The explosive growth of renewables has compounded the modeling challenges for investment and operational decisions in the energy area: (i) joint representation of hydro, wind, solar as a multivariate, multiscale stochastic process; (ii) solving the co-optimization of storage (hydro, batteries etc.), renewable-driven generation reserves and power transmission as a multistage nonconvex stochastic optimization; and (iii) because renewable integration benefits from regional interconnections (portfolio effect), probabilistic simulations are carried out for very large systems. In this talk, we show that these challenges can be successfully addressed by the combination of: new nonconvex stochastic optimization algorithms such as SDDiP; advanced geoprocessing and Bayesian networks; distributed computational and data management tools; and new optimization-centered programming languages such as Julia/JUMP. The application of these tools will be illustrated with real planning studies for the US Pacific Northwest and energy integration of South America.

#### Data Driven Optimization and Learning

Sponsored: Optimization/Optimization Under Uncertainty

Sponsored Session

Chair: Andrew Lim, National University of Singapore, Singapore, 119245, Singapore

#### 1 - When Can We Improve on Sample Average Approximation?

Edward James Anderson, University of Sydney, Discipline of Business Analytics, Room 487, Merewether Bld H04, Sydney, NSW 2006, Australia

We want to minimize the expected value of an objective function  $f(x,y)$  with a decision variable,  $x$  and a random variable  $Y$ , where we have  $N$  samples drawn from  $Y$ . The standard approach of sample average approximation simply minimizes the average value over the observed samples. We consider how to use information on the underlying distribution (e.g. that it has a continuous density). We also consider robust approaches that minimize the worst outcome achieved after a small change to the sample points or the weights applied to them. We explore this through looking at a univariate decision variable, and simple functions  $f$ . We demonstrate problems for which robustification makes the SAA solution worse.

## 2 - “Model-based Regularization” in a Context of Choice Modeling

Shanshan Huang, National University of Singapore, National University of Singapore, BIZ2 B1-01, Singapore, 117592, Singapore, Andrew Lim, Tong Wang

This work defines and explores the notion of “model-based regularization in the context of choice modeling. Regularization is an important tool from Machine Learning that is used to stabilize the solutions of regression problems when there is little data (relative to covariates). We take the more general view that regularization is simply a perturbation of a data-driven estimate towards a sensible default solution so as to remove “variance at the cost of some bias.

## 3 - Effective Scenarios in Multistage Distributionally Robust Stochastic Programs with Total Variation Distance

Guzin Bayraksan, The Ohio State University, 210 Baker Systems, 1971 Neil Avenue, Columbus, OH, 43210-1271, United States, Hamed Rahimian, Tito Homem-de-Mello

We consider multistage distributionally robust stochastic programs (DRSP) with a finite number of scenarios, where we use total variation distance to form conditional ambiguity set of distributions. We investigate the question of which scenarios have “effect on the optimal value of this multistage DRSP. To identify the effective scenarios, we conduct perturbation analysis with respect to a collection of scenarios being excluded and propose easy-to-check conditions for them. We explore the effectiveness for a scenario path as well as for a scenario conditional on the history of the stochastic process. Computational experiments illustrate the results on finance and environmental problems.

## 4 - Approximating the Gittins Index for High-dimensional Bayesian Bandits

Andrew Lim, National University of Singapore, 15 Kent Ridge Drive, Mochtar Riady Building, Singapore, 119245, Singapore, Michael Kim

While the optimal policy for the Gittins-Whittle formulation of the multi-armed bandit is fully characterized in terms of the Gittins index, these are notoriously difficult to compute for high dimensional Bayesian bandits. We develop a method for approximating the dynamics of the posterior using the Bayesian Central Limit Theorem and show how it can be used to approximate the Gittins index for high-dimensional Bayesian bandits. Comparisons of the Gittins-Whittle framework to Thompson sampling and the Upper Confidence Bound approach will be discussed, and applications of our approximation to Bayesian bandits where the rewards are mixtures will also be presented.

### Robust Optimization with Varying Uncertainty

Sponsored: Optimization/Optimization Under Uncertainty

Sponsored Session

Chair: Kartikey Sharma, Northwestern University, Evanston, IL, 60208, United States

#### 1 - Robust Non-stationary Queueing Theory

Chaithanya Bandi, Kellogg School of Management, Northwestern University, 2001 Sheridan Rd, 566, Evanston, IL, 60208, United States

We consider the problem of obtaining delay bounds for queueing systems with time varying arrival and service rates. We formulate optimization problems that allow tractable calculation of bounds on the waiting time.

#### 2 - Optimization under Decision-dependent Uncertainty

Omid Nohadani, Northwestern University, 2145 Sheridan Road, Technological Institute M233, Evanston, IL, 60208-3119, United States, Kartikey Sharma

The efficacy of robust optimization spans a variety of settings with predetermined uncertainty sets. In many applications, uncertainties are affected by decisions and cannot be modeled with current frameworks. This talk takes a step towards generalizing robust optimization to problems with decision-dependent uncertainties, which we show are NP-complete. We introduce a class of uncertainty sets whose size depends on decisions, and proposed reformulations that improve upon alternative techniques. In addition, the proactive uncertainty control mitigates over conservatism of current approaches.

## 3 - Optimization under Connected Uncertainty

Kartikey Sharma, Northwestern University, Room C223. 2145 Sheridan Road, Evanston, IL, 60208, United States, Omid Nohadani

Robust optimization methods provide a tractable method to address uncertainties in optimization. Typically, the uncertainty models are prespecified. In problems spread across multiple time periods, however, the uncertainty may be influenced by the past. In this presentation, we leverage this influence by, what we call, connected uncertainty sets, where the set parameters at each period depend on previous realizations. To find optimal here-and-now solutions, we reformulate robust constraints for these connected uncertainty sets. We evaluate the performance of this framework on a knapsack problem with different levels and directions of past dependence.

## 4 - Mixed-integer Recourse via Prioritization

Yuan Yuan Guo, University of Michigan, 1205 Beal Avenue, Ann Arbor, MI, 48109, United States, Ruiwei Jiang

In this talk, we study the transmission expansion planning problem with prioritization (TEP-P), where we rank the candidate circuits by considering the uncertainty of development budget, electricity load, and renewable energy supply. We propose a two-stage robust TEP-P model and solve this problem by using the Benders' decomposition approach. We validate the performance of the proposed approach via case studies based on real-world wind power data.

### TIMES Distinguished Speaker

Sponsored: Technology, Innovation Management & Entrepreneurship

Sponsored Session

Chair: Gulru F. Ozkan-Seely, University of Washington Bothell, University of Washington Bothell, bothell, WA, 98011, United States

#### 1 - Alpha Strategies: Sustained Advantage in Entrepreneurial and Established Firms

Karl Ulrich, University of Pennsylvania, Philadelphia, PA, United States

All innovation begins with some kind of disequilibrium, and may lead to supra-normal profits for the pioneering enterprise. However, all disequilibrium eventually fades. This talk links what we know about strategy, finance, and innovation into a framework for understanding sustained competitive advantage for innovating organizations, whether new entrants or incumbents. I also examine the evidence for the magnitude and duration of sustained profitability above the cost of capital in established public companies, and consider the extent to which such profits are the result of innovation.

### Computational Integer Programming

Sponsored: Optimization/Integer and Discrete Optimization

Sponsored Session

Chair: Ezgi Karabulut, Georgia Tech, 2257 Burdett Avenue, Troy, NY, 12180-2406, United States

#### 2 - Using the Membership Linear Program and General Split Disjunctions to Approximate the Split Closure

Junghwan Kwak, Korea Advanced Institute of Science & Technology, Daejeon, Korea, Republic of, Sungsoo Park

Split cuts are widely used cutting planes to solve general mixed-integer linear programs (MILPs). The split closure has been computationally shown to provide strong bounds for the optimal solutions of MILPs. To approximate the split closure, we generate rank-1 split cuts iteratively by applying general split disjunctions to the membership LP, which was used by Bonami (2012). Our algorithm can be carried out with any LP solver, without needing simplex tableau information. We study the properties of the membership LP (applied with general split disjunctions) and propose some practical strategies for improving the performance of the algorithm. Finally, we present detailed computational results.

### 3 - Enhanced Algorithms for Solving Biobjective Mixed Integer Programs

Ian Herszterg, Georgia Institute of Technology, 755 Ferst Dr, Atlanta, GA, 30318, United States, Diego Pecin, Natasha Boland, Tyler Perini, Martin Savelsbergh

We present fast and robust algorithms for solving biobjective mixed integer programs. The algorithms extend and merge ideas from two existing state of the art methods: the Boxed Line Method and the Epsilon-Tabu Method. We demonstrate their efficacy in an extensive computational study and demonstrate that they are capable of producing a high-quality approximation of the nondominated frontier in a fraction of the time required to produce the complete nondominated frontier.

### 4 - Decentralized Algorithms for Distributed Integer Programming Problems with a Coupling Knapsack Constraint

Ezgi Karabulut, Rensselaer Polytechnic Institute, Troy, NY, 12180-2406, United States, Shabbir Ahmed, George L. Nemhauser

Distributed optimization has been a trending topic in the recent years with the use of multiple processors to solve optimization problems. We are interested in optimizing discrete problems that use a common resource, namely integer programming problems coupled with a cardinality constraint. We focus our research on finding the optimal allocation of the resource in a decentralized way. Our distributed auction algorithm outputs an optimal allocation for problems that possess concavity property, with computational complexity of  $O(K)$ , where  $K$  is the amount of the resource. We further test the performance of the algorithm on problems without the optimality guarantee.

### 5 - Automatic Structure Detection in Mixed Integer Programs

Taghi Khaniyev, MIT Sloan School of Management, Cambridge, MA, United States, Matthew Galati, Samir Elhedhli

Bordered block diagonal structure in constraint matrices of integer programs lends itself to Dantzig-Wolfe decomposition. We introduce a new measure of goodness to capture desired features in such structures. We use it to propose a new approach to identify the best structure inherent in the constraint matrix. The main building block of the proposed approach is community detection which alleviates one major drawback of the existing approaches in the literature: predefining the number of blocks. When tested, the proposed algorithm was found to identify structures that lead to significant improvements both in computation time and optimality gap compared to those detected by the state-of-the-art.

### Special Session: Recent Advances in Conic Optimization

Sponsored: Optimization/Linear and Conic Optimization

Sponsored Session

Chair: Somayeh Moazeni, Stevens Institute of Technology, Stevens Institute of Technology, Hoboken, NJ, 07030, United States

#### 1 - Facial Reduction in Cone Optimization with Applications to Matrix Completions

Henry Wolkowicz, University of Waterloo, Faculty of Mathematics, Waterloo, ON, N2L 3G1, Canada

Strictly feasibility is at the heart of convex optimization. This is needed for optimality conditions, stability, and algorithmic development. New optimization modelling techniques and convex relaxations for hard nonconvex problems have shown that the loss of strict feasibility is a much more pronounced phenomenon than previously realized. These new developments suggest a reappraisal. We describe the various reasons for the loss of strict feasibility, whether due to poor modelling choices or (more interestingly) rich underlying structure, and describe ways to cope with it and, in particular, "take advantage of it".

## MD06

North Bldg 122C

### Joint Session OPT/Practice Curated: Theories and Applications of Nonconvex Quadratic Programming

Sponsored: Optimization/Global Optimization

Sponsored Session

Chair: Yiling Zhang, University of Michigan, Ann Arbor, MI, 48105, United States

#### 1 - Strong Formulations for Quadratic Optimization with M-matrices and Indicator Variables

Alper Atamturk, University of California-Berkeley, Industrial Eng. & Operations Research, 4141 Etcheverry Hall, MC 1777, Berkeley, CA, 94720-1777, United States, Andres Gomez

We study quadratic optimization with indicator variables and an M-matrix, i.e., a PSD matrix with non-positive off-diagonal entries. We prove that the minimization problem is solvable in polynomial time by showing its equivalence to a submodular minimization problem. To strengthen the formulation, we decompose the quadratic function into a sum of simple quadratic functions with at most two indicator variables each, and provide the convex-hull descriptions of these sets. We also describe strong conic quadratic valid inequalities. Computational experiments indicate that the proposed inequalities can substantially improve the strength of the continuous relaxations.

#### 2 - Strong Formulations for Conic Quadratic Optimization with Indicator Variables

Andres Gomez, University of Pittsburgh, Pittsburgh, PA, 15217, United States

We study the convex hull of a mixed-integer set given by a conic quadratic inequality and indicator variables. We provide the convex hull description of the set under consideration when the continuous variables are unbounded. We propose valid nonlinear inequalities for the bounded case, and show that they describe the convex hull for the two-variable case. All the proposed inequalities are described in the original space of variables and are SOCP-representable. We present computational experiments demonstrating the strength of the proposed formulations.

#### 3 - Exact Semidefinite Formulations for a Class of Random Nonconvex Quadratic Programs

Samuel Burer, University of Iowa, Dept Mgmt Sci/Tippie College of Business, S346 Pappajohn Business Building, Iowa City, IA, 52242-1000, United States, Yinyu Ye

We study a general class of random quadratically constrained quadratic programs (QCQPs), which has exact semidefinite relaxations with high probability as long as the number of variables is significantly larger than the number of constraints.

#### 4 - Ambiguous Chance-constrained Binary Programs under Mean-covariance Information

Yiling Zhang, University of Michigan, Ann Arbor, MI, 48105, United States, Ruiwei Jiang, Siqian Shen

We consider chance-constrained binary programs, where each row of inequalities that involve an uncertain technology matrix needs to be satisfied probabilistically. With the information of the mean and covariance matrix available, we solve distributionally robust chance-constrained binary programs (DCBP). Using two different ambiguity sets, we equivalently reformulate the DCBPs as 0-1 second-order cone (SOC) programs. We further utilize the submodularity of 0-1 SOC constraints and lifting to derive extended polymatroid inequalities. We incorporate the valid inequalities in a branch-and-cut algorithm for efficiently solving DCBPs. Finally, we demonstrate the computational efficacy.

North Bldg 123

### Network Optimization and Graph Algorithms I

Sponsored: Optimization/Network Optimization

Sponsored Session

Chair: Bastian Matias Bahamondes, Universidad de Chile, Sur 1848 Maipu, Santiago, 9271708, Chile

#### 1 - A Fast Max Flow Algorithm

James B. Orlin, Massachusetts Institute of Technology, MIT E62-570, Cambridge, MA, 02139, United States, Xiaoyue Gong

In 2013, Orlin proved that the max flow problem could be solved in  $O(nm)$  time. For graphs with  $n$  nodes and  $m$  arcs, his algorithm ran in  $O(nm + m^{1.94})$  time, which is the fastest time for very sparse graphs. If the graph is not sufficiently sparse, the fastest running time was an algorithm due to King, Rao, and Tarjan [1994]. We describe a new variant of the excess scaling algorithm for the max flow problem. Its running time strictly dominates the running time of the algorithm by King, Rao, and Tarjan.

#### 2 - A Nested Cluster Ratio Cut for Divisive Hierarchical Clustering

Victoria Ellison, Duke University, Durham, NC, United States

Building upon the strengths of the minimum cluster ratio cut problem and hierarchical clustering algorithms, we propose an optimization-based divisive hierarchical clustering algorithm for networks, which we call the Nested Cluster Ratios Algorithm. This algorithm uses a proposed extension of the cluster ratio cut. We demonstrate this problem's hierarchical clustering property via its dual relationship with a modified uniform multicommodity flow problem. Finally, we give a parametric linear programming based heuristic for this algorithm and test performance on gene co-association networks.

**3 - An Empirical Investigation of Network Polarization**

Celso C. Ribeiro, Universidade Federal Fluminense,  
Rua Capistrano de Abreu 28, Apartment 702, Rio de Janeiro,  
22271-000, Brazil, Ruben Interian

New tools for evaluating the polarization of a network are presented. We depart from the definition of a new measure of node homophily and consider the homophily distribution over the nodes as an indicator of the strength of polarization. Next, to address the polarization of the network as a whole, a probabilistic approach is developed, providing a more insightful understanding of the status of the network. The usefulness of the approach is illustrated on real-life networks. Two graph optimization problems are formulated and explored to deal with the reduction of polarization: (1) the maximum-cardinality homophily reduction problem and (2) the minimum-cardinality balanced edge addition problem.

**4 - Supervalid Inequalities for Network Interdiction Problems**

Ningji Wei, PhD Candidate, University at Buffalo, SUNY,  
North Tonawanda, NY, United States, Jose Luis Walteros

We focus on attacker-defender network interdiction problems in which: 1) the objective minimizes the attacker's cost of achieving a fixed disruption level over the defender's problem; 2) the defender's problem is to select an optimal graph structure (e.g., a shortest path, a spanning tree) over the residual graph; 3) the attacker strategies are defined over the same ground set of the graph structures. e.g., if the structures are defined over the edges, the attacker also interdicts edges. We develop a cut-generating framework that produces a general class of supervalid inequalities that remove non-trivial suboptimal solutions. We show how to adapt our framework to tackle a wide variety of problems.

**5 - Routing and Wavelength Assignment for All-optical Networks: A Defender-attacker-operator Game**

Mehdi Hemmati, New Mexico State University, Las Cruces, NM,  
88011, United States, Cole Smith

All-optical Networks (AONs) form the foundation of Internet backbone. They transmit the data over light rays, which require dedicated wavelengths. Hence, the routing problem in AONs turns into the so-called Routing and Wavelength Assignment (RWA) problem. We discuss an extension of the RWA problem to study the resilience of AONs in the presence of intentional disruptions. We propose a multi-level integer program and investigate the solution techniques by studying the solution space of the related optimization problem.

**6 - Adaptivity in Network Interdiction**

Bastian Bahamondes, Universidad de Chile, Santiago, Chile,  
Jose Correa, Jannik Matuschke, Gianpaolo Oriolo

We study a network security game arising in the interdiction of fare evasion or smuggling. A defender places a security checkpoint in the network according to a chosen probability distribution over the links. An intruder, knowing this distribution, wants to travel from her initial location to a target node. For every traversed link she incurs a cost equal to its transit time, and if she encounters the checkpoint, she has to pay a fine. The intruder may adapt her path online, exploiting additional knowledge gained along the way. We study the complexity of computing optimal strategies for the intruder and defender and the worst-case ratio of the intruder's best adaptive to her best non-adaptive strategies.

North Bldg 124A

**Joint Session OPT/Practice Curated: Integer Programming for Network Optimization and Applications**

Sponsored: Optimization/Network Optimization

Sponsored Session

Chair: Ou Sun, University of Arizona, Tucson, AZ, 85719, United States

Co-Chair: Neng Fan, University of Arizona, Tucson, AZ, 85721, United States

**1 - Algorithms and Complexity Results for Routing Trains through a Railyard**

Kelly Sullivan, University of Arkansas, 4207 Bell Engineering  
Center, 1 University of Arkansas, Fayetteville, AR, 72701,  
United States, Negin Enayaty Ahangar

We consider the problem of identifying a shortest route for a locomotive pulling a cut of cars through a railyard network in which nodes correspond to switches and edges correspond to tracks. As compared to a traditional shortest path problem, this problem is challenging because the route must accommodate, subject to the geometry of the yard tracks, the length of the cut of cars plus the length of the locomotive at any time. We model this problem as an integer program, prove its NP-hardness, and propose a solution approach that is polynomial for an important special case.

**2 - Benders Cut-and-solve: A New Versatile Tool for Network Optimization**

Carlos Armando Zetina, Concordia University, CORS/INFORMS  
Montreal Operations Research Stu, 1455 de Maisonneuve  
Boulevard W, Montreal, QC, H3G 1M8, Canada, Ivan Contreras,  
Jean-Francois Cordeau

Cut-and-solve has been used to solve the TSP and facility location to optimality. This method can be thought of as a generalized local branching in which at each level of the enumeration tree only two child nodes exist, one corresponding to a smaller "sparse" problem and the other as its complement known as the "dense" problem. We propose the use of Benders-based branch-and-cut as the black box MIP solver for "sparse" problems. Two important advantages of this are the reduced problem size and the re-usability of the Benders cuts generated in previous iterations. We present promising computational results for a naive implementation used to solve the fixed-charge multicommodity network design problem.

