Luwen (Vivian) Huangfu, University of Arizona, Tucson, AZ, United States

Overweight is epidemic in the United States and elsewhere in the world, which is serious and costly nowadays. However, it's humans' nature to store energy in case of famine, causing overweight outbreaks on a large scale due to the increased availability and consumption of high-calorie food. We are motivated to study overweight based on the language of food on Twitter using deep learning. Our result reached a good performance, with remarkable improvement when comparing with the benchmark, revealing that deep learning can be utilized to monitor overweight issues from Twitter.

#### 2 - An Exact and Robust Conformal Inference Method for Counterfactual and Synthetic Controls

Yinchu Zhu, University of Oregon, Eugene, OR, 97401, United States, Kaspar Wuthrich, Victor Chernozhukov

We introduce new inference methods for counterfactual and synthetic control methods for evaluating policy effects. Our inference methods work in conjunction with many modern and classical methods for estimating the counterfactual mean outcome in the absence of a policy intervention. Specifically, our methods work together with the difference-in-difference, canonical synthetic control, constrained and penalized regression methods for synthetic control, factor/matrix completion models for panel data, interactive fixed effects panel models, time series models, as well as fused time series panel data models.

#### 3 - Completing the Online-offline Circle at the Last-mile: A Large Randomized Field Experiment

Tianshu Sun, University of Southern California, 3670 Trousdale Parkway, Bridge Hall, BRI 310B, Los Angeles, CA, 90089, United States, Rongqing Han, Leon Zhu, Lixia Wu

Pickups stations have the promise to reduce the logistic cost of last-mile delivery in E-commerce. At the same time, they also serve as an ideal touchpoint to connect customers and brands in the physical world and can bring benefits to the platform. In this study, we examine whether E-commerce platforms can take advantage of pick-up stations and complete the online-offline circle at the last mile. We design a large experiment with Alibaba and examine 1) Whether platforms can use online intervention to elicit customers to utilize offline pickup service (Online-to-Offline) and 2) Whether offline interaction with products can encourage customers to engage with brands and platform (Offline-to-Online).

#### 4 - Nowcasting the Local Economy: Using Yelp Data to Measure Economic Activity

Hyunjin Kim, Harvard Business School, 84 HBS Mail Center, MA, Boston, MA, 02163, United States, Edward L. Glaeser, Michael Luca

Can new data sources from online platforms help to measure local economic activity? In this paper, we present evidence that Yelp data can complement government surveys by measuring economic activity in close to real-time, at a granular level, and across geographic scale. Changes in the number of businesses reviewed on Yelp can generate an algorithm that explains 29.2 percent of the residual variance in changes in the number of establishments in County Business Patterns (CBP), after accounting for lagged CBP data. The algorithm is more accurate for denser, wealthier, and more educated ZIP codes.

### Joint Session QSR/Practice Curated: High Dimensional Data Analysis and its Applications in System Informatics and Control

Sponsored: Quality, Statistics and Reliability

Sponsored Session

Chair: Mostafa Reisi Gahrooei, Georgia Tech, 755 Ferst Dr, Atlanta, GA, 30318, United States

Co-Chair: Kamran Paynabar, Georgia Tech, Atlanta, GA, 30332, United States

#### 1 - Image Based Online Defect Detection and Closed Loop Quality Control for Additive Manufacturing Processes

Chenang Liu, Virginia Tech, VA, United States, Zhenyu Kong

A major challenge in additive manufacturing (AM) is how to ensure product quality and consistency by eliminating defects. To address this challenge, this work develops an image-based closed-loop quality control system for the fused filament fabrication (FFF) process. This system consists of a real-time image acquisition device, a high accuracy image-based classification algorithm to monitor the status of surface quality, and a PID-based controller for defects mitigation. The case studies based on actual AM experiments demonstrate the effectiveness of the proposed method.

#### 2 - Multiple Tensor-on-tensor Regression

Mostafa Reisi Gahrooei, Georgia Tech, Atlanta, GA, 30318, United States

In recent years, measurement or collection of heterogeneous sets of data such as those containing scalars, waveform signals, images, and even structured point clouds, has become more common. This work addresses the problem of estimating a process output, measured by a scalar, curve, image, or structured point cloud by a set of heterogeneous process variables such as scalar process setting, profile sensor readings, and images.

#### 3 - An Efficient Monitoring of Variance in High-dimensional Process

Sangahn Kim, Rutgers University, 96 Frelinghuysen Road, Room 201, Piscataway, NJ, 08854, United States, Galal M. Abdella, Jinho Kim, Khalifa M. Al-Khalifa, Myong Kee Jeong, Abdelmagid S. Hammuda

In high-dimensional processes, monitoring process variability is considerably difficult due to a large number of variables and the limited number of samples. Monitoring changes in the covariance matrix is often used for monitoring process variability under the assumption that only a few elements in the covariance matrix are changed simultaneously. In this presentation, we propose a control chart based on an adaptive LASSO-thresholding for monitoring process variability and illustrate the advantages of the proposed method through simulated and real data from both semiconductor industry and high-dimensional milling process.

#### 4 - Learning Inter-layer Bonding Effects in 3D Printing through a Convolution Formulation

Yuanxiang Wang, University of Southern California (USC), CA, United States, Qiang Huang

Geometric accuracy control is critical for additive manufacturing (AM) or three-dimensional (3D) printing. The prediction and control of out-of-plane deviation of 3D printed products needs the understanding of inter-layer bonding effects. This work presents a convolution formulation for the inter-layer interactions to predict out-of-plane shape deviations. Experimental investigation using stereolithography process validates the proposed model.

### Image-Based Statistical Process Control in Advanced Manufacturing

Sponsored: Quality, Statistics and Reliability

Sponsored Session

Chair: Anh Bui, Northwestern University, Evanston, IL, United States

#### 1 - Tomography Reconstruction with Sparsity Regularization for Accurate Measurement of Nanoproduct Dimensions in 3D

Chen Mu, FAMU-FSU College of Engineering, Tallahassee, FL, United States, Chiuwoo Park

The dimensions of nanomaterials often determine their properties and functionalities. Therefore, measuring the dimensions of nanomaterial products is an essential step for quality assurance of nanomaterial production. This talk is concerned with how to measure the dimensions of nanomaterial products in 3d with a series of its low dimensional projection images from different projection angles, which is well known as a tomography reconstruction problem. We presents a novel tomography reconstruction approach that combines the computational advantage of the existing filtered back projection approach and the precision advantages of the iterative optimization approach.

#### 2 - Image Comparison for Online Image Monitoring

Peihua Qiu, University of Florida, CTRB, 5th Floor, 2004 Mowry Road, Gainesville, FL, 32610, United States

Images are commonly used for quality control purposes. If the quality of the products is good, then their images should be all similar to the image of a good-quality product. So, comparison of images is a fundamental task in image-based quality control. This problem is complicated because of noise and geometrical mismatch between images. In this talk, we present an effective method for detecting difference between two images of products, and our proposed method can accommodate both noise and geometric mismatch mentioned above. Theoretical results and numerical examples show that it can work effectively in applications. This is a joint research with Dr. Long Feng.

#### 3 - Statistical Modeling and Analyzing Methods for Dynamic Nanomaterial Video Data

Yanjun Qian, Virginia Commonwealth University, 1015 Floyd Ave, Room 4134, Richmond, VA, 23220, United States

A large amount of nanomaterial video data has been collected by transmission electron microscopes (TEM). To model a nanoparticle growth process from such videos, we develop dynamic nonparametric models for time-varying probability density functions (pdfs) estimation. Unlike simple statistics, a pdf contains fuller information about the nanoscale objects of interests. Characterizing the dynamic changes of the pdf as the nanoparticles are growing into different sizes, the proposed nonparametric methods are capable of analyzing an in situ TEM video to delineate growth stages in a retrospective analysis or tracking the nanoparticle growth process in a prospective analysis.

#### 4 - Identifying Variation Patterns in Stochastic Textured Surface Data

Anh Tuan Bui, Northwestern University, Evanston, IL, 60208, United States, Daniel Apley

Existing methods for understanding manufacturing variation in multivariate or profile data are inapplicable for stochastic textured surface data. A primary challenge is the lack of an existing measure of the dissimilarity or distance between surface samples, due to their stochastic nature. We propose a pairwise dissimilarity measure and then use manifold learning on these dissimilarities to discover a low-dimensional parameterization of the surface variation patterns. Visualizing how the surfaces change as the manifold parameters are varied helps build an understanding of the physical nature of each variation pattern, which we demonstrate with real textile and simulation examples.

### Joint Session DEA/Practice Curated: Applications in DEA

Emerging Topic: Productivity, Efficiency and Data Envelopment Analysis

Emerging Topic Session

Chair: Kankana Mukherjee, Babson College, Wellesley, MA, 02481, United States

#### 1 - Hospitals Efficiency Redux: The Role of Medical and Surgical Research

Antonio Garcia Romero, Assistant Professor, IE Business School, Maria de Molina 31 Bis, MADRID, 28006, Spain, Josep A. Tribo, Alvaro Escribano

DEA methods have been widely applied to the analysis of hospitals' efficiency.

However, there is little empirical evidence showing how the research conducted in hospitals can affect their outcomes. The structure of hospitals is a two-stage network process. Therefore, we use two-stage DEA methods for evaluating the performance in a sample of 189 Spanish hospitals over the period 1996-2009. We use the Malmquist productivity index for estimating the changes in efficiency since we use a longitudinal database. We measure the efficiency on several outcomes (i.e., the average length of stay or mortality rate. We measure the hospitals' research activity by using a set of bibliometric indicators.

#### 2 - Labor-cost Efficiency with Indivisible Outputs and Inputs: A Study of Indian Bank Branches

Kankana Mukherjee, Babson College, 231 Forest Street, Babson Park, MA, 02457, United States, Subhash C. Ray, Abhiman Das

This study uses Data Envelopment Analysis to examine the efficiency of branches of a major Indian public sector bank across four large metropolitan cities. We model branch operations following the production approach and introduce several methodological extensions to account for the product mix of branches in creating the efficient cost frontier. Overall, Chennai branches are found to be the most efficient. Across the three types of labor, attaining efficiency in the number of clerks would have the highest impact in terms of cost savings.

#### 3 - Predicting Corporate Failure for Non-Manufacturing Firms - DEA SBM

Joseph C. Paradi, Professor Emeritus, University of Toronto, 200 College Street, College St, Toronto, ON, M5S3E5, Canada

Slacks-Based DEA Model is used to predict corporate failure of non-manufacturing companies. The benchmark was the Altman Z" model. Others used DEA models (BCC) to using Altman's original asset-dominated Z-score model. Here, non-manufacturing firms were examined without their asset size. Data from non-manufacturing companies that filed for bankruptcy between 2000 and 2006 for up to five years before bankruptcy. Non-bankrupt companies were matched these, using SIC codes. Altman's model classified more companies as bankrupt than DEA, whereas DEA classified more as non-bankrupt. This indicated that bankruptcy could be predicted without the use of total assets or liabilities as variables.

### Decision Diagram Approaches for Optimization

Sponsored: Computing

Sponsored Session

Chair: Merve Bodur, University of Toronto, 5 King's College Rd., Toronto, ON, M5S 3G8, Canada

#### 1 - Dexter: A Global Solver Based on Decision Diagrams

Danial Davarnia, Carnegie Mellon University, Pittsburgh, PA, United States, Christian Tjandraatmadja, Willem-Jan Van Hoeve

We develop a branch-and-cut technique to solve integer nonlinear programs, where the cuts are derived from the decision diagram representation of the model. The graphical structure of decision diagrams allows for specialized branching schemes that improve the relaxation by refining infeasible integer points, while benefiting from tighter representation due to the domain reduction. Such a modification of decision diagrams is efficient through branch-and-bound. We introduce a solver designed based on this approach. We conclude with computational results.

#### 2 - A Binary Decision Diagram Based Algorithm for Solving a Class of Binary Two-stage Stochastic Programs

Leonardo Lozano, University of Cincinnati, Cincinnati, OH, 45219, United States, Cole Smith

We consider a class of two-stage stochastic integer programming problems with binary variables in both stages, for which the second-stage variables belong to the intersection of sets corresponding to first-stage binary variables that equal one. Our approach uncovers strong dual formulations to the second-stage problems by transforming them into dynamic programming (DP) problems parameterized by first-stage variables, formed using of binary decision diagrams, which then yield traditional Benders inequalities that can be strengthened based on observations on the structure of the underlying DPs. We test our approach on a set of stochastic traveling salesman problems.

#### 3 - Network-based Approximate Linear Programming for Discrete Optimization

Andre Augusto Cire, University of Toronto-Scarborough, Department of Management, UTSC, 1265 Military Trail, Toronto, ON, M1C-1A4, Canada, Selvaprabu Nadarajah

We present a new hierarchy of approximate linear programming methods for a general class of discrete optimization problems. Our basis functions, in particular, are composed of network-based approximations for the problem, such as those derived from state-space relaxations and decision diagrams. Moreover, we exploit the network structure to iteratively construct a sequence of approximate linear programs with improving bounds that converge to the optimal solution value of the original problem. A numerical evaluation is discussed on challenging discrete optimization problems arising in practice.

#### 4 - Network Models for Multiobjective Discrete Optimization

Merve Bodur, University of Toronto, 5 King's College Rd., Toronto, ON, M5S 3G8, Canada, David Bergman, Andre Augusto Cire, Carlos Henrique Cardonha

We propose a novel framework for solving multiobjective discrete optimization problems with an arbitrary number of objectives. Our framework formulates these problems as network models, in that enumerating the Pareto frontier amounts to solving a multicriteria shortest path problem in an auxiliary network. We design tools and techniques for exploiting the network model in order to accelerate the identification of the frontier. We show that the proposed framework yields orders-of-magnitude performance improvements over existing state-of-the-art algorithms on four problem classes containing both linear and nonlinear objective functions.

#### 1 - Combinatorial Exchanges for Trading Fishery Access Rights

Martin Bichler, Technische Universität München, Department of Informatics, Boltzmannstr. 3, Munich, 85748, Germany, Douglas Ferrell, Jacob K. Goeree

Overfishing is a prime environmental concern. Catch share systems have recently been shown to be effective tools to combat overfishing. Yet, the allocation of catch shares has always been a challenging policy problem. There is an active discussion about market-based solutions for the allocation and re-allocation of fishery shares. Unfortunately, until yet there have not been adequate market designs to address the specific requirements in these markets. The recent subsidized share trading market in New South Wales (NSW) is a first-of-a-kind market design for the reallocation of catch shares and the largest combinatorial exchange to date. The market design needed to address several non-standard requirements, most importantly the lack of participation and fair payments. While these features were crucial for the adoption of the proposed design, they led to computationally challenging allocation and pricing problems. The implemented exchange illustrates how computational optimization and market design can provide new policy tools, able to solve complex policy problems considered intractable only a few years ago. The exchange operated from May to July 2017 and effectively reallocated shares from inactive fishers to those who needed them most. It can provide a template for the reallocation of catch shares in other fisheries world-wide as well.

#### 2 - Collaborative Human-UAV Search and Rescue for Missing Tourists in Nature Reserves

Yu-Jun Zheng, Hangzhou Normal University, Hangzhou, China, Wei-Guo Sheng, Yi-Chen Du, Hai-Feng Ling

The use of unmanned aerial vehicles (UAVs) is becoming commonplace in search and rescue tasks in complex terrains. In the literature, there are a number of studies on UAV search with the objective of minimizing search time and/or maximizing detection probability. However, little effort has been devoted to collaborative human and UAV search, which is necessary in many applications where the target has to be ultimately reached by human rescuers. In this paper we present a collaborative human-UAV search planning problem with the aim of minimizing the expected time at which the target is reached by human rescuers. The presented problem is of high complexity, and thus traditional exact algorithms would be very time-consuming or even impractical for solving even relatively small instances. We propose an evolutionary algorithm which uses biogeography-inspired operators to efficiently evolve a population of solutions to find the optimum or a near-optimum within an acceptable time. Computational experiments demonstrate the advantages of our algorithm over a number of other popular algorithms. The proposed method has been successfully applied to two real-world operations for searching and rescuing missing tourists in a nature reserve in China. It is estimated that, compared to the old method used by the organization, our method shortened the time required for reaching the targets by 79 minutes and 147 minutes in the two cases, respectively, providing a great improvement in the life-critical operations.

### Searching the Solution Space in Multiple Criteria Optimization

Sponsored: Multiple Criteria Decision Making

Sponsored Session

Chair: Banu Lokman, Middle East Technical University, Ankara, 06800, Turkey

Co-Chair: Murat Mustafa Koksalan, Middle East Technical University, Ankara, 06531, Turkey

#### 1 - A Multi Objective Approach to Clustering Data with Heterogeneous Inputs

Banu Lokman, Middle East Technical University, Department of Industrial Engineering, Üniversiteler Mahallesi, Ankara, 06800, Turkey, Dilay Aktas, Tulin Inkaya

Clustering algorithms mostly use a single dissimilarity matrix to partition a set of objects into a set of groups such that the objects assigned to the same group are similar for some criteria. When more than one dissimilarity matrix is available, many applications aggregate the matrices to come up with a single matrix, possibly masking the true nature of the original data. In this study, we develop a multi-objective approach to generate a number of clustering solutions considering different dissimilarity matrices.

#### 2 - Representing the Nondominated Set for Multi-objective Integer Programs

Ilgin Dogan, University of California Berkeley, Berkeley, CA, 94708, United States, Banu Lokman, Murat Mustafa Koksalan

Multi-Objective Integer Programs have a wide variety of application areas. Since the number of nondominated points grows exponentially with the problem size and finding all points is hard, generating a subset with "desired properties" is important. In this study, we observe that the distribution of nondominated points is critical in defining the desired properties of the representative subset. Based on our observations, we develop algorithms to generate a subset of points that represents the nondominated set with a prespecified coverage error. Our computational experiments show that our algorithms outperform the existing ones in terms of cardinality of the representative set and solution time.

### 3 - Robustness and Prediction Error in Multi Response Parameter Design Optimization

Melis Ozates, Middle East Technical University, Industrial Engineering Dept, Office Room 318, Ankara, 06800, Gulser Koksall, Murat Mustafa Koksall

Parameter design optimization that involves two or more responses of products or processes is a well-known research problem. This problem involves multiple objectives typically formulated as response surface models using regression. These models are constructed with some prediction error even though the model structure is appropriate. In comparing alternative solutions of the model, the decision maker (DM) has difficulty to comprehend closeness of mean response is to its target, variance of true response (robustness) and magnitude of prediction error. In this study, these components are analyzed under certain conditions and guidance is provided for the DM to facilitate the comparison.

### 4 - An Interactive Approximation Algorithm for Multi-objective Integer Programs

Banu Lokman, Middle East Technical University, Department of Industrial Engineering, Universiteler Mahallesi, Ankara, 06800, Turkey, Murat Mustafa Koksall, Pekka J. Korhonen, Jyrki Wallenius

We develop an interactive algorithm that approximates the most preferred solution for any multi-objective integer program with a desired level of accuracy. We assume that the preferences of the decision maker (DM) are consistent with a quasiconcave value function unknown to us. Based on the pairwise comparisons of the DM, we construct convex cones and eliminate the inferior regions that are close to being dominated by the cones in addition to the regions dominated by the cones. Our computational experiments show that the algorithm performs very well in terms of the quality of the solution found, the solution time, and the required preference information.

### 5 - A Multi-objective Approach for Magnetic Resonance Imaging/ultrasonography Fusion-guided Targeted Prostate Biopsies

Utku Lokman, TOBB University of Economics and Technology, Ankara, Turkey, Banu Lokman, Sukru Ali Altan, Oztug Adsan

Magnetic resonance imaging (MRI) of the prostate has recently gained substantial attention in the diagnostic workup of prostate cancer (PCa), which is the most common cancer in males. The standard prostate biopsy method is 12-core blind systematic sampling of the whole prostate. An innovative fusion of previously acquired MRI images with the real-time ultrasound (US) may lead to improved PCa detection, by identifying the suspicious areas in the prostate and targeting them accurately under MRI/US-fusion guidance, thus necessitating fewer biopsies with fewer side effects. In this study, we develop a multi-objective model to decide on the quantity of tissues obtained per each suspicious lesion.

### INFORMS-MAS Awards Session

Sponsored: Military and Security

Sponsored Session

Chair: Andrew Oscar Hall, United States Military Academy, West Point, NY, 10996, United States

#### 1 - MAS President Remarks

Andrew Oscar Hall, United States Military Academy, 86 B. Patridge Pl, West Point, NY, 10996, United States

The current president of MAS will provide an overview of the annual society awards, motivate future applicants, and introduce the most recent award winners who will, respectively, share an overview of their ongoing and planned work (Bonder Scholarship), present the results of their award-winning paper (Koopman Prize), and share selected insights and observations learned over a career of meaningful contributions to the discipline (J. Steinhardt Prize).

#### 2 - 2018 Seth Bonder Scholarship

The purpose of the Seth Bonder scholarship for applied operations research in military applications is to promote the development and application of process modeling and operations research analysis to military issues. The scholarship provides funding to support the development of highly qualified individuals and promote the interchange of military O.R. research knowledge in conjunction with INFORMS.

#### 3 - 2018 Koopman Prize

This award for the best published paper or report on military operations research topics directly related to the goals of MAS. The award honors the memory of Bernard Koopman (1900-1981), who was a pioneer in the field of operations research. He was active in the founding of the Operations Research Society of America (ORSA), later merged with TIMS to form INFORMS, and served as its president in 1956.

#### 4 - 2018 J. Steinhardt Prize

The J. Steinhardt Prize is sponsored by the CNA Corporation. The prize is awarded for outstanding contributions to Military Operations Research and is awarded for life work rather than for any particular contribution.

#### 1 - A Decomposition-based Heuristic for Stochastic Emergency Routing Problems

Belleh Fontem, University of Mary Washington, Fredericksburg, VA, 22407, United States, Sharif Melouk, Burcu B. Keskin, Naeem Bajwa

This paper proposes a decomposition-based heuristic for a network delivery problem in which relief workers acquire valuable emergency supplies from relief warehouses, and transport them to meet the urgent needs of distressed population centres. The problem context dictates that the relief items reach these population centres before critical deadlines. However, coordination challenges and random disruptions introduce uncertainty in both network travel times and the destination deadlines. Hence, relief workers have to negotiate the tension between ensuring a high probability of punctual delivery and maximising the combined value of the relief supplies delivered. For an arbitrary routing scheme which guarantees punctual delivery in an uncertainty-free state of nature, the heuristic yields an upper bound on the probability that, under uncertainty, the routing scheme described will lead to tardy delivery. We demonstrate our solution approach on a small numerical example and glean insights from experiments on a realistically sized problem. Overall, our central model and proposed solution approach are useful to managers who need to evaluate routing options and devise effective operational delivery plans in humanitarian crisis situations.

#### 2 - Demand Fulfillment Probability in a Multi-item Inventory System with Limited Historical Data

Canan Gunes Corlu, Boston University, 808 Commonwealth Avenue, Boston, MA, 02215, United States, Bahar Biller, Sridhar Tayur

In a budget-constrained multi-item inventory system with independent demands, we consider the case of unknown demand parameters that are estimated from limited amounts of historical demand data. In this situation, the probability of satisfying all item demands, as a measure of demand fulfillment, is a function of the finite-sample estimates of the unknown demand parameters; thus, the demand fulfillment probability is a random variable. First, we characterize the properties of an asymptotical approximation to the mean and variance of this random variable due to the use of limited data for demand parameter estimation. Second, we use the characterization of the variance of the demand fulfillment probability for quantifying the impact of demand parameter uncertainty on demand fulfillment via numerical experiments. Third, we propose an inventory optimization problem that minimizes the variance of the demand fulfillment probability due to demand parameter uncertainty subject to a budget constraint on the total inventory investment. Our numerical experiments demonstrate that, despite the availability of limited amounts of historical demand data, it is possible to manage inventory with significantly reduced variance in the demand fulfillment probability.

#### 3 - Exploring the Value of Waiting during Labor

Karen T. Hicklin, University of North Carolina at Chapel Hill, B-24 Hanes Hall, Chapel Hill, NC, 27599-3260, United States, Julie Ivy, Fay Cobb Payton, Meera Viswanathan, Evan Myers

Of the nearly 4 million births that occur each year in the United States, almost one in every three is a cesarean delivery. Despite the increasing C-section rate over the years, there is no evidence that the increase has caused a decrease in neonatal or maternal mortality or morbidity. Bayesian decision analysis is used to model the decision between classifying a patient as "failure-to-progress, which is cause for a C-section, using either current information (prior probability) or information gathered (posterior probability) as labor continues. The Bayesian decision models determine the conditions under which it is appropriate to gather additional information (i.e., take an observation) prior to deciding to end labor and perform a C-section based on the decision maker's belief of successful labor. During an observation period, the decision maker learns more about the patient and her medical state and the likelihood of a successful vaginal delivery is updated. This study determines the conditional value of information (conditional on the decision maker's prior belief) and determines the conditions under which information has positive value. This model can be used to facilitate shared decision making for labor and delivery through communicating beliefs, risk perceptions, and the associated actions.

#### 4 - Routing and Staffing when Servers are Strategic

Ragavendran Gopalakrishnan, Cornell University, 220 Hollister Hall, Department of Civil and Environmental Engg., Ithaca, NY, 14853, United States, Sherwin Doroudi, Amy R. Ward, Adam Wierman

Traditionally, research focusing on the design of routing and staffing policies for service systems has modeled servers as having fixed (possibly heterogeneous) service rates. However, service systems are generally staffed by people. Furthermore, people respond to workload incentives; that is, how hard a person works can depend both on how much work there is, and how the work is divided between the people responsible for it. In a service system, the routing and staffing policies control such workload incentives; and so the rate servers work will be impacted by the system's routing and staffing policies. This observation has consequences when modeling service system performance, and our objective in this paper is to investigate those consequences. We do this in the context of the M/M/N queue, which is the canonical model for large service systems. First, we present a model for "strategic servers that choose their service rate in order to maximize a trade-off between an "effort cost", which captures the idea that servers exert more effort when working at a faster rate, and a "value of idleness", which assumes that servers value having idle time. Next, we characterize the symmetric Nash equilibrium service rate under any routing policy that routes based on the server idle time (such as the longest idle server first policy). We find that the system must operate in a quality-driven regime, in which servers have idle time, in order for an equilibrium to exist. The implication is that to have an equilibrium solution the staffing must have a first-order term that strictly exceeds that of the common square-root staffing policy. Then, within the class of policies that admit an equilibrium, we (asymptotically) solve the problem of minimizing the total cost, when there are linear staffing costs and linear waiting costs. Finally, we end by exploring the question of whether routing policies that are based on the service rate, instead of the server idle time, can improve system performance.

#### Joint Session PSOR/Practice Curated: Emergency Medical Services

Sponsored: Public Sector OR

Sponsored Session

Chair: Pieter van den Berg, RSM, RSM, Rotterdam, 3062 PA, Netherlands

#### 1 - A Scenario-based Ambulance Location Problem with Two Types of Servers

Soovin Yoon, University of Wisconsin-Madison, 1415 Engineering Drive, Room 3261, Madison, WI, 53706, United States, Laura Albert

Emergency medical service planning is challenging when there are heterogeneous patients and ambulances. Some of the challenges stem from uncertain demand and interdependencies between ambulances. We propose a data-driven approach that lifts distributional assumptions by sampling call arrival scenarios directly from the call log. A two-stage stochastic integer program is formulated to deploy and dispatch two types of servers to serve calls promptly and also match server types to varying patient needs. We conduct the numerical study with two real-world datasets to demonstrate the effectiveness of our model.

#### 2 - Determining Ambulance Destinations in the Presence of Offload Delay Using an Markov Decision Process

Mengyu Li, PhD Candidate, Dalhousie University, Halifax, NS, Canada, Peter Vanberkel

Ambulance offload delay (AOD) is a prolongation when an ambulance arrival in the emergency department (ED) and transfer of patient care, typically due to ED crowding. We formulate an infinite horizon, discrete-time Markov decision process (MDP) model to determine when it is advantageous to send appropriate patients to out of region hospitals. Out of region hospitals have longer transport times but shorter offload times. The decision model considers patient acuity, travel distance, and AOD. A computational study is applied and a policy to return ambulances to service more quickly is found. This model can be used as a decision support tool to generate optimal ambulance patient allocation policy.

#### 3 - Shift Schedule Optimization for Basic Life Support Ambulances Using Stochastic Programming

Pieter van den Berg, RSM, Burgemeester Oudlaan 50, Rotterdam, 3062 PA, Netherlands, Theresia van Essen

Many ambulance services have a fixed schedule of shifts for their vehicles. This defines the available capacity for each time of the day, which does not always match the demand for ambulances. We present a Stochastic Programming model to optimize the shift schedules of Basic Life Support (BLS) ambulances that are used for non-urgent patient transportation. By optimizing the schedule based on a large set of simulated scenarios, we find schedules that can improve the service provided to non-urgent patients. As emergency ambulances execute any patient transportation that cannot be served by a BLS ambulance, this also improves the coverage for emergency calls.

#### 1 - Social-vulnerability Driven Infrastructure Network Component Importance Measures

Deniz Berfin Karakoc, University of Oklahoma, 202 W. Boyd, Room 448, Carson Engineering Center, Norman, OK, 73019, United States

Critical infrastructures are often described as interdependent in nature, vulnerable to multiple hazards, and vital for societies. To plan a comprehensive preparedness plan, we identify the critical components that have the largest impact on the performance of these networks and on the society. In this work, we propose two different component importance measures to quantify the effect of disruption and the impact of restoration on components over the resilience of interdependent infrastructure networks. We integrate multiple social vulnerability measures using a multi-criteria decision analysis technique and illustrate our approach with three infrastructure networks in Shelby County, TN.

#### 2 - Restoring Community Structures in Interdependent Infrastructure Networks

Kash Barker, University of Oklahoma, 202 West Boyd, Room 124, Norman, OK, 73019, United States, Yasser A. Almoghathawi

Community structures exist in many infrastructure networks where each network is partitioned into sets of densely connected components with sparse connections between them. However, infrastructure networks depend on one another for their proper functionality, which potentially make them highly vulnerable to disruptions. This work studies the restoration problem of community structures in interdependent infrastructure networks following a disruption. A restoration model is proposed with the objective of enhancing the resilience of the system of interdependent networks considering their interdependencies. The proposed model is illustrated through a set of interdependent networks.

#### 3 - Measuring Multi-dimensional Network Resilience

Christopher Zobel, Virginia Tech, 880 West Campus Drive, Blacksburg, VA, 24061-0235, United States, Milad Baghersad

This paper discusses a new multi-dimensional measure of critical infrastructure network resilience that takes the relative resilience of different network components into account. The new measure allows for explicitly considering the tradeoffs between system loss and recovery time, and it also allows for applying relative weights to different sub-components in order to represent varying degrees of criticality within the network.

#### 4 - Infrastructure Resilience Evaluation in Multiple Public Transportation Systems when Disruptions Occur, the Case of New York City

Gabriela Noemi Gongora Svartzman, Stevens Institute of Technology, 1 Castle Point On Hudson, Hoboken, NJ, 07030, United States, Jose Emmanuel Ramirez-Marquez, Kash Barker

Public transportation systems can be subject to unforeseen events, ranging from sick passengers up to weather conditions. The novelty of this research resides in evaluating the resilience of public transportation as multi-modal, interdependent systems. The usual behavior of different modes of transportation (buses, subway, bicycles) is modeled through discrete events simulations, and compared against their real data when a range of disruptions occur. The aggregated commuting times, the type of area affected (e.g. residential or commercial) and the possible transportation alternatives are calculated. Visualizations are created to analyze New York City as a case study.

#### 5 - Stochastic Optimization for Maintenance Decisions in Transportation Networks under Seismic Hazard

Jorge-Mario Lozano, Universidad de los Andes, Bogota, 111711, Colombia, Camilo Gómez, Jack W. Baker

Transportation networks are particularly vulnerable to seismic hazards and critical for cities' sustainability. Hence, deciding whether to retrofit a bridge in the present, or wait to repair it after an earthquake, is important to ensure reasonable travel times and limit the disruption of city dynamics. In this paper, we present a risk management optimization approach for the San Francisco Bay Area for a hazard-consistent set of earthquake scenarios. We use a regularized continuous Benders decomposition strategy, which provides advantages with respect to existing combinatorial approaches in terms of convergence, as well as shadow price analysis and prioritization capabilities.

**Data-Driven and Robust Optimization I**

Sponsored: Optimization/Optimization Under Uncertainty

Sponsored Session

Chair: Phebe Vayanos, University of Southern California, Los Angeles, CA, 90089, United States

**1 - Distributionally Robust Strategic Queues**

Madhushini Narayana Prasad, The University of Texas at Austin, Austin, TX, 78712, United States, Grani Adiwena Hanasusanto, John Hasenbein

We extend the classical Naor's model for observable systems by relaxing the principal assumption of a deterministic arrival rate. While the Markovian assumptions still hold, we assume the arrival rate is uncertain and only the information about first-order moment is known to the strategic customers and managers. We derive the optimal threshold strategies of a revenue maximizer, a social optimizer and an individual customer, by maximizing the worst-case expected profit over the set of distributions satisfying the known information. We then compare and contrast our observations with the classical model results, and finally present our computational results.

**2 - Robust Factored Markov Decision Process**

Man-Chung Yue, Imperial College London, London, United Kingdom

Factored Markov decision process where the transition probabilities are uncertain is considered. We first provide a mathematical framework and discuss the difficulties of this class of problems. In particular, the optimization problem associated with the value function of any given policy has exponentially many constraints and variables and suffers from multi-linearity. Based on a novel rectangularity assumption, we construct a lifted MDP whose value function is the equivalent to that of the original factored MDP but do not suffer from multi-linearity. Efficient approximation is then obtained by combining this result with techniques such as linear approximation to reduce the exponentiality.

**3 - Data-driven Approach for Demand Forecasting and Inventory Control of Slow-moving Items**

Sheng Bi, National University of Singapore, Singapore, 138600, Singapore, Long He, Chung-Piaw Teo

We consider the demand forecasting and inventory control problem with intermittent usage. The data is often used to estimate the demand distribution if the item is ordered, and also the probability that an order will materialize in a period. However, errors in the estimation may skew the performance of this approach. In this paper, we use a portfolio approach to hedge the risk of inventory exposure between successive order arrivals, using as input an estimate of the joint distribution of demand and interarrival time. To account for errors in estimation, we propose a distributionally robust model using the Wasserstein uncertainty set to determine the state-dependent order-up-to levels.

**4 - Robust Reinforcement Learning**

Huan Xu, ISyE Ga Tech, 755 Ferst Drive, NW., Atlanta, GA, 30332, United States, Aurko Roy, Sebastian Pokutta

We study reinforcement learning under model misspecification, where we do not have access to the true environment but only to a reasonably close approximation to it. We address this problem by extending the framework of robust MDPs to the model-free Reinforcement Learning setting, where we do not have access to the model parameters, but can only sample states from it. We define robust versions of Q-learning, SARSA, and TD-learning and prove convergence to an approximately optimal robust policy and approximate value function respectively. We scale up the robust algorithms to large MDPs via function approximation and prove convergence under two different settings.

**Robust Optimization – Dynamic and Discrete Considerations**

Sponsored: Optimization/Optimization Under Uncertainty

Sponsored Session

Chair: Dan Andrei Iancu, Stanford University, Stanford, CA, 94107, United States

**1 - Distributionally Robust Linear and Discrete Optimization with Marginals**

Peng Xiong, National University of Singapore, Singapore, Singapore, Zhi Chen, Melvyn Sim

We study linear and discrete optimization problems in which the objective coefficients are chosen randomly from a distribution, and the goal is to find robust bounds on the expected optimal value and the marginal distribution of the optimal solution. The set of joint distributions is assumed to be specified up to only the marginal distributions. With a primal-dual formulation, we generalize previous assumptions on the marginals to arbitrary marginals using optimal transport theory, and we identify a sufficient condition for polynomial time solvability using extended formulations. We conclude by exploring the implications on the solvability of problems in areas such as scheduling and max-flow.

**2 - Adaptive Robust Optimization with AROMA**

Peng Xiong, National University of Singapore, Singapore, Singapore, Zhi Chen, Melvyn Sim

We present a tractable framework for adaptive robust optimization. The proposed framework could naturally unify classical stochastic programming, robust optimization, and more recent distributionally robust approaches with a new scenario-wise ambiguity set. Such an ambiguity set inspires a scenario-wise recourse approximation that provides tractable solutions to adaptive problems. Based on the new framework, we have developed a generic software package, named AROMA (Adaptive Robust Optimization Made Accessible) for a straightforward implementation of the proposed framework. Experiments are conducted to demonstrate the effectiveness of the proposed framework and software package.

**3 - Dynamic Robust Optimization and Discrete Convexity**

Dan Andrei Iancu, Stanford University, 655 Knight Way, Stanford, CA, 94107, United States, Yehua Wei

We discuss necessary and sufficient conditions for the optimality of specific classes of policies in dynamic robust optimization. We then focus on the specific case of affine policies, and show how our conditions can be used to recover and generalize several existing results in the literature. Our treatment draws interesting connections with the theory of discrete convexity (L-natural / M-natural convexity and multimodularity) and global concave envelopes, which may be of independent interest. Time permitting, we also discuss some related applications of the results in the context of a learning and stopping problem.

**4 - Robust Dynamic Optimization for R&D Project Selection**

Aurelie Thiele, Southern Methodist University

We investigate adaptive decision rules in multi-stage binary programming in the context of R&D project selection, where a manager can decide whether to continue or abandon projects, subject to future cash flow uncertainty represented using a robust optimization paradigm. The manager can choose from projects with various risk-return profiles. Information about cash flow uncertainty is updated over time. We study the computational tractability of the approach and present theoretical insights. Numerical experiments are encouraging.

**1 - The Impact of Social Orientation on Firm Innovation**

Xiaojin Liu, University of Virginia, Darden, Charlottesville, VA, 22903, United States, Raul Chao

This study addresses the questions of whether and how firm social orientation influences firm innovation. In so doing, we propose mechanisms geared toward either proactive or reactive social orientation in project funding. Integrating large scale archival datasets, we empirically investigate the long term impact of social orientation on firm innovation.

## 2 - The Impact of Knowledge Transfer on Knowledge Development Strategies

Wenli Xiao, University of San Diego, 5998 Alcala Park, Olin Hall 335, San Diego, CA, 92110, United States, Cheryl Gaimon

We introduce a dynamic model to explore a manager's pursuit of a new product development project and an existing product improvement project. Two key features of our model are the characterization of the knowledge transfer process from the new product development project to the existing product improvement project, and the absorptive capacity for both knowledge development and knowledge transfer. We provide the optimal strategies for knowledge development and knowledge transfer for the two projects.

## 3 - Search for the Best Alternative: An Experimental Approach

Gulru Ozkan-Seely, University of Washington, Seattle, WA, United States, David C. Hall, Jeremy Hutchison-Krupat

We use a controlled experiment to study how this behavior is impacted by two factors: the difficulty associated with an initiative, and the degree to which its value is sensitive to time. Our results indicate that, individuals who face a more difficult initiative under-invest to a greater extent than those who face a simpler initiative.