**3 - Minimum Cost Vertex Blocker Clique Problem**

Farzaneh Nasirian, University of Massachusetts-Boston,  
100 William T. Morrissey Blvd, Boston, MA, 02125, United States,  
Foad Mahdavi Pajouh, Josephine Namayanja

This talk addresses the minimum cost vertex blocker clique problem (CVCP) in which we are interested in detecting a subset of vertices in a graph with a minimum blocking cost whose removal bounds the weight of any weighted clique in the remaining graph by a given  $\tau > 0$ . We propose new linear 0-1 programming formulations with the exponential number of constraints and a new set of facets for the CVCP polytope. We also develop the first combinatorial branch-and-bound algorithm to solve this problem. The computational performance of these exact algorithms is studied on a test-bed of randomly-generated and real-life graphs.

**4 - Manufacturing Processes with Renewable Energy Integration and Demand Response**

Jose Luis Ruiz Duarte, University of Arizona, 1127 E. James E.  
Rogers Way, Tucson, AZ, 85721, United States, Neng Fan

International efforts for CO2 reduction require the engagement of industry sector, as a major energy consumer in the world. The integration of renewable energy sources (RES) into manufacturing processes is an alternative. In this work, a mathematical programming model is developed to obtain the optimal production schedule considering consecutive processes, integration of both onsite and grid RES, onsite energy storage systems, and demand response policies. Robust formulation approach is used to obtain optimal operations under the worst-case scenario for RES generation. A solution algorithm is developed to solve this formulation and is validated by numerical experiments

**5 - A Stochastic Mixed Integer Programming for GIS-based Biorefinery Facility Location Problem**

Ou Sun, University of Arizona, 827 E. Drachman Street, Tucson,  
AZ, 85719, United States, Neng Fan

A typical biomass supply chain consists of the following five components: harvesting and collection, storage, pretreatment, transportation, and conversion. Facility location problem is embedded in and vital to both pretreatment, and conversion processes. Geographic information system (GIS) is widely used to decide the facility locations with consideration of different related factors. Due to the special characteristics of biomass, the harvest yield is uncertain, which leads to the uncertainties through the whole supply chain. We take uncertainties into consideration and formulate a stochastic mixed integer programming by utilizing GIS tools for biorefinery facility location problem.

Evanston, IL, 60208, United States

**1 - A Stochastic Line Search Method with Convergence Rate Analysis**

Katya Scheinberg, Lehigh University, 200 W. Packer Ave,  
Bethlehem, PA, 18015, United States, Courtney Paquette

For deterministic optimization, line-search methods augment algorithms by providing stability and improved efficiency. We adapt a classical backtracking Armijo line-search to the stochastic optimization setting. While traditional line-search relies on exact computations of the gradient and values of the objective function, this method assumes that these values are available up to some dynamically adjusted accuracy which holds with some sufficiently large, but fixed, probability. We show the expected number of iterations to reach a near stationary point matches the worst-case efficiency of typical first-order methods, for nonconvex convex and strongly convex objectives

**2 - Nonlinear Programming Reformulations of Chance Constraints**

Alejandra Peña-Ordieres, Northwestern University, Evanston, IL, United States, Andreas Waechter, Jim R. Luedtke

We present a new method for solving nonlinear continuous optimization problems with chance constraints. We introduce reformulations of the probabilistic constraints based on quantile functions and examine the theoretical and statistical guarantees of the approximation. To handle joint chance constraints, we propose an exact penalty function and use it to design an S1QP-type trust-region method. We demonstrate the efficiency of the method in numerical experiments.

**3 - A Unifying Scheme of Primal-dual Algorithms for Distributed Optimization**

Fatemeh Mansoori, Northwestern University, Evanston, IL, United States, Ermin Wei

We study the problem of minimizing a sum of local convex objective functions over a network of processors/agents. Many of the existing distributed algorithms with constant stepsize can only converge to a neighborhood of optimal solution. To circumvent this shortcoming, we propose to develop a class of distributed primal-dual algorithms based on augmented Lagrangian. To improve convergence speed, we design algorithms with multiple primal updates per iteration. We can show that such algorithms converge to the optimal solution under appropriate constant stepsize choices. The proposed class of algorithms can be extended to the general form of linearly-constrained convex optimization problems.

**4 - Applying Model-based Derivative Free Methods in Reinforcement Learning**

Liyuan Cao, Lehigh University, Bethlehem, PA, 18015, United States

Model-based derivative free methods are algorithms designed to optimize black-box functions. We use them in reinforcement learning, where the problems are modeled as black-box functions whose input is the set of parameters that define the policy, and the output is the reward. We test these methods in the OpenAI Gym environment and show that they are capable of learning high quality policies. Issues in the objective functions such as noise and non-smoothness are addressed. We compare our approach to recently proposed methods based on randomized finite differences and show connections between them.

**1 - Pathwise Optimization for Merchant Energy Production Modeled as a Switching Option**

Bo Yang, Carnegie Mellon University, Pittsburgh, PA, 15213, United States, Selvaprabu Nadarajah, Nicola Secomandi

Merchant energy production modeled as a switching option gives rise to an intractable Markov decision process (MDP). It is common to combine least-squares Monte Carlo (LSM) and information relaxation and duality techniques to compute a feasible operating policy and bounds on the optimal policy value for this MDP. We extend the less explored pathwise optimization (PO) approach for this purpose, developing preconditioning and decomposition methods to make the resulting linear program solvable. On realistic instances, PO leads to substantially better optimality gaps but requires longer run times than LSM, slightly improving on the near-optimal LSM based operating policies.

**2 - Analysis of Competitive Energy Markets under Capacitated Transportation**

Ian Yihang Zhu, University of Toronto, 144A, 60 Harbord Street, Toronto, ON, M5S3L1, Canada, John R. Birge, Timothy Chan, Michael Pavlin

This paper considers the interplay between the transportation network, market structure and equilibrium prices of energy markets. We derive analytical methods drawing on inverse optimization and clustering methods that allows us to obtain insights into market structure and integration using only easily available regional pricing data. We show through several case studies of the North American gasoline market how our methodology yields results that are consistent with the underlying transportation network and market structure.

**3 - Operations and Investment of Energy Storage in a Tree Network**

Owen Wu, Indiana University, Kelley School of Business, 1309 E. 10th Street, Bloomington, IN, 47405, United States, Roman Kapuscinski

Matching electricity supply with demand is challenging due to inherent variabilities in demand and renewable power generation. Energy storage, though expensive, is operationally beneficial to electricity systems. In this talk, we discuss the optimization of energy storage investment and operations. In particular, we consider the problem of siting (where to invest) and sizing (how much capacity to invest) storage facilities in a tree network that has one power generation node and many demand nodes. The objective is to minimize the total storage investment and long-run power generation costs. We provide new insights on the key factors that affect storage investment decisions and the total costs.

**4 - Managing Shutdown Decisions in Merchant Commodity and Energy Production: A Social Commerce Perspective**

Selvaprabu Nadarajah, College of Business, University of Illinois at Chicago, 601 South Morgan Street., UH 2406, Chicago, IL, 60607, United States, Alessio Trivella, Stein-Erik Fleten, Denis Mazieres, David Pisinger

Merchant commodity/energy production assets operate in markets with volatile prices and exchange rates. Plant closures often adversely affect the parent company and the local community. We study if mitigating these effects is financially viable by designing two types of policies that delay or avoid a plant closure. The first policy is grounded in anticipated regret theory and determined using approximate dynamic programming (ADP), while the second extends production margin-based heuristics used in practice and is computed using ADP and binary classification. Our operating policies significantly delay/avoid shutdowns for small asset value losses on real aluminum production instances.

**1 - Government Financing for Clean Technology Development**

Seung Hwan Jung, Texas A&M University-Kingsville, 3118 La Rochelle Way, Corpus Christi, TX, 78414, United States, Lingxiu Dong

The goal of this paper is to study government financing for a firm's clean technology development under a financial constraint. In this paper, we investigate the impact of government financing on environment and the firm's bankruptcy risk when market uncertainty exists.

**2 - Operational Risk Management: Optimal Incentive Contract**

Yuqian Xu, University of Illinois at Urbana-Champaign, Wohlers Hall 487, 1206 S. 6th St, Champaign, IL, 61820, United States, Lingjiong Zhu, Michael L. Pinedo

In this paper, we study how a financial firm can offer incentive bonus contracts to its employees so as to incentivize them to exert efforts in reducing potential operational risk losses. Each employee then needs to balance the trade-off between the effort based bonus and the cost of the efforts to him or her (in a non-monetary form). We characterize the equilibrium strategy between the firm and its  $N$  employees, and then discuss the conditions under which incentive bonuses would be issued.

**3 - Comparison of Integrated Risk Management Frameworks for Newsvendors**

Panos Kouvelis

We study a newsvendor problem with profit risk control using VaR constraints. When a firm's demand correlates with the price of a tradable financial asset, both financial tools (derivatives) and operational tools (inventory) can be used for profit risk management. Such integrated risk management (IRM) approaches have been studied using various optimization frameworks to reflect the risk aversion of decision-makers. To the best of our knowledge, we are the first to study IRM in a newsvendor setting using profit maximization under VaR constraints (mean-VaR). We compare different IRM frameworks and find that only under mean-VaR, inventory and financial hedging decisions are separable.

#### 4 - Impact of Information Asymmetry and Limited Production Capacity on Business Interruption Insurance

Yuan-Mao Kao, Duke University, Durham, NC, 27708,  
United States, N. Bora Keskin, Kevin Shang

We study adverse selection and moral hazard issues that arise when an insurer offers business interruption insurance to a firm for guarding against disruption risks. The insurer cannot observe the firm's demand forecasts and recovery effort when a disruption occurs. We characterize the optimal insurance contracts to deal with the information asymmetry, and show how the firm's limited production capacity impacts the insurer's contract design. We also analyze the impact of ignoring the information asymmetry in designing insurance contracts.

#### 1 - Product Line Design under Multinomial Logit Choices

Hongmin Li, Arizona State University, WP Carey School of Business, Dept of Supply Chain Management, Tempe, AZ, 85287, United States, Scott Webster, Gwangjae Yu

We study a product-line design problem in which customer choice among multiple products is given by a multinomial logit (MNL) model. A firm determines product attributes and prices in an evolving product line to maximize profit. In particular, given the prices and attributes of products that already exist in a product line, the firm optimizes prices and/or attributes of the new products to be added to the same product line.

#### 2 - Dynamic Pricing for Varying Assortments

Emily Mower, Harvard University, Cambridge, MA, United States, Kris Johnson Ferreira

Most multi-product demand learning and dynamic pricing algorithms learn product-specific demand parameters as opposed to attribute-specific demand parameters. We develop an attribute-specific learning-then-earning dynamic pricing algorithm geared for companies whose assortments change over time. To maximize efficiency in the learning phase, we incorporate methods from conjoint analysis and optimal experimental design. We test our algorithm in a randomized controlled field experiment at an e-commerce platform that sells excess inventory of fitness studio classes offered the following day.

#### 3 - Dynamic Choice and Consumption

John H. Semple, Southern Methodist University, Cox School of Business, 6212 Bishop Boulevard, Dallas, TX, 75205, United States, Aydin Alptekinoglu

We investigate the problem of purchasing a bundle of different (but substitutable) products for future consumption. We term this bundle an "n-pack. The optimal consumption of the pack can be analyzed using dynamic programming, which we use to derive the optimal policy and the structure of the value function for this multi-state problem. In some cases, the value function can be given in closed form, and thus our problem does not suffer from the usual curse of dimensionality.

#### 4 - A Comparative Empirical Study of Discrete Choice Models in Retail Operations

Gustavo J. Vulcano, Universidad Torcuato di Tella, Av Figueroa Alcorta 7350, Suite 405, Buenos Aires, 1428, Argentina, Gerardo Berbeglia, Agustin Garassino

In this paper, we conduct a systematic, empirical study of different demand models and estimation algorithms, spanning both maximum likelihood and least squares criteria. Through an exhaustive set of numerical experiments on synthetic and real data, we provide comparative statistics of the quality of different choice models and estimation methods, and characterize operational environments suitable for different model/estimation implementations.

### Behavioral, Incentive and Policy Issues in Healthcare

Sponsored: Manufacturing & Service Oper Mgmt/Healthcare Operations

Sponsored Session

Chair: Tinglong Dai, Johns Hopkins University, Johns Hopkins University, Baltimore, MD, 21202, United States

Co-Chair: Ozlem Yildiz, University of Virginia, Charlottesville, VA, United States

#### 1 - Physician Peer Effects on Speed and Quality: Evidence from the Emergency Department

Raha Imanirad, Harvard Business School, Boston, MA, 02472, United States, Soroush Saghafian, Stephen J. Traub

In this study, we estimate peer effects in the context of an Emergency Department (ED) setting by addressing the question of whether peer physicians' characteristics including relative performance, experience, type of medical degree, and gender affect a physician's performance. Our findings provide strong evidence on the existence of peer effects in this setting. Our results have important practical implications for improving the operations of EDs. These include superior physician scheduling where one needs to decide which providers should be scheduled during the same shift as well as in physician training where one needs to provide guidance to physicians with ways to improve their performance.

#### 2 - Can Yardstick Competition Reduce Waiting Times?

Ozlem Yildiz, University of Virginia, Darden School of Business, 100 Darden Blvd. Darden School of Business., Office: FOB 189, Charlottesville, VA, 22903, United States, Nicos Savva, Tolga Tezcan

In this paper, we first show that the hospital reimbursement system currently used in practice does not incentivize hospitals to reduce waiting times. We then propose a modification which can achieve socially optimum investment without placing an onerous informational burden on hospital payers.

#### 3 - Conditions of Participation: Inducing Organ Discards and Patient Deaths on Transplant Waiting Lists?

Mohammad Delasay, Assistant Professor, Stony Brook University, Stony Brook, NY, United States, Sridhar R. Tayur

We investigate waiting list management from the viewpoint of a transplant center in the presence of the conditions of participation (COP). COP penalizes centers with lower-than-expected post-transplant survivals. We model the waiting list as a multi-dimensional queue, which we analyze by proposing accurate truncation bounds of its state space. Our experiments illustrate that a single COP threshold setting scheme across diverse transplant centers without consideration of transplant centers' specifications could induce cherry-picking of the candidates and offered organs. We discuss that COP lacks a net benefit approach by focusing only on post-transplant outcomes.

#### 4 - Optimal Sequencing of Diagnostic Tests for Differential Diagnosis

Simrita Singh, Northwestern University, Evanston, IL, United States, Sarang Deo, Sumit Kunnumkal

Motivated by the challenges of diagnosing TB from other respiratory illnesses, we consider the problem of optimal differential diagnosis: The decision maker has to identify the correct underlying condition in the patient by sequentially conducting imperfect diagnostic tests, each aimed at diagnosing a single condition. We model this problem as a stochastic dynamic program and obtain partial characterization of the optimal policy. We employ a novel data-driven implementation of information relaxation approach to construct a computationally efficient and tight upper bound. We also develop a policy improvement algorithm based on a greedy heuristic that yields near-optimal performance.

### Joint Session MSOM/Practice Curated: Learning and Information Theory Applications in Queues

Sponsored: Manufacturing & Service Oper Mgmt/Service Operations

Sponsored Session

Chair: Nur Sunar, UNC, Chapel Hill, NC, 27517, United States

#### 1 - Reinforcement with Fading Memories

Kuang Xu, Stanford Graduate School of Business, 655 Knight Way, Stanford, CA, United States

We study the effect of imperfect memory on decision making in the context of a stochastic sequential action-reward problem. An agent chooses a sequence of actions which generate discrete rewards at different rates. She is allowed to make new choices at rate  $\gamma$ , while past rewards disappear from her memory at rate  $\delta$ . We provide closed-form formulae for the agent's steady-state choice distribution in the regime where the memory span is large ( $\gamma \gg \delta$ ), and show that the agent's success critically depends on how quickly she updates her choices relative to the speed of memory decay.

#### 2 - Signaling in Queues with Risk Averse Customers

Krishnamurthy Iyer, Cornell University, Ithaca, NY, 14850, United States, David Lingenbrink

We study revenue-optimal signaling in an unobservable queue offering service at a fixed-price to a Poisson arrival of customers, who decide to join or balk upon arrival. We focus on the setting where customers are strategic and risk-averse: a customer joins only if the sum of the mean of her waiting time and a multiple of its standard deviation is below a given threshold. Although the revelation principle no longer holds, a restricted form of the principle allows us to formulate an iterative approach to solve the information design problem, where each iteration involves optimizing a linear objective under quadratic constraints.

#### 3 - A Semi-parametric Bayesian Model for Call Center Arrivals

Kaan Kuzu, Univ of Wisconsin-Milwaukee, Sheldon B. Lubar School of Business, P.O. Box 742, Milwaukee, WI, 53201-0742, United States, Refik Soyer

We describe and analyze data for arrivals to a call center by presenting a modulated Poisson process model, which takes into account both covariate and time effects on the call volume intensity. We introduce a semi-parametric model and develop its Bayesian analysis to assess the effectiveness of different advertising strategies as well as to predict call arrival patterns. The proposed model and the methodology are implemented using real call center arrival data. We show that the proposed semi-parametric model has higher prediction accuracy than prior parametric models in literature.

#### 4 - Dynamic Learning and Rational Customers in Services

Nur Sunar, UNC, 1604 Village Crossing Drive, Chapel Hill, NC, 27517, United States, Yichen Tu, Serhan Ziya

We study a queueing system where customers can dynamically learn about a service feature. Our analysis shows that such rational customers can help the service provider boost its expected profit.

### Joint Session MSOM/Practice Curated: Business Analytics

Sponsored: Manufacturing & Service Oper Mgmt/Service Operations

Sponsored Session

Chair: Han Ye, U. of Illinois at Urbana-Champaign, Champaign, IL, 61820, United States

Co-Chair: Haipeng Shen, Hong Kong

#### 1 - On the Accuracy of the Last-to-enter-service Announcement: Bridging Theory and Practice

Rouba Ibrahim, University College London, MS&I department, UCL, Gower Street, London, WC1E 6BT, United Kingdom, Achal Bassamboo

We propose a new, practice-driven, correlation-based framework to assess the relative accuracy of static and dynamic delay announcements. For a dynamic announcement, we consider the delay of the last customer to have entered service. Our approach combines queueing-theoretic analysis and an empirical study of real-life data.

#### 2 - Issue Resolution Estimation for Customer Service Centers

Han Ye, U. of Illinois at Urbana-Champaign, 350 Wohlers Hall, 1206 South Sixth Street, Champaign, IL, 61820, United States

Issue resolution estimation is critical for service center management. Traditionally, it is estimated via surveys and monitoring. In this paper, new models are developed to estimate issue resolution from operational data. The proposed models are then compared to existing practices under various scenarios. Performance grids of each studied model are constructed to provide practical guidelines on model selection.

#### 3 - Can Customer Arrival Rates Be Modelled by Sine Waves?

Donald Lee, Yale University, New Haven, CT, 06520, United States, Ningyuan Chen, Haipeng Shen

Customer arrival patterns typically exhibit strong seasonal effects. It is therefore natural to ask: Can a nonhomogeneous Poisson process (NHPP) with a rate that is the sum of sinusoids provide an adequate description of reality? We empirically investigate this question in two settings of interest to operations scholars: Arrivals to an emergency department and to a call centre. We develop novel estimation and testing procedures to show that the model is consistent with arrivals data from both settings. Our findings, combined with the flexibility and tractability of sinusoids, suggest that the NHPP with a sinusoidal rate function is a worthy workhorse model for time-varying arrival processes.