## 4 - Blockchain and the Value of Operational Transparency for Supply-Chain Finance

Gerry Tsoukalas, Wharton School of Business, 3730 Walnut Street, 567 Jon M. Huntsman Hall, Philadelphia, PA, 19104, United States, Jiri Chod, Nikolaos Trichakis, Henry Aspegren, Mark Weber

We examine how blockchains, which were originally designed to provide verifiability of digital goods transactions, can provide verifiability of physical goods transactions. We identify some of the unique implementation challenges and propose ways to mitigate them. To exemplify, we describe an open-source blockchain platform we developed and one of its use cases in agricultural supply chains. We then develop a theory showing how the proposed blockchain-enabled verifiability of physical goods transactions can be leveraged by high-quality firms to signal their operational capabilities through their upstream inventory orders, and thereby finance their operations more efficiently.

### Joint Session OPT/Practice Curated: Mixed-Integer Quadratic Programming

Sponsored: Optimization/Integer and Discrete Optimization  
Sponsored Session

Chair: Richard Forrester, Dickinson College, Department of Mathematics, College and Louthier Street, Carlisle, PA, 17013, United States

#### 1 - Representability in Mixed-Integer Quadratic Programming

Jeffrey Poskin, Boeing, Seattle, WA, United States, Alberto Del Pia

Representability results play a fundamental role in optimization since they provide characterizations of the feasible sets that arise from optimization problems. In this work we study the sets that appear in the feasibility version of Mixed-Integer Quadratic Programming (MIQP) problems. MIQP has a number of practical applications, including in power systems and portfolio optimization, and also serves as a first generalization of Mixed-Integer Linear Programming to Mixed-Integer Nonlinear Programming. This work continues the study of representability in Mixed-Integer Nonlinear Programming performed by the authors as well as Lubin, Zadik, and Vielma. We provide a number of complete characterizations of the sets that appear in different classes of convex MIQPs. These settings include (i) bounded convex MIQPs, (ii) continuous convex QPs, and (iii) mixed binary convex quadratic optimization problems.

#### 2 - Efficient Ways of Computing Strong Upper and Lower Bounds for Generalized Quadratic Assignment Problems

Monique Guignard-Spielberg, Professor, University of Pennsylvania, 500 JMH-Old Department, Wharton School/Univ Penn, Philadelphia, PA, 19104-6340, United States, Aykut Ahlatcioglu, Jongwoo Park

The Generalized Quadratic Assignment Problem (GQAP) assigns a job to one machine but a machine can handle several jobs, within its capacity. Assignment costs depend on pairwise combinations of assignments. We describe the Convex Hull Heuristic and use it to generate quickly good feasible solutions. We also show how to compute RL2-quality bounds by computing Lagrangean bounds for a special 0-1 RL1-like model. We present results for GQAP instances from the literature as well as for the special case of the Crossdock Door Assignment Problem with up to 6000 0-1 variables.

## 3 - Optimal Solutions to the Quadratic Knapsack Problems: Experiments with Improved Linearization

Yu Du, Professor, University of Colorado Denver, 1475 Lawrence Street, Office 5021, Denver, CO, 80202-2219, United States, Gary A. Kochenberger, Fred W. Glover, Haibo Wang

A common approach for finding optimal solutions to Quadratic Knapsack Problems (QKP) is to adopt an equivalent linearization of the quadratic model and then solve the linear model with an exact solver such as CPLEX. Previous studies have demonstrated the potential of this approach. At the same time, these studies have exposed a limitation in terms of long solution times as problems scale in size. In this study we adopt a successful linearization and experiment with simple ways to enhance its performance by strengthening a key parameter (bound) in the model. Substantial computational experience is provided giving guidance for improved practice.

## 4 - A Computational Study of Linearization Strategies for 0-1 Quadratic Programs

Richard Forrester, Professor of Mathematics, Dickinson College, Department of Mathematics, College and Louthier Street, Carlisle, PA, 17013, United States

A common approach for solving 0-1 quadratic programs is to recast the nonlinear program into an equivalent form through the introduction of auxiliary variables and constraints. Then the resulting model can be solved using a standard mixed 0-1 solver. In this talk we present the results of an extensive computational study examining the strengths and weaknesses of the many different linearization approaches considered in the literature. In addition, we provide recommendations for which approach to use based on the specific class of 0-1 quadratic programs to be optimized.

### Recent Advances in Optimization Algorithms

Sponsored: Optimization/Linear and Conic Optimization  
Sponsored Session

Chair: Robert Michael Freund, Massachusetts Institute of Technology, 77 Massachusetts Avenue E62-567, E62-567, Cambridge, MA, 02139-4307, United States

#### 1 - Accelerating Greedy Coordinate Descent Methods

Robert Michael Freund, Professor, Massachusetts Institute of Technology, 77 Massachusetts Avenue E62-567, E62-567, Cambridge, MA, 02139-4307, United States, Haihao Lu, Vahab Mirrokni

We study ways to accelerate greedy coordinate descent in theory, in practice, or both. We introduce and study two algorithms: Accelerated Semi-Greedy Coordinate Descent (ASCD) and Accelerated Greedy Coordinate Descent (AGCD). While ASCD takes greedy steps in the x-updates and randomized steps in the z-updates, AGCD only takes greedy steps (but lacks acceleration guarantees). We show that ASCD achieves  $O(1/k^2)$  convergence. Our computational experiments demonstrate that AGCD and ASCD outperform Accelerated Randomized Coordinate Descent on a wide variety of instances. We also present a Lyapunov energy function argument that yields insight into the different performance of these methods.

#### 2 - Solving Linear Inequalities via Non-convex Optimization

Jourdain Lamperski, MIT, Cambridge, MA, 02139, United States

We mainly consider solving homogeneous linear inequalities. We formulate a non-convex optimization problem in a slightly lifted space, whose critical points map to feasible solutions of the linear inequalities. We show various properties of the non-convex objective function and develop an algorithm that computes critical points thereof, thus yielding an algorithm for linear inequalities. We establish convergence guarantees for the algorithm and further investigate its performance via computational experiments.

#### 3 - An Optimal Algorithm for Stochastic Three Composite Optimization

Renbo Zhao, MIT, Muckley Bldg, 1 Amherst St, Cambridge, MA, Boston, MA, 02142, United States

We develop an optimal primal-dual first-order algorithm for a class of stochastic three-composite convex minimization problems. The convergence rate of our method not only improves upon the existing methods, but also matches a lower bound derived for all first-order methods that solve this problem. We extend our proposed algorithm to solve a composite stochastic program with any finite number of nonsmooth functions. In addition, we generalize an optimal stochastic alternating direction method of multipliers algorithm proposed for the two-composite case to solve this problem, and establish its connection to our optimal primal-dual algorithm.

#### 4 - Convergence Rate of Distributed Random Projections

Thinh Doan Doan, Georgia Institute of Technology,  
755 Ferst Drive, Atlanta, GA, 30332, United States

Stochastic gradient descent is a common algorithm used in machine learning, especially when the loss function is in a separable form. Here, we consider SGD for constrained convex optimization problems, where the constraint is expressed as an intersection of a large number of convex sets. We study a distributed version of the random projections since a centralized approach is too slow for very large-scale problems. Under a mild regularity condition on the convex sets, we show that the rate of convergence of distributed SGD with distributed random projections is the same as that of distributed SGD applied to a problem with no constraints, except for a factor which captures the regularity assumption.

#### 5 - Motivation Dynamics: A Nonlinear Saddle Point Algorithm for Dynamically Satisfying Statically Unsatisfiable Constraints

Paul Reverdy, Assistant Professor, University of Arizona,  
1130 N. Mountain Ave., P.O. Box 210119, Tucson, AZ, 85721,  
United States

We propose a dynamical system that can be interpreted as a saddle-point algorithm with a nonlinear Lagrange multiplier dynamics. The system is designed to solve constraint satisfaction problems in Euclidean space. When the constraints are reconcilable, i.e., when there exists a feasible solution, the system converges to the feasible solution. When no such solution exists, we derive conditions under which the system exhibits a stable limit cycle where it periodically satisfies the various constraints.

#### 1 - Stronger Polyhedral Relaxations for Polynomial Optimization Problems

Aida Khajavirad, Carnegie Mellon University, 1405 Second Ave,  
Apartment 3S, New York, NY, 10021, United States,  
Alberto Del pia

We consider the Multilinear set defined by a collection of multilinear terms over the unit hypercube. Such sets appear in factorable reformulations of many types of MINLPs. Utilizing an equivalent hypergraph representation for the Multilinear set, we derive various types of facet defining inequalities for its polyhedral convex hull and present a number of tightness results based on the acyclicity degree of the underlying hypergraph. Subsequently, we detail on the complexity of corresponding separation problems and embed the proposed cut generation algorithm at every node of the branch-and-reduce global solver BARON. Extensive computational results will be presented.

#### 2 - Improved Representations of the Quadratic Linear Ordering Problems

Boshi Yang, Clemson University, Clemson, SC, United States,  
Audrey Nicole DeVries, Warren P. Adams

The quadratic linear ordering problem (QLOP) seeks a least-cost permutation of  $n$  objects where a cost is incurred based on the relative ordering and on products of pairwise orderings. We obtain three results for the QLOP. First, we provide a lifting theorem about the facets of QLOP. Second, we obtain the convex hull representation for  $n=3$  objects with only half the number of restrictions as recent work. Third, we provide the convex hull representation for  $n=4$  objects, expressed in terms of five families of facets. Computational results are presented to show the advantage of our reduced number of constraints in a solution strategy.

#### 3 - Computational Experimentation with Branching Strategies for Global Optimization of Nonlinear Programs and Mixed Integer Nonlinear Programs

Carlos Jose Nohra Khouri, Carnegie Mellon University,  
Department of Chemical Engineering, 5000 Forbes Avenue,  
Pittsburgh, PA, 15213, United States, Nikolaos Sahinidis

Current global optimization solvers rely predominantly on branch-and-bound algorithms for the solution of nonconvex nonlinear programs (NLPs) and mixed-integer nonlinear programs (MINLPs). The efficiency of these algorithms depends to a large extent on the techniques used for partitioning the search space. In this work, we investigate novel branching strategies for nonconvex NLPs and MINLPs. We integrate these strategies into the global optimization solver BARON and analyze their impact by conducting an extensive computational study on a large collection of problems selected from publicly available test sets.

#### 4 - Computational Evaluation of New Models for Tree Ensembles Optimization

Jean-Philippe P. Richard, University of Minnesota, Industrial and  
Systems Engineering, 111 Church Street S.E., Minneapolis, MN,  
55455, United States, Jongeun Kim, Bijan Taslimi,  
Mohit Tawarmalani

Tree ensemble models are widely used to predict the value of a dependent variable as a function of independent variables. When the independent variables are controllable, the problem of optimizing the value of the dependent variable by adjusting the values of the independent variables naturally arises. Models have recently been proposed for such three ensembles optimization problems. In this talk, we introduce new models, formulations and heuristics for this problem and compare provide a numerical evaluation of their performance.

#### Supply Chain and Transportation Networks

Sponsored: Optimization/Network Optimization

Sponsored Session

Chair: Pedro Cesar Lopes Gerum, Rutgers University, 100 Canterbury  
Court, Piscataway, NJ, 08854, United States

#### 1 - Optimizing Medical Supply Distribution in Rural Regions Considering Uncertainty

Larissa P. G. Petroianu, PhD Student, University of Washington,  
1703 Harvard Avenue, apartment 6, Seattle, WA, 98122,  
United States, Zeldia B. Zabinsky, Mauricio G. C. Resende

Delivery of medical supplies to rural regions is a challenge. Uncertainty contributes to making this a complex task. In the rainy season, roads are often flooded and other means of transportation are needed. We seek to improve the efficiency of distribution, considering the cost of transportation, uncertainties of demand and weather, transportation modes, and transit times. We construct four models: deterministic, robust, chance constraint, and two-stage stochastic program. We present numerical results and discuss differences between the models and how each one addresses uncertainty.

#### 2 - A Comparative Study of Supply Network Robustness: Topological Sensitivity Analysis for Random and Targeted Disruptions

Hyunwoo Park, The Ohio State University, 2100 Neil Ave, 632  
Fisher Hall, Columbus, OH, 43210, United States, Yusoon Kim

Based on 38 empirically derived models of supply networks representing multiple real-world industries, we conducted a sensitivity analysis of supply network robustness. We propose a new measure of supply network robustness to disruption when there are multiple sources and multiple sinks in a network. In the analysis, we simulate both random and targeted disruptions and explain varying vulnerabilities across different supply networks based on the topology (i.e., underlying network structure) and stage-level operational attributes such as cost and time.

#### 3 - The European Hinterland Transport Network as a Complex Network - How is Robustness Affected by the Multi-mode Structure?

Camill Harter, PhD Candidate, Erasmus University Rotterdam,  
Burgemeester Oudlaan 50, T09-08, Rotterdam, 3062PA,  
Netherlands, Rob A. Zuidwijk, Otto Koppius

Robustness of transport networks has widely been studied for unimodal networks. Hinterland container transport, however, comprises multiple interlinked networks formed by different transport modes, which impacts robustness. On the one hand, alternative transport modes provide backup capacities, on the other hand, disruption can cascade easier across interlinked networks. We show that robustness against random and targeted failure differs substantially between multimodal networks and their unimodal counterparts and assess how this generalizes to other multimodal networks. We use a unique dataset containing all intermodal services scheduled in the European hinterland from 2016-2018.

#### 4 - Describing the Distribution of Traffic Density on Corridors Affected by Non-recurrent Congestion Using Minimal Statistical Information

Pedro Cesar Lopes Gerum, Rutgers University,  
173 Walnut Court, Highland Park, NJ, 08904-1931, United States,  
Melike Baykal-Gursoy, Marcelo Ricardo Figueroa

We investigate reliability measures to assess the performance of roadway traffic density subject to non-recurrent incidents through applied queueing theory. For this, we consider stationary analytical solutions for the number of customers with Markov-modulated service rates. We validate these parametric distributions for peak and non-peak hours, and then generate explicit dependencies on traffic density and incident parameters, thus avoiding the use of costly simulation. Our model will contribute to the design of management tools for roadway traffic, and to incident mitigation, leading to safer and more efficient movement of people and goods.

Sponsored: Optimization/Network Optimization

Sponsored Session

Chair: Gino J. Lim, University of Houston, Professor and Chairman,  
Dept of Industrial Engineering, Houston, TX, 77204, United States

**1 - Generating Directed Networks with Predefined Degree Distribution and Directed Clustering Coefficient**

Alex Marshall, Analyst, The Perduco Group, Beavercreek, OH,  
45431, United States, Paul F. Auclair

Experimental designs that require the generation of directed networks with predefined clustering are often limited to the undirected clustering coefficient. This presentation reviews an adaption and extension of the Kashyap-Ambika Degree Preserving Rewiring (DPR) techniques for tuning clustering in directed networks. The adaptation enhances the DPR techniques by facilitating downward, in addition to upward, adjustment of directed clustering. The extension integrates the DPR techniques and adaptations enabling the systematic generation of directed networks with a predefined degree distribution and directed clustering coefficient.

**2 - A Bi-objective Covering Tour Problem**

Sanaz Goldani, PhD Student, North Carolina State University,  
Raleigh, NC, 27606, United States, Yahya Fathi

We introduce several families of valid inequalities for the constrained Covering Tour Problem and discuss appropriate strategies for incorporating these inequalities in the context of a branch and cut algorithm for solving the corresponding IP model. We then employ this algorithm to solve a corresponding bi-objective covering tour problem and present the result of a limited computational study.

**3 - The Team-orienting Problem with Diversity Constraints: Application to the Travel Industry**

Yanlu Zhao, ESSEC Business School, Paris, France,  
Laruent Alfordari

This paper examines how the online travel agencies (OTAs) are re-structuring human modern lifestyle. We formulate the tour plan process as a team orienting problem (TOP) with restriction on budget and duration. Different from the TOP, we are the first to consider the diversity in tour design and provide a diversified tour package rather than multiple independent tours. Such diversity enables us to explore the tradeoff between personal preferences in customer choices and economies of scale in agency bargain power. Further, we reformulate the model as a tractable master problem and solve it by column generation. Finally, we use a real dataset to test the algorithm and explore the effect of diversity.

**4 - An Integrated Problem of Hub Location and Revenue Management with Network Disruptions**

Yanting HOU, Tongji University, 1500 Siping Road, Shanghai,  
200092, China

We maximize the total profits in an integrated problem of star capacitated single allocation p-hub location problem and revenue management taking into account disruptions and customer segmentation considerations. The problem is to decide on the locations of hubs and their capacities at the risk of disruptions, the connections, the booking limits and the protection levels of tickets on multiple fare classes.

**5 - A Consistent Network Complexity Measure and its Application in Logistics Network Design**

Yunhui Lin, National University of Singapore, Engineering Drive 2,  
Blk E1 #07-21, Singapore, Singapore, Yuan Wang, Loo Hay Lee

The problem to quantify network complexity has been a challenging topic in various disciplines. Most of the network complexity measures are not consistent and some of them are even counter-intuitive. We examine the consistency of some entropy-based network complexity measures for directed graph, and check whether these measures agree with our intuition. We finally propose a consistent network complexity measure and show how to apply it as a decision making tool and how to integrate into optimization models in logistics network designs.

**6 - A Bi-objective Optimization Model Toward a Robust Network Partitioning**

Gino J. Lim, University of Houston, Professor and Chairman, Dept  
of Industrial Engineering, Houston, TX, 77204, United States,  
Saeedeh Abbasi, Masoud Barati

Dealing with large network-structured systems is difficult. Therefore, a parallel processing is recommended by partitioning the network; which can facilitate the process by reducing the size of the target network at each moment. The common partitioning criterion is modularity while considering another metric beside is beneficial to the result. This study addresses the network partitioning challenges in vulnerability of the partitions via maximization of edge-connectivity beside the modularity. The problem is formulated as a bi-objective maximization model. Two case studies of random graphs in size of 6- and 40-node are analyzed to demonstrate the model's performance.

Co-Chair: Nuri Denizcan Vanli, Massachusetts Institute of Technology,  
Cambridge, MA, 02141, United States

**1 - Beyond Gradient Methods: Models in Stochastic and Non-convex Optimization**

John Duchi, Department of Statistics - 390 Serra Mall,  
Stanford University, Stanford, CA, 94305, United States

We consider minimization of stochastic functionals that are (potentially) non-smooth and non-convex, but are locally approximable (in a sense we make precise) by convex functions. This class includes compositions of a (potentially) non-smooth convex function  $h$  and smooth function  $c$ . We develop methods that build local models of the problem and show theoretically and empirically that they have good performance, typically substantially better than subgradient methods. We analyze this problem class in the context of generic nonlinear measurement problems, showing that we can solve these problems (even with faulty measurements) with high probability under appropriate measurement models.

**2 - Implicit Bias of Optimization in Learning**

Suriya Gunasekar, Toyota Technological Institute at Chicago,  
Chicago, IL, United States, Jason Lee, Nathan Srebro,  
Daniel Soudry

In optimization problems with multiple non-equivalent global minima, we look at the question of how different optimization algorithms influence the specific global minimum they converge to? We will focus on underdetermined regression or separable classification tasks in machine learning, where the training loss has multiple global minima that all give zero training loss, but different minima have different performance on test data. In such problems we will see cases where the specific global minimum reached by specific optimization algorithms have simple characterizations in terms of the geometry of the algorithm and independent of hyperparameter choices such as step size and momentum.

**3 - Robust Accelerated Gradient Method**

Alireza Fallah, Massachusetts Institute of Technology, 77  
Massachusetts Ave., Room 32-D640, Cambridge, MA, 02139,  
United States, Mert Gurbuzbalaban, Asuman Ozdaglar,  
Necdet Serhat Aybat

We study the trade-off between rate of convergence and robustness to gradient errors in designing the first-order algorithms. In particular, we focus on standard optimization algorithms such as gradient descent (GD) and Nesterov's accelerated gradient (AG) method for strongly convex objectives when the gradient has random errors in the form of additive white noise. In this work, we develop a tractable algorithm that allows us to set the parameters of each algorithm to achieve a particular trade-off between rate and robustness. In addition, our results show that AG can achieve acceleration while being more robust to random gradient errors.

**4 - Spurious Local Minima in Neural Networks: A Critical View**

Chulhee Yun, Massachusetts Institute of Technology, Cambridge,  
MA, United States, Suvrit Sra, Ali Jadbabaie

We investigate the loss surface of nonlinear neural networks. We prove that even for networks with one hidden layer and "slightest" nonlinearity, there can be spurious local minima. Our results thus indicate that in general "no spurious local minima" is a property limited to deep linear networks. Specifically, for ReLU(-like) networks we prove that for almost all practical datasets there exist infinitely many local minima. We also present a counterexample for more general activation functions, for which there exists a local minimum strictly inferior to the global minimum. Our results make the least restrictive assumptions relative to the existing results on local optimality in neural networks.

**5 - A Stochastic Trust Region Algorithm with Careful Step Normalization**

Rui Shi, Lehigh University, Lehigh University, Bethlehem, PA,  
United States, Benjamin Field Hobbs

In this talk, we are going to present a stochastic trust region algorithm with emphasis on the normalized steps. We derive the method from a stochastic trust region subproblem but we will also show that if we adapt the trust region subproblem directly, we are going to lose the convergence. Hence our approach involves a modified update scheme which we show convergence for both convex and nonconvex objectives. We will also provide numerical example to show that our method outperform SG in convex and nonconvex machine learning problems.

### Joint Session MSOM/Practice Curated: Marketplace Innovation

Sponsored: Manufacturing & Service Oper Mgmt  
Sponsored Session

Chair: Fuqiang Zhang, Washington University in St. Louis, St. Louis, MO, 63130, United States

#### 1 - Managing Ride-sharing Demand Shocks with Surge Pricing

Bin Hu, UNC Chapel Hill, UNC Chapel Hill, Assistant Professor, Chapel Hill, NC, 27599, United States, Ming Hu, Han ZHU

Surge pricing by ride-sharing platforms has long been accused by media of gouging riders. Instead, economic theory advocates surge pricing as a way of efficiently regulating supply and demand. We propose an alternative argument in support of surge pricing. An important, but often neglected feature is that drivers react magnitudes slower than riders to surge pricing. A short-lived surge can inform nearby drivers of unserved riders, attracting them to relocate and leading to a more efficient market outcome than maintaining less varied prices. Moreover, we find a low-then-high penetration surge may be more profitable for the platform than a more commonly-used high-then-low skimming surge.

#### 2 - Crowdfunding or Bank Financing: Effects of Market Uncertainty and Word-of-mouth Communication

Fasheng Xu, Washington University in St. Louis, Saint Louis, MO, 63130, United States, Xiaomeng Guo, Guang Xiao, Fuqiang Zhang

In the fast growing rewards-based crowdfunding marketplace, startups launch projects not only to raise funding directly from the crowd to cover early stage investment, but also to expand product awareness via word-of-mouth communication. Compared to bank financing, we find that crowdfunding is always preferred by startups under weak product awareness base or poor credit rating; otherwise, crowdfunding may underperform when market uncertainty is within certain medium range. Our model provides a framework to rationalize the advantage of crowdfunding by demonstrating three underlying benefits: capital-raising, awareness-expanding, and demand-validating.

#### 3 - Social Learning and the Design of New Experience Goods

Yiangos Papanastasiou, University of California at Berkeley, Pnina Feldman, Ella Segev

This work focuses on the implications of social learning from product reviews for a monopolist firm's choice of product design. Our main finding is that, in the presence of social learning, the firm's design choice results in a product whose expected quality is lower either in the absolute sense, or relative to the product's price.

#### 4 - Information Sharing on Retail Platforms

Zekun Liu, Washington University in St. Louis, One Brookings Drive, St. Louis, MO, 63130, United States, Fuqiang Zhang, Dennis Zhang

We study how the retail platform should share demand information with its sellers under revenue sharing contract. With no fairness concern, the platform always truthfully shares market or private information to a subgroup of the sellers. With fairness concern, the platform has to offer symmetric information for each seller. When the number of sellers is relatively big, the platform has the incentive to share noised private signals to sellers. Furthermore, when the sellers are heterogeneous in their market power, we show that the platform prefers to share information truthfully with sellers who have relatively low market power.

### MSOM iFORM Sessiona

Sponsored: Manufacturing & Service Oper Mgmt/iFORM  
Sponsored Session

Chair: Robert Louis Bray, Kellogg School of Management, Northwestern University, Evanston, IL, 60202, United States

Co-Chair: Juan Camilo Serpa, McGill University, Montreal, QC, H2L 3S2, Canada

#### 1 - A Structural Estimation Approach to Agent Attrition

Seyed Morteza Emadi, University of North Carolina at Chapel Hill, 300 Kenan Center Drive, Chapel Hill, NC, 27599, United States, Bradley R. Staats

Worker attrition is a costly and operationally disruptive challenge throughout the world. Although large bodies of research have documented drivers of attrition and its operational consequences, managers still lack an integrated approach to understanding attrition and making decisions to address it on a forward-going basis. To fill this need, we build a structural model that captures both the firm's

decision to terminate a workers' employment (involuntary attrition) and uses an optimal stopping problem process to model a workers' decision to leave the firm (voluntary attrition).

#### 2 - Loss Aversion in Managers' Pricing Decision Making at a Fast Fashion Retailer

Anna Saez de Tejada Cuenca, UCLA Anderson School of Management, 110 Westwood Plaza, B-501, Los Angeles, CA, 90024, United States, Felipe Caro, M. Keith Chen

We analyze managers' pricing decision making during the sales season of a fast fashion retailer. We observe empirically that, even when assisted by a DSS that recommends revenue-maximizing prices, they systematically deviate from the optimal prices, in a way that is compatible with a number of behavioral biases: loss aversion, salience of the inventory, time discounting, and status quo. We build a structural model to disentangle their degree of loss aversion from other biases, and compare loss aversion coefficients across managers and across product groups (e.g., fashion vs. basics).

#### 3 - Ration Gaming and the Bullwhip Effect

Robert Louis Bray, Kellogg School of Management, Northwestern University, 830 Hinman Ave., 2s, Evanston, IL, 60202, United States

We model a single-supplier, 73-store supply chain as a dynamic discrete choice problem. We estimate the model with transaction-level data, spanning 3,251 products and 1,370 days. We find two interrelated phenomena: the bullwhip effect and ration gaming. We estimate that the latter causes the former.

### Operations Management for Global Health & Development

Sponsored: Manufacturing & Service Oper Mgmt  
Sponsored Session

Chair: Prashant Yadav, PhD, Harvard Medical School, Seattle, WA

#### 1 - Farmer Engagement with Markets in Rural Uganda

Jarrod D. Goentzel, Massachusetts Institute of Technology, 77 Massachusetts Avenue, E38-650, Cambridge, MA, 02139, United States, Micaela Wiseman, Courtney Blair, Tim Russell

To understand agricultural markets in Uganda, we surveyed farmers and nearby agribusinesses to explore their engagement. We purposively selected 5 districts, randomly chose 2x2km areas, identified households using satellite imagery, and randomly visited households. The survey results characterize behaviors, relationships, and conditions regarding farmer engagement with markets. Further analysis explores the barriers for farmers not connected to the market and how agribusiness help farmers engage in the market. We close with recommendations for market facilitation efforts that support supply chain actors to grow their business and address farmers' challenges.

#### 2 - Estimating Demand of Health Commodities at Rural Chemists in the Absence of Point-of-sale Data

Sripad K. Devalkar, Indian School of Business, Ac3 L1 Room 3114, Hyderabad, 500032, India, Sarang Deo, Aditya Jain, Naireet Ghosh, Shubham Akshat

Adoption of better treatment options in rural areas requires both demand and supply side interventions to increase awareness about the effectiveness of these treatment options and making these commodities accessible. Improving access to health commodities through better replenishment policies requires reliable estimates of demand for such commodities. However, existing methods of demand estimation cannot be used in rural health supply chains due to unavailability of POS data. We overcome this challenge by developing a new methodology that jointly estimates the parameters of the inventory policy of the retailer and the underlying demand distribution by using upstream replenishment data.

#### 3 - Impact of Increased Stock Visibility and Stock Information Sharing on Vaccine Stock Outs in Karnataka India

Anup Akkihal, Logistimo, Seattle, WA, United States, Prashant Yadav, Gaurav Singhal, Vinayak Kothurwar

Impact Of Increased Stock Visibility And Stock Information Sharing On Vaccine Stock Outs In Karnataka India

#### 4 - Does Higher Availability Lead to Higher Use? Understanding the Relationship Between Vaccine Stock Availability and Immunization Coverage in Nigeria.

Prashant Yadav, PhD, Harvard Medical School, Seattle, WA, 98109, United States, Emily Gooding, Eirini Spiliotopoulou

The impact of increases in availability on coverage has not been rigorously evaluated in literature. We use data from Nigeria and a linear mixed effects model to estimate the effect of vaccine availability on routine immunization coverage and to identify factors which affect this relationship. We find that vaccine stockouts significantly decrease the number of children immunized and that for most vaccines, the effect lasts for several months after a stockout. The magnitude of the impact varies by vaccine.

#### 5 - Sourcing Uncertain Product Quality: Competition, Learning, and Volume Postponement

Alexander Rothkopf, Massachusetts Institute of Technology, Cambridge, MA, United States, Felix Lauton, Richard Pibernik

Global-health buyers seek to introduce competition by incenting new generics suppliers with uncertain performance/quality to enter the market. We investigate the benefits of postponing a portion of the award to learn entrant's performance and how the dynamics of learning and competition depend on the size of the postponed volume.

#### Joint Session MSOM-Health/APS: Data, Learning, and Decision-Making

Sponsored: Manufacturing & Service Oper Mgmt/Healthcare Operations

Sponsored Session

Chair: Mohsen Bayati, Stanford University, Stanford, CA, 94305, United States

Co-Chair: Khashayar Khosravi, Stanford University

#### 1 - Matrix Completion Methods for Causal Panel Data Models

Khashayar Khosravi, Stanford University, Stanford, CA, United States, Susan Athey, Guido Imbens, Nikolay Doudchenko, Mohsen Bayati

A central tool in empirical operations management is average treatment effect (ATE) estimation from observational data. In this setting, the presence of potential confounders leads to biased estimates of ATE. One way to reduce this bias is to use panel data models where a subset of units is exposed to a binary treatment during some time-periods and the goal is estimating the counterfactual outcomes for all treated units/time-period pairs. We study a class of estimators that minimize the distance between the estimated matrix and the original matrix, while favoring less complex models. We prove the consistency of our estimators by extending the existing results in the matrix completion literature.

#### 2 - Optimized Prediction of Mortality (OPOM): A Novel Machine-learning Approach for Liver Transplant Allocation

Yuchen Wang, Massachusetts Institute of Technology, Cambridge, MA, 02142, United States, Dimitris Bertsimas, Jerry L. Kung, Nikolaos Trichakis, Ryutaro Hirose, Vagefi Parsia

Since 2002, the MELD score has been used to rank candidates for liver transplantation. However, despite numerous revisions, MELD allocation does not allow for fair access to all waitlisted candidates. We developed an Optimized Prediction of Mortality (OPOM) to allow for more equitable allocation of these scarce resources. OPOM uses state-of-the-art machine learning Optimal Classification Tree models that were trained to predict a candidate's three-month waitlist mortality. OPOM exhibited the highest out-of-sample AUC and can decrease 405.92 deaths every year compared to the current rules. Improved survival was noted across all candidate demographics, diagnoses, and geographic regions.

#### 3 - Question-design for Healthcare Plan Recommendation

Jonathan Z. Amar, MIT, 503 Franklin St, Apt 3, Cambridge, MA, United States, Nikos Trichakis, Chaitanya Bandi

We develop a novel question-design mechanism in order to improve healthcare plan recommendations. Our algorithm is based on accurately estimating the differences of utilities associated with every plan. Rather than being agnostic to it, our formulation is driven by available assortment, and therefore achieves better performance for plan recommendation. We establish theoretical justification for our algorithm which outperformed state-of-the-art methods on real datasets.

#### Managing Queues: Capacity, Information, and Pricing

Sponsored: Manufacturing & Service Oper Mgmt/Service Operations

Sponsored Session

Chair: Philipp Afeche, University of Toronto, Toronto, ON, M5S 3E6, Canada

Co-Chair: Luyi Yang, Johns Hopkins University, Baltimore, MD, 21202, United States

#### 1 - Pricing and Capacity Decisions for Shared Service Systems Under Competition

Eda Kemahlioglu-Ziya, NC State University, Raleigh, NC, United States, Wei Gu, H. Sebastian Heese, Serhan Ziya

We consider service systems where customers' utility depends on price as well as their service experience, which in turn depends on how crowded the service environment is and who the service environment is shared with. We investigate how two such systems under competition make pricing and capacity decisions under competition.

#### 2 - Managing Two-sided Platforms with Self-scheduling Agents and Impatient Customers

Rouba Ibrahim, University College London, MS&I Department, UCL, Gower Street, London, WC1E 6BT, United Kingdom

We study the operational management of service platforms with self-scheduling agents and impatient customers. Since the customer impatience distribution plays an important role, we propose controlling it using delay announcements, and characterise the interaction between three controls at the manager's disposal: the staffing level, the compensation offered to agents, and the announcements made to customers.

#### 3 - The Economics of Line Sitting

Luyi Yang, Johns Hopkins University, 100 International Drive, Baltimore, MD, 21202, United States, Shiliang Cui

We study an emerging business model of line-sitting in which customers seeking service can hire others (line-sitters) to wait in line on behalf of them. We develop a queueing-game-theoretic model that captures the interaction among customers, the line-sitting firm, and the service provider to examine the impact of line-sitting on the service provider's revenue and customer welfare. We also contrast line-sitting with the well-known priority purchasing scheme as both allow customers to pay extra to skip the wait.

#### 4 - Pricing in a Two-sided Market with Time-sensitive Customers and Suppliers

Philipp Afeche, University of Toronto, Rotman School of Management, 105 St. George Street, Toronto, ON, M5S 3E6, Canada, Mustafa Akan

We consider a firm that matches stochastically arriving and time-sensitive customers and suppliers. We characterize and compare the structure and performance of the profit-maximizing and socially optimal pricing policies.

#### Revenue Management and Marketing for Online Retail

Sponsored: Manufacturing & Service Oper Mgmt/Service Operations

Sponsored Session

Chair: David Simchi-Levi, Massachusetts Institute of Technology, Cambridge, MA, 02139, United States

Co-Chair: Clark C. Pixton, Massachusetts Institute of Technology, Cambridge, MA, 02139, United States

#### 1 - E-word of Mouth on Action: Analysis of Operational Decisions when Customers are Resentful

Nesim K. Erkip, Bilkent University, Dept of Industrial Engineering, Ankara, 06800, Turkey, Bahar Cavdar

In this talk, we explore the impact of electronic word-of-mouth (WoM) communication in an online shopping system where there are two types of customers, namely premium and regular customers. Our results reveal insights about the long-run behavior of customer demand and operational decisions under different WoM signals on the perceived quality of different service types and customer behaviors.

## 2 - Understanding the Value of Overlapping Time Windows for Scheduled Delivery Problems

Yeqing Zhou, Columbia University, 550 W. 120th St, New York, NY, 10027, United States, Adam Elmachtoub

We consider a problem where customers choose a delivery time window for a service (such as groceries, laundry, or repair) among a set of options that include small and large time windows. A customer who chooses a large time window receives a reward, while the service provider gains some flexibility. Customers arrive dynamically to the system, and the service provider may dynamically price the time windows. We assume a VRP is solved to satisfy all customers at the end of the horizon. We report on the structure of optimal policies as well as the value of various strategies for designing time windows.

## 3 - Customer Learning for Online Sales of Durable Goods

Clark C. Pixton, Assistant Professor, Brigham Young University, 407 N. 2150 W, Provo, UT, 84601, United States

Motivated by data from a large online retailer, we study online sales of durable goods, focusing on the effects of uncertainty about product quality and learning from customer reviews. We describe the nature of the tradeoff between learning product quality over time and substitution effects between products offered in the same category on the same website. We offer an alternate explanation for market dominance based on transient effects of a learning process which involves decisions under risk, and show that the learning is slower and market dominance more likely in higher price markets. We discuss operational implications for new product timing and incentivizing customer reviews.

### Operations in Developing Economies

Sponsored: Manufacturing & Service Oper Mgmt/Sustainable Operations  
Sponsored Session

Chair: Luyi Gui, The Paul Merage School of Business, UC Irvine, Irvine, CA, 92697-3125, United States

#### 1 - Operational Challenges in a Medical Transportation Platform in India

Gonzalo Romero, Rotman, University of Toronto, 91 Ferrier Avenue, Toronto, ON, M4K 3H6, Canada, Andre Du Pin Calmon

A centralized ambulance dispatch center, like 911 in the U.S., does not exist in many developing countries. Therefore, people that need medical transportation must call their local hospital or hire private ambulances. This translates into long waiting times for patients and costly routes for the ambulances. A medical transportation platform can address this problem by aggregating and dispatching life-saving services. Motivated by our ongoing collaboration with a company in India, we model and analyze the operational challenges of managing a healthcare transportation company in an emerging market.

#### 2 - Impacts of Logistics Information on Sales: The Evidence from Taobao

Ying Rong, Shanghai Jiao Tong University, No. 1 Lane 9, Yunwushan Road, Shanghai, 200051, China, Jifeng Luo, Huan Zheng

Leading e-commerce companies are rapidly expanding their logistics networks to deliver items faster and more reliably. This improved logistics quality drives customers to share their positive experiences online. Using a dataset from China's largest e-marketplace platform, we empirically explore the role of logistics services and their effect on online consumer purchasing behaviors.

#### 3 - Supplier Encroachment Deterrence Through Forecasting Scheme Design

Guangrui Ma, Tianjin University, 92 Weijin Road, 25A, CoME, Tianjin, 300072, China, Ying-Ju Chen

We study how a retailer should design its forecasting scheme facing the supplier encroachment risk, under truthful information sharing agreement with its supplier. We identify three different forecasting schemes that should be implemented according to competition intensity between the indirect channel and direct channel, and supplier's channel investment efficiency.

#### 4 - Optimal Subsidy Schemes and Budget Allocations for Government Trade-in Programs

Shu Hu, National Dong Hwa University, 462 Wenyuan Road, Ningbo, 610031, China, Luyi Gui, Jiaru Bai, Zujun Ma, Rick So

This paper develops an analytical framework for designing effective subsidy scheme to motivate consumer trade-ins. We find that a sharing subsidy scheme is always more effective than a fixed subsidy. We further derive analytical results which illustrate how the government should allocate its total available budget for multiple products based on the individual product and market characteristics. Based on the results from our analysis and numerical experiments, we devise a simple budget allocation mechanism that provides near-optimal solutions.

### Informational and Reputational Issues in Value Chains

Sponsored: Manufacturing & Service Oper Mgmt/Supply Chain  
Sponsored Session

Chair: Haresh B. Gurnani, Wake Forest University, Winston Salem, NC, 27106, United States

Chair: Saibal Ray, McGill University, Montreal, QC, Canada

#### 1 - Managing Reputation Risk in Supply Chains: The Role of Contract-embedded Insurance

Vibhuti Dhirga, University of British Columbia, 2053 Main Mall, Vancouver, BC, V6T1Z2, Canada, Harish Krishnan

We study the role of contract-embedded insurance in managing a buyer's reputation risk arising due to supplier responsibility violations. We find that insurance can both decrease and increase supplier violations. When insurance reduces violations, the buyer benefits from a lower reputation risk. But if reputation costs are low, the buyer can use insurance to squeeze the supplier's margin even if this increases violations. We then consider the impact of supplier noncompliance on the buying firm's investors. We show that a salary-based compensation for the buying firm's manager is insufficient to align incentives across the three tiers, but risk-based bonus compensation schemes can be effective.