### Socially Sustainable and Inclusive Operations

Sponsored: Manufacturing & Service Oper Mgmt/Sustainable Operations

Sponsored Session

Chair: Beril L. Toktay, Georgia Institute of Technology, Atlanta, GA, 30308, United States

#### 1 - Stable Schedules: A Win for Both Retail Associates and Stores

Saravanan Kesavan, University of North Carolina-Chapel Hill, Kenan-Flagler Business School, Cb 3490 Mccoll Building, Chapel Hill, NC, 27599-3490, United States

In this study at the Gap Inc., we run a large field experiment in 30 of their stores over a 10 month period to investigate the impact of improving schedule stability of 3000 part-time associates. We follow a randomized encouragement design to allow store managers to implement five interventions in the treatment stores. We document the increase in stability and its impact on sales, productivity, and turnover of employees.

#### 2 - Preventing the Cost of Over Development in China

Kwan Yu (Chris) Lo, The Hong Kong Polytechnic University, Hong Kong, Hong Kong, Yi Zhou, Christopher S. Tang

The low-cost sourcing strategy of international brands is one of the reasons of over-development in developing countries; the manufacturing firms in developing countries jeopardize society assets for the firms' economic benefits. We challenge if such short-term economic success could last in today's transparent global supply chain. Based on the environmental violations data of the listed manufacturing firms published by Institute of Public and Environmental Affair (IPE), we estimate the long-term impact of environmental violations, and identify the key predictors of environmental violations in China. We developed prediction models to identify high-risk firms before they pollute.

#### 3 - Optimal Seeding Policy under Rainfall Uncertainty

Ying Zhang, Clemson University, Clemson, SC, United States, Jayashankar M. Swaminathan

Increased agricultural productivity is often cited as a solution to the impending global food shortage problem. In this paper, we develop a model to determine the optimal seeding policy under rainfall uncertainty using a finite-horizon stochastic dynamic program. In our model, a farmer needs to decide whether to plant a seed in each period given the soil moisture. We show that the optimal policy is a time-dependent threshold-type policy where the farmer should plant when the seed amount on hand is above the optimal threshold. Utilizing field weather data from Southern Africa, we show significant yield advantage of the optimal schedule over commonly used heuristics.

#### 4 - Effects of Incentive Programs for Workplace Safety

Ravi Subramanian, Georgia Institute of Technology, 800 West Peachtree Street Nw, Scheller College of Business, Atlanta, GA, 30308, United States, Vinay Ramani

Using analytical models, we contrast the effects of contextual parameters on the occurrence and reporting of safety incidents under outcome-based and behavior-based incentive programs for workplace safety.

**Global Supply Chain Management**

Sponsored: Manufacturing &amp; Service Oper Mgmt/Supply Chain

Sponsored Session

Chair: Lauren Xiaoyuan Lu, University of North Carolina at Chapel Hill  
- Kenan Flagler, Chapel Hill, NC, 27599, United States

**1 - Optimizing Local Content Requirements under Technology Gaps**

Lauren Xiaoyuan Lu, University of North Carolina at Chapel Hill -  
Kenan Flagler, Kenan-Flagler Business School, CB #3490, Mccoll  
Building 4701, Chapel Hill, NC, 27599, United States, Shiliang Cui

We study how the government of a developing country optimizes its Local Content Requirement (LCR) policy to maximize social welfare in a setting where foreign OEMs produce and sell multi-component products in the developing country. Due to technology gaps between local and global suppliers, local sourcing of components is more costly than global sourcing.

**2 - Dual Sourcing Inventory Management Over the Product Life Cycle**

Jan A. Van Mieghem, Northwestern University, Kellogg School of  
Mgmt, Evanston, IL, 60208-2009, United States, Jiankun Sun,  
Jason Acimovic, Douglas Thomas

We investigate dual sourcing inventory management policies, including the capped dual index policy, and their applications to the product life cycle.

**3 - Cover-up of Vehicle Defects: The Role of Regulator Investigation Announcement**

Woonam Hwang, HEC Paris, Jouy-en-Josas, 78350, France,  
Soo-Haeng Cho, Victor DeMiguel

Automakers such as Toyota and GM have been recently caught by the U.S. regulator deliberately hiding product defects in an attempt to avoid massive recalls. Interestingly, regulators in the U.S. and U.K. employ different policies in informing consumers about potential defects. To understand how the different announcement policies may affect cover-up decisions of automakers, we model the strategic interaction between a manufacturer and a regulator, and study whether and when the manufacturer has an incentive to cover up a potential defect. Based on our findings, we make four policy recommendations to help mitigate manufacturers' cover-ups.

**4 - Sourcing under the Supplier-auditor Collusion Risk**

Shiqing Yao, Monash University, Melbourne, Australia, Li Chen,  
Kaijie Zhu

Global brands are increasingly relying on third-party auditor to screen out low-quality suppliers. However, an unethical auditor may collude with a low-quality supplier to produce a false report. In this study, we investigate the buyer's equilibrium strategy in setting quality requirement under the risk of supplier-auditor collusion.

**Joint Session BMI/Practice Curated: Empirical Research in Online Marketplaces**

Emerging Topic: Business Model Innovation

Emerging Topic Session

Chair: Yao Cui, Cornell University, Ithaca, NY, 14853, United States

**1 - Optimizing Services in Retail Networks using High-dimensional Panel Data**

Amandeep Singh, The Wharton School, 500 Jon M. Huntsman  
Hall, 3730 Walnut St., Philadelphia, PA, 19104, United States,  
Gad Allon, Ken Moon

We study how retail stores' multi-dimensional service levels affect consumers' buying behavior in a spatial setting. To this end, we propose the Double Block-Lasso BLP estimator, which combines the double selection procedure introduced in Belloni, Chernozhukov, and Hansen (2014), with demand estimation methods set forth in Berry, Levinsohn and Pakes (1995). Under mild assumptions of structural stability and sparsity, we obtain consistent estimates of the influences that retail stores exert across various spatial markets. Using the estimated influence structure, we highlight the service quality interventions promising greatest joint impact on consumers' buying patterns.

**2 - Consumer Preferences and System Design for Pooled Transportation**

Kashish Arora, INSEAD, Fontainebleau, France, Fanyin Zheng,  
Karan Girotra

In this study, we look at the drivers of the choice between non-demand cabs and a pre-determined and scheduled shuttle service. We use these to estimate the "inconvenience costs associated with shuttle platforms. Specifically, we estimate the inconvenience costs associated with walking to the shuttle, waiting for its arrival and traveling the extra distance on the shuttle. Secondly, we use the sensitivity estimates to design policy counterfactuals for determining the optimal size and frequency of the shuttle service and to suggest new routes for expansion

**3 - Impact of the Mobile Channel on Sales Concentration**

Fangyun Tan, Southern Methodist University, 6212 Bishop Blvd,  
Dallas, TX, 75275, United States, Nitish Jain

This study employs data from a large online apparel retailer, which operates both mobile and PC channels, to compare the causal effects of these two online channels on sales concentration, in terms of the share of popular products. We use a difference-in-differences estimation strategy that leverages a quasi-experiment stemming from the retailer's decision to discontinue its PC sales channel. We find that the mobile channel increases the share of popular products purchased by about 5% as compared with the PC channel. Furthermore, we find evidence which corroborates the role of a search cost led mechanism in driving the difference between the two channels' sales concentration level.

**4 - Tax-induced Inequalities in the Sharing Economy: Evidence from Airbnb**

Yao Cui, Cornell University, 401N Sage Hall, Ithaca, NY, 14853,  
United States, Andrew M. Davis

In this paper, we investigate the impact of occupancy tax on Airbnb listings.

**1 - Platforms and Bloggers: Implications on Polarization and Learning**

Kimon Drakopoulos, University of Southern California, Los  
Angeles, CA, 90066, United States, Gad Allon, Vahideh Manshadi

In this paper we explore the implications of platform intervention and malicious bloggers on polarization and learning results.

**2 - Network Interactions and Social Value of Information**

Gowtham Tangirala, Columbia University, 3022 Broadway,  
4th Floor West, New York, NY, 10027, United States,  
Alireza Tahbaz-Salehi

We study decisions made by agents in a network with heterogeneous externalities under incomplete information. We consider an economy with one unknown fundamental and finitely many agents with quadratic payoffs and private, correlated information about the fundamental. We study how equilibrium welfare varies with commonality and precision of information. We find that it is possible for social welfare to exhibit a non-monotonic behavior with respect to commonality in efficient networks. We also find that under complementary (substitution) network effects, a more diffused (less diffused) network exhibits a higher social welfare.

**3 - Tampering with Information**

Odilon Camara, USC, Los Angeles, CA, United States,  
Ricardo Alonso

We study a game between a sender and a receiver, in which the sender can tamper with the information she provides to the receiver (falsify the results of an experiment). The receiver has access to some auditing technology to uncover tampering. We characterize the receiver's optimal auditing technology, taking into account how auditing affects the sender's equilibrium choice of information provision and tampering.

Chair: Ramesh Johari, Stanford University, Stanford, CA, 94305-4121, United States

#### 1 - A Conditional Gradient Approach for Nonparametric Estimation of Mixing Distributions

Ashwin Venkataraman, Harvard University,  
Cambridge, MA, United States, Srikanth Jagabathula,  
Lakshminarayanan Subramanian

A key challenge in estimating mixture models is that the mixing distribution is often unknown and imposing apriori parametric assumptions can lead to model misspecification issues. We propose a new methodology for nonparametric estimation of the mixing distribution. We formulate the likelihood-based estimation problem as a constrained convex program and our key contribution is applying the conditional gradient (aka Frank-Wolfe) algorithm to solve this convex program, showing that it iteratively generates the support of the mixing distribution. We show that our estimator is robust to different ground-truth mixing distributions and outperforms the EM benchmark in two case studies on real data.

#### 2 - Bandit Learning with Positive Externalities

Virag Shah, Stanford University, Mail Code: 4026, Management  
Science and Engineering, Stanford, CA, 94305, United States,  
Jose Blanchet, Ramesh Johari

In many platforms the future user arrivals are likely to have preferences similar to users who were satisfied in the past. In other words, arrivals exhibit positive externalities. We study multiarmed bandit (MAB) problems with positive externalities. We show that the self-reinforcing preferences may lead standard benchmarks such as UCB to exhibit linear regret. We develop a new algorithm, Balanced Exploration, which explores arms carefully to avoid suboptimal convergence of arrivals before sufficient evidence is gathered, and an adaptive variant which successively eliminates suboptimal arms. We analyze their regret and establish optimality by showing that no algorithm can perform better.

#### 3 - Incentivizing Exploration by Heterogeneous Users

Peter Frazier, Cornell University, School of Operations Research,  
and Information Engineering, Ithaca, NY, 14853, United States,  
Bangrui Chen

We consider incentivizing exploration with heterogeneous agents. In this problem, bandit arms provide random attribute vectors from unknown fixed distributions over which agents have heterogeneous utilities. Selfish myopic agents arrive sequentially, observe past pulls, and pull the arm with the largest expected utility. Agents may be incentivized to pull underexplored arms through payments. We design an incentivization algorithm whose expected cumulative regret and payment are constant in the time horizon  $T$ , when agent types are finite and all arms are preferred by some agents. This contrasts with  $\log(T)$  regret in the standard MAB. Succinctly, heterogeneity provides free exploration.

#### 4 - Stochastic Bandits Robust to Adversarial Corruptions

Thodoris Lykouris, PhD Candidate, Cornell University,  
107 Hoy Road, Gates 336, Ithaca, NY, 14853, United States,  
Vahab Mirrokni, Renato Paes Leme

We introduce a new model of stochastic bandits with adversarial corruptions which captures settings where most of the input follows a stochastic pattern but a fraction of it is adversarially changed to trick the algorithm, e.g. click fraud, fake reviews, and email spam. The goal of this model is to encourage the design of bandit algorithms that (i) work well in mixed adversarial and stochastic models, and (ii) whose performance deteriorates gracefully as we move from fully stochastic to fully adversarial models. We provide an algorithm whose performance gracefully degrades with the total corruption the adversary injected in the data (while being agnostic to it) and a corresponding lower bound.

Sponsored Session

Chair: Mehmet Gumus, McGill University, Montreal, QC, H3A 1G5, Canada

Co-Chair: Saibal Ray, McGill University, Montreal, QC, H3A 1G5, Canada

#### 1 - The Rise of Ship-to-store: Theoretical and Empirical Analyses of Its Impact on Online Sales

Necati Ertekin, Santa Clara University, Department of OM&IS,  
Leavey School of Business, Santa Clara, CA, 95053, United States,  
Mehmet Gumus, Mohammad Nikoofal

In this paper, we first develop a customer choice model to generate theoretical predictions regarding the impact of ship-to-store (STS) on online sales for two types of products, namely online-exclusive products (i.e., products available only online) and hybrid products (i.e., products available both online and offline), as well as on overall online sales. Next, we empirically test our predictions using data from an omnichannel retailer that launched STS at two different brand names. We find that, due to STS, online sales decrease at one brand name and increase at the other. We explain this controversy with our theoretical model and the extensive empirical analysis.

#### 2 - An Empirical Analysis of Intra Firm Product Substitutability in Fashion Retailing

Elcin Ergin, McGill University, 1001 Sherbrooke St W, Room 521,  
Montreal, QC, H3A 1G5, Canada, Mehmet Gumus, Nathan Yang

Our study investigates the impact of product shortages on sales in neighboring outlets using novel data from a fast fashion retailing chain. Our analysis reveals that sales for an item at a focal store increases when that same item experiences a stock out in neighboring store. We show that these product substitutability patterns across stores vary depending on the location type. We also demonstrate in a forecasting exercise that information about stock outs in neighboring outlets has value for prediction for certain periods of the product's life cycle. Finally, we investigate the revenue impact of making inventory allocation decisions using the neighboring outlets' stock out information.

#### 3 - Generating Realistic Customer Purchase Baskets Using Generative Adversarial Networks

Saibal Ray, McGill University, Desautels Faculty of Management,  
1001 Sherbrooke Street W, Montreal, QC, H3A 1G5, Canada,  
Thang Doan, Brian Keng

This project uses the purchase history from loyalty member card at the basket level (i.e., all items bought by a customer during a particular trip) for customers under the loyalty program of a chain drug store to develop a model that can generate realistic future "customer shopping list (basket) using the novel machine learning technique of Generative Adversarial Networks (GAN). Our first objective in this project is to find a representation/embedding of customers and the baskets they buy by analyzing the transaction histories. Once the above task has been accomplished, we will build a customer simulator that will generate realistic future customers and their purchase baskets for the next 4 weeks

#### 4 - Visual Listening In: Extracting Brand Image Portrayed on Social Media

Liu Liu, New York University, New York, NY, United States,  
Daria Dzyabura, Natalie Mizik

Images are on their way to surpassing text as the medium of choice for social conversations. In this paper, we propose a "visual listening in" approach to measuring how brands are portrayed on social media (Instagram), by mining visual content posted by users. We first train image classifiers of brand attributes via SVM and Convolutional neural networks. Then we apply the classifiers to brand-related images on social media. We study 56 brands in the apparel and beverages categories, and compare their portrayal in consumer-created images with images on the firm's official Instagram account, as well as with consumer brand perceptions measured in a national brand survey to derive managerial insights.

### Consumer Oriented Operations Models

Sponsored: Revenue Management & Pricing

Sponsored Session

Chair: Mingcheng Wei, University at Buffalo, Buffalo, NY, 14260, United States

#### 1 - Optimal Pricing in Online Marketplaces

Xuanming Su, University of Pennsylvania, The Wharton School,  
3730 Walnut Street, Philadelphia, PA, 19104, United States

We develop a pricing model for online marketplaces that match demand from customers with supply from firms. We consider prices between customers, firms, workers, and the marketplace, and then relate our results to current practice.

## 2 - When Prospect Theory Meets Consumer Choice Models: The Role of Reference Prices

Ruxian Wang, Johns Hopkins University, Carey Business School,  
100 International Dr, Baltimore, MD, 21202, United States

Reference prices arise as price expectations against which consumers evaluate products in their purchase scenarios. We investigate what will happen when prospect theory (e.g., reference prices) meets consumer choice models from the perspectives of both the consumers and the firm.

## 3 - Optimal Information Control Strategies for the Online P2P Platform

Shu Hu, Ningbo Supply Chain Innovation Institute China,  
Shiliang Cui, Mingcheng Wei

We investigate the optimal information control strategies for the online P2P platform, which will decide whether to provide product information for the buyer, and whether to provide market information for the seller, when it aims to maximize the average transaction volume and the average transaction amount, respectively. We further examine the value of product information for buyers and the value of market information for sellers.

## 4 - Dynamic Pricing of the Fixed-term Subscription Contracts or One-time Purchase Offered to the Strategic Customers in a Heterogeneous Market

Roozbeh Yousefi, Queen's University, 310 Bath Rd., Unit 1112,  
Kingston, ON, K7M9H1, Canada, Jue Wang, Yuri Levin,  
Mikhail Nediak

Subscriptions are agreements between a company which commits to deliver a service or provide access to a service and its customers. We present a continuous time dynamic pricing model for a monopolist offering a fixed term subscription contract without per-use charges and limit of access or a one-time purchase at all the instances, to strategic customers in a growing heterogeneous market. We modeled the discrete choice problem of customers and used it to formulate the monopolist's problem in terms of optimal control, derive its optimality conditions. We demonstrate the optimal pricing results in numerical experiments.

## 5 - Online Decision-making with High-dimensional Covariates and Binary Response

Wang Xue, Penn State University, Leonhard, Building, 310 S.  
Barnard St, University Park, PA, United States, Mingcheng Wei,  
Tao Yao

In this study, we consider the online learning and decision-making problem with high-dimensional covariates and binary response. We penalize the bandit model with Minimax Concave Penalty (MCP-bandit) to handle the high-dimensional issue. Under epsilon-decay sampling scheme, we show the cumulative regret of MCP-bandit is upper bound  $O(s^3 \log d \log T)$ , where  $s$  is the sparsity level,  $d$  is the total dimension and  $T$  is the time length. Moreover, we prove the  $\log T$  dependence of cumulative regret is optimal.

### Joint Session FSS/Practice Curated: Stochastic Games with Applications

Sponsored: Finance

Sponsored Session

Chair: Xin Guo, University of California-Berkeley, Piedmont, CA,  
94611, United States

#### 1 - A Stochastic Game and Moving Free Boundary Problem

Renyan Xu, University of California-Berkeley, 4141 Etcheverry  
Hall, OR Department, Berkeley, CA, 94720, United States,  
Xin Guo, Wenpin Tang

Stochastic control problems are closely related to free boundary problems, where both the underlying fully nonlinear PDEs and the separating boundaries are integral parts of the problems. In this talk, we propose a class of stochastic games and show how the free boundary problems involve moving boundaries due to the additional game nature. We will provide explicit solutions in terms of Nash equilibria by solving a Skorokhod problem with moving boundaries. We will use some special cases of the games in light of the classical finite fuel problem to compare game strategies in terms of pooling and sharing. We will also discuss the Nash equilibrium strategies in the framework of controlled ranked SDEs.

#### 2 - A Stochastic Numerical Method for Mean Field Games

Mathieu Lauriere, Princeton University, Princeton, NJ,  
United States

We present a new stochastic algorithm to solve mean field games and optimal control problems of McKean-Vlasov dynamics. This numerical method relies on the system of forward-backward stochastic differential equations characterizing the solutions to these problems. Several examples of applications will be provided. This is joint work with Ren Carmona.

## 3 - The Coordination of Centralized and Distributed Generation

Matteo Basei, University of California, Berkeley, Berkeley, CA,  
United States, Ren Aid, Huyen Pham

We analyse the interaction between centralised carbon-emissive technologies and distributed non-emissive technologies. A representative consumer can satisfy her electricity demand by investing in solar panels and by buying power from a centralised firm. We consider the point of view of the consumer, the firm and a social planner, formulating suitable McKean-Vlasov control problems with stochastic coefficients. First, we provide explicit formulas for the production strategies which minimise the costs. Then, we look for an equilibrium price.