#### 2 - The Informational Role of Buyback Contracts

Haresh B. Gurnani, Wake Forest University, 319 Farrell Hall, School of Business, 1834 Wake Forest Road, Winston Salem, NC, 27106, United States, Shouqiang Wang, Upender Subramanian

Retailers often carry inventory in anticipation of demand. Manufacturers can encourage them to stock sufficient inventory by offering to buyback any unsold inventory at a pre-specified price using a buyback contract. We examine the manufacturer's use of a buyback contract as a signaling mechanism when the retailer is less informed about either the manufacturer's reliability of honoring its buyback commitment or about its product's demand potential.

#### 3 - The Perils of Omniscient Online Retailers

Saibal Ray, McGill University, Desautels Faculty of Management, 1001 Sherbrooke Street W, Montreal, QC, H3A 1G5, Canada, Michelle Y. Lu, Yuxin Chen

With the help of big data technologies, online retailers now become omniscient, i.e., knowing everything about consumer preferences, and product matches between firms and consumers. Online retailers can strategically sell firms information about consumer preferences or withhold matching information but charge firms to reveal them to consumers. Is it good to have such powerful retailers? Our research analyzes this complicated issue and investigates the welfare implications on consumers.

## ■ TA18

North Bldg 128A

### Joint Session BMI/Practice Curated: Empirical Research on Marketplace Innovation

Emerging Topic: Business Model Innovation  
Emerging Topic Session

Chair: Ashish Kabra, INSEAD, Fontainebleau, 77305, France

#### 1 - Do P2P Ride-Hailing Platforms Lead to Pooling or Crowding? Quasi-Experimental Evidence from Uber's Entry in California

Suvrat Dhanorkar, Pennsylvania State University, 466 Business Building, University Park, PA, 16802, United States

Taking advantage of Uber's staggered entry into various geographic markets in California, we execute a regression-based difference-in-difference design to estimate the pooling benefits of ride-sharing services.

#### 2 - Designing Incentives to Scale Marketplaces

Ashish Kabra, INSEAD, Boulevard de constance, Fontainebleau, 77305, France

Marketplace operators run aggressive incentive schemes to achieve scale, that is key to the efficacy, survival and eventual domination of a marketplace. This study quantifies and compares the effect of incentives given to the "buyer side and "seller side using data from a leading ride-hailing market. We build a structural model to accurately capture the driver and passenger response to incentives, and the nature of incentives. Driver effort on the platform is unobserved, for which we devise a novel local matching model based imputation method. We find that in short-term (current week) passenger incentives are more effective while the opposite is true in the long-term (next 3 months).

**3 - Platform and Merchant Interactions in Online-to-offline****Marketplace**

Jiaqi Xu, Carnegie Mellon University, Tepper School of Business,  
5000 Forbes Avenue, Pittsburgh, PA, 15213, United States, Hui Li,  
Sridhar R. Tayur

There are many forms of online platforms that connect local offline merchants to consumers. These business models are referred to as Online-to-Offline (O2O) commerce. We develop a framework to analyze the pricing decision and revenue sharing arrangements between O2O platforms and local merchants. We show that the pricing incentives for the two parties do not align when the revenue sharing arrangement does not fully account for the long-run revenue generated from attracting new consumers. We offer recommendations on how to design the revenue sharing arrangement and discuss the economic viability of various O2O business models observed in practice.

**4 - Surge Pricing Under Spatial Spillover: Evidence from Uber's Operations**

Brad Lee, Boston University Questrom School of Business, 595  
Commonwealth Ave, Boston, MA, 02215, United States, Marcus  
A. Bellamy, Nitin Joglekar

Ride-sharing platforms employ surge pricing to match anticipated capacity spillover with demand. We develop an optimization model to characterize the relationship between surge price and spillover. We test predicted relationships using a spatial panel model on a dataset from Uber's operation. Results reveal that Uber's pricing accounts for both capacity and price spillover. There is a debate in the management community on the efficacy of labor welfare mechanisms associated with shared capacity. We conduct counterfactual analysis to provide guidance in regards to the debate, for managing congestion, while accounting for consumer and labor welfare through this online platform.

**■ TA19**

North Bldg 128B

**Dynamic Preferences in Pricing and RM**

Sponsored: Revenue Management & Pricing

Sponsored Session

Chair: Mikhail Nediak, Queen's University, Kingston, ON, K7L 3N6,  
Canada

**1 - Dynamic Pricing Strategies for Perishable Products**

Cansu Altintas, Eindhoven University of Technology, Technische  
Universiteit Eindhoven P.O. Box 513 Pav.F04, Eindhoven, 5600  
MB, Netherlands, Shaunak Dabadghao, Zumbul Atan, Tarkan Tan

Food waste at the retail level arises for a variety of reasons with expiry of use by date being one of the most common ones. As periodic replenishment practices give rise to the coexistence of units with different expiry dates, customers are inclined to select fresher units which provide a higher perception of quality, as long as there is no price differential. In this study, we consider dynamic discounting as a waste management strategy. We study pricing decisions faced by a retailer selling a perishable product with a shelf life of more than two periods where products with different remaining shelf life can coexist.

**2 - Pricing Decisions when Consumers Have Access to Quality Reviews and the Secondary Market**

Sadegh Kazemi, Washington State University, Pullman, WA,  
United States, Mike Wei, Michelle Wu

We study firm's pricing strategies when quality reviews are available and customers are strategic.

**3 - A Vertical Competition in a Supply Chain with a Cash Constraint Rational Newsvendor Type Retailer and a Supplier Offering Trade Credit**

Meisam Soltani-koopa, Queen's University, Unit 306, 220 Eglinton  
Ave. East, Toronto, ON, M4P 1K4, Canada, Yuri Levin,  
Mikhail Nediak, Anton Ovchinnikov

Trade credit is a form of short-term financing that typically appears as a grace period for invoice payment. We study a supply chain with a supplier and a rational newsvendor type retailer in a form of dynamic Stackelberg game with the supplier as a leader. We examine effects of rationality and ability to make dynamic decisions by both sides and the impact of the cash constraint on the resulting supply-chain outcome. The equilibrium is analyzed using semi-infinite programming approach.

**Mechanism Design**

Sponsored: Revenue Management & Pricing

Sponsored Session

Chair: Gabriel Weintraub, Stanford Graduate School of Business,  
Stanford, CA, 94304, United States

**1 - Allocation and Price Guarantees in an Uncertain Internet Advertising Market**

Antoine Desir, INSEAD, Fontainebleau, France, Maxime Cohen,  
Nitish Korula, Balasubramanian Sivan

Buying display ad impressions via auctions in Internet advertising exchanges comes with significant allocation and price uncertainties. We consider the problem of designing a contract to mitigate this risk. In particular, we propose augmenting the traditional auctions with the option of buying at a premium a Market-Maker contract that removes uncertainties in outcome. We rigorously analyze the equilibrium outcome in the presence of a Market-Maker contract and show how to design it to yield an improvement both in the seller's revenue and in the buyer's utilities, therefore improving the total welfare.

**2 - Sequential Procurement through Contractual and Observational Learning**

Gregory Macnamara, Stanford University, Stanford, CA,  
United States, Yonatan Gur, Daniela Saban

We study a dynamic game of incomplete information that models the interactions between a buyer, who demands the same good or service repeatedly over time, and a seller, who can produce the good at a marginal cost and an average quality that are his private information. The quality of the delivered good is stochastic in each time period and unknown in advance. Moreover, the delivered quality is not (objectively) ex post verifiable. We characterize the equilibrium when the buyer makes price offers and identify two forms of learning that may take place with two types of sellers. We identify key parametric regimes which are characterized by different structures of the buyer's optimal learning dynamics.

**3 - The Scope of Sequential Screening with Ex-post Participation Constraints**

Francisco Javier Castro, Columbia University, Columbia School of  
Business, 527 West 121st, New York, NY, 10027, United States,  
Gabriel Weintraub, Dirk P. Bergemann

We study the classic sequential screening problem in the presence of ex-post participation constraints. We establish when the optimal selling mechanism is static (no screening) and dynamic (screening). Our main result establishes a necessary and sufficient condition under which the static contract is optimal and characterize the optimal contract with binary interim types. If the optimal ex-post prices of the interim types are sufficiently close, no screening is optimal. If they are sufficiently apart, screening is optimal. The latter contract randomizes the low type allocation and gives a deterministic allocation to the high type. We also study the optimal contract in the multiple type setting.

**4 - Boosted Second Price Auctions: Revenue Optimization for Heterogeneous Bidders**

Hamid Nazerzadeh, USC Marshall School of Business, Bridge  
Memorial Hall - BRI 401B, 3670 Trousdale Parkway, Los Angeles,  
CA, 90089, United States, Negin Golrezai, Max Lin,  
Vahab Mirrokni

Due to its simplicity and desirable incentive properties, the second price auction has been the prevalent auction format used by advertising exchanges. However, even with the optimized choice of reserve prices, this auction is not revenue optimal when the bidders are heterogeneous and their valuation distributions differ significantly. In order to optimize the revenue of advertising exchanges, we propose an auction format called the boosted second price auction, which assigns a boost value to each bidder. The auction favors bidders with higher boost values and allocates the item to the bidder with the highest boosted bid.

### Using Estimation Techniques and Field Experiments to Optimize Operations and Marketing Decisions

Sponsored: Revenue Management & Pricing

Sponsored Session

Chair: Spyros Zoumpoulis, Paris, 75005, France

#### 1 - On the Learning Benefits of Resource Flexibility

Mihalis Markakis, Universitat Pompeu Fabra, Barcelona, Spain,  
Jiri Chod, Nikolaos Trichakis

We consider a firm that acquires resources to sell two products/services. We compare the demand learning under two designs: one with non-flexible resources and one with a single flexible resource. Our analysis reveals that resource flexibility improves learning, unless the products/services have significantly different demand characteristics or economic parameters, leading to an important managerial implication: flexibility is not just the “ability to react;” it also provides better demand information, which can be used pro-actively for better resource planning, pricing, and assortment decisions.

#### 2 - Setting Retail Staffing Levels: A Methodology Validated with Implementation

Santiago Gallino, Dartmouth College, 100 Tuck Hall, Hanover, NH,  
03755, United States, Marshall L. Fisher, Serguei Netessine

We describe a three-step process that a retailer can use in setting retail store sales staff level. First, use historical data on revenue and planned and actual staffing levels by store to estimate how revenue varies with staffing level at each store. We disentangle the endogeneity between revenue and staffing levels by focusing on randomly occurring deviations between planned and actual labor. Second, using historical analysis as a guide, validate these results by changing the staffing levels in a few test stores. Finally, implement the results chain-wide and measure the impact. We describe the successful deployment of this process with a large specialty retailer.

#### 3 - Targeting Prospective Customers Using Field Experiments: Efficient Causal Inference and Robustness of Machine Learning Methods to Data Challenges

Spyros Zoumpoulis, INSEAD, Fontainebleau, France,  
Duncan I. Simester, Artem Timoshenko

We investigate how firms can use the results of field experiments to optimize the targeting of promotions when prospecting for new customers. We propose an approach to designing and analyzing field experiments that has substantive efficiency advantages over standard approaches for experimenting and evaluating targeting policies. We also evaluate seven widely used machine learning methods using a series of two large-scale field experiments, and discuss how well the methods address common data challenges.

#### 4 - Spatial Pricing in Ride-sharing Networks

Kostas Bimpikis, Stanford University, Ozan Candogan,  
Daniela Saban

We explore spatial price discrimination in a ride-sharing platform that serves a network of locations. Riders are heterogeneous in their destinations and their willingness to pay. Drivers decide whether, when, and where to work to maximize their earnings, given the platform's prices. Our findings highlight the impact of the demand pattern on prices, profits, and the induced consumer surplus. We establish that profits and consumer surplus are maximized when the demand pattern is balanced across the network. Also, we show that they both increase with the balancedness of the demand. If demand is not balanced, the platform can benefit substantially from pricing rides differently based on their origin.

### Design of Online Marketplaces

Sponsored: Revenue Management & Pricing

Sponsored Session

Chair: Kostas Bimpikis, Stanford University

#### 1 - Optimal Pricing in Markets with Non-convex Costs

Navid Azizan, California Institute of Technology, Pasadena, CA,  
United States, Su Yu, Krishnamurthy Dvijotham, Adam Wierman

We consider a market run by an operator, who seeks to satisfy a given consumer demand by purchasing it from a group of suppliers with non-convex cost functions. The operator knows the cost functions and announces a price function for each supplier. Each supplier then makes an individual decision about how much to produce. We propose a new pricing scheme, which is applicable to

general nonconvex costs, and allows using general parametric price functions. The flexibility of our scheme allows finding prices that are typically more economically-efficient and less discriminatory. We supplement the proposed method with a polytime approximation algorithm for finding the optimal quantities and parameters.

#### 2 - Efficiency and Information Aggregation in Heterogeneous Markets

Yaarit Even, Columbia Business School, New York, NY,  
United States, Alireza Tahbaz-Salehi, Xavier Vives

This paper studies how heterogeneous preferences shape the informational and allocative efficiency of centralized markets with asymmetric information. We show that introducing agent-level heterogeneity to the standard rational expectations equilibrium models reduces price informativeness. This reduction in price informativeness in turn manifests itself as an informational externality: in the presence of heterogeneity, agents do not internalize the impact of their trading decisions on the information revealed to others via prices. We conclude by investigating the welfare implications of market segmentation in the presence of this informational externality.

#### 3 - Social Learning with Product Choice

Stefano Vaccari, LUISS University, Via Pietro Ceccato, 15, Roma,  
00156, Italy, Costis Maglaras, Marco Scarsini

We study a model where consumers infer the quality of a set of products through online reviews, and make their subsequent product choice according to an MNL model. Consumers that purchase, write reviews based on their experienced quality. We study the impact of choice on the learning outcome and the speed of learning. We explore the platform display order optimization problem in a setting where consumers have search costs.

### Systemic Risk and Network Models

Sponsored: Finance

Sponsored Session

Chair: Zachary Feinstein, Washington University in St. Louis,  
St. Louis, MO

#### 1 - Systemic Risk in a Multilayered Network

Zachary Feinstein, Washington University in St. Louis,  
St. Louis, MO, 63130, United States

In this talk we provide a general framework for modelling financial contagion in a system with obligations in multiple illiquid assets, e.g., currencies. In so doing, we develop a multi-layered financial network that extends the single network of Eisenberg & Noe (2001). In particular, we develop a financial contagion model with fire sales that allows institutions to both buy and sell assets to cover their liabilities and act as utility maximizers. Under standard assumptions, equilibrium portfolio holdings and market prices exist which clear the multi-layered financial system.

#### 2 - A Time-dynamic Eisenberg-Noe Network Model

Tathagata Banerjee, Washington University in St. Louis,  
St. Louis, MO, United States, Alex Bernstein, Zachary Feinstein

We will consider a generalized extension of the Eisenberg-Noe model of financial contagion to allow for time dynamics in both discrete and continuous time. We will provide the derivation and the interpretation of the financial implications. Emphasis will be placed on the continuous-time framework and its formulation as a differential equation driven by the operating cash flows. Mathematical results on existence and uniqueness of firm wealths under the discrete and continuous-time models will be provided. We will discuss the financial implication of the time dynamics with the focus on how the dynamic clearing solutions differ from those of the static Eisenberg-Noe model.

#### 3 - Systemic Risk and Trade Compression

Stephan Sturm, WPI, Department of Mathematical Sciences,  
100 Institute Road, Worcester, MA, 01609, United States

Since the financial crisis 2008 the practice of trade compression has taken off in over-the-counter derivatives markets. We analyze the impact of different trade compression schemes on the systemic risk in derivatives markets.

#### 4 - Systemic Risk Measures and Portfolio Choice

Alexey Rubtsov, Global Risk Institute, Toronto, ON, Canada,  
Agostino Capponi, Alex LaPlante

We develop a model for the optimal portfolio choice in presence of systemic risk. In our modelling approach we use two risk measures: VaR and CoVaR (Adrian and Brunnermeier (2011)). Our investor maximizes portfolios expected returns conditioned on a systemic risk index being at (at most at) its VaR level and portfolios returns below their CoVaR level. Under some assumptions the optimal investment strategy is derived in closed form. The proposed methodology is flexible in balancing the significance of portfolios variance and portfolios correlation with systemic risk index.

**Information and Operations Management**

Sponsored: EBusiness

Sponsored Session

Chair: Rakesh Reddy Mallipeddi, Texas A&M University, College Station, TX, 77843-4217, United States

**1 - Buyer and Supplier Perspectives on the Transactional Use of Digital Technologies: Two Sides of the Same Coin?**

Nils Van den Steen, Ghent University, Ghent, 9100, Belgium, Willem Standaert, Steve Muylle, Amit Basu

Prior research has shown that the use of digital technologies can improve the performance of processes involved in supply-chain transactions in a variety of industries. While their impact has been investigated for the procurement process, process-oriented research on the effect of digitization for sales is limited. In addition, both perspectives have not been examined in an integrated and comprehensive way. This study adds to the literature by taking a bilateral perspective on the process performance impact of buyer-supplier transactional use of digital technologies.

**2 - How Much to Open, How Fast to Fix and Develop? Impacts of Open Innovation on New Software Development and Maintenance**

Rakesh Mallipeddi, Texas A&M University, 320 Wehner - 4217, Mays Business School, Dept of Info&Operations, College Station, TX, 77843-4217, United States, Emre M. Demirezen, Subodha Kumar, Ram Gopal

Proprietary software vendors have begun to emulate the open source software community in opening up part of their software to accelerate new product development. In this research, we develop a data-driven model to analytically analyze how open source software, a form of open innovation, affects vendors' software maintenance and new product development strategies.

**3 - Optimizing Surge Pricing Dynamically in Ride Sharing Platforms: A Differential Games Approach**

Samayita Guha, Temple University, Philadelphia, PA, United States, Emre M. Demirezen, Subodha Kumar

The entry of ride-sharing platforms has caused disruptive changes in transportation industry. We use a differential game theory approach to optimize surge pricing for these platforms. We consider how consumers' perception and wait time dynamically influence demand.

**4 - Incentive to Offer Ad Removal in Digital Content**

Lin Hao, University of Notre Dame, 351 Mendoza College Of Business, Notre Dame, IN, 46556, United States

In this paper, we develop a stylized game-theoretic model to study in which market conditions a content provider has the incentive to provide ad removal as an option to its content users. The preliminary results have shown that both the supply-side and demand-side factors playing important roles in determining the equilibrium results.

**1 - The Impact of Mobile Payment Channel on Consumer**
**Consumption: Evidence from Alipay**

Yuqian Xu, University of Illinois at Urbana-Champaign, Wohlers Hall 487, 1206 S. 6th St, Champaign, IL, 61820, United States, Anindya Ghose, Binqing Xiao

The rapid development of mobile technology has introduced a new channel for consumer consumption. In this paper, we investigate how mobile payment channel affects other bank payment channels. We utilize a unique data set from one of the largest bank in China, which contains the consumer credit card consumption from online, offline, and mobile payment channels. We find the transaction amount increases around 2.4% after Alipay adoption, and the transaction frequency increases around 23.5%. Furthermore, we find Alipay channel acts as a substitute for the offline (physical card) channel, and a complement for the online banking channel.

**2 - Improving Patient Flow in the Presence of Heterogeneous Patient Types**

Woo-Hyung Cho, Cornell University, Ithaca, NY, United States, Shane Henderson, David B. Shmoys

Outpatient medical facilities face a challenging scheduling and resource allocation problem given heterogeneous streams of patients competing for the same resources. We are working with a large breast imaging facility in NYC, where different patient types experience a nested service requirement. Through analyses of patient timestamp data, we identify potential bottlenecks in the system and examine strategies to systematically take advantage of underutilized resources. We use a data-driven discrete-event simulation model to measure the impact of implementing our proposed strategy under various scenarios.