## 4 - Non-zero Sum Stochastic Games with Impulse Control

Haoyang Cao, University of California, Berkeley, Berkeley, CA,  
United States

This is a joint work with Prof. Xin Guo and Mr. Matteo Basei. We generalize the single-agent impulse control problem, i.e. the cash management problem as in [Constantinides and Richard, 1978], to an N-player impulse game. In this impulse game, each agent controls its own state dynamics and they are coupled together through cost functions. We provide two versions of verification theorems, one requiring value functions to be continuous everywhere, the other relaxing the regularity condition and adding assumptions on cost structures instead. Under a symmetric setting, we are able to give a semi-explicit Nash equilibrium.

#### 1 - Does Money Talk? The Evidence from an Online Peer to Peer Car Sharing Platform

Yixin Lu, The George Washington University, 2201 G. Street NW,  
Funger Hall 506, Washington, DC, 20052, United States

We conduct a randomized field experiment at a large online peer-to-peer car sharing platform to examine the impact of monetary incentives on user onboarding. We find that monetary incentives are no better than simple email reminders in encouraging self-disclosure of private information nor user engagement with the platform.

#### 2 - Predicting Time to Upgrade Under Successive Product Generations

Xinxue Qu, Iowa State University, 4815 Todd Drive, 71, Ames, IA,  
50014, United States, Aslan Lotfi, Zhengrui Jiang

In the presence of successive product generations, customers may decide to purchase a future generation before its release. As a result, sales of the new generation often show a declining pattern. In this study, we propose an exponential-decay survival model to predict customers' time to upgrade decisions. Empirical analysis using data for a major sports video game series shows that the Expo-Decay model performs better in prediction accuracy. Empirical results reveal that previous adoption and usage habits impact upgrade decisions: (i) potential switching customers are more likely to upgrade; (ii) heavy players tend to upgrade earlier; (iii) specialized customers are less likely to upgrade.

#### 3 - Predicting Stock Price Movements via Multi-relational Inter-firm Networks

John Rios, University of Iowa, Iowa City, IA, United States,  
Kang Zhao, Nick Street

Predicting stock movements is challenging, but has attracted tremendous amount of attention from both practitioners and researchers. At the same time, firms interact with each other in a multi-relational network with multiple types of relationships. Using real-world supply and competition networks among more than 1,000 firms, we predict a firm's stock movements by leveraging performance of its customers, suppliers, and competitors. We show that features based on network neighbors of a firm significantly contribute to the prediction of its future stock movements. Additional analyses show that suppliers' and competitors' performance is more indicative of firms' stock movement than customers'

#### 1 - Higher Education as a Service: Applying the Service Science Canvas Model to an International Undergraduate Program

Oleg V. Pavlov, Worcester Polytechnic Institute, SSPS, 100 Institute Rd., Worcester, MA, 01609, United States, Joan Lofgren, Frank Hoy

This article contributes to the understanding of higher education as a service by applying the service science framework to an academic program in northern Europe. We utilize the Service Science Canvas, which is a new tool that combines elements of the service science theory. The service science framework highlights unique features of the program such as the intensive curriculum, which promotes value co-creation among faculty and students. The framework also recognizes the importance of clear quality measures and effective governance due to the program's heavy reliance on visiting faculty.

#### 2 - Improving Volunteering in Non Profit Sector. Empirical Evidence from a Non Profit Organization in Education Sector in India

Sandeep Chitla, Indian School of Business, Hyderabad, 500111, India, Milind Sohoni, Arun Kumar Rout

Nonprofit Organizations (NPOs) typically face two critical challenges: (a) poor operational efficiency, and (b) inability to scale. We are working with a large NPO in the education sector in India to understand the challenges of hiring volunteers. We analyze demographic and behavioral characteristics of candidates who volunteered with the NPO in past. We also evaluate the efficacy of operational interventions done by NPO during the recruitment process.

#### 3 - Using the Service Science Canvas to Understand Institutional Change in a Public School System

Shari Weaver, Director, Teacher Preparation Program, Worcester Polytechnic Institute, 100 Institute Road, Worcester, MA, 01527, United States, Oleg Pavlov

Reforming STEM education in the United States continues to be a topic of active discussion and research. Why do some school districts succeed while others fail at implementing similar educational interventions? To answer this question, we apply the service science theory to characterize a PK-12 district that is viewed as a complex educational system. Our analysis utilizes the Service Science Canvas, which is a convenient methodological tool that includes common elements of the service science framework.

### Integrating OR/MS/Analytics Scholarship and Teaching

Sponsored: Education (INFORMED)

Sponsored Session

Chair: Neil Desnoyers, Saint Joseph's University, Saint Joseph's University, Upper Darby, PA, 19082, United States

#### 1 - Master Scheduling in K-12 Education

Neil Desnoyers, Saint Joseph's University, 5600 City Avenue, Philadelphia, PA, 19131, United States, Rabia Ansari

For almost all those individuals who are tasked with performing it, the Master Scheduling process in K-12 education is painful. As one K-12 administrator

responsible for Master Scheduling in her school commented recently, "...it's a very daunting and time-consuming task." Significant advances in K-12 Master Scheduling have not occurred frequently. In fact, the last significant advance in the field ("block scheduling") was developed over 20 years ago. Improvements in data availability, scheduling algorithms, and programming languages since that time should change the landscape of the problem.

#### 2 - Research in the Classroom: Bridging the Gap at the Undergraduate Level

Ruben A. Mendoza, Saint Joseph's University, 5600 City Avenue, Philadelphia, PA, 19131, United States

Presenting academic research on Business Intelligence and Analytics to undergraduate students is difficult because the research can be too narrow or focused for undergraduates, require extensive familiarity with academic literature to interpret it correctly, or flat-out be too technical for the level of expertise (or interest) of the average undergraduate student. Finding accessible, current, and appropriate academic research that is pedagogically useful requires a very large investment of time and planning. How can academics find and learn to use practitioner-level research that is pedagogically and technically adequate to meet competing goals of rigor and accessibility?

#### 3 - A Projects Course to Prepare Undergrads for Analytics Careers

Michael H. Veatch, Gordon College, Department of Mathematics, 255 Grapevine Rd, Wenham, MA, 01984, United States

Mathematics undergraduates often lack some of the project and soft skills to help them enter analytics careers. We offer a course with semester-long industry projects using data analysis and O.R. The course has also led to some faculty-student research.

#### 1 - An Empirical Investigation of the Matching Technology in the Ride-sourcing Market

Daniel Vignon, University of Michigan, Ann Arbor, MI, United States, Zhengtian Xu, Yafeng Yin

With the rise in popularity of ride-sourcing services, ride-sourcing companies face challenges in meeting an ever growing demand. In order to answer these challenges, a deep understanding of the underlying mechanisms at play in the market is needed. For this purpose, we propose an empirical model of the ride-sourcing market, focusing especially on the matching technology. This model allows us to not only understand possible failure modes of the ride-sourcing market, but also how to remedy them.

## 2 - Inferring Multimodal Day-to-day Travel Dynamics using Smartphone App Data

Shanjiang Zhu, George Mason University, Nguyen Engineering Building, Suite 1300, 4400 University Drive Ms 6c1, Fairfax, VA, 22030, United States, Zhuo Yang, Guanqi Liu, Lei Zhang

This study investigates the day-to-day travel dynamics on a multi-modal network. Longitudinal travel trajectories data were collected using a smartphone app among commuters during Washington Metro Safetrack project. Algorithms were developed to infer the travel choices before, during, and after the network disruptions, which are crucial for assessing the impact of the unprecedented maintenance work at the Washington Metro. Findings from this study could help to inform agencies who are struggling with the aging infrastructure across the country and help them to develop better strategies.

## 3 - Early Warning Signal for Congested Large-scale Traffic Networks

Xiaozheng He, Rensselaer Polytechnic Institute, 110 8th St., JEC 4034, Troy, NY, 12180, United States, Chunhen Jiang, Jihui Nie, Jianxi Gao

This study proposes an early warning signal to indicate whether the traffic condition of a congested network is getting close to its critical degradation threshold, beyond which congestion is difficult to mitigate. The early warning signal is developed based on the critical slowing down theory for perturbed dynamical systems. Using the collected field data, we validate the proposed signal and show that the system recovery process becomes increasingly slow when the traffic condition approaches the critical point.

## 4 - Estimating Probability Density of Origin-destination Matrices on Congested Networks

Yudi Yang, 1420 Lake Boulevard, Apartment 17, Davis, CA, 95616, United States, Yueyue Fan, Johannes Royset

To understand the stochastic nature of travel demand is gaining more attention in transportation studies as reliability and resilience become important performance measures for transportation project evaluation. In this study, we aim to infer the probability density function (pdf) of Origin-Destination (O-D) demand variables by integrating (potentially) multiple data sources. Unlike most traditional statistical approaches that are only applicable to non-congested networks, the proposed method is designed to be capable of incorporating traffic network flow rules/models in a congested network and determining route choice proportion and O-D matrix simultaneously.

## 5 - Transportation Big Data: Promises, Issues, and Implications

Rong Fan, University of Washington, Seattle, WA, United States, Xuegang (Jeff) Ban

Big data and related data analytics methods have received much attention recently in transportation for various planning and operational applications. This talk summarizes the promises of big data and illustrates the issues of some commonly used big data sources in transportation. We then briefly discuss the implications of such issues and suggest a pathway that may help address those issues.

### Facility Layout

Sponsored: TSL/Facility Logistics

Sponsored Session

Chair: Churlzu Lim, UNC-Charlotte, Systems Engineering & Engineering Management, 9201 University City Boulevard, Charlotte, NC, 28223, United States

## 1 - An Evaluation Method for Layout Design of a Spacecraft Using Canonical Correlation, Data Envelopment Analysis, and Choquet Integral

Claudia Ramirez, Doctoral Student, University of North Carolina-Charlotte, 9201 University City Blvd, Charlotte, NC, 28223, United States, Simon Hsiang, Churlzu Lim

The ideal arrangement of task spaces in a spacecraft reflects a minimal overall volume while maximizing the crewmembers' health, performance, and safety for the duration of a mission to Mars. Their "happiness" is evaluated by considering design factors that rank and score different layout designs based on the factors' priority order designated by the user. The evaluation is achieved through the relationship between the spacecraft's physical characteristics and their psychophysical attributes by using Canonical Correlation Analysis, Data Envelopment Analysis, and Choquet Integral.

## 2 - Dominance Results for the M Finite-size Facility Placement Problem

Rakesh Nagi, University of Illinois at Urbana-Champaign, Department of Industrial & Enterprise Systems, 117 Transportation Building, MC-238, Urbana, IL, 61801, United States, Ketan Date

We study the M Finite-size Facility Placement Problem: Optimally placing M new finite size rectangular facilities (NFs) in a layout with N existing rectangular

facilities (EFs). Pairs of facilities interact through Input/output points located on the facility boundary. We propose lower bounds and dominance in an implicit enumeration scheme that significantly reduces the number of candidate solutions, making this a viable solution approach in practice.

## 3 - Effect of Dynamic Demand Uncertainty on Facility Layout Design: Revisiting Integrated Facility Layouts

Melih Celik, Middle East Technical University, ODTU Endustri Muh. Bolumu, Universiteler Mh. Dumlupinar Bl. No: 1, Ankara, 06800, Turkey, Beg n Efeoglu, Haldun S ral

We consider the integrated facility layout problem (IFLP), where the aim is to determine the material or product flows among (duplicates or copies of) work centers and machines, in conjunction with their locations within the facility. In many manufacturing environments, the amount of demand may not be known in advance. For this end, we consider the stochastic IFLP in a dynamic environment where the jobs have different demand distributions in each period. We propose a dynamic programming approach based on the enumeration of possible machine assignments with given machine types, machine copies, and locations in each period. We show the effectiveness of our approach using instances from the literature.

## 4 - Overlap Cuboid Packing Optimization for Spacecraft Layout Design and Computational Enhancements

Churlzu Lim, University of North Carolina-Charlotte, Systems Engineering & Engineering Management, 9201 University City Boulevard, Charlotte, NC, 28223, United States, Richard Alaimo, Claudia Ramirez, Simon M. Hsiang

Consider a variant of the packing problem, called overlap cuboid packing problem, which allows for cuboid items to share space in order to further minimize the dimensions of the container. The objective of this study is to investigate a mixed-integer linear program that effectively provides a packing solution in the context of designing the layout for a spacecraft module. This talk will briefly review the bi-objective function that enforces specific adjacency requirements between gradient cuboids, and discuss about computational enhancements that display promising results in a numerical study.

### Logistics, Supply Chain, and Multi-modal Transportation

Sponsored: TSL/Intelligent Transportation Systems (ITS)

Sponsored Session

Chair: Nasibeh Zanjirani Farahani, University of Missouri, E3437 Thomas and Nell Lafferre Hall, Columbia, MO, 65211, United States

## 1 - A Sim-heuristic Approach for Near Real-time Optimization of Single-track Railway Scheduling

Qi Tian, Dalian University of Technology, 2 Linggong Road, Ganjingzi District, Dalian, 116024, China, Rutgers, The State University of New Jersey, 96 Frelinghuysen Road, Piscataway, NJ, 08854, United States, Weihong Guo, Wenyan Wang, Zijian Guo

The wide applications of real-time sensing devices and big data methods are providing unprecedented opportunities for developing new solutions for single-track railway scheduling. Considering near real-time information such as unexpected delays caused by inclement weather or train breakdowns, this research develops a sim-heuristic solution algorithm to minimize the total weighted delay time. The proposed method provides near real-time optimization for single-track railway scheduling. The effectiveness of the proposed algorithm is demonstrated in both simulation and a real-world case study.

## 2 - A Scalable Non-myopic Atomic Game for Smart Parking Mechanism

Hamid R. Sayarshad, Cornell University, Ithaca, NY, 14850, United States, Shahram Sattar, H. Oliver Gao

We propose a new smart parking mechanism which seeks to reduce cruising for parking at multiple parking facilities in a crowded area. A non-myopic atomic game is formulated to search the equilibrium solution through allocating travelers to candidate parking facilities which considers travel time difference for the vehicles, walking time, dynamic pricing, cruising time and parking facilities' occupancy. This study integrates a social efficiency price which accounts customer waiting time for parking searching. We involve the network travel time variation into our dynamic policy and make the game model reflect reality better by the competition of vehicles in both road resources and parking spaces.

### 3 - Modeling a Battery Swapping Station for Electric Vehicles with Time-varying Demand

Kyle Hovey, North Carolina State University, Raleigh, NC,  
United States, Yunan Liu, Xiang Li

We model a battery swapping station (BSS) for electric vehicles that has a fixed supply of available battery charging slots. When customers arrive, the BSS will replace their drained batteries with those supply batteries having the highest charge that also meet an acceptable quality level (e.g., charge greater than 80% of capacity). Our model captures three realistic features of this process: i) time-varying arrivals, ii) non-linear battery charging, and iii) random residual charges. We take a queueing theory approach by keeping track of the real time ages of the batteries that are being charged. We give asymptotic performance analysis as the scale of the system increases.

### 4 - Relationship Between Uncertainties in Supply Chain and Its Risk Perception

Yuji Sato, Professor, Chukyo University, 101 Yagotohonmach,  
Showa, Nagoya, Aichi, 466-8666, Japan

This paper clarifies the relationship between uncertainties in supply chain and its risk perception. Rapid spread of globalization pushes firms to face the higher level of uncertainty, where they must formulate necessary and sufficient strategy for supply chain management. Such a strategy, however, involves a broad range of factors, including some that are subjective. This paper addresses this issue by refining existing structural model of supply disruption. A case study was conducted that demonstrates the applicability of the approach based on the proposed structural model to the real markets in both developed and developing countries.

### 5 - The Shortest Path Approaches with Time Window in Multi-graph Networks

Nasibeh Zanjirani Farahani, PhD Student, University of Missouri,  
E3443 Thomas and Nell Lafferre Hall, Columbia, MO, 65211,  
United States, Moein Enayati, James S. Noble,  
Ronald G. McGarvey

One of the common problems of Service Network Design is finding the shortest path. Networks as the infrastructure of the logistics are the graphs which are used to show the communications of different nodes by connection edges. Those types of networks that consider multiple edges in between two nodes are multigraphs and shortest path problems are rarely discussed on them. In this research different methods of solving shortest path problems for multigraph networks with time window are explained and new approaches to solving such problems are classified and explained. In the end, a new mathematical model and a metaheuristics algorithm to find the best path in such networks are proposed.

### Research with Autonomous Vehicles and Platooning

Sponsored: TSL/Freight Transportation & Logistics

Sponsored Session

Chair: Ann Melissa Campbell, University of Iowa, Iowa City, IA, 52242-1994, United States

#### 1 - Dynamic Operation of Autonomous Vehicle Fleets for Urban Mobility Applications

Hani S. Mahmassani, Northwestern University, Transportation  
Center, 600 Foster Avenue, Evanston, IL, 60208-4055,  
United States, Michael Hyland

We present dynamic fleet assignment strategies for autonomous vehicle fleet operations under different business models for urban goods delivery. Recent results from shared passenger mobility applications are also discussed.

#### 2 - Dynamic Synchronization of Truck Platoons

Anirudh Kishore Bhoopalam, Erasmus University, Rotterdam,  
Netherlands, Niels Agatz, Rob A. Zuidwijk

Automated vehicle technology enables the formation of platoons in which virtually linked trucks drive closely behind one another. Platooning helps to reduce fuel consumption and emissions. In this study, we look at the dynamic planning of platoons of two trucks. To determine the platoons and the associated synchronized truck routes, we present an exact algorithm and several quick heuristics. We perform numerical experiments on different instances to study the impact of the maximum detour length and the waiting time on the total system-wide travel costs.

#### 3 - Use of Autonomous Robots for Single Package Delivery

Iurii Bakach, University of Iowa, Iowa City, IA, 52240,  
United States, Ann Melissa Campbell, Jan Ehmke

Autonomous robots can help making last-mile deliveries more efficient and customer friendly. We examine the use of robots to deliver individual packages in urban last-mile delivery. We will look at the number of robots required and time of completion as compared with traditional truck delivery models. We will examine different assumptions on the speed of travel, geography, and working hours to understand where autonomous robots are particularly valuable.

### 4 - The Impact of Parking on the Use of Autonomous Vehicles in Urban Delivery

Sara Reed, University of Iowa, Ann Melissa Campbell,  
Barrett Thomas

In the dense road network of urban areas, the time spent to find parking can impact the overall time of parcel delivery. With the use of autonomous vehicles, this time can be minimized allowing the vehicle to be in continuous travel while being used for the loading of parcels at determined locations. With capacity constraints on a delivery person between loading times, we look to analyze the relationship between these constraints and estimated time of parking. This work aims to examine the competitiveness of using autonomous vehicles for delivery in urban areas.

### 5 - Autonomous Truckload Delivery

Kamal Lamsal, Barrett Thomas, Ann Melissa Campbell

The impact of autonomous vehicles will be huge. If the vehicle no longer requires a driver, the drive time across country can be reduced. One conservative estimate is that all driving across interstate highways is done with trucks on autonomous settings and handled by a regular driver from the exit of the highway to the final destination. We study the impact of autonomous drivers on truckload shipping. We assume that if a driver is used to make the delivery, the FMCSA regulations on drivers applies. If an autonomous vehicle is used, the FMCSA regulations do not apply on interstate portion. We experiment with different distributions of deliveries to understand the impact of delivery location on final costs.

### Joint Session ORAM/QSR/Practice Curated: Data Analytics Methods for Smart Manufacturing Systems Monitoring and Control

Emerging Topic: OR and Advanced Manufacturing

Emerging Topic Session

Chair: Mohammed Shafae, University of Arizona, Tucson, AZ, 85743, United States

Co-Chair: Dazhong Wu, University of Central Florida, FL, United States

#### 1 - A Feature-Based Data-Level Fusion Model for Degradation Modeling and Prognostics

Yupeng Wei, Pennsylvania State University, PA, United States,  
Dazhong Wu, Janis Terpenny

The rapid development of sensor technologies has enabled multiple in-situ sensors to monitor the degradation status of operation units. To achieve an accurate prediction of remaining useful life (RUL), multiple sensor signals should be fused. This work presents a new data-level fusion methodology for degradation signals based on statistical features, which is designed to provide much more accurate features to better support the prediction of RUL. In addition, 4 machine learning algorithms are facilitated to predict the RUL based on features extracted from the fused signal. Our methodology was evaluated through a degradation dataset of an aircraft gas turbine engine that was generated by C-MAPSS.

#### 2 - Parallel Computing and Network Analytics for the Monitoring of Industrial Internet-of-Things (IIoT) Machines

Chen Kan, TX, United States, Hui Yang, Soundar Kumara

This paper presents a new method for IIoT machine condition monitoring. First, dissimilarities among machine signatures were characterized. Then, we proposed a stochastic learning algorithm to construct a large-scale dynamic network of IIoT machines. When machine condition varies, the network structure is changed accordingly. A parallel computing scheme is further developed to significantly improve the computational efficiency. Results show the developed algorithm effectively and efficiently captures cycle-to-cycle dynamics of a machine and machine-to-machine variations in large-scale IIoT.

#### 3 - Cloud-Based Parallel Machine Learning for Tool Wear Prediction

Dazhong Wu, University of Central Florida, FL, United States

Cloud computing and machine learning have the potential to advance smart manufacturing. One of the limitations of current machine learning methods is that large volumes of training data are required to train predictive models. Consequently, computational efficiency remains a primary challenge. In this presentation, we will introduce a parallel random forests algorithm. This algorithm is implemented on the cloud with varying combinations of processors and memories. This algorithm is demonstrated using condition monitoring data collected from milling experiments.

#### 4 - Optimum Placement of Actuators for Large Space Structure Shape Control

Juan Du, Peking University, College of Engineering, 5 Yiheyuan Road, Beijing, 100871, China, Xiaowei Yue, Jianjun Shi

Shape control of large space structure is critical for the usage functionality. To realize large space structure shape adjustment, actuators are essential tools. Given the fixed number of actuators, different actuator placements influence the shape control capability. Optimization of actuators' placements is very important but challenging. This presentation proposes an automatic actuator placement approach for efficient large space structure shape control by developing a sparse learning model and corresponding estimation algorithm. The case study shows that our proposed method achieves good performance for shape adjustments of large space structure.

#### 4:30 - 5:15 AMPL/ 5:15-6:00 Didi Chuxing

Vendor Workshop Session

##### 1 - Model-Based Optimization + Application Programming = Streamlined Deployment in AMPL

Robert Fourer, AMPL Optimization Inc., 2521 Asbury Ave, Evanston, IL, 60201, United States, Filipe Brandão

AMPL offers the advantages of modeling in a specialized optimization environment combined with the power of application development via general-purpose programming. Optimization problems are formulated concisely and naturally in AMPL's modeling language, promoting rapid development, reliable maintenance, and evaluation of multiple solvers and data sources. APIs for popular full-featured programming languages facilitate embedding of AMPL models and scripts into complex applications, with access to data management and interface development libraries. We illustrate using AMPL's APIs for Python and R, and conclude with a preview of features for invoking Python within AMPL scripts.

##### 2 - Ride-sharing Services Research at Didi Chuxing

Didi Chuxing, Didi Chuxing, Beijing, China

Didi Chuxing is the world's leading mobile transportation platform. The company offers a full range of mobile tech-based mobility options for nearly 400 million users. As many as 20 million rides were completed on DiDi's platform on a daily basis, making DiDi the world's second largest online transaction platform. DiDi acquired Uber China in August 2016. DiDi is committed to working with communities and partners to solve the world's transportation, environmental and employment challenges using big data-driven deep-learning algorithms that optimize resource allocation. In 2016, DiDi was named one of the World's 50 Smartest Companies by MIT Technology Review.

#### Topics in Healthcare Provider Productivity & Satisfaction

Sponsored: Manufacturing & Service Oper Mgmt/Healthcare Operations

Sponsored Session

Chair: Robert Batt, Wisconsin School of Business, UW-Madison, Madison, WI, 53706, United States

##### 1 - The Impact of Shift Changes on Medication Ordering and Delivery in the Intensive Care Unit

Lesley Meng, The Wharton School, University of Pennsylvania, 3730 Walnut Street, Suite 500 JMHH, Philadelphia, PA, 19104, United States, Ann M. Huffenberger, Krzysztof Laudanski, Christian Terwiesch

Patients spending time in the intensive care unit (ICU) of a hospital are often there to receive stabilizing, life-saving care. Providers working in this environment must pay careful attention to medication delivery so that these patients may recover as quickly as possible without complications. We utilize a comprehensive dataset consisting of all ICU patient visits across 3 academic teaching hospitals over 5 years to study the accuracy of medication orders and the timing of medications delivered.

##### 2 - Mixing It Up: Operational Impact of Hospitalist Workload

Masoud Kamalahmadi, Indiana University, 1309 E. 10th Street Room HH 4100, Bloomington, IN, 47405, United States, Alex Mills, Jonathan Helm, Kurt M. Bretthauer

Hospitalists are physicians that specialize in caring for hospital inpatients, replacing a primary care physician who may only make rounds once per day and thereby reducing delays. Given a limited number of hospitalists in a hospital, we seek to determine their optimal service mix (workload and patient types).

##### 3 - Customized Office Revisit Intervals and Evisits in Primary Care

Hessam Bavafa, Wisconsin School of Business, 4284C Grainger Hall, 975 University Avenue, Madison, WI, 53706, United States, Sergei Savin, Christian Terwiesch

The demand for physician services in primary care is shaped by the number of patients associated with each physician and the frequency of scheduled office visits. While a physician can typically set the size of her patient panel without regard for individual patient preferences, office revisit intervals are determined jointly by the physician and her patients. In our model, a physician can manage the demand for her services using two "customization approaches: (1) adjusting the office revisit intervals based on patient health status, and (2) diverting some of the patient demand away from the office visits and into "e-visits.

##### 4 - Payment Mechanisms, Incentives for Adoption and Value of Health-information Exchanges (HIEs)

Mehmet Ayvaci, University of Texas-Dallas, Richardson, TX, United States, Huseyin Cavusoglu, YeongIn Kim, Srinivasan Raghunathan

Diffusion of health information outside the boundaries of an organization through health-information exchanges (HIEs) is a critical step in achieving socially desirable care outcomes. In this paper, we study the relationships among a payment model, providers' incentives to adopt HIEs, and the value of HIEs using a game-theoretical model. We demonstrate that assessing the value of HIEs in isolation from the underlying payment mechanism and patient switching behavior may result in under- or overestimation of the HIE value. Therefore, as payment models evolve over time, there is a real need to reevaluate the value of HIE adoption and the government policies that induce providers to adopt HIE.

#### 1 - Adaptive Estimation using Regularized Empirical Risk

Sara van de Geer, PhD in Mathematics in 1987 at Leiden University, ETH Zurich, Zurich, 8092, Switzerland

We examine a general class of algorithms based on minimizing an empirical risk function. Examples of empirical risk functions are the least squares risk, and more generally a minus log-likelihood. We consider complex models, for example models with a large number of parameters. Adding a penalty to the empirical risk will help to avoid overfitting. Our focus will be on norm-penalized estimators, where the norm is inducing sparsity. Aim is to show why such penalties lead to favourable theoretical properties namely adaptivity to both complexity and curvature. Moreover, the results do not always require the estimator to be a global minimizer.

Chair: Larry Head, University of Arizona, Tucson, AZ, 75719, United States

Co-Chair: Qing He, University at Buffalo, SUNY, Buffalo, NY, 14260, United States

#### 1 - Understanding the Problem: Traffic Safety Analysis

Brendan Russo, Assistant Professor, Northern Arizona University, P.O. Box 15600, Flagstaff, AZ, 86011, United States

Traffic crashes cost society billions of dollars each year as a result of property damage, injuries, fatalities, and non-recurring delay. This analysis explores factors affecting the frequency and severity of crashes along the Arizona portion of the I-10 corridor, with a particular focus on freight-related crashes. The safety performance along the I-10 is analyzed through the development of crash frequency and severity prediction models using integrated crash, roadway, traffic, and environmental data. The results showed that several roadway-, crash-, vehicle-, and person-specific variables were associated with the frequency and/or severity of crashes along the study corridor.

#### 2 - Machine Learning Investigation using Integrated Data for Identification of Critical Factors for Safety and Mobility

Zuoyu Miao, University of Arizona, Tucson, AZ, United States

Potential safety and mobility concerns are rising due to the facts that huge losses could occur by the risks of accidents and travel time degradation. To identify critical factors leading to potential losses, multiple data sources are investigated, including history crash reports, travel time records, weather information, etc. Several statistical machine learning methods are combined for analyzing above data and identifying critical factors. Based on identified critical factors and their related impacts, several different countermeasures are discussed for avoiding severe accident injuries and decreasing the accident frequency.

#### 3 - Quantifying Freight Performance Measures using Multisource Traffic Data

Abolfazl Karimpour, Graduate Research Assistant, The University of Arizona, Tucson, AZ, United States, Yao-Jan Wu

With the emerging development of Intelligent Transportation System (ITS) technologies, surface-transportation data can now be collected by a wide variety of ITS traffic detectors, including Bluetooth detectors, automatic vehicle location (AVL) devices, inductive loop detectors, and radar-based detectors. It has been challenging to take full advantage of the ITS data from multiple sources by enabling them to exchange information with each other to compensate for their various disadvantages. This presentation will be focused on freight performance measurement using multi-source traffic data collected on the Arizona freeway network.

#### 4 - Optimizing Traffic Signals Using Multi-source Data: From a Practical Perspective

Yao-Jan Wu, Assistant Professor, University of Arizona, 1209 E. 2nd St. Room 324F, Civil Engineering, Tucson, AZ, 85721, United States

Cities have invested a great deal amount of funding in intelligent transportation systems, especially traffic sensor technologies, to better manage traffic and reduce congestion. However, not all cities/agencies have fully utilized the capacities of the advanced technologies. This presentation aims at providing data-driven solutions to enhancing traffic data usability for optimizing traffic signal timing using multiple sources of data. Different from traditional operation research, this presentation focuses more on the practical side of traffic signal optimization and take other key factors, such as safety and operability into account during the signal re-timing process.

### Supply Chain Risk Management

Sponsored: Manufacturing & Service Oper Mgmt

Sponsored Session

Chair: Florian Lucker, Cass Business School, London, EC1Y 8TZ, United Kingdom

#### 1 - Recall Analytics and Supply Chain Risk

Ahmet Colak, Clemson University, Greenville, SC, 29601, United States, Robert Louis Bray

Product safety is one of the most critical drivers of brand equity and reputation in consumer goods industries. I will focus on how automakers trade off between defect liabilities and product recalls, using a sample of 1M consumer defect reports and 15K component recalls. I will also talk about how the federal government enforces its mandated-recall programs, studying the government-initiated recalls for a period of 20 years. I will then elaborate on the supply chain drivers of quality defects from a sample of 26K auto suppliers. And last, I will discuss about data analytics tools to improve failure and recall prediction accuracy dynamically, mining detailed defect report statements.

#### 2 - Inventory Dispersion in a Sequential Inventory System with Demand Forecast Evolution

Isik Bicer, Swiss Federal Institute of Technology in Lausanne (EPFL), Chemin de Veilloud 11, Ecublens, 1024, Switzerland, Florian Lucker

Inventory dispersion along a supply chain occurs as raw materials are processed and allocated to the production of different end-products, and also when the end-products are sent to different locations to be sold to the customers. We develop a dynamic optimization model to find the optimal order quantities in a multi-echelon setting such that inventory dispersion may occur in different echelons and the demand forecasts of the end products evolve according to a multiplicative martingale model. We show that postponing high-cost activities leads to higher profits than postponing the point of differentiation.

#### 3 - Examining Resiliency in Pharmaceutical Drug Supply Chain Considering Human Behaviors Component

Rozhin Doroudi, Northeastern University, Boston, MA, 02116, United States, Ozlem Ergun

The growing epidemic of drug shortages in the United States demonstrates the lack of resiliency within drug delivery supply chain. A key, and often understudied, element in resiliency of supply chains is the role of human behavior. Human decision makers should anticipate and react to the contingencies and disruptions that arise. We propose an integrated simulation framework which allows for instantiating, testing, and improving supply chain resiliency while accounting for human behavior component. We demonstrate the applicability of our method through several experiments.

#### 4 - Scheduling Optimization in Continuous Steel Casting and Rolling Operations

Joshua Betz, Colorado School of Mines, CO, 80401, United States

In continuous steel casting operations, molten steel is batched into heats inside a ladle that is cast into slabs, which are then rolled into coils. We present a mixed integer program to produce a daily casting schedule that is solved using state-of-the-art software. This model minimizes penalties incurred by violating plant best practices while strictly adhering to safety and logical constraints to manage risk for manufacturing incidents that can occur in the rolling mill. A heuristic produces an initial feasible solution to expedite the generation of near-optimal schedules.

## 5 - Disruption Risk Management in Serial Multi-echelon Supply Chains

Florian Lucker, Cass Business School, 106 Bunhill Row, London, EC1Y 8TZ, United Kingdom, Sunil Chopra

This talk deals with managing supply chain disruption risk in a multi-echelon serial supply chain using risk mitigation inventory and reserve capacity. We show that it is typically optimal to hold more risk mitigation inventory downstream than upstream. At the same time, it is often optimal to hold additionally more reserve capacity downstream than upstream. These results hold under the assumption that inventory and reserve capacity holding costs are larger downstream than upstream.

## ■ MD40

North Bldg 226B

### Utility Theory Developments

Sponsored: Decision Analysis

Sponsored Session

Chair: Ying He

#### 1 - Shapley Values, Interactions and Supermodularity

Emanuele Borgonovo, Bocconi University, Via Sarfatti 25, Milano, 20136, Italy, Giovanni Rabitti

In this work, we present a miscellanea of results concerning the study of interactions in decision analysis modelling. We show the link between interactions and supermodularity. We contrast these findings to the study of interactions as determined by the Shapley-Owen value.

#### 2 - Simulated Decision Processes

Fabio Maccheroni, Università Bocconi, Via Sappfath, 25, Milan, Italy, Carlo Baldassi, Simone Cerreia-Vioglio, Massimo Marinacci

A successful model to describe two-alternative speeded decisions between consumption goods is the Drift Diffusion Model (DDM) of Ratcliff (1978). In this paper, we provide an axiomatic foundation for the DDM. Our axioms present a test for model misspecification and connect the externally observable properties of choice induced by the DDM with its mechanistic account of the choice process. Moreover, by combining binary DDM comparison with Markovian exploration, we extend the DDM to multi-alternative choice. The resulting “Metropolis-DDM algorithm” is consistent with the eye-tracking findings of Russo and Rosen (1975), converges to the multinomial logit, and is robust to discretization.

#### 3 - Revisiting Ellsberg and Machina's Paradoxes: A Two Stage Evaluation Model Under Ambiguity

Ying He, University of Southern Denmark, Campusvej 55, Odense, M, 5230, Denmark

We revisit the Ellsberg paradox by showing that the preference does satisfy the independence axiom under a weak assumption. Such an observation motivates us to develop a two-stage model for decision making under ambiguity. This two-stage model can not only accommodate preferences in different versions of Ellsberg's paradoxes but also the preferences in paradoxes recently proposed in Machina (2009, 2014) that challenge the validity of many existing models for decision making under ambiguity. Finally, we propose some conjectured examples to illustrate how our model becomes more flexible compared with some existing models in the literature without sacrificing the parsimony of the model.

### Infrastructure Systems Towards a Smart City

Emerging Topic: Smart Cities

Emerging Topic Session

Chair: Hiba Baroud, Vanderbilt University, Nashville, TN, 37235, United States

#### 1 - Analyzing Socially Considerate Multi-Modal Routing Algorithms

Chinmaya Samal, Vanderbilt University, Nashville, TN, United States, Abhishek Dubey

Ride-sharing platforms such as Uber and Lyft are becoming a more commonplace, particularly in urban environments. While such services may be deemed more convenient than riding public transit due to their on-demand nature, reports show that they do not necessarily decrease the congestion in major cities. In this presentation, we will describe socially considerate multi-modal routing algorithms that are proactive and consider, via predictions, the shared effect of riders on the overall efficacy of mobility services. Our results indicate that even at a low penetration (social ratio), we are able to achieve an improvement in system-level performance.

#### 2 - Modernization of Buildings: The Interplay of Buildings and Smart Cities' Emerging Systems

Atefe Makhmalbaf, University of Texas-Arlington, Arlington, TX, United States

Buildings are an integral part of the built environment. Americans spend about 90% of their time indoors. Hence, building design and operation have direct impact on occupant's health and productivity. Moreover, buildings consume about 40% of energy and 72% of electricity and contribute to 34% of greenhouse gas emissions. Successful deployment of smart cities necessitates design of smart buildings. This presentation will discuss the evolving roles of buildings and the importance of decision support systems during all phases of a building life-cycle from design, to construction and operation to satisfy the broader objectives of smart cities including those of sustainability and resiliency.

#### 3 - Water Infrastructure Resilience: Measurement and Optimization

Mohsen Shahandashti, Assistant Professor, University of Texas at Arlington, Arlington, TX, United States

A variety of metrics could be used to measure the resilience of water distribution networks subjected to natural hazards, such as earthquakes. Selection of resilience metrics has a significant impact on formulating optimized rehabilitation policies. This significant impact is highlighted by comparing various optimized policies for proactive seismic rehabilitation of a water pipe network based on different resilience metrics. These results highlight the importance of aligning resilience measurement with the experience and expectations of water utilities to formulate effective proactive rehabilitation policies.

### Sandia Session

Emerging Topic: Energy and Climate

Emerging Topic Session

Chair: Peter Kobos, Sandia National Laboratories, NM, United States

Co-Chair: John Eddy, Sandia National Labs, Albuquerque, NM, 87185-1011, United States

#### 1 - The Microgrid Design Toolkit

John Eddy, Sandia National Labs, P.O. Box 5800, Albuquerque, NM, 87185-1011, United States

The MDT is a visual design and trade-space optimization capability for microgrids. It uses a multi-objective optimization algorithm that executes a discrete event Monte-Carlo simulation to characterize performance and reliability of candidate microgrid designs. The output is a Pareto frontier of efficient alternative microgrid designs and visualizations to help a designer understand the trade-offs. This presentation will describe the technology underlying the MDT and discuss some recent analyses conducted.

## 2 - Offline Framework to Optimize Current Energy Converter Simulation with Multiple Correlated Functional Response

Sterling Stewart Olson, Sandia National Labs, Albuquerque, NM, 87185, United States, Chris Chartrand, Jesse Roberts, Humberto Silva, Cheping 'Jack' Su

Current energy converters are an important component of sustainable energy. However experimental measurements are prohibitively expensive making modeling a critical component to increasing the technology readiness level of devices. This research sought to optimize a Gaussian process regression meta-model relating four turbulence parameter inputs to two outputs (velocity and turbulent intensity) related by partial differential equations as a function of distance for a long wall clock simulation. The meta-model optimized parameters showed acceptable results for a ten-fold decrease in total simulation time and provides many opportunities for future research.

## 3 - Rolling Horizon Optimization for a H2Electrolyzer Station Used to Service H2 Vehicles

Ross Guttromson, PhD, Sandia National Labs, Albuquerque, NM, 87185, United States

The integration of hydrogen vehicles into the US transportation system relies upon coordinated access to various energy supply systems. The diversity of these energy supplies helps to manage cost and resilience, but will also add complexity with regards to economic and other operating decisions. A multi-period, rolling-horizon optimization was developed to provide reliable and sound economic, real-time decisions for a hydrogen electrolyzer system used to fulfil potential H2 vehicle demand. The optimization considers decisions associated with the purchase of wind and solar renewable energy, storage of H2, the purchase of electricity on a day-ahead basis, the sale of excess electricity on a real-time market, fulfillment of station service electrical demand, and the sale of a zero-net-energy regulation product, similar to the PJM RegD market. This model was also used to economically size the infrastructure based on demand and price forecasts.