**3 - The Impact of Competition on Hospitals' Progression Towards Meaningful Use**

Varun Gupta, Penn State Erie, The Behrend College, 5101 Jordan Rd, Burke 281, Penn State Erie, The Behrend College, Erie, PA, 16563, United States, Xin Ding, Xin Ding, Ozgun Demirag

In this paper, we examine how competition in local hospital service area drives hospitals' decision to move along the meaningful use stage model with performance data from 2011 to 2015. Additionally, we develop a series of hypotheses based on game theory and test the hypotheses with the performance data in econometric models.

**4 - Rebalancing Bike Sharing Systems: A Data-driven Approach**

Weiwei Chen, Rutgers Business School, 100 Rockefeller Road, Supply Chain Management, Piscataway, NJ, 08854, United States, Junming Liu, Leilei Sun, Hui Xiong

Bike sharing systems aim at providing the missing links in public transportation systems and have become increasingly popular worldwide. Due to geographical and temporal unbalance of bike usage demand, bikes need to be reallocated among stations so as to maintain a high service level of the system. This talk introduces a data-driven hierarchical optimization methodology, including bike demand predictors and a clustering-based decomposition optimizer, in solving this daily operational problem of bike sharing systems. Numerical experiments using data from NYC, Chicago and Boston show the accuracy of the demand predictors and the effectiveness of the optimizer.

**1 - The Rise of Data Literacy**

Jordan Morrow, Qlik, Bountiful, UT, United States

With the growing desire of organizations to utilize data to drive insight and decisions, individuals need to be empowered with skills in data literacy. Join this session to learn about the world of data literacy and how individuals and organizations can help drive skills to help everyone succeed in the analytics economy.

## 2 - Understanding Gaze Events and Brain Activities in Online-learning through Electroencephalography and Eye-tracking

Yuzhi Sun, Oregon State University, 1500 SW Jefferson St., Corvallis, OR, 97331, United States, David Nembhard

We investigated the degree to which gaze events and brain activities are predictive of individual online learning performance through 2-by-2 experiment. Through the research, the gaze events were taped and documented via eye-tracking, the brain activities were monitored and recorded by the electroencephalogram (EEG), and the quiz scores measured the learning performance. ANOVA models and SEM models were considered to examine the relationships. Notably, the models indicate that there exists a significant association between design factors, gaze event durations, and learning outcomes. Levels of correlation between brain activities and gaze events were also found.

## 3 - Optimal Weighting for Exam Composition

Sam Ganzfried, Ganzfried Research, 1504 Bay Road, Apt. 1706, Miami Beach, FL, 33139, United States, Farzana Beente Yusuf

A problem faced by many instructors is that of designing exams that accurately assess the abilities of the students. Typically, generic question scores are used based on rough approximation of the question difficulty and length. We describe a novel framework where algorithms from machine learning are used to modify the weights to optimize the exam scores, using the overall final score as a proxy for a student's true ability. We show that significant error reduction can be obtained by our approach over standard weighting schemes. We make several new observations regarding the properties of the "good" and "bad" exam questions that can have an impact on the design of improved future evaluation methods.

### Resilient Rail and Failure Prediction

Sponsored: Railway Applications

Sponsored Session

Chair: Nikola Besinovic, Delft University of Technology, Delft, 2600CN, Netherlands

#### 1 - Train Rescheduling and Circulation Planning in Case of Complete Blockade for an Urban Rail Transit Line

Yihui Wang, Beijing Jiaotong University, Beijing, China, Lingyun Meng, Tao Tang, Bin Ning

With the rapid development of urban rail transit system, the disruptions occur more frequently due to the uncertain factors, such as signal failures. Once a disruption is occurred, the passengers' safety and travel efficiency are seriously affected. Moreover, this impact of the disruption may spread to the adjacent lines and even to the whole network. Train rescheduling has a great effect on evacuating passengers quickly and relieving the mismatch of transport capacity and traffic volume. To maintain the transport capacity as much as possible under the disruption scenarios, this paper considers the train rescheduling and circulation planning in case of complete blockade for an urban rail line.

#### 2 - Modelling Resilience of Rail Transport Networks

Nikola Besinovic, Delft University of Technology, Stevinweg 1, Delft, 2600CN, Netherlands

In current railway system disruptions are inevitable and more, their number is expected to further increase making the system even more vulnerable. We propose resilience performance indicators (RPI), to accurately estimate system performance during disruptions. We consider both topological and operational causes such as infrastructure and rolling stock failures. In addition, the effects of both single and multiple disruptions are investigated. For this purpose, historical traffic data from the Netherlands is used. As an outcome, we determine the most efficient RPI and a set of the most critical disruptions, which can be used in evaluating and optimizing resilience of future railway systems.

#### 3 - Predicting Locomotive Failures: A Machine Learning Approach

Clark Cheng, Sr. Director Operations Res & Chief Data Scientist, Norfolk Southern Corporation, 1200 Peachtree Street NE, Mail Stop 171, Atlanta, GA, 30309, United States, Mabby Amouie, Ilya Lavrik

Locomotive reliability is a mission-critical issue for freight railroads. A locomotive failure will likely cause train delay, line-of-road congestion, service disruption, and ripple effect across the rail network. In this presentation, we'll describe a machine-learning approach to predicting locomotive failures using sensor data ingested from locomotives.

## 4 - Modeling and Predicting Recurrent Rail Defects

Faeze Ghofrani, University at Buffalo, SUNY, Buffalo, NY, United States, Qing He, Reza Mohammadi

Provided six-year data from a US Class I railroad, this study develops a robust methodology for predicting the recurrence of rail defects at the same location by using the conditional frailty cox model. The results of this study are useful for railroads to develop effective strategies for track corrective maintenance to reduce the recurrence of rail defects.

## 5 - Positioning and Coordination of Resources for Reliable Emergency Response to Railroad Incidents

Yanfeng Ouyang, U. of Illinois at Urbana-Champaign, 205 N. Mathews Ave, 1209 Newmark Lab, MC-250, Urbana, IL, 61801, United States, Siyang Xie

This talk discusses strategic positioning and allocation of emergency response resources that may be impacted by rail incidents. Mathematical models and solution techniques are developed to systematically analyze the emergency response system in case: (i) joint dispatches are needed from multiple locations, and (ii) the emergency response system itself is vulnerable; e.g. due to blockage of railroad crossings after the incident.

### Market Design Approaches for Transportation Systems

Sponsored: TSL/Urban Transportation

Sponsored Session

Chair: Changhyun Kwon, University of South Florida, Tampa, FL, 33620, United States

#### 1 - Spatio-temporal Pricing for Ridesharing Platforms

Hongyao Ma, Harvard University, 33 Oxford Street, MD 242, Cambridge, MA, 02138, United States, Fei Fang, David C. Parkes

A challenge in dynamic pricing in ridesharing platforms is to set prices that are appropriately smooth in space and time, so that drivers will choose to accept their dispatched trips, rather than drive to another area or wait for a better trip. We introduce the Spatio-Temporal Pricing (STP) mechanism, which is subgame-perfect incentive compatible for drivers, and also welfare-optimal, envy-free, individually rational and budget balanced from any history onward. We prove that there can be no dominant-strategy mechanism with the same economic properties, and show via simulation that STP achieves significantly higher social welfare than a myopic pricing mechanism, where drivers have high regret.

#### 2 - Combinatorial Auction with Bidder-defined Items for Fractional Ownership of Autonomous Vehicles

Mahdi Takaloo, Tampa, FL, 33613, United States, Aigerim Bogyrbayeva, Hadi Charkhgard, Changhyun Kwon

In this study, a combinatorial auction with bidder defined items is proposed to design a market for vehicle fractional ownership under autonomous vehicles. Considering spatial information of bidder, we formulate the winner determination problem for the proposed combinatorial auction market under both discrete- and continuous-time settings. We show that the continuous-time model is superior, in terms of social welfare maximization, to the discrete-time model. We provide a clique-based reformulation of the continuous-time model, for which we develop an efficient algorithm.

#### 3 - Acyclic Mechanism Design for Freight Consolidation

Wentao Zhang, 3715 McClintock Ave, GER 240, Los Angeles, CA, 90089, United States, Nelson A. Uhan, Maged M. Dessouky, Alejandro Toriello

Freight consolidation is a logistics practice that improves the cost-effectiveness and efficiency of transportation operations, and also reduces energy consumption and carbon footprint. A "fair" shipping cost sharing scheme is indispensable to help establish and sustain the cooperation of a group of suppliers in freight consolidation. We design a truthful acyclic mechanism to solve the cost-sharing problem in a freight consolidation system. We study the budget-balance of the mechanism both theoretically and numerically. We also study the economic efficiency of our mechanism numerically to investigate its impact on social welfare.

#### 4 - American Options-Based Collaboration Mechanism for Multiple Less-Than-Truckload Carriers Under Demand Uncertainty

Choungyeol Lee, Purdue University, West Lafayette, IN, United States, Srinivas Peeta

We propose an American freight options-based collaboration mechanism for multiple less-than-truckload carriers that provides the flexibility to exercise the options at any time up to the expiry date so as to enhance operational efficiency. The proposed mechanism can address demand uncertainty by allowing for cost-efficient capacity allocation adjustments depending on future demand realization. Results of numerical experiments show that the proposed mechanism enables the collaborating carriers to enhance capacity utilization and profitability, while leveraging excess capacity in a more cost-efficient manner.

### Transportation Aspects Towards a Smart City

Emerging Topic: Smart Cities

Emerging Topic Session

Chair: Stephen Mattingly

#### 1 - The Marginal Congestion of a Taxi in New York City

Alejandro Molnar, Asst Professor, Vanderbilt University,  
415 Calhoun Hall, Nashville, TN, 37240, United States,  
Daniel Mangrum

We exploit the partial deregulation of New York City taxi medallions to provide a causal estimate of the impact of taxi supply on congestion. We employ taxi trip records to measure historical street-level speed. We find that the roll-out of newly authorized taxis caused a local 8-9% decrease in speed. We estimate an empirical congestion elasticity curve from heterogeneous changes in speed and taxi supply, counted from aerial orthoimagery. Additionally, we provide novel urban sensor data to document a substantial traffic slowdown since 2013. Most of the slowdown in midtown Manhattan is accounted for by new supply from ridehail applications.

#### 2 - Integrating Transportation Education and Research for Smart Cities

Ruey Cheu, University of Texas at El Paso, El Paso, TX,  
United States, Miroslav Svitek, Tomas Horak

The concept of smart cities requires professionals in different disciplines to work together and engaging the community, but there is a lack of such education program. In this presentation, the speakers will examine the strength and weaknesses of discipline specific transportation education programs in universities. They will then discuss several smart cities education and research initiatives at The University of Texas at El Paso (UTEP) and Czech Technical University (CTU) at undergraduate, graduate and PhD levels. They will next share their experience in transforming the dual master degree program in transportation between UTEP and CTU, to a new dual master degree program in smart cities.

#### 3 - Decentralized Optimization of Urban Traffic Flows

Stephen F. Smith, Carnegie Mellon University, Robotics Institute,  
Carnegie Mellon University, Pittsburgh, PA, 15213, United States

Recent work in decentralized, schedule-driven traffic signal control has produced a promising new approach to traffic flow optimization in urban road networks. This approach, which relies on a novel formulation of the intersection control problem as a special type of single machine scheduling problem, has yielded significant efficiency improvements in initial field deployments. In this talk, we describe current research aimed at broadening network-level optimization performance through use of queueing theory concepts, more expressive problem representations, and bi-directional information exchange.

#### 4 - I-STREET Testbed: Progress and Challenges

Clark Letter, University of Florida, Gainesville, FL, United States,  
Lily Elefteriadou

The University of Florida and its Transportation Institute (UFTI), the Florida Department of Transportation and the City of Gainesville have coordinated the development of a smart testbed on the UF campus and adjoining city streets. The testbed is established to deploy and evaluate numerous advanced technologies including connected and autonomous vehicles, smart devices, and sensors, as well as to develop novel applications for their use. Many challenges arise when deploying new technologies, and I-STREET hopes to share lessons learned with other agencies.

### Integration of Learning Approaches and Emerging Traffic Operation and Control Technologies

Sponsored: TSL/Intelligent Transportation Systems (ITS)

Sponsored Session

Chair: Lili Du, University of Florida, 2550 Yeager Road, Gainesville, FL, United States

#### 1 - Clustering Based Mixed Strategy Coordinated In-vehicle Routing for Connected and/or Autonomous Vehicles

Wang Peng, University of Florida, Gainesville, FL, United States

This study develops a clustering based mixed strategy coordinated in-vehicle routing approach. Specifically, this study develops graphical and network flow approaches to evaluate the direct and indirect competition potential among

multiple travelers on network route resources. Furthermore, we design an adaptive centroid-based clustering algorithm to find a local optimal clustering solution. Built upon that, a mixed strategy coordinated routing mechanism is implemented to coordinate in-vehicle routing decisions for multiple traveler clusters over a large scale network. The numerical experiments are conducted to validate the efficiency and applicability of the proposed approaches.

#### 2 - Macroscopic Traffic Flow Modeling with Mixed Connected and Human-driven Vehicles

Xianfeng (Terry) Yang, University of Utah, Salt Lake City, UT,  
United States, Zhehao Zhang, Zhao Zhang

Although connected vehicles (CVs) will soon go beyond testbeds, it can be expected that CVs and human-driven vehicles (HVs) will co-exist over a long period. Due to the capability of exchanging data, CVs behave differently compared with HVs. In this study, we aim to develop a macroscopic traffic flow model to understand how speed change of CVs would impact HVs in the traffic stream. Particularly, friction factors are introduced to the speed formulations for accounting interactions between CVs and HVs. Then extended Kalman Filter is employed to update both model parameters and friction factors in real-time. For model evaluation, we employ simulated data as ground truth for conducting numerical tests.

#### 3 - Information Dissemination Dynamics via Vehicle-to-vehicle Communication over Transportation Networks

Ala S. Alobeidyeen, University of Florida, Gainesville, FL,  
United States

The study developed a discrete mathematical model to track information spreading dynamics via V2V over an urban transportation network at discrete time steps. Specifically, an information network flow combined with the IT-CTM (Du et al., 2016) is developed to respectively track traffic information wave spreading dynamics at traffic intersections and road segments. Moreover, machine learning approach is used to investigate the correlation between information coverage and traffic congestion based on simulation experiments.

#### 4 - Online Demand-driven Car Sharing Rebalancing

Xiaopeng Li, University of South Florida, 4202 E. Fowler Avenue,  
Tampa, FL, United States, Dongfang Zhao

This study proposes an online car-sharing rebalancing model to deal with the car sharing fleet management problem using reinforcement learning. We develop a multi-agent reinforcement learning framework using a deep Q-learning algorithm. The goal of the algorithm is to maximize the total profit of the platform by repositioning available cars to the locations with outstanding demand-supply gaps. This model does not make any assumption on the demand and is completely driven by spatially distributed demand data history. With real-world data, we show significant improvements of the proposed framework over state-of-the-art approaches through extensive empirical studies.

## ■ TA32

North Bldg 222B

### Same-day Delivery

Sponsored: TSL/Freight Transportation & Logistics

Sponsored Session

Chair: Niels Agatz, Erasmus University, Rotterdam, Netherlands

#### 1 - Splitting Pickup and Delivery Tasks in a Same-day Personal Shopper Service

Alp Arslan, Erasmus University Rotterdam, Admiraliteitskade  
50-713, Rotterdam, 3062ED, Netherlands, Niels Agatz,  
Mathias A. Klapp

We consider a same-day personal shopper service that receives customer delivery requests that require pickups at one or more stores. All requests that can be served in their requested time window are accepted. We study the benefits of splitting a single customer request into various delivery tasks served by different shoppers to improve the percentage of customers served throughout the day.

#### 2 - Tactical Design of Same-day Delivery Systems

Alex Stroh, Georgia Institute of Technology, Atlanta, GA, 30332,  
United States, Alan Erera, Alejandro Toriello

We study tactical designs for same-day delivery (SDD) systems. We look for structure in optimal dispatch policies when a SDD system is modeled with smoothed customer demand and vehicle route durations are approximated by a continuous time function of the number of customers served. Using these optimal policies, we study tactical decisions for SDD systems which prior research has used as model inputs. Specifically, we can answer questions like: How large of a fleet is required? When during a service day should a retailer stop accepting same-day orders? How often can a retailer expect to dispatch delivery vehicle? We illustrate our findings with a set of realistic examples.

### 3 - Provably High-quality Solutions for the Meal Delivery Routing Problem

Baris Yildiz, Asst.Prof., Koc University, Rumeli Feneri Yolu, Sariyer, Istanbul, 34450, Turkey, Martin W. P. Savelsbergh

Meal delivery is arguably the ultimate challenge in last mile logistics: a typical order is expected to be delivered within an hour (much less if possible), and within minutes of the food becoming ready. We introduce a novel formulation for a meal delivery routing problem in which we assume perfect information about order arrivals, and develop a simultaneous column and row generation method for its solution. The analysis of our extensive computational study, using instances derived from real-life data, demonstrates the efficacy of the solution approach, and provides valuable insights into, among others, the (potential) benefits of order bundling, courier shift scheduling, and demand management.

### 4 - Shuttle Scheduling for Same-day Courier Service

Iman Dayarian, Culverhouse College of Commerce, The University of Alabama, Box 870226, Tuscaloosa, AL, 35487, United States, Adolfo Antonio Rocco Rocco, Martin W. P. Savelsbergh

We consider data-driven design of an intra-city logistics service network of an express courier company, offering same- and next-day delivery services. The system is designed on a multi-layer network. At the lowest level, the couriers are responsible for pick-up and delivery of the packages at the customer locations. In an intermediate level network, the riders are responsible for transferring packages between couriers and local hubs where, the shipments are sorted, consolidated, and transferred to their destination local hubs through a network of shuttles. Our goal is to design shuttle routes and schedules that guarantee on-time delivery of same-day packages, given the dynamic nature of demand.

### Advances in Traffic Flow Modeling

Sponsored: TSL/Intelligent Transportation Systems (ITS)

Sponsored Session

Chair: Dianchao Lin, New York University, New York University, New York, NY, United States

#### 1 - A Car Following Model Incorporating Reaction Time Dynamics Online Calibration and Case Study

Kerem Demirtas, Arizona State University, 699 S. Mill Ave. Tempe, Brickyard Engineering 553, Tempe, AZ, 85281, United States, Pitu B. Mirchandani, Xuesong Zhou

In this study, we are interested in online calibration of car following parameters to explore both inter-driver and intra-driver heterogeneity. Specifically, we offer an augmented state space system for a lower order linear spacing car following model, and implement a modified Kalman filter algorithm to track the leader-follower pairs and simultaneously predict and estimate the parameters related with the behavior of the followers. Three different state transition models are proposed which incorporate reaction time dynamics exploiting instantaneous local density information. Comparison and interpretation of the results, and promising future research directions are given.

#### 2 - Modeling Flood Dynamics: Interacting Processes between Transportation and Water Networks

Cesar N. Yahia, The University of Texas at Austin, Austin, TX, 78705, United States, Isha Deo, Stephen D. Boyles, Paola Passalacqua

We model real-time flood dynamics by considering the influence of hydrologic terrain and processes on the transportation network. We propose a data-driven model that integrates information from multiple sensors. This enables short range predictions on the disruption state of the transportation network.

#### 3 - Stochastic Fluid Queuing Model for Evaluating Smart Highway Operations

Li Jin, Assistant Professor, New York University, Brooklyn, NY, United States, Saurabh Amin, Patrick Jaillet

We present a stochastic, finite-buffer fluid queuing model of serially connected highway segments that serve a mix of normal traffic and connected vehicle platoons. The queuing dynamics is governed by a Markov chain, which models capacity perturbations (due to incidents), and/or randomness in platoon integration. We derive a necessary condition and a sufficient condition for the stability of this system, and analyze the sensitivity of expected throughput under various operational scenarios. Our analysis provides novel insights for incident management and vehicle platooning operations.