## 4 - Design of Community-Focused Resilience Metrics for Effective Infrastructure Investment

Robert Fredric Jeffers, PhD, Sandia National Labs, Albuquerque, NM, 87185, United States

Abstract not Available

## 5 - Power System Resiliency Reliability Cooptimization

Bryan Arguello, R&D Computer Science, Sandia National Labs, 1515 Eubank Blvd. SE, NM, Albuquerque, NM, 87123, United States, Brian Pierre, Shabbir Ahmed, Emma Johnson

The purpose of our work is to co-optimize power system reliability and resiliency investment decisions. Our working definition of resiliency is resistance to load shed during low-probability, high-impact events. Similarly, we define reliability as resistance to load shed during high-probability, low-impact events. We have developed both a distribution-level reliability investment model driven by historical outage data, and a transmission-level stochastic resiliency investment model driven by extreme weather event scenarios. Through our co-optimization technique, we explore the tradeoff between transmission resiliency and distribution reliability when the models share a budget.

## Joint Session ENRE/Practice Curated: Optimization and Machine Learning for Electric Power Systems

Sponsored: Energy, Natural Res & the Environment/Electricity  
Sponsored Session

Chair: Yu Zhang, PhD, UC Santa Cruz, 1156 High St SOE2, Santa Cruz, CA, 95064, United States

## 1 - Application of Machine Learning to Distribution Synchrophasors

Alireza Shahsavari, University of California, Riverside, Riverside, CA, United States, Hamed Mohsenian-Rad

The recent development of distribution-level phasor measurement units, a.k.a. micro-PMUs, has been an important step towards achieving situational awareness in power distribution networks. A typical micro-PMU is connected to single- or three-phase distribution circuits to measure GPS time-referenced magnitudes and phase angles of voltage and current phasors at 120 readings per second. The challenge in using micro-PMUs is to transform the large amount of data that is it generates to actionable information and match the said information to use cases with practical value to distribution system operators. In this talk, we adopt a big-data approach to address this open problem. We introduce a novel data-driven event detection technique to pick out valuable portion of data from extremely large raw micro-PMU dataset. We then develop a data-driven event classifier to effectively classify power quality events. Importantly, we use field expert knowledge and utility records to conduct an extensive data-driven event labeling. Certain aspects from event detection analysis are adopted as additional features to be fed into the classifier model.

## 2 - Joint Structure and Parameter Estimation in Power Distribution Under Limited Observability

Deepjyoti Deka, Los Alamos National Lab

Efficient operation of distribution grids in the smart-grid era is hindered by the limited presence of real-time meters. This paper studies the problems of topology and parameter estimation in the limited observability regime where measurements are restricted to only the terminal nodes of the grid and all intermediate nodes are unobserved/hidden. To this end, we propose two algorithms for exact topology (and impedances) estimation. We discuss the computational and sample complexity of our proposed algorithms and demonstrate that topology (and impedance) estimation by our algorithms are optimal with respect to number of nodal observability required.

## 3 - Stochastic Continuous Time Unit Commitment

Anna Scaglione, Arizona State University, Tempe, AZ, United States, Kari Hreinsson, Bitá Analui

Conventional power system unit commitment problems are deterministic and assume piece wise constant behavior of net-load, while in reality net-load is uncertain and inter-period generator ramps are not well defined. We will discuss a stochastic continuous time problem formulation, where we try to give a more realistic generator ramp trajectories, as well as incorporating a multi-stage stochastic decision framework, where dispatch decisions are revised over the modeling horizon.

## 4 - Wind Power Forecasting via Deep Neural Networks

Yu Zhang, University of California, Santa Cruz, Jiao Hao Miao

Accurate forecasting of renewable generation is a challenging task due to its inherent intermittency and volatility. In this context, this talk deals with a new machine learning approach for predicting wind power generation with various meteorological factors including wind speed, direction, humidity, etc. We first utilize data visualization techniques for the feature selection, and then develop a deep neural network to predict the wind power outputs. Numerical results show that our proposed approach outperforms existing methods including persistence, support vector regression and ARMA.

North Bldg 228A

## Equilibria in Low-Carbon Electricity Markets

Sponsored: Energy, Natural Res & the Environment/Electricity  
Sponsored Session

Chair: Rodrigo Moreno, University of Chile, Santiago, Chile

Co-Chair: Francisco Munoz

## 1 - Investigating the Role and Value of Flexible Technologies in Low Carbon Deregulated Electricity Markets

Dimitrios Papadaskalopoulos, Imperial College-London, London, United Kingdom

The challenges associated with the decarbonization and the deregulation of electricity markets have attracted significant interest around the role and value of new flexible technologies such as flexible demand and energy storage. The author will present a new multi-period equilibrium programming model of the electricity market, capable of capturing for the first time both the strategic behavior of independent market players and the complex time-coupling characteristics of new flexible technologies. Results from case studies on a UK-based test market will demonstrate the impacts of these technologies on the business case of different market players and the overall efficiency of the market.

## 2 - Equilibrium Analysis of a Tax on Carbon Emissions with Pass-through Restrictions and Side-payment Rules

Francisco David Munoz, Universidad Adolfo Ibáñez, Santiago, Chile, Gabriel D az, Rodrigo Moreno

We develop an equilibrium model with endogenous investments in generation capacity to quantify the economic inefficiencies of an emissions policy with pass-through restrictions and side-payment rules. We provide general results that show that social costs and long-term electricity prices are always lower under a standard carbon tax than under an emissions policy with such restrictions. We explore the effects of the policy through numerical experiments and find that its effect on carbon emissions is ambiguous. Tax revenues can be much higher under such emissions policy than under a standard carbon tax, which gives the regulator weak incentives to modify the regulation.

### 3 - Impacts of Proactive Expansion Planning Under Multiple Equilibria on Generation Expansion Decisions

Enzo E. Sauma, Pontificia Universidad Catolica de Chile,  
Ave. Vicuna Mackenna 4860, Santiago, Chile, David Pozo,  
Javier Contreras

We use a proactive three-level equilibrium model for power transmission and generation expansion to study the potential impacts of proactive expansion planning on generation expansion decisions. In particular, we show that proactive transmission expansion decisions may lead to suboptimal solutions when the generation expansion equilibrium problem have multiple solutions (i.e., leading to higher total costs and lower social welfare). The resulting formulation is stated as a mathematical program subject to an equilibrium problem with equilibrium constraints (EPEC). To deal with this problem, we also propose an approach to derive tractable EPEC solutions with global optimality guaranteed.

### 4 - Market Design Considerations for Scarcity Pricing

Anthony Papavasiliou, Universite Catholique de Louvain, Center  
for Operations Research and Econometrie, Voie du Roman Pays 34,  
Louvain la Neuve, 1348, Belgium

Scarcity pricing can potentially remunerate flexibility within the context of an energy-only market design. A crucial aspect of scarcity pricing is the back-propagation of real-time scarcity signals to earlier forward markets. The successful back-propagation of scarcity signals hinges on a variety of specific short-term electricity market design choices, including (i) the trading of reserve capacity in real time, (ii) virtual trading, and (iii) the timing of the clearing of reserve capacity in day-ahead markets. In this presentation we propose a family of stochastic equilibrium models for addressing how each of these market design choices affects the back-propagation of scarcity signals.

### Joint Session ENRE/Practice Curated: Energy Modeling: Open Source, Applications and New Developments

Sponsored: Energy, Natural Res & the Environment/Energy

Sponsored Session

Chair: Denis Lavigne, PhD, Royal Military College St-Jean, 15, rue  
Jacques-Cartier Nord, St-Jean-sur-Richelieu, QC, J3B 8R8, Canada

#### 1 - Representing the Demand Side in Energy System Optimization Models

Benjamin D. Leibowicz, Assistant Professor, University of Texas-  
Austin, ETC 5.128D, 204 E. Dean Keeton St. C2200, Austin, TX,  
78712-1591, United States

Energy system optimization models have traditionally focused on supply-side technology investment and operation decisions. They often neglect demand-side dynamics related to end-use technology choices and demand levels because they are determined by myriad actors making individual decisions. This presentation outlines methodologies for representing the demand side in energy system optimization models, with OSeMOSYS formulations of transportation and buildings as examples.

#### 2 - Storage End Effects and the Value of Stored Energy

Taco Niet, British Columbia Institute of Technology,  
3700 Willingdon Avenue, Burnaby, BC, V5G 3H2, Canada

High temporal resolution modelling of energy systems often requires modelling a number of sub-periods, with the end condition of one sub-period being used to seed the next. When storage is modeled a challenge is to keep the model from draining the stored energy at the end of each sub-period. A common approach is to model extra-long sub-periods and to discard this end effect, increasing computational complexity. We evaluate the alternative of assigning a monetary value to the stored energy at the end of each sub-period using the OSeMOSYS energy system model. We find that assigning a monetary value to storage is an effective method to reduce the impact of end effects when modelling storage.

#### 3 - Osemosys.org and the Global Climate-land-energy-water Model: An Integrated Resource Assessment Tool Supporting Sustainable Pathways for the Energy System

Mark Howells, KTH Royal Institute of Technology, Brinellvagen 68,  
Stockholm, 10044, Sweden, NA, Agnese Beltramo,  
Constantinos Taliotis

The Open Source Energy Modelling System (OSeMOSYS) was used recently to perform integrated resource assessment analysis. In these applications, the modelling framework has been enhanced to represent interlinkages in between natural resources and identify possible Climate, Land, Energy and Water strategies (CLEWs) towards more sustainable development pathways for the energy system. In this context, the Global Least-cost User-friendly CLEWs Open Source Explorative (GLUCOSE) model is presented as an example of the developed methodology. It will provide an overview of the resource constraint the environment is facing at the global level and which might affect the energy system in the long run.

### 4 - An Overview of Past, Present and Future GHG Emissions and Objectives for Canada Leading to Open-source Energy Modeling

Denis Lavigne, Professor, Royal Military College Saint-Jean, 29,  
rue Louis-Frechette, Saint-Jean-sur-Richelieu, QC, J2W 1E9,  
Canada

This talk presents an overview of past, present and future GHG emissions and objectives for Canada. The discussion also includes emissions intensities and provincial figures through the years. A parallel history of some particular bottom-up energy modeling tools is presented. It leads to the opportunity to use an open-source modeling framework such as OSeMOSYS to model cities and provinces of Canada. Examples of such existing work is presented.

#### 5 - Open Source Multi-state Continental Investment Models to Support an Analysis Ecosystem

Mark Howells, Royal Institute of Technology (KTH), Stockholm,  
Sweden, Hauke Henke, Nandi Moksnes, Constantinos Taliotis,  
Agnese Beltramo

Large multi-state electricity generation investment models have been developed. They can be absorbed into teaching programs; extended for special research applications; reduce the time needed to have a functional model and allow for the extraction of sub-models: either single or multi-state. At present such models exist for three regions of the world. These are TEMBA, SAMBA and OSEMBE for Africa, South America and EU-28 respectively. A model for North America are yet to be developed. This paper discusses pertinent aspects of these model bases and lays out challenges to be addressed.

### Joint Session Tutorial/Practice Curated: Coalescing Data and Decision Sciences for Analytics

Emerging Topic: Practice Curated Track

Emerging Topic Session

Chair: Lewis Ntamo, Texas A&M University, 3131 TAMU,  
College Station, TX, 77843, United States

#### 1 - Coalescing Data and Decision Sciences for Analytics

Suvrajeet Sen, University of Southern California, Daniel J. Epstein  
Dept. of, Industrial and Systems Engineering, Los Angeles, CA,  
90089-0193, United States, Yunxiao Deng, Junyi Liu

The dream of analytics is to work from common data sources, so that all of its facets (descriptive, predictive, and prescriptive) are supported via a coherent data-driven vision. This vision of analytics is what we refer to as "Integrative Analytics". In this tutorial we will cover a variety of OR/MS applications that require specific statistical learning models to be integrated with optimization models. For instance, certain cross-sectional data describing dependence among random variables may lead to regression models with multivariate error terms to be integrated with Stochastic Programming (SP) models. Others may require time series models to be integrated with Stochastic Model Predictive Control (S-MPC). Still other examples lead to particle filtering models providing data for network routing. In essence this tutorial will use these illustrations to motivate a new class of models, which we refer to as Learning Enabled Optimization (LEO) models. As suggested in the title of this tutorial, the applications are derived from integrative analytics. In addition to presenting these examples, the tutorial will cover fundamental concepts for modeling, statistically approximate solution concepts, sampling-based algorithms, and finally, model assessment and selection in the context of LEO models. Given the novelty of this paradigm, we will also outline how instructors may use the material for a graduate course on integrative analytics.

### Multi-Scale Feedbacks in Food-Energy-Water Decisions

Sponsored: Energy, Natural Res & the Environment Environment & Sustainability

Sponsored Session

Chair: Robert Barron, The University of Kansas

Co-Chair: Misty Porter, University of Kansas, Lawrence, KS, United States

#### 1 - Pareto Optimality in Group Utility Functions

Ali E. Abbas, University of Southern California, 3650 McClintock Ave, OHE 310R, Los Angeles, CA, 90089, United States, Zhengwei Sun

The Pareto optimality condition is a widely used assumption in group decision making. It requires that if each individual in the group prefers one alternative to another, then the group as a whole should prefer that alternative. This condition implies that the group utility function is an additive combination of the utility functions of the group members. We argue that Pareto optimality is a desirable property for deterministic decisions but it need not be desirable for lotteries. We present a new condition "independence of indifferent group members." We show that it is a weaker condition than Pareto optimality and derive the corresponding functional form of the group utility function.

#### 2 - Science for Creative Solutions: Obtaining Sustainable Agriculture in Arid Regions when the Well Runs Dry

Mary C. Hill, Professor, The University of Kansas, 1440 Naismith Drive, 170D Slawson, Lawrence, KS, 66045-0001, United States, Robert Barron

The proposed FEWTUREsim (Food, Energy, and Water Technology Use in Resilient Environmental and economic sustainability Simulations) provides a vision of sustainable water and energy use and economic resilience in agricultural systems. Here, we discuss the object-oriented program design and proposed tests with use cases from arid rural communities. Any analysis that ignores global effects such as energy demand and supply and resulting costs, and climate change scenarios will produce a false assessment of system risks. Integration with results from selected GCAM simulations are explored as a way to account for global scale concerns.

#### 3 - Discover Water: An Interactive Spatio-temporal Framework for Scalable Multivariate Analysis

Misty Porter, University of Kansas, Lawrence, KS, United States, Mary Hill

Combining qualitative and quantitative reasoning within a visual context supports the need for collaborative conservation to protect water resources. Previous work resulted in a visualization platform capable of clearly depicting correlations and suggesting interdependencies between time-varying, spatially-distributed quantities; it is called DiscoverWater. DiscoverWater is a time-evolving map and graphs based on time-series data. Together, these components elucidate trends so that the user can try to envision the relations between groundwater-surface water interactions, the impacts of pumping on these interactions, and the interplay of climate.

#### 4 - Evaluating Sustainability of Energy Development Using Multi Criteria Decision Analysis: A Case Study on Mexico

Rodrigo Mercado, University of Massachusetts-Amherst, Amherst, MA, United States, Erin Baker

This paper examines the use of multi criteria decision analysis (MCDA) to evaluate the sustainability of different expansions in the Mexican Electrical Grid. In particular, we will include the transmission, generation, natural gas and CO<sub>2</sub> storage networks into the evaluation of sustainability for each pathway. We use a set of social, economic and environmental criteria to evaluate the sustainability of each expansion plan up to 2050. The goal will be to use the insight of the sustainability of each expansion plan to better inform decision maker in developing energy policy.

#### 5 - Modeling the Intersections of Food Energy and Water in Climate Vulnerable Ethiopia with an Application to Small Scale Irrigation

Ying Zhang, Johns Hopkins University, Baltimore, MD, United States, Sriram Sankaranarayanan, Jess Carney, Wanshu Nie, Ben Zaitchik, Sauleh Ahmad Siddiqui

To understand the coupled FEW dynamics, we are developing a multi-player micro-economic (MME) partial-equilibrium model. The MME studies how shocks such as drought and development of resilience technologies would influence the system. The MME model is based on aggregating individual optimization problems for relevant players to capture food and energy supply chain across zones. As small-scale irrigation has been promoted as a resilience technology that could affect food security and economic well-being in Ethiopia, here, we focus on the energy usage for small-scale irrigation and the collective impact on crop production and water resources across zones in the MME model.

### Joint Session ENRE/Practice Curated: One and Two-level Equilibrium Modeling with Applications in Energy

Sponsored: Energy, Natural Res & the Environment/Energy

Sponsored Session

Chair: Steven A. Gabriel, University of Maryland, University of Maryland, College Park, MD, 20742-3021, United States

Co-Chair: Ben Hobbs

#### 1 - A Median Function Approach for Discretely Constrained Equilibrium Problems

Steven A. Gabriel, University of Maryland, Dept Civil Environ Eng, 1143 Glenn L. Martin Hall, College Park, MD, 20742-3021, United States

In this talk we present a new approach for solving discretely constrained, complementarity problems. Such problems can related to energy markets with discrete (e.g., go-no go) restrictions and also equity-enforcing restrictions. The result is a mixed integer nonlinear program based on finding the zero of a certain median function and then minimizing the norm of this function subject to integer and other constraints. The approach is presented with both theory and numerical results to proof its usefulness.

#### 2 - Equilibria in Electricity and Gas Systems under Limited Information Interchange

Antonio J. Conejo, The Ohio State University, Department of Integrated Systems Engineering, 210 Baker Systems Building, Columbus, OH, 43210, United States, Sheng Chen, Ramteen Sioshanshi

We consider the independent but interrelated operation of a gas system and a power system. The gas operator seeks maximum gas supply profit by solving a second order conic problem, while the electricity operator seeks minimum electricity supply cost by solving a linear programming problem. CCGTs link significantly the operation of both systems. We characterize the equilibria reached under different levels of communication granularity (both temporal and spatial) between the gas and electricity system operators.

#### 3 - Long-term Electricity Market Equilibria with Storage in the Presence Stochastic Renewable Infeed

Christoph Weber, PhD, University of Duisberg-Essen, Essen, Germany

Renewable energy sources (RES) in the electricity system increase the need for flexible balancing of supply-dependent infeed, storage is thereby one important option. We formulate the long-term partial equilibrium model for competitive electricity markets with conventional generation, storage and stochastic infeed represented by a discrete recombining tree. We explore the KKT conditions to derive operation principles for storage based on a time-varying position in the supply stack resulting from stochastic changes in the co-state variable. Additionally, characteristics of the long-term investment equilibrium are derived based on the zero-excess profit condition.

#### 4 - Strategic Multinational Transmission Expansion Planning using a Three-stage Equilibrium Model

Simon Risanger, MSC, Norwegian University of Science and Technology, Trondheim, Norway, Martin Kristiansen, Paolo Pisciella

Market agents often have different objectives and ignoring this can lead to inefficient markets. An example is multinational transmission expansion planning, where countries maximize their own social welfare, while system and market operators want system optimal results. To confront this challenge, we propose a three-stage equilibrium model. By exploiting relationships between binary variables from disjunctive constraints and dual variables, a mixed integer linear problem providing global optimum is formulated. The method is demonstrated on a case study of the North Sea Offshore Grid.

### Freestyle O.R. Supreme: Frame that Problem

Sponsored: INFORMS Section on Practice (formerly CPMS)

Sponsored Session

Chair: Carrie Beam, University of Arkansas, Walnut Creek, CA, 94596, United States

#### 1 - Freestyle OR Supreme Moderator

Carrie Beam, University of Arkansas, Walnut Creek, CA, 94596, United States

Join us at our Freestyle OR Supreme competition. Our 'clients' will present their OR/Analytics problem to our teams, who will have to formulate and present their OR/Analytics solution on the fly - with no Internet. This is great experience to frame and solve a problem quickly, and a great showcase for any budding consultants (or hiring companies) out there. Winners will be selected by the client, with possible influence from audience applause.