#### 4 - Lane-change Strategies for Connected Vehicles Using Cooperative Game Theory

Dianchao Lin, Ph.D Candidate, New York University, New York, NY, United States, Li Li, Saif Eddin G. Jabari

This paper proposes two new lane changing strategies to serve connected vehicles using cooperative game theory: transferable utility strategy which allows vehicles to transact lane usage timely using transferable utility solution, and the non-transferable utility strategy using Nash bargaining solution. Simulations using

Cellular Automata are employed to explore the impact of transaction vehicles percentage, traffic density and value of time. Results showed that, cooperation between drivers could help achieve win-win result. Besides, a properly designed utility function could encourage vehicles to participate in transactions, and prevent them from cheating in their value of time.

### 7:30 - 8:15 Mem Computing Inc./ 8:15 - 9:00 Palisade

Vendor Demo Session

#### 1 - Overview of MemComputing Inc.

Mem Computing, Mem Computing Inc., La Jolla, CA, United States

Companies in all industries are seeking to optimize the efficiencies of their business environments in order to stay competitive. Data science is now coming to the forefront across departments as they seek ways to leverage big data collections to implement solutions for improved efficiency and profitability. There are a set of problems associated with optimization, big data analytics and operations research among other areas, where companies are having to accept less than the optimal answer. The challenge lies within the fact that the size and complexity of the problems will grow exponentially as the inputs and constraints grow linearly. To find viable solutions, alternative methods are employed such as reducing the amount of data analyzed, breaking the problem up into smaller problems or accepting an incomplete answer when time reaches the threshold. This is not advantageous nor is it economical as efficiencies, innovations and revenues decline. This tutorial presents a novel coprocessing architecture that is shifting the computing paradigm. Based on novel technology developed by MemComputing, Inc. its MemCPU Coprocessor platform speeds up computational time solving and finding accurate solutions for complex optimization and combinatorial problems of high economic value.

#### 2 - Quantitative Risk Analysis in Excel with @RISK

Jos Ra-I Castro, Palisade Trainer/Consultant, Palisade Corporation, Ithaca, NY, United States

This tutorial will guide you in the use of @RISK for analyzing historical data and making better decisions in an uncertain business environment. @RISK is part of Palisade's Decision Tools Suite and runs as an add-in for MS Excel. It provides all the features you need to quantify and understand risks with the support of Monte Carlo Simulation, including graphical capabilities and quick reports to help you present results to a non-technical audience.

### Joint Session AAS/Practice Curated: UAS Applications and Optimization

Sponsored: Aviation Applications

Sponsored Session

Chair: Maga Khachatryan, MagAnalytics, 3883 Park Place Estates Dr., Bridgeton, MO, 63044, United States

#### 1 - Optimization of Grid Coverage Operations in Flight Aerial Imagery Data Collection

Maga Khachatryan, MagAnalytics, St. Louis, MO, United States, Ara Nefian, Naira Hovakimyan

Today, we live in the age of digital revolution which impacts modern agriculture. Every season farmers cultivate millions of acres leveraging technologies such as IoT, drones and satellites. Along with benefits technology also brings challenges. Particularly, cost of aerial imagery throughout growing season can be very high. One of the most common imagery delivery methods are airplanes. Here we describe two-stage airplane routing problem with business constraints. First stage reduces the solution space by generating flight patterns to allow faster second-stage optimization. The second stage optimizes airplane flight schedule by selecting most profitable patterns to fly over farming area.

#### 2 - Opportunities and Challenges of Integrating UAS in the US

Dipasis Bhadra, Economist, Federal Aviation Administration, 800 Independence Avenue 935-937, Washington, DC, 20591, United States, Michael Lukacs

UAS has become one of the most vibrant sector of the economy in the US. With over a million registered owners/operators, the sector holds promises that span over commercial applications of numerous types to personal recreational uses. While the challenges are many, the FAA has launched various initiatives ranging from pilot programs to regulatory reforms integrating UAS into NAS. An active research program undertaken by the Agency facilitates these activities ensuring safe integration of UAS into the National Airspace System (NAS). This presentation will broadly touch on Agency's outlook of the future, activities that are presently undertaken and the challenges/opportunities that lie ahead.

### 3 - Impact Of Payload Amount On Battery Consumption Rate In a Delivery Application Of Drones

Maryam Torabbeigi, University of Houston, UH, Houston, TX,  
United States, Gino J. Lim, Seon Jin Kim, Navid Ahmadian

The drone battery charge limitation is an important factor in drone scheduling in order not to run out of battery during the flight. This study investigates the relationship between battery consumption rate (BCR) and the payload amount, and also the impact of payload amount (customer's demand) on the drone scheduling. The collected data verifies a linear relationship between BCR and the payload amount. A routing problem is proposed for the drone scheduling. The model determines the number of drones, their path, the assigned customers, and the battery charge at each flight segment. The results show the impact of including BCR in the scheduling.

### 4 - Multiobjective Uav Route Planning In Continuous Terrain Using a Preference-based Evolutionary Algorithm

Murat Mustafa Koksalan, Middle East Technical University,  
Industrial Engineering Department, Ankara, 06531, Turkey, Erdi Dasdemir, Diclehan Tezcaner Ozturk

Multiobjective route planning for unmanned air vehicles (UAV) in continuous terrain involves determining the visiting order of targets and the trajectories used between target pairs under multiple objectives. In this research, a hybrid heuristic approach is developed. Order of targets are first determined with a preference-based evolutionary algorithm converging to the desired regions of the Pareto-optimal frontier using the decision maker's preferences. Then the trajectories between target pairs are found with a heuristic approach using the results of the evolutionary algorithm. The algorithm is implemented on several problems and results are promising.

### Joint Session Drones/Practice Curated: Drones in Logistics

Emerging Topic: Robotics, Drones and Autonomous Vehicles in Logistics

Emerging Topic Session

Chair: James F. Campbell, University of Missouri-St Louis,  
Saint Louis, MO, 63121-4499, United States

#### 1 - Coordinated Logistics with a Truck and a Drone

John Gunnar Carlsson, University of Southern California, 3750  
McClintock Avenue, Los Angeles, CA, 90089, United States

We determine the efficiency of a delivery system in which an unmanned aerial vehicle (UAV) provides service to customers while making return trips to a truck that is itself moving. In other words, a UAV picks up a package from the truck (which continues on its route), and after delivering the package, the UAV returns to the truck to pick up the next package. By combining a theoretical analysis in the Euclidean plane with real-time numerical simulations on a road network, we demonstrate that the improvement in efficiency is related to the square root of the ratio of the speeds of the truck and the UAV.

#### 2 - Optimization of a Drone-aided Network

Bahar Kara, Bilkent University, Department of Industrial Eng,  
Ankara, 06800, Turkey, Aysu Ozel, Oya Ekin Karasan

Integrating drones into delivery networks has advantages such as reduced delivery times, costs and access to hardly reachable points. However, due to the limited abilities of drones, it is not possible to deploy solely drones in delivery networks. Thus, drones should be collaborated with the traditional delivery vehicles and this collaboration requires synchronization between drones and delivery vehicles. In this study we propose a mixed integer mathematical model minimizing the time of the last delivery in a network in which a drone and a truck works in synchronization.

#### 3 - Mothership and Drone Routing Problems

Bruce L. Golden, University of Maryland-College Park, 10375  
Eclipse Way, Columbia, MD, 21044, United States,  
Stefan Poikonen

The Mothership and Drone Routing Problem considers a tandem between a ship and a drone. The drone is required to visit each of a set of targets. However, the drone has finite battery life and, thus, must coordinate with the ship. The problem combines elements of combinatorial optimization and continuous optimization. Second order cone programming is used in a proposed solution method that is flexible to adapt to alternative objective functions and constraint sets. We then consider several generalizations.

### Data Science and Applied Probability

Sponsored: Applied Probability

Sponsored Session

Chair: Gah-Yi Ban, London Business School, London Business School,  
London, NW1 4SA, United Kingdom

#### 1 - Statistical Inference for Model Parameters with Stochastic Gradient Descent

Xi Chen, New York University, New York, NY, 10012,  
United States, Jason Lee, Xin Tong, Yichen Zhang

In this talk, we investigate the problem of statistical inference of model parameters based on stochastic gradient descent (SGD). To this end, we propose a consistent estimator of the asymptotic covariance of the average iterate from SGD — batch-means estimator, which only uses the iterates from SGD. As the SGD process forms a time-inhomogeneous Markov chain, our batch-means estimator with carefully chosen increasing batch sizes generalizes the classical batch-means estimator designed for time-homogeneous Markov chains. The proposed batch-means estimator allows us to construct asymptotically exact confidence intervals and hypothesis tests.

#### 2 - Assessing the Spillover Effect on Delivery Time: An Empirical Study on a Logistic Platform

Yifan Feng, The University of Chicago Booth School of Business,  
5807 S. Woodlawn Avenue, Chicago, IL, 60637, United States,  
Rene A. Caldentey, Linwei Xin

Our study is based on a dataset from a major logistics platform for e-commerce business in China. We quantify the spillover effects on delivery time and demonstrate its relationship with the philosophy of complete resource pooling (CRP).

#### 3 - Validating Optimization Under Uncertainty

Henry Lam, Columbia University, 500 W. 120th St., New York, NY,  
10027, United States, Huajie Qian

Optimization formulations to handle decision-making under uncertain constraints, such as (distributionally) robust optimization, often contain parameters that control the level of conservativeness. We investigate strategies to select parameter values by validating their performances in terms of both feasibility and optimality. We demonstrate the effectiveness of these strategies in relation to the optimization class and problem dimension.

#### 4 - Confidence Intervals for Data-driven Inventory Policies with Demand Censoring

Gah-Yi Ban, London Business School, Regent's Park, London,  
NW1 4SA, United Kingdom

We revisit the classical dynamic inventory management problem of Scarf (1959) from the perspective of having  $n$  historical selling seasons of data and making ordering decisions for the upcoming season. We develop a nonparametric estimation procedure for the  $(S; s)$  policy that is consistent, then characterize the finite-sample properties of the estimated  $(S; s)$  levels by deriving their asymptotic confidence intervals. We also consider having at least some of the past selling seasons of data censored from the absence of backlogging. We then show how to correctly use the censored data to obtain consistent decisions and derive asymptotic confidence intervals for this policy using Stein's method.

### Joint Session APS/Practice Curated: Bandits, Optimal Stopping, and Control

Sponsored: Applied Probability

Sponsored Session

Chair: David Goldberg, Cornell University, Ithaca, NY, 14850,  
United States

#### 1 - Recent Progress at the Intersection of Optimal Stopping and Bandits

Yilun Chen, Cornell, 292 Rhodes Hall, Ithaca, NY, 14853,  
United States, David Goldberg

We present progress on the problem of optimal stopping, and its application to bandits. We develop a new pure-dual algorithm for optimal stopping, which leads to an expansion (for the optimal value) in which each term has a natural representation in terms of certain (infima of) conditional expectations, and can enable better approximation with fewer nested conditional expectations. For Bayesian bandits, we present several novel insights into the (optimal) Gittins index policy, shedding light on what, qualitatively, makes the Gittins index policy truly optimal, as compared to other policies optimal only w.r.t. (asymptotic) first-order regret.

**2 - Sequential Search For The Best Alternatives**

David Brown, Duke University, Fuqua School of Business, 100 Fuqua Drive, Durham, NC, 27708, United States, Santiago Balseiro

We consider a variation of the sequential search problem studied in Weitzman (1979), where a DM sequentially searches a given set of alternatives with unknown rewards, drawn from independent distributions. Search is costly but reveals the rewards of an alternative. The DM can select previously revealed alternatives and collect the associated rewards. We study a variation in which the DM has the capacity to select multiple alternatives, which significantly complicates the problem. We consider a simple reservation price rule, with reservation prices depending only on the remaining capacity and show that the policy is asymptotically optimal as the number of alternatives grows large.

**3 - On Learning the C Rule**

Subhashini Krishnasamy, Tata Institute of Fundamental Research, Mumbai, 400005, India, Ari Arapostathis, Ramesh Johari, Sanjay Shakkottai

We study the  $c$  rule for multi class queueing systems. When the service rates are known, the  $c$  rule is known to minimize the expected holding cost over any fixed time horizon in the single server setting. For a parallel server network, we demonstrate that the  $c$  rule does not ensure stability. We present sufficient conditions for the stability of the  $c$  rule for a general parallel server network and also necessary and sufficient conditions for a specific class of parallel server networks. When the service rates are unknown, we propose, both for single and parallel server networks, algorithms using empirically learned service rates that achieve a holding-cost regret that does not depend on the time horizon.

North Bldg 226A

**Non-stationary Stochastic Networks with Information**

Sponsored: Applied Probability

Sponsored Session

Chair: Jamol Pender, Cornell University, Ithaca, NY, 14850, United States

**1 - New Perspectives on the Erlang-a Queue**

Andrew Daw, Cornell University, Jamol Pender

The non-stationary Erlang-A queue is a fundamental model used to describe the dynamic behavior of large scale multi-server service systems that experience customer abandonments, such as call centers, hospitals, and urban mobility systems. In this talk, we develop novel approximations for the moments, moment generating function, and cumulant generating function. We provide precise bounds for the difference of our approximations and the true model. Moreover, we show that our approximations have explicit stochastic representations as shifted Poisson random variables. Our approximations and bounds also hold for non-stationary Erlang-B and Erlang-C queues under certain stability conditions.

**2 - Asymptotic Methods for Queues with Delayed Information**

Sophia Novitzky, Cornell University, Ithaca, NY, United State

With the advancement of online technologies, services often provide waiting time or queue length information to customers. This information allows the customers to determine whether to remain in line or in the case of multiple lines, which line to join. Unfortunately, there is usually a delay associated with the waiting time information: either the information is not provided in real time or it takes the customers travel time to join the service after having received the information. Recent empirical and theoretical work uses functional dynamical systems as models for queueing systems and shows that if information is delayed long enough, a Hopf bifurcation can occur and cause unwanted oscillations in the queues. However, it is not known how large the oscillations are when a Hopf bifurcation occurs. To answer this question, we model queues with functional differential equations and implement two methods for approximating the amplitude of the oscillations. The first approximation is analytic and yields a closed-form approximation in terms of the model parameters. The second approximation uses a statistical technique, and delivers highly accurate approximations over a wider parameter range than does the first method.

**3 - The Impact of Smartphone App Information on****Bike Sharing Networks**

Shuang Tao, Cornell University, Ithaca, NY, United States

Many systems like Citibike and Divvy provide riders with information about the network via smartphone apps so that riders can find stations with available bikes. In this paper, we study the impact of the smartphone app and its power to guide riders to non-empty stations. By combining customer choice modeling and finite capacity queueing model, we prove a mean-field limit and a central limit theorem for an empirical process of the number of stations with  $k$  bikes. Our results illustrate that if we increase the proportion of customers that use smartphone app information, the entropy of the bike sharing network is reduced, the network has a higher throughput, and riders experience less blocking in the network.

**4 - The Impact of Queues with Delay and Pollution Announcements**

Jamol Pender, Cornell University, 228 Rhodes Hall, Ithaca, NY, 14850, United States

Travel time information has been estimated and provided to drivers to help them make better routing decisions and alleviate congestion. However, because of challenges in data collection and sensor delays, travel time information is often delayed and hence inaccurate. This can misguide drivers and result in unstable traffic patterns. To this end, we explore the potential of giving drivers real-time en-route air pollution information and we develop a new queueing model that considers the behavior of drivers provided with both travel time and air pollution information. Our results indicate that provision of real-time air pollution information to travelers may help stabilize traffic.

**Expert Elicitation**

Sponsored: Decision Analysis

Sponsored Session

Chair: Erin Baker, Univ of Massachusetts-Amherst, Univ of Massachusetts-Amherst, Amherst, MA, 01003, United States

Co-Chair: Claire Cruickshank, Plano, TX, 75093, United States

**1 - An Anchoring Explanation of Over- and Under-confidence during Probability Elicitation**

Saurabh Bansal, Penn State University, 405 Business Building, State College, PA, 16801, United States

Understanding how good individuals are at estimating probability distributions is critical to theory and practice of decision analysis. A large body of literature has addressed this issue. The findings appear contradictory: some article report that decision makers' judgments exhibit overconfidence while some others report underconfidence. We reconcile these seemingly inconsistent findings by using an anchoring-and adjustment model. A series of laboratory studies confirm the theoretical development.

**2 - Combining Point Forecasts into a Predictive Distribution**

Zhi Chen, INSEAD, 1 Ayer Rajah Avenue, Singapore, 138676, Singapore, Anil Gaba

Experts provide forecasts for a variable of interest often in the form of point forecasts, i.e., single-valued predictions. However, a decision maker has to then take the additional step of converting the point forecasts into a predictive distribution for that variable, necessary for the decision at hand. Theoretical and practical issues on this additional step will be discussed, including accounting for dependence among the experts.

**3 - Does the Elicitation Mode Matter? Comparing Different Methods for Eliciting Expert Judgement**

Claire Cruickshank, MS. Student, University of Massachusetts, Amherst, MA, 01003, United States, Erin Baker

An expert elicitation is a method of eliciting subjective probability distributions over key parameters from experts. Traditionally an expert elicitation has taken the form of a face-to-face interview; however, interest in using online methods has been growing. Our research project compared online and face-to-face elicitations by examining the effect of elicitation mode on the central values, overconfidence, accuracy and satisficing. Our results indicated that, in instances where the elicitation modes were directly comparable, the differences between the modes was not significant. Consequently, a carefully designed online elicitation may be used to obtain accurate forecasts.

**4 - Aggregating Non-expert Opinions: Mechanism Design of Grading Scheme in MOOCs**

Steve Yoo, University College London, London, United Kingdom, Dongyuan Zhan

One issue of operating Massive Open Online Courses (MOOCs) is the scalability of grading. MOOCs resort to peer-grading system. We model student learning and grading efforts in two stages. We find that with proper incentive in peer-grading, students exert more efforts in grading, which motivate their learning. Our model presents empirically testable model for researchers, and objective metrics for MOOCs to tailor their grading mechanism for each course.

### Decision Analysis, Game Theory, Big Data, and Homeland Security

Sponsored: Decision Analysis

Sponsored Session

Chair: Jun Zhuang, PhD, University at Buffalo, Buffalo, NY, 14260, United States

#### 1 - Concentrated vs. Distributed Defense as a Deterrent to Cyber Attackers: A Behavioral Analog Simulation Game

Richard S. John, University of Southern California, Dept of Psychology MC 1061, Los Angeles, CA, 90089-1061, United States, Sarah Kusumastuti, Heather Rosoff, James Blythe

Deterrence is an important component of cyber security that requires an understanding of attacker perceptions of success uncertainty. We developed an analog simulation game that offers attackers 4 different types of equally defended targets, including 3 with concentrated defenses at 1 of 3 different layers and 1 with a distributed (layered) defense. A total of 80 attackers played 36 rounds of the game in which the likelihood of success was held constant for all 4 target types. Compared to the distributed (layered) defense, attackers preferred to attack the concentrated defenses at the 2nd and 3rd layers, and were most deterred by the concentrated defense at the perimeter.

#### 2 - Optimal Standard of Human Rights in Countering an Insurgency: Theory and Empirical Analysis of AFSPA in India

Aniruddha Bagchi, Kennesaw State University, 1000 Chastain Road, MD 0403, Kennesaw, GA, 30144, United States, Jomon Paul

We explore why human rights violations take place in the midst of a rebellion. Our results indicate that faulty intelligence compels governments to tolerate human rights violations of its armed forces. We then examine the effect of a decrease in the human rights standard on the probability of quelling the rebellion. In our theoretical model, this effect is indeterminate (that is, can be positive or negative). We therefore empirically quantify this effect using the case of the Armed Forces Special Powers Act (AFSPA) in India. We find that a lowering of the standard of human rights reduces the chance of quelling the rebellion and this effect is statistically significant.