#### Panelists

James T. Williams, FICO, 2665 Long Lake Rd, Building C, Roseville, MN, 55113, United States

Aaron Burciaga, Booz Allen Hamilton, 4305 Majestic Lane, Fairfax, VA, 22033, United States

Sanjay Saigal, Graduate School of Management, UC Davis, 327 Oakwood Place, Menlo Park, CA, 94025, United States

Kenneth J. Fordyce, Arkieva, 5460 Fairmont Drive, Wilmington, DE, 19808, United States

### Scheduling II

Emerging Topic: Project Management and Scheduling, in Memory of Joe Leung,

Emerging Topic Session

Chair: Yumei Hou, City University of New York, College of Staten Island

#### 1 - Multitasking Scheduling Problem with Deteriorating Job and Efficiency Promotion

Yan Wang, Northwestern Polytechnical University, Xi'an, China, Junqiang Wang

In a human-related scheduling environment, operators have a need for multitasking to cope with the challenges like deterioration effect. Multitasking scheduling allows the processing of a primary job can be interrupted by waiting jobs that are available but unfinished. We consider the position-dependent deterioration of the primary job, and positive effect of the waiting jobs on efficiency promotion. This research trades off gains in multitasking against losses in deterioration effect. The related research methods and results will provide a scientific support to efficiently improve production scheduling performance, and further a new insight to better understand human-related behavior.

#### 2 - Minimizing Total Completion Time on Flow Shop with Unavailability Constraint

Hairong Zhao, Purdue University Northwest, 2200 169 Street, Hammond, IN, 46323, United States

We consider the problem of minimizing total completion time on 2 stage flow shop with the unavailability constraint on the second machine. We show that some special cases are solvable optimally in polynomial time. For the general case, the problem is extremely difficult. We develop some meta-heuristics whose performance is evaluated by experimental results.

#### 3 - Multicriteria Scheduling Subject to Limited Machine Availability

Yumei Huo, City University of New York, College of Staten Island, 2800 Victory Boulevard, 1N 215, Staten Island, NY, 10314, United States

We study the problems of multi-criteria scheduling subject to machine availability. As Panwalkar et al. points out, decision makers are often faced with the problem of satisfying several different groups of people simultaneously. On the other hand, machines may not be continuously available due to breakdown, preventive maintenance or processing unfinished jobs from a previous planning horizon. So it is natural to consider bi-criteria scheduling subject to the limited machine availability. Theoretically, the problems of multi-criteria scheduling subject to machine availability are more complicated. In this talk, we will present all the polynomial solvable problems.

#### 4 - Multi-compartment Vehicle Routing Problem for Oil Products Distribution with Transshipment

Yaxian Zhou, Dalian University of Technology, No 2 Linggong Road, Gaoxinyuan District, DaLian, 116023, China, Lijun Sun, Haiyang Shi, Xiangpei Hu

This paper addresses the multi-compartment vehicle routing problem for oil products distribution with transshipment. A mixed distribution scheme combining separate distribution and co-distribution is proposed to reduce the total distribution cost. We solve the problem with the Clarke and Wright savings algorithm incorporating the exchange and insertion operators. Numerical results show that the mixed scheme is always better than the separate distribution used in practice. As a result, the mixed scheme is advisable in oil products distribution with transshipment.

#### 5 - Parallel-batching Scheduling: Impact of Adding Machine Capacity

Jun Xu, Northwestern Polytechnical University, Xi'an, China, Junqiang Wang

Scheduling performance can be improved with extra cost by resource augmentation such as adding machine capacity. This paper investigates the impact of adding machine capacity on the scheduling objective function. We measure such capacity impact by the ratio and give the bounds on the capacity impact for the problem to minimize the makespan and total completion time. Furthermore, to trade off gains in scheduling performance against the losses in adding machine capacity extra cost, we propose a cost-effective approximate algorithm and analyze the corresponding worst-case ratio.

North Bldg 231C

### Joint Session SMA/Practice Curated: Social Media Analytics and Business Value

Emerging Topic: Social Media Analytics

Emerging Topic Session

Chair: Nohel Zaman, Blacksburg, VA, 24060, United States

#### 1 - Effective Text Mining Techniques for Understanding Employee Opinions

David Michael Goldberg, Virginia Tech, 880 West Campus Drive, Suite 1007, Blacksburg, VA, 24060, United States, Nohel Zaman

Employee satisfaction is a vital component of workplace culture, and it has substantial impacts in firm performance. In this work, we propose and compare several text analytics methods for understanding employee perceptions of their work environment using data from online discussions. These techniques will allow firms to understand nuanced employee perceptions and to pursue remediation if necessary.

#### 2 - The Effects of Online Consumer Reviews on Product Sales in Mobile Apps Industry: An Empirical Study

Zhilei Qiao, Virginia Institute of Technology, 880 West Campus Drive, Blacksburg, VA, 24061, United States

Prior studies show that online consumer reviews have significant impacts on consumers' adoption decisions and firms' sales. This study extends the previous research and examines the effect of online user reviews on new product sales in the mobile app industry. Our results show that the review valence has a significant positive effect on new paid products, whereas the review valence has a significant negative effect on free products. Furthermore, we find that in-app purchase option has a moderating effect on the relationship between review characteristics and product sales for free and paid products. These surprising results show that review ratings have strong persuasive effects on product sales.

#### 3 - Comparing Text Analytics Methods for Understanding Hotel Reviews

Nohel Zaman, Virginia Tech, 880 West Campus Drive, Suite 1007, Blacksburg, VA, 24060, United States, David Michael Goldberg

The hotel industry is rife with various service issues, which lead to dissatisfied customers. Online user-generated content presents firms with a valuable opportunity to collect business intelligence and to understand these problems. This study focuses on comparing the performance of text analytics for detecting these instances in online media and determining how best to analyze different types of consumer complaints.

## ■ MD53

North Bldg 232A

### Market Design

Sponsored: Auction and Marketing Design

Sponsored Session

Chair: Itai Ashlagi, Stanford University, Stanford, CA, 94305, United States

#### 1 - Centralized Admissions for Engineering Colleges in India

Yash Kanoria, Columbia Business School, 404 Uris Hall, New York, NY, 10027, United States, Surender Baswana, Partha Pratim Chakrabarti, Sharat Chandran, Utkarsh Patange

We designed and implemented a new joint seat allocation process for over 500 programs across 80 engineering colleges in India, including the Indian Institutes of Technology (IITs). Our Deferred Acceptance-based process overcomes a number of challenges. The joint seat allocation process has been successfully running since 2015, with a 70% reduction in vacancies at the IITs. Particular concerns have been (i) allocative efficiency and reducing vacancies due to students accepting a seat but then withdrawing or not reporting for classes, (ii) transparency, integrity and fairness, (iii) logistical simplicity for both candidates and institutes, and (iv) the incentive structure for candidates.

#### 2 - On the Competition Complexity of Dynamic Mechanism Design

Christos-Alexandros Psomas, Carnegie Mellon University, 5000 Forbes Avenue, GHC 9116, Pittsburgh, PA, 15213, United States, Siqi Liu

Consider the following problem: a monopolist is auctioning off  $m$  items in  $m$  consecutive stages to  $n$  interested buyers. A buyer realizes her value for item  $k$  in the beginning of stage  $k$ . How many additional buyers are necessary and sufficient for a second price auction at each stage to extract revenue at least that of the optimal dynamic auction? We prove that the number of additional buyers, i.e. the Competition Complexity, is at most  $3n - 1$  and at least linear in  $n$  - even when the buyers' values are correlated across stages, under a monotone hazard rate assumption on the stage (marginal) distributions.

#### 3 - Repeated Sales for Multiple Strategic Buyers

Emmanouil Pountourakis, University of Texas at Austin, 16 Bristol Street, Unit 3, Cambridge, MA, 02141, United States, Nicole Immorlica, Brendan Lucier, Sam Taggart

In a market with repeated sales of a single item to a single buyer, prior work has established the existence of a zero revenue perfect Bayesian equilibrium in the absence of a commitment device for the seller. We show that in fact almost any revenue can be achieved in equilibrium, but the zero revenue equilibrium uniquely survives natural refinements. However, this market failure depends crucially on the assumption of a single buyer. If there are multiple buyers, we construct an intuitive equilibrium for multiple buyers that survives our refinements, in which the seller obtains a constant factor of the per-round Myerson optimal revenue.

#### 4 - Maximizing Efficiency in Dynamic Matching Markets

Maximilien Burq, PhD Student, Massachusetts Institute of Technology, 77 Massachusetts Avenue, Cambridge, MA, 02139, United States, Itai Ashlagi, Patrick Jaillet, Amin Saberi

We study the finite horizon problem of matching agents who arrive at a marketplace over time and leave after  $d$  time periods. Each pair of agents can yield a different match value, and we study matching algorithms that perform well over arbitrary arrivals. Our main contribution is a  $1/4$ -competitive algorithm which randomly selects a subset of agents who will wait until right before their departure to get matched, and maintains a maximum-weight matching with respect to the other agents. We extend the model to the case with stochastic departures, and establish a  $1/8$ -competitive algorithm in this setting. Finally we show on real-world data that a modified version of our algorithm performs well in practice.

## ■ MD54

North Bldg 232B

### New Areas in Behavioral Operations

Sponsored: Behavioral Operations Management

Sponsored Session

Chair: Evgeny Kagan, Ann Arbor, MI, 48103, United States

#### 1 - Entrepreneurial Market Research - When Hypotheses Outnumber Samples

Evgeny Kagan, University of Michigan, Ross School of Business, 701 Tappan Ave, Ross School of Business, Office R5425, Ann Arbor, MI, 48103, United States, Stephen Leider, William S. Lovejoy

In "technology-push" (relative to "demand-pull") innovation, technology teams

often develop a new capability that may find voice in a range of industrial settings. However, the team may lack the marketing budget to explore each in great depth, or even all of them at any depth. We formulate a bandit model to study this problem and develop a novel approach to its resolution, which includes simulation, interpretation, communication and implementation of search strategies.

#### 2 - Effect of Flexibility on Consumption of Services

Rajiv Mukherjee, Southern Methodist University, 11113 New Orleans Dr, Frisco, TX, 75035, United States, Sreekumar R. Bhaskaran, Sanjiv Erat

In this paper, we experimentally investigate how flexibility in consumption interacts with the actual usage of a service by consumers. Subsequently, we study a firm's pricing and capacity planning decision under the presence of these effects. The results have interesting implications in industries where managing congestion is an important consideration.

#### 3 - The Effects of Mental Accounting on Project Management and Performance

Yael S. Grushka-Cockayne, Darden School of Business, University of Virginia, 100 Darden Boulevard, Charlottesville, VA, 22903, United States, Manel Baucells, Woonam Hwang

We consider a project manager who decides on the budget and the scope of a project, and must react to news as the project evolves, possibly revising the cost and scope. The project manager is likely to compare ongoing cost and scope to a baseline. When costs and benefits are dissociated in time—as is the case of a project—such comparisons give rise to a mental accounting process where costs and benefits are either mentally banked or amortized. We develop a stylized model capturing this process, and investigate the impact of loss aversion, reference-point updating, and narrow framing on a project manager's decisions and the project's financial performance.

#### 4 - From Noise to Bias in Linked Supply Chain Decisions

Jordan D. Tong, University of Wisconsin Madison, 975 University Ave, Room 4293, Madison, WI, 53706, United States, Daniel Feiler

We complement BOM research on random error by studying how noisy behavior plays out in linked decisions. In the choose-forecast-invest task combination, one must (a) choose which product to sell (b) make a demand forecast for the chosen product and (c) make an investment decision for the chosen product. Through behavioral models and lab experiments, we show how adding unbiased random noise to the process leads to systematic overinvestment. This bias arises due to the way that random noise filters through the linked decisions and statistical naivety on the part of the decision-maker. We show how some kinds of noise reduce the bias while others actually mitigate it, and test a debiasing technique.

### Getting Funded by NSF: Proposal Preparation and the Merit Review Process

Emerging Topic: NSF

Emerging Topic Session

Chair: Irina Dolinskaya, National Science Foundation, 2415 Eisenhower Ave, Alexandria, VA, 22314, United States

#### 1 - Getting Funded by NSF: Proposal Preparation and the Merit Review Process

Irina Dolinskaya, National Science Foundation, 2415 Eisenhower Ave, Alexandria, VA, 22314, United States

So, you think you have a great research idea, now how do you get funding from the National Science Foundation (NSF) to do the work? A well-scoped and written proposal is instrumental to successful submission. This session targets junior faculty and researchers who might be new to NSF and describes detailed guidelines and practical advice for proposal preparation. The presenters will go over NSF review process and Intellectual Merit and Broader Impacts criteria, as well as share most common mistakes made by the PIs when submitting a proposal. Question-and-answer session will follow the presentation.

## ■ MD56

West Bldg 101A

### Medical Decision Analysis by Bonder Scholars

Sponsored: Health Applications

Sponsored Session

Chair: Pooyan Kazemian, Harvard Medical School, Boston, MA, 02114, United States

#### 1 - Ambulance Emergency Response Optimization in Developing Countries: Application

Justin James Boutilier, University of Toronto, 532 Palmerston Boulevard, Apartment 6, Toronto, ON, M6G 2P5, Canada, Timothy Chan

The lack of emergency medical transportation is viewed as the main barrier to the access and availability of emergency medical care in low and middle-income countries (LMICs). In this paper, we present a robust optimization approach to optimize both the location and routing of emergency response vehicles, accounting for uncertainty in travel times and spatial demand characteristic of LMICs. We then combine our robust optimization approach with two machine learning frameworks and real data from Dhaka, Bangladesh. The focus of this talk is to provide an in-depth investigation into three policy-related questions.

#### 2 - Trial Termination and Drug Misclassification in Sequential Adaptive Clinical Trials

Alba Rojas-Cordova, Southern Methodist University, Dallas, TX, 75219, United States, Ebru Korular Bish, Niyousha Hosseinichimeh

We examine the nature and implications of wrongly terminating the development of an effective candidate drug, which may lead to unrecoverable expenses, and unfulfilled patients' needs. To this end, we build a simulation model of a Phase 3 sequential adaptive trial, and focus on the continuation or termination decision at one of the planned interim analysis points, based on the feedback from the drug testing process. We examine the effects of imperfect information and the conditions that lead to drug misclassification by conducting an extensive Monte Carlo-style sensitivity analysis. Contrary to the literature's focus on false positives, our results suggest that false negatives can be more likely.

#### 3 - The Development and Validation of a New Microsimulation Model of Type 2 Diabetes

Pooyan Kazemian, Harvard Medical School, 50 Staniford Street, 9th Floor, Room 930B, Boston, MA, 02114, United States, Deborah Wexler, Naomi Fields, Robert Parker, Amy Zheng, Rochelle Walensky

We developed a novel microsimulation model of type 2 diabetes progression and outcomes using data from recent randomized clinical trials and cohort studies. We validated the model against outcomes from two clinical trials (ACCORD and VADT) using several statistical methods which demonstrate that our model can accurately predict clinical outcomes of patients with type 2 diabetes in the modern era. The model will be used to project long term clinical and economic outcomes of treatment interventions for type 2 diabetes.

#### 4 - Data-driven Optimization Models for Concussion Management Decisions

Gian-Gabriel P. Garcia, University of Michigan, Ann Arbor, MI, 48105, United States

Concussion is an emerging public health issue. Recent research has begun to illuminate the relationship between concussion and long-term consequences including cognitive impairment, neurodegenerative disease, and early onset dementia. Concussion management plays a critical role in long and short-term health outcomes for those with concussion. In this talk, we discuss how we apply data-driven optimization to address major challenges in concussion diagnosis and post-injury management.

### Financial Incentives in Healthcare Delivery

Sponsored: Health Applications

Sponsored Session

Chair: Turgay Ayer, Georgia Institute of Technology, Atlanta, GA, 30332, United States

Co-Chair: Zhaowei She, Georgia Institute of Technology, Atlanta, GA, 30332, United States

#### 1 - Reference Pricing for Healthcare Services

Shima Nassiri, University of Michigan, Ross School of Business, 701 Tappan Avenue, Ann Arbor, MI, 48109, United States, Elodie Adida, Hamed Mamani

The traditional payment system between an insurer and hospitals does not incentivize hospitals to limit their prices and patient to choose less expensive providers, hence contributing to high insurer costs. Reference pricing (RP) has been proposed as a way to better align incentives and control rising costs. Under RP, the patient may be responsible for part of the cost if they select a high-price hospital. We propose a model to analyze the RP payment scheme that incorporates an insurer choosing the reference price, competing price-setting hospitals, and patients selecting a provider based on a multinomial logit choice model. Our goal is to understand how RP compares with the current payment system.

#### 2 - The Role of Non-clinical Workforce on Patient Service: Evidence from NHS Helpline

Bilal Gokpinar, UCL School of Management, 1 Canada Square (38th floor), Canary Wharf, London, E14 5AA, United Kingdom, Emmanouil Avgerinos

Healthcare organizations rely on a mix of clinical and non-clinical personnel in delivering health services. Although non-clinical workers are vital in many healthcare delivery settings today, their impact on efficiency and quality of patient service has not been examined in the operations management literature. In this study, making use of a novel dataset based on National Health Service (NHS)'s new 111 non-emergency helpline in England, we quantify and demonstrate trade-offs associated with employing non-clinical personnel in delivering patient service.

#### 3 - Pay-for-quality or Pay-for-selection? An Analysis of the Capitation Payment Models in Healthcare

Zhaowei She, Georgia Institute of Technology, 755 Ferst Drive NW, Main 346 B, Atlanta, GA, 30332, United States, Turgay Ayer, Daniel Montanera

Capitation payment models have been increasingly adopted by payers in U.S. healthcare markets during the past decade, as a remedy for fee-for-service (FFS) payment models. However, early empirical evidence found that Medicare Advantage (MA), the largest capitation program in the U.S., has been suffering from another kind of market failure: risk selection. While the existing literature attributes the observed risk selection in capitation programs primarily to imperfect estimation in risk adjustment, this paper discovers a new source of risk selection: Pay-for-Selection. We further conduct a difference-in-difference (DID) estimation to identify the pay-for-selection effect in MA market.

#### 4 - Why Is Cost at a Modern Indian Hospital Lower than at Well-managed US Peers?

Feryal Erhun, University of Cambridge, University of Cambridge, Trumpington Street, Cambridge, CB2 1AG, United Kingdom

Modern Indian hospitals attain lower cost of care while meeting US-equivalent quality accreditation standards. This is unsurprising because they pay far lower market prices for inputs to care. Whether their cost advantage is also attributable to care delivery methods that could be adopted by hospitals in the US remains unresolved and is the focus of this study.

West Bldg 101C

### Joint Session HAS/Practice Curated: Analytics and Optimization in Health Systems

Sponsored: Health Applications

Sponsored Session

Chair: Seyma Guven-Kocak, Georgia Institute of Technology, Atlanta, GA, 30340, United States

Co-Chair: Pinar Keskinocak, Georgia Institute of Technology, Atlanta, GA, 30332, United States

Co-Chair: Dave Goldman, Georgia Institute of Technology, Atlanta, GA, 30332-0205, United States

#### 1 - Pediatric Kidney Post-Transplant Survival Analysis and Risk Factor Identification

Yao Xie, Georgia Institute of Technology, 4049 Wieuca Road NE, Atlanta, GA, 30342, United States, Xi He, Pinar Keskinocak, Joel Sokol

We build statistical models that accurately predict the post-transplant survival functions for pediatric kidney transplant patients and identify the most important risk factors. The pediatric transplant recipients are less commonly studied in the existing literature, while models developed for the general transplant recipients are not applicable. We use a large-scale UNOS (United Network for Organ Sharing) dataset and apply statistical variable selection techniques, specifically the group lasso and the random forest variable importance, to identify the most important risk factors. We also successfully identify multiple subgroups where the survival characteristics are different.

## 2 - Optimizing Population Screening for Infectious Diseases. The Case of Sleeping Sickness Control in Congo

Harwin de Vries, INSEAD, Boulevard de Constance,  
Fontainebleau, 77210, France

Population screening by mobile units is crucial to control several infectious diseases. We consider the following planning problem: given a set of populations at risk, the expected evolution of the epidemic in these populations, and a fixed number of mobile units, which villages should be screened when? We present descriptive models for the development of the burden of disease over time which take screening explicitly into account, use these to develop and analyze several classes of planning policies, and numerically analyze them in the context of the control of the HAT disease in D.R. Congo.

## 3 - Individual Wait Time Estimation in the Organ Allocation System

Ana Maria Estrada Gomez, Georgia Institute of Technology,  
Atlanta, GA, United States, Kamran Paynabar

When a patient is offered an organ, he/she needs to decide whether to accept or decline it. This complex decision depends in part on the estimated wait time until the next organ offer and that organ's quality. Using a match-run database, we develop methods to predict the wait time for an organ (liver, kidney, lung, heart) offer of a desired quality, given the patient's characteristics and compare our estimates to those provided by UNOS.

## 2 - Optimizing Population Screening for Infectious Diseases. The Case of Sleeping Sickness Control in Congo

oris Van de Klundert, Albert P M Wagelmans

Population screening by mobile units is crucial to control several infectious diseases. We consider the following planning problem: given a set of populations at risk, the expected evolution of the epidemic in these populations, and a fixed number of mobile units, which villages should be screened when? We present descriptive models for the development of the burden of disease over time which take screening explicitly into account, use these to develop and analyze several classes of planning policies, and numerically analyze them in the context of the control of the HAT disease in D.R. Congo.

## 3 - Individual Wait Time Estimation in the Organ Allocation System

Joel Sokol, Pinar Keskinocak

When a patient is offered an organ, he/she needs to decide whether to accept or decline it. This complex decision depends in part on the estimated wait time until the next organ offer and that organ's quality. Using a match-run database, we develop methods to predict the wait time for an organ (liver, kidney, lung, heart) offer of a desired quality, given the patient's characteristics and compare our estimates to those provided by UNOS.

## 4 - A Scan Statistic for Disease Detection

Dave Goldsman, Georgia Institute of Technology, School of ISyE,  
Atlanta, GA, 30332-0205, United States, Ignacio Erazo

Consider a square containing a number of uniformly distributed points. We use analytical methods and Monte Carlo simulation to obtain the distributions of certain scan statistics, for instance, the maximum number of points contained in a smaller square as it sweeps through the original square. These distributional results lead to statistical tests to detect the occurrence of a significant event such as a disease outbreak. Several examples illustrate our method's efficacy, statistical power, and ease of use.

## Methods for Decision Making in Healthcare

Sponsored: Health Applications

Sponsored Session

Chair: Vishal Ahuja, Southern Methodist University, Dallas, TX, 75275, United States

## 1 - Using a Deep Learning Algorithm to Quantify Common Barriers to Discharge

Taghi Khaniyev, MIT Sloan School of Management, Cambridge,  
MA, United States, Dominic Breuer, Kyan Safavi,  
Ana Cecilia Zenteno, Mark Seelen, Jonathan Zanger,  
Bethany Daily, Peter Dunn, Retsef Levi

Hospital congestion is caused among other factors by an imbalance of the timing of patient admissions and discharges. We implemented a real-time clinical support tool to predict next-day's surgical patient discharges based on previous patients' recovery care paths at a large academic medical center. Further, we analyzed mismatches between predicted and actual discharges to identify areas for improvement in the discharge process and to enhance the accuracy of the tool. Results show that the top 10 patients predicted to leave are discharged 81% of the time within 24 hours. Mismatches occurred without clinical reason 45% of the time and were due to clinical practice variation 25% of the time."

## 2 - "Wait and then Hurry Up" – the Effect of Flexible Service Rates in Appointment Scheduling Systems

Aditya Jain, Baruch College, Zicklin School of Business, 55  
Lexington Ave, Suite 9-240, New York, NY, 10010, United States,  
William P. Millhiser

Recent empirical evidence suggests that ambulatory care healthcare workers vary service rates in response to time of day and queue length. In this paper, we explore a theoretical justification of this behavior using trade-off between waiting and processing costs and analyze its implications for established appointment systems, and how they should be adapted.

## 3 - A New Patient Trajectory Simulation Method for Staffing in Care Coordination Programs

Ekin Koker, University of Massachusetts, Mechanical and  
Industrial Engineering, 160 Governors Drive, Amherst, MA,  
01003, United States, Rebecca Castonguay, Hari Balasubramanian,  
Zachary Martinez, Aaron Truchil

Care Coordination programs intended to improve outcomes and lower cost of care for patients with complex health and social needs have proliferated in recent years. Staff encounters with patients in these programs can be modeled as a trajectory, each encounter marked with a staff type, duration and a timestamp from enrollment date. Using encounter data from a care coordination program, we simulate different realizations by sampling patient trajectories randomly without replacement, allowing for a constant and a Poisson patient arrival rate. We present our findings and offer insights for healthcare organizations looking to start care coordination programs.

## 4 - Optimization Approaches for Concussion Management Decisions

Gian-Gabriel Garcia, Mariel Sofia Lavieri

We apply optimization for concussion management decisions.

## Scheduling and Resource Allocation in Health Systems

Sponsored: Health Applications

Sponsored Session

Chair: Pinar Keskinocak, Georgia Institute of Technology, Atlanta, GA, 30332, United States

Co-Chair: Seyma Guven Kocak, Georgia Tech, Atlanta, GA, United States

## 1 - Staff Planning with Cost Estimation and Optimization

Kumar Rajaram, University of California-Los Angeles, Anderson  
School, 110 Westwood Plaza, Los Angeles, CA, 90095-1481,  
United States, Sandeep Rath

We consider the staff planning problem of anesthesiologists which consists of determining how many anesthesiologists have to be on regular duty and on call each day. We model this problem as a two-stage integer stochastic dynamic program. We use structural estimation to assess the implicit costs in this model. We develop a solution algorithm, and test the model with real data from the UCLA medical center.

## 2 - Home Health Care Routing and Scheduling with Continuity of Care

Seyma Guven-Kocak, Georgia Institute of Technology,  
1235 Parkway Circle N, Atlanta, GA, 30340, United States,  
Aliza R. Heching, Pinar Keskinocak, Alejandro Toriello

This work addresses a real-world home health care routing and scheduling problem (HHCRRSP) faced by a home care agency in the U.S. In home health care scheduling, there is a desire to retain consistency with respect to the nurses servicing each patient, which is referred to as continuity of care. In order to handle this requirement, we propose a dynamic approach and present two different methods to solve the problem on a daily basis: a MIP with approximations and a variant of a petal heuristic. We aim to quantify and control the deviation from the existing schedule in place, so that some of the assignments are retained in the new schedule. We discuss the performance and computational efficiency of these methods.

### 3 - Consistent Nursing Staff Planning Under Heterogeneous Service Demand

Nan Kong, Purdue University, 206 South Marting Jischke Drive,  
Biomedical Engineering, West Lafayette, IN, 47906-2032,  
United States, Mingyang Li, Mingzheng Wang

The aging population in the U.S. demands a significant amount of long-term care (LTC) services. As major LTC service providers, nursing homes (NHs) are responsible for caring the frailest population of elderly adults with 24/7 formal assistance for a variety of services and supports. To improve the quality of care and realize resident-entered NH care, we develop accurate predictive models for characterizing complex service demand of individual NH residents. We also develop more proactive and cost-effective NH staff optimal planning model with a stochastic programming approach.

### 4 - Integrating New Testing Mechanisms Into Emergency Department Workflow

Jonathan Helm, Arizona State University, W.P. Carey School of  
Business, 300 E. Lemon St, Tempe, AZ, 85287, United States,  
Zhongjie Ma, Pengyi Shi, H. Sebastian Heese

In medical research, new diagnostic tests are developed and evaluated solely on their efficacy in detecting an illness. However, ignoring the workload impact of introducing new tests into existing workflow can create barriers to adoption, particularly in busy units e.g. Emergency Department (ED). In collaboration with an ED physician, we develop a framework for evaluating the workload impact of adopting new tests to bridge the gap between medical research and clinical workflow. Our queueing framework is applied to a new test, D-dimer, for detecting Pulmonary Embolism in EDs to understand what characteristics make adopting a test feasible and how to best integrate the D-dimer into the ED workflow.

### 5 - An Optimization Model for Collecting and Distributing Blood Products

Ayca Erdogan, San Jose State University, Davidson College of  
Engineering, Industrial and Systems Engineering, San Jose, CA,  
95192, United States, Nazanin Nader

We present an integer programming model to find the optimal routes for a blood donation center. The model minimizes the total travel time for vehicles that collect donated blood from donation locations &lt; distribute processed blood to several hospitals, considering lateness thresholds in order to minimize the blood wastage.

### Telecommunications Optimization Modeling

Sponsored: Telecommunications and Network Analytics

Sponsored Session

Chair: Eli Olinick, Southern Methodist University, Dallas, TX, 75275-0123, United States

#### 1 - Big Data Processing Platform for Healthcare Applications

Albena Mihovska, Aarhus University BSS, Birk Centerpark 15,  
Herning, 7400, Denmark

This work proposes a novel conceptual approach to IoT/cloud convergence and its implementation in healthcare application platforms. The proposed platform allows for the collection, exchange and processing of healthcare related data without distorting the quality of the collected data and without compromising the personal aspects of the processed data; based on an elastic from point of view of security and performance wireless network and a distributed processing platform and their seamless integration. To this end the work addresses the processing of multiple data streams, the design of the interfaces between the sensing and cloud environments; and the secure communications between the IoT devices and big data applications.

#### 2 - Impact of Telecommunications on Household Finances

Stanko Dimitrov, Associate Professor, University of Waterloo,  
200 University Avenue West, Waterloo, ON, N2L 3G1, Canada,  
Brian Paul Cozzarin

Telecommunications have positive impacts such as reduced cost of data delivery. However, there may be negative, financial, impacts. Using a Canada wide survey data, we find that using online banking causes an increase in personal debt-to-income ratio of 1.42 dollars more for every dollar earned on average, relative to not banking online. Our finding is supported and contributes to work in telecommunications in retail. The findings hopefully inform consumers' actions when deciding to engage in online banking, as well as banks when assessing the risk of its customers.

### 3 - Determining Queue Assignment and Threads in a Multi-Queue Multi-Threaded System

Adam Colley, Southern Methodist University, Dallas, TX, United States, Eli Olinick

We present a methodology for performance tuning an online business-to-business integration (B2BI) service that manages a system of G/G/1 queues running on a multicore computer processing unit (CPU), or network of CPUs. Tuning consists of optimizing the assignment of processes to priority queues, the assignment of threads to queues, and the relative queue weights. We demonstrate the methodology, and analyze its performance, on a real-world application of the IBM B2B Integrator.

### Interfaces Between Optimization and Machine Learning

Sponsored: Data Mining

Sponsored Session

Chair: Velibor Mistic

#### 1 - Discovering Optimal Policies: A Pattern Recognition Approach to Model Analysis

Fernanda Bravo, UCLA Anderson School of Management, 110  
Westwood Plaza, B4.11, Los Angeles, CA, 90024, United States,  
Yaron Shaposhnik

We study the application of machine learning algorithms to derive insights and identify structural properties of mathematical models. As a proof of concept, we apply the proposed framework to core optimization problems, such as inventory replenishment, queueing admission control, revenue management and multi-armed bandit problems. We formulate classification and regression problems and show how numerically obtained optimal solutions can be used to identify structural properties, derive compact representations and interpret complex policies.

#### 2 - Optimization of Tree Ensembles

Velibor Mistic, UCLA Anderson School of Management,  
110 Westwood Plaza, Suite B406, Los Angeles, CA, 90095,  
United States

Tree ensemble models such as random forests and boosted trees are often used to predict the effect of different decisions. While such models are widely used for predictions, little is known about how to use them for effective decisions. In this talk, we consider the problem of finding a decision that is optimal with respect to a tree ensemble model. We formulate this problem as a mixed-integer optimization model and present theoretical results on its structure. We test our method on real data sets, including two case studies in drug design and customized pricing, and show that it can efficiently solve large-scale instances to near or full optimality, outperforming heuristic solutions.

#### 1 - A Dissimilarity Regularization Approach for Distinct Feature Learning with Autoassociative Neural Networks

Phillip Howard, Intel Corporation, 5000 W. Chandler Blvd,  
Chandler, AZ, 85226, United States, Daniel Apley, George Runger

Autoassociative neural networks (ANNs) are useful for performing dimensionality reduction and have been proposed as a nonlinear extension of principal component analysis. While ANNs can learn complex nonlinear representations of high-dimensional data, they also have a tendency to extract repetitive features which are difficult to interpret. In this work, we present a new dissimilarity regularization method for encouraging the features learned by ANNs to be distinct. We demonstrate the effectiveness of our method for learning distinct

feature representations from both simulated and real data sets.

## 2 - Time Series Dimensionality Reduction Using Convolutional Recurrent Neural Networks

Maziar Kasaei Roodsari, Arizona State University, Tempe, AZ,  
United States, Sangdi Lin, George Runger

As huge volume of time series data is collected from various wearable devices and sensors in real-life, we are facing challenges in the storage, analysis, and visualization of time series data. An effective dimensionality reduction method for time series data is an important step towards solving these challenges. In this presentation, we discuss a novel deep learning model for time series dimensionality reduction which utilizes both convolutional neural networks and recurrent neural networks. The proposed model not only achieves low reconstruction error, but also generates discriminative features for future decision making.

## 3 - Ensemble-based Fast Shapelet Approximation

Berk Gorgulu, Bogazici University, Istanbul, Turkey,  
Mustafa Gokce Baydogan, Gonenc Yucel

Nearest-neighbor (NN) classifiers are widely used for classification of time series (TS) because of their simplicity. Recent TS classification methods focus on discovering discriminative subsequences, namely shapelets, to avoid problems with NN classifiers. Instead of pairwise distance calculations between the whole TS, shapelet-based approaches map TS to a feature vector based on the existence of the shapelets. We propose Ensemble-based Fast Shapelet Approximation (EFSA) that utilizes ensembles of regression trees to learn a piecewise approximation for shapelet identification in a supervised manner. Experiments show that EFSA yields fast and competitive results on benchmark datasets.

### Joint Session DM/Practice Curated: Data Science for Food and Agriculture

Sponsored: Data Mining

Sponsored Session

Chair: Durai Sundaramoorthi

#### 1 - Optimal Control in Dynamic Food Supply Chain Under Service Level Constraints

Ashton Kappelman, Kansas State University, 2061 Rathbone Hall,  
1701B Platt St., Manhattan, KS, 66506, United States,  
Ashesh Kumar Sinha

We consider a dynamic food supply chain with multiple suppliers and service level constraints. We propose an integrated approach that involves developing a Bayesian network to analyze the interaction of process parameters of suppliers on the service levels of the end product, and involves stochastic optimization models to provide insights on the structure of the optimal policy comprising of supplier at each level their process parameters.

#### 2 - Predictive Analytics and Vehicle Routing for an Urban Food Delivery Platform

Alexander Hess, PhD Student, WHU - Otto Beisheim School of  
Management, Burgplatz 2, Vallendar, 56179, Germany

This talk illustrates the application of predictive analytics in conjunction with vehicle routing for an urban food delivery platform. In particular, we show how more accurate forecasts achieved with machine learning algorithms lead to an improved routing. This in turn lowers the need for capacity in vehicles.

#### 1 - Target-driven Navigation for Multi-robot via Deep Reinforcement Learning

Mengqi Hu, University of Illinois at Chicago, 842 W. Taylor Street,  
MC 251, 2039 ERF, Chicago, IL, 60607, United States, Zishun Yu

Multiple unmanned ground vehicle (UGV) navigation has attracted greater attention. In this research, we propose a multi-agent deep deterministic policy gradient (DDPG) model for multi-UGV navigation where the UGVs should move to their target points as fast as possible without collision with obstacles. DDPG is a model-free actor-critic algorithm for continuous control problem. In this model, we directly define the system state as a 1,500x3 matrix using data collected from

LiDAR installed on UGVs and actions as the angular and linear velocities. The experimental results demonstrate that the DDPG algorithm shows superior performance compared to state-of-the-art navigation algorithms.

#### 2 - Improving Berth Schedule Efficiency via Evolutionary Algorithms with Efficient Parameter Control

Maxim A. Dulebenets, Florida A&M University-Florida State  
University, Tallahassee, FL, 32311, United States,  
Masoud Kavooosi, Junayed Pasha, Olumide Abioye

This study presents a self-adaptive Evolutionary Algorithm for the berth scheduling problem, where the crossover and mutation probabilities are encoded in the chromosomes and evolve throughout the algorithmic run. Computational experiments are undertaken to assess performance of the developed algorithm against the alternative Evolutionary Algorithms, which rely on the deterministic parameter control, adaptive parameter control, and parameter tuning strategies respectively. Results show superiority of the self-adaptive Evolutionary Algorithm over the alternative algorithms.

#### 3 - Production Planning Using Reinforcement Learning

Karthick Gopalswamy, PhD Student, North Carolina State  
University, Raleigh, NC, 27606, United States

We consider the problem of finding optimal release plans for a production system under congestion given deterministic demand and random processing time. The problem is formulated as a model-free simulation based Reinforcement Learning (RL) problem. We outline the methodology and provide computational results comparing the operational costs of RL based algorithm and a simulation optimization algorithm.

#### 4 - An Image Based Deep Convolutional Neural Network for Industrial Product Defect Detection

Shengfeng Chen, Western Michigan University, 1903 Western  
Michigan Avenue, Kalamazoo, MI, 49008, United States,  
Lin Cheng

Machine vision system are increasingly being used in industrial product defect detection. Traditional methods work well only under certain conditions with many requirements. We propose a deep convolutional neural network (CNN) structure that can efficiently and reliably extract powerful features for defect detection. With only four deep convolution layers, the proposed model can detect tiny changes in the image with a small training dataset of less than 400 prior knowledge of images. Experimental results achieve a high accuracy of near 100 percent.

#### 1 - More than the Quantity: Estimating the Value of Editorial Review for UGC Platform

Yipu Deng, Purdue University, 2826 Peachleaf Drive, West  
Lafayette, IN, 47906, United States, Jinyang Zheng,  
Warut Khern-am-nuai, Karthik Kannan

This work studies the implication of an editorial review platform where a review platform starts to supplement the user-generated content on its website with editorial reviews that are written by the platform. Our research question is whether platform-generated content (i.e., editorial reviews) influences subsequent user-generated content (i.e., user reviews) both in terms of the quantity and quality. Our analysis suggests that editorial reviews have a positive net effect on subsequent user reviews in general. Specifically, users post more reviews for restaurants that have editorial reviews. Moreover, these user reviews tend to be longer and resemble editorial reviews in respect of quality.

#### 2 - Social CRM and Brand Crisis: A Natural Experiment from Airline Industry

Ramah Al Balawi, University of Illinois at Chicago, 601 S. Morgan  
St, Chicago, IL, 60607, United States, Yuheng Hu, Liangfei Qiu

This work aims to understand how brands change their engagement strategy in response to a crisis. By using a recent crisis of United Airlines, we collected Twitter data about United Airline customer service and find that United Airline strategically changes its social media policy when engaging with its customers.

### 3 - Strategically Combining Human Intelligence and Machine Intelligence in Clinical Decision Support Systems

Long Xia, Virginia Polytechnic Institute and State University, 880 W. Campus Drive, 2069 Pamplin Hall, Blacksburg, VA, 24061, United States

Healthcare is a domain in which experts' knowledge plays significant roles in a variety of tasks. This is one of reasons why solely using deep learning models often could not achieve satisfactory results. We adopted the crowd wisdom concept and proposed a framework to strategically combine human intelligence and machine intelligence in the context of clinical decision support systems. Our experimental evaluations demonstrate that our approach can make a significant performance improvement compared with existing approaches.