#### 3 - Denuclearization or Not? A Multiple-player Sequential , United StateGame Model

Jun Zhuang, University at Buffalo, Buffalo, NY, United States, Puyu Ye

The Democratic People's Republic of Korea (DPRK) nuclear crisis is a complex international issue. We use a multiple-player sequential game model to analyze the strategic interactions of these players. A multi-attribute (politics, economy, military) utility model is used for each player. The developed framework provides insights to decision making in this complex and important issue of denuclearization.

#### 4 - Does Learning from Past-disasters Make Future Disasters Costlier?: Insights from Fema's Public Assistance

Allison C. Reilly, Assistant Professor, University of Maryland, , 4298 Campus Dr., College Park, MD, 20742, United States, Hamed Ghaedi

The factors that explain rising costs of natural disasters are numerous: more intense hazards, more exposure in vulnerable places, and the lack of preparedness by residents. However, in the era of more frequent hazards, might disaster costs be rising because some individuals and organizations are simply learning how to more effectively apply for disaster aid? In this research, using statistical methods, we explore the propensity and ability of organizations to file for disaster aid based on their previous experience(s) filing for aid.

### Teaching Simulation

Sponsored: Simulation

Sponsored Session

Chair: Laurel Travis, Virginia Tech

#### 1 - Adventures in Teaching Simulation: Virtual Reality, Vendor Competitions, and Real-world Projects in Very Large Classes

Laurel E. Travis, Virginia Tech, 3440 Cameo Lane, Blacksburg, VA, 24060, United States

We will discuss "tales from the field in teaching simulation within resource constraints. Specifically, 1) Introducing virtual reality into a discrete-event simulation course without any investment in equipment and only a small

investment of time, 2) Coaching a world champion team in the Simio student competition with limited faculty time, and 3) Managing semi open-ended applied projects with real-world clients in a class of nearly 200 students. Costs and benefits of these experiences will be discussed, with ideas on how to make them practical. Teaching materials will be distributed.

#### 2 - Survival Tips for Teaching Undergraduate Classes, Especially Simulation

Shane Henderson, Cornell University, School of ORIE 230 Rhodes Hall, Cornell University, Ithaca, NY, 14853, United States

I'll discuss my opinions on teaching undergraduate classes, with special emphasis on Monte Carlo and discrete-event simulation. The principles are mostly more general than just simulation, though. Key concepts include: If all else fails, be organized; No surprises; Design lectures like heartbeats; Avoid email; Take care with designing exams; One point wonders; Why is it true; Don't build models in class.

#### 3 - Teaching Undergraduate Simulation – What Works, What Doesn't

Jeffrey Smith, Auburn University, Industrial and Systems Engineering Dept, 3301 Shelby Center, Auburn University, AL, 36849-5346, United States

This talk focuses on teaching undergraduate simulation in an engineering department. The material is based on the experiences of doing this for 25 years and using several simulation tools and alternative textbooks and external resources. I'll focus on what has worked for me and what hasn't.

## ■ TA43

North Bldg 227B

### Energy and Climate III

Emerging Topic: Energy and Climate

Emerging Topic Session

Chair: Murat Erkok, University of Miami, Hialeah, FL, 33015, , United StateUnited States

#### 1 - A Multiobjective Model for Integrated Electricity and Natural Gas Pipeline Networks with Nonlinear Natural Gas Investment Cost

Ahmet Akgun, Wichita State University, Wichita, KS, 67226, United States, Mehmet Bayram Yildirim, Mehmet Barut

A multi-objective mathematical model for long-term integrated electricity and natural gas pipeline network is presented. The multiobjective model optimizes both electricity and natural gas networks simultaneously to determine the type of generation and transmission units, the location and capacity of these units. The nonlinear natural gas investment cost function is linearized by using PLA method.

#### 2 - Energy Policy Making with a Multi-objective Multi-perspective Game Theoretic Approach

Busra Keles, University of Miami, 1251 Memorial Drive, McArthur Engineering Building, Coral Gables, FL, 33146, United States, Murat Erkok, Nurcin Celik

Current energy policy solutions are struggling to overcome strategic decisions that involve a large number of stakeholders, sustainable actions of exploiting renewable energy sources, future capacity investments, and economical regulations. This paper addresses these issues and handles a energy policy making problem on the development and incentivization of energy policies. The problem is stated as a multi-objective (economic well-being, environmental protection, and energy surety) multi-perspective problem, and the solution framework is proposed in a game theoretic approach. Our approach overcomes the problem of valuation of conflicting objectives in an uncertain environment.

#### 3 - A Dynamic Data-driven Application Systems for Infosymbiotic Challenges of Solar-powered Microgrids

Haluk Damgacioglu, PhD. Candidate, University of Miami, Miami, FL, 33143, United States, Nurcin Celik

The integration of renewable energy sources and energy storage systems into microgrids premises energy resilience and independence for the communities. Yet, this integration, together with the uncertainties in the power supply and demand, makes the control of such microgrids quite challenging. Here, we present a preliminary dynamic-data-driven adaptive systems framework for the design and configuration of a solar-powered microgrid for a real world case study. Our approach shows promising results in terms of selecting the best available design using a tractable robust optimization model and a multi-fidelity microgrid simulation.

#### 4 - Detection and Attribution of Climate Change Using Offline Model Simulations for Streamflow in the Columbia River Basin

Mingzhou Jin, University of Tennessee-Knoxville, 525D John D. Tickle Engineering Building, Industrial and Systems Engineering, Knoxville, TN, 37996, United States, Whitney Forbes, Jiafu Mao

Detection and attribution analysis is the processes of statistically detecting a change in a particular climate variable or affected variables. Variables studied here are annual and seasonal in the Columbia River Basin for 1950 - 2008. The availability of a daily naturalized streamflow dataset and a new ensemble of semi-factorial land surface model simulations with less biased precipitation make the streamflow study for the basin more accurate. For forcings, the effects of climate change and variability, carbon dioxide concentration, nitrogen deposition, and land use and land cover change are used. Changes of the center of timing and seasonality were detected and attributed to climate changes.

#### Managing Uncertainty in Electric Power Networks

Sponsored: Energy, Natural Res & the Environment/Electricity  
Sponsored Session

Chair: Johanna L. Mathieu, University of Michigan, Ann Arbor, MI, 48109, United States

##### 1 - Data-driven Distributionally Robust Stochastic Optimal Power Flow

Tyler Summers, University of Texas Dallas, Dallas, TX, United States

We propose a data-based method to solve a multi-stage stochastic optimal power flow (OPF) problem based on limited information about forecast error distributions. Instead of assuming the uncertainties follow prescribed probability distributions, we consider ambiguity sets of distributions centered around a finite training dataset. By utilizing the Wasserstein metric to quantify differences between the empirical data-based distribution and the real unknown data-generating distribution, we formulate a multi-stage distributionally robust OPF problem to compute control policies that are robust to both forecast errors and sampling errors inherent in the dataset.

##### 2 - Statistical Ranking for Flexible Robust Unit Commitment

Lindsay Anderson, Cornell University, 316 Riley-Robb Hall, Ithaca, NY, 14853-5701, United States, Amandeep Gupta

With increasing scale, complexity, and variability in modern power systems, there is a benefit to combining statistical tools with analytical framework of power system methods to provide much needed flexibility to system operators. This work describes a statistical ranking methodology that allows for adaptive robust stochastic unit commitment using a modular and customizable structure. The method and its applications are illustrated via case studies performed on IEEE-30 bus and 118-bus test systems and compared to other established approaches. The ranking model is further implemented in a multi-objective framework to analyze performance with competing worst-case scenarios.

##### 3 - Operating Under Uncertainty in Smart Communities

Kyri Baker

Evolving energy systems are introducing heightened levels of uncertainty and stress on the electric grid. Increasing renewable generation, new market structures, and the proliferation of connected devices are transforming the operation of traditional energy systems, from the bulk grid to the operation of individual building components. To alleviate these issues, practical operational strategies which directly incorporate uncertainty need to be developed. This talk will introduce chance constrained and joint chance constrained optimization methods that aim to ensure operational guarantees in distribution networks and grid interactive buildings in future smart communities.

##### 4 - Distributionally Robust Chance Constrained Optimal Power Flow Assuming Log-concave Distributions

Bowen Li, University of Michigan, Ann Arbor, MI, United States, Ruiwei Jiang, Johanna Mathieu

Chance constrained (CC) optimization is widely used to solve the optimal power flow (OPF) problem under uncertainty but its solution can be affected by an inaccurate estimate of the underlying distribution. To obtain a robust solution, distributionally robust (DR) techniques are used by considering a set of distributions sharing the common properties rather than a single distribution. Here, we develop a new DRCC OPF formulation that incorporates moment, support, and log-concavity information. We then derive approximations based on second-order cone programs and evaluate the results on IEEE test cases.

##### 5 - Learning Demand Response Elasticity in Chance-constrained Optimal Power Flow

Yury Dvorkin, New York University, Metrotech Center, Fay Street, Brooklyn, NY, 11201, United States

The flexibility of demand response (DR) resources can be leveraged to accommodate the stochasticity of some distributed energy resources. This presentation will describe an approach to continuously learn time-variant price

elasticity of DR resources and integrate this updated knowledge in the chance-constrained optimal power flow framework. This integration is shown to adequately remunerate DR resources and efficiently co-optimize the dispatch of DR and conventional generation resources.

#### Sustainable Energy and Environmental Policy

Sponsored: Energy, Natural Res & the Environment/Electricity  
Sponsored Session

Chair: Makoto Tanaka, National Graduate Institute for Policy Studies (GRIPS), 7-22-1 Roppongi, Minato-ku, Tokyo, 106-8677, Japan

##### 1 - Regulatory Jurisdiction and Policy Coordination: A Bi-level Modeling Approach for Performance-based Policy

Makoto Tanaka, National Graduate Institute for Policy Studies (GRIPS), 7-22-1 Roppongi, Minato-ku, Tokyo, 106-8677, Japan, Yihsu Chen, Afzal Siddiqui

This study discusses important aspects of policy modeling based on a leader-follower game of policymakers. We specifically investigate non-cooperation between policymakers and the jurisdictional scope of regulation via bi-level programming. Performance-based environmental policy under the Clean Power Plan (CPP) in the U.S. is chosen for our analysis. We argue that integration of policymakers is welfare enhancing. Somewhat counterintuitively, full coordination among policymakers renders performance-based environmental policy redundant. We also find that distinct state-by-state regulation yields higher social welfare than broader regional regulation.

##### 2 - Market Power in Policy Mix: Cap-and-trade and Renewable Portfolio Standards

Mari Ito, Tokyo University of Science, Chiba, Japan, Ryuta Takashima

Policies for reducing greenhouse gas emissions, e.g., emissions permits trading as cap-and-trade (C&T), and renewable energy policy as renewable portfolio standards (RPS), have been introduced in various countries. In this work, we examine market equilibria under C&T and RPS mix in bi-level optimization framework. For the lower level, generation of outputs of renewable and non-renewable sectors and electricity prices are decided by maximizing sectors' profits. For the upper level, the policy maker chooses the rate of emission cap and the RPS requirement in an attempt to maximize the social welfare. Our results indicate that their policy mix is the best scheme for increasing social welfare.

##### 3 - Multiagent Simulation with Reinforcement Learning Agents for Integrative Evaluation of Renewable Energy Policies

Masaaki Suzuki, Tokyo University of Science, 2641 Yamazaki, Noda-shi, Chiba, Japan, Mari Ito, Ryuta Takashima

Even as governments combat greenhouse emissions through a range of initiatives, scholarship has yet to clarify how renewable energy policy, energy market structure, and number of energy producers impact social welfare. We model a deregulated market for electricity as a blind single-price call auction and construct a multi-agent system with reinforcement learning that facilitates more realistic market evaluations and observation of equilibrium processes. We validate our simulation by comparing its results with the results from theoretical analysis in a simplified market.

##### 4 - Investment in Power Generation and Transmission: The Effect of Capacity Size and Expansion

Kazuya Ito, National Graduate Institute for Policy Studies (GRIPS), Japan, Makoto Tanaka, Ryuta Takashima

The penetration of renewable energy has induced a decrease in capacity factors and a decommissioning for existing generations, and a reduction in new investments. This problem implies a fear for the shortage of capacity in the electricity market. Thus, in order to meet the capacity in the market, policymakers implement various policies for capacity procurement. In this work, we analyze investments in power generation and transmission by means of real options theory. The ISO decides the investment timing by maximizing social welfare whereas a power generator invests by maximizing the own profit. Especially, we examine the effect of capacity procurement for the ISO on the investment decisions.

##### 5 - Real Options in Renewable Portfolio Standards

Makoto Goto, Hokkaido University, Sapporo, Japan, Ryuta Takashima

In this paper, we examine a market equilibrium under uncertainty in RPS by means of real options analysis. More concretely, we analyze an investment timing for renewable producer. After that, we derive optimal RPS target. We have found results about the effect of uncertainty on market equilibrium and optimal RPS target. For fixed RPS target, high RPS target accelerates investment and decreases greenhouse gas. For the optimal RPS target, high RPS target disturbs innovation due to decrease in RE's revenue from REC market, and increases greenhouse gas due to investment delay. This is a new finding in this area.

**Energy System Optimization**

Sponsored: Energy, Natural Res &amp; the Environment/Energy

Sponsored Session

Chair: Kai Pan, Hong Kong Polytechnic University, M507a, 5/F, Li Ka Shing Tower, Kowloon, Hong Kong

**1 - High Performance Computing Based Real-time Power System Contingency Analysis Considering Corrective Actions**

Yong Fu, PhD, Mississippi State University, Mississippi State, MS, 39762, United States

To achieve a high level of power system reliability, higher order contingencies should be included in the real-time system operation analysis. This presentation will discuss a high performance computing compatible comprehensive framework to enable real-time power system contingency analysis with consideration of various combinations of contingency events. The proposed approach ensures all decomposed subproblems scalable and tractable. In addition, the proposed approach is implemented on the high performance computing platform that significantly reduces the computation time to meet real-time operation requirements while improving the power system operation to a higher level.

**2 - Demand Response in Data Centers via Integration of Server Provisioning and Power Procurement**

Soongeol Kwon, Binghamton University, SUNY, 4400 Vestal Pkwy E, Systems Science and Industrial Engineering, Binghamton, NY, 13902, United States

Data centers consume a phenomenal amount of energy that contributes to huge energy costs and CO2 emissions. Thus, data centers have been striving to improve energy-efficiency, meet power demand load in response to the time of use rate, and utilize clean renewable energy. This study is motivated by the unique opportunity to improve the current practice by facilitating demand response based on the co-optimization of server operations and power procurement. The main objective of this study is to develop a decision-making model for applying demand response to data centers, and this study evaluates the quantitative benefits of the proposed model through numerical experiments using real historical data.

**3 - Co-optimizing Energy and Ancillary Services**

Kai Pan, Hong Kong Polytechnic University, M507a, 5/F, Li Ka Shing Tower, Kowloon, Hong Kong, Jianqiu Huang, Yongpei Guan

To ensure system reliability, ancillary services are introduced for power system operations to reserve excess generation capacities so as to accommodate uncertainties. In this paper, we develop an optimization model for system operators to efficiently schedule the generation assets, so as to jointly optimize power generation and ancillary services.

**4 - A Fully-distributed Asynchronous Approach for Multi-area Coordinated Network-constrained Unit Commitment**

Lei Wu, Clarkson University, 8 Clarkson Avenue, P.O. Box 5720, Potsdam, NY, 13676, United States

A consensus-based alternating direction method of multipliers (ADMM) approach is discussed to solve the multi-area coordinated network-constrained unit commitment (NCUC) in a distributed manner, including: (i) A tie-line power flow based area coordination strategy is designed to reduce global consensus variables; (ii) Different penalty parameters are assigned to individual consensus variables and are updated via certain rules during the iterative procedure; (iii) Heuristic rules are adopted to fix certain unit commitment variables for avoiding oscillations; and (iv) An asynchronous distributed strategy is studied.

**Optimization Modeling and Techniques for Systemic Risk Assessment and Control in Financial Networks**

Emerging Topic Session

Chair: Douglas Shier, Clemson University, Dept Mathematical Sciences, Clemson, SC, 29634-0975, United States

**1 - Optimization Modeling and Techniques for Systemic Risk Assessment and Control in Financial Networks**

John R. Birge, University of Chicago, Booth School of Business, 5807 South Woodlawn Avenue, Chicago, IL, 60637, United States, Jiming Peng, Aein Khabazian

Since the crisis in 2007-2008, the assessment and control of systemic risk in financial networks has become one of the most important and active research areas in economics and finance. In this tutorial, we give a basic introduction to various optimization models including linear optimization problems (LO) with

uncertain data, linear optimization with non-convex quadratic constraints (QCLO), mixed integer linear optimization (MILO), and stochastic optimization that arise from the following three topics in the risk analysis of financial networks: (i) vulnerability analysis; (ii) identification of the least stable network structure; (iii) risk mitigation.

## ■ TA48

**Supply Chain Information Disclosure Workshop**

Sponsored: Energy, Natural Res &amp; the Environment Environment &amp; Sustainability

Sponsored Session

Chair: Donna Marshall, University College-Dublin, Dublin, Ireland

Co-Chair: Steve New, University of Oxford, United Kingdom

**1 - Untangling Sustainability - Comparing Processes for Social and Environmental Performance at Chinese Suppliers**

Veronica H. Villena, Penn State University, 412 Business Building, Supply Chain and Information Systems, State College, PA, 16802, United States, Miriam Wilhelm, Cheng Yong Xiao

We use a multi-method approach to untangle the drivers of environmental and social sustainability. We first conducted a case study with nine Chinese suppliers and then analyzed longitudinal data for 145 Chinese suppliers in the 2013-2017 period. Our study offers a systematic comparison between the environmental and social sustainability and reveals the drivers for each dimension of sustainability.

**2 - Blockchain Research in Supply Chain Management: A Structured Literature Review**

David Swanson, University of North Florida, Jacksonville, FL, United States, Dawn Russell, Jin Yao, Kristoffer Francisco

This research provides results from a systematic literature review on blockchain literature in supply chain management from January 2015 through August 2018. Research articles are coded by theories used, journal, author, discipline, subject, methodology, and other criteria. Information is tabularized and graphed to ease interpretation. The tables are presented so that researchers can use the information for their own research into supply chain applications of blockchain. Conclusions and implications for academia and practice are drawn from the data.

**3 - Reveal the Supplier List? A Trade-off in Capacity vs. Responsibility**

Kalkanci Basak, Georgia Institute of Technology, Atlanta, GA, United States, Erica Plambeck

Some buying firms, facing scrutiny regarding social and environmental violations in their suppliers' operations, have recently made commitments to publish the identities of their current and/or terminated suppliers. In this paper, we study the trade-offs faced by a buying firm in deciding whether or not to make such transparency commitments. We identify the conditions under which a buying firm should commit to publish its supplier list, and the conditions under which the buying firm should make complementary investments to help the supplier become more productive.

**4 - A Longitudinal Investigation of Supply Chain Information Disclosure in the Electronic Industry: The Case of Hewlett Packard**

Uche Okongwu, Professor of Supply Chain Management, Toulouse Business School, 20 Boulevard Lascrosses, Toulouse, 31000, France

It has been reported in the literature that disclosure requirements are transitioning from voluntary to mandatory as sustainability reporting becomes required by regulators and stakeholders. Therefore, some research is needed to investigate the extent as well as the speed at which companies are gaining maturity in disclosing sustainability information. By conducting a longitudinal study, this paper looks at the evolution of supply chain sustainability information disclosed by Hewlett Packard, a leading electronic company. To carry out this study, we used a framework that takes into consideration three components: the category, the nature and the measurability of the information disclosed.

**5 - Drivers and Outcomes of Supply Chain Information Disclosure**

Donna Marshall, University College Dublin, Carysfort Road, Dublin, Ireland, Lucy McCarthy, Paul McGrath

This study shows the development of a theory of supply chain information disclosure. We develop 16 cases from fashion, electronics, medical devices and pharmaceuticals in order to build a model of supply chain information disclosure and understand the drivers, barriers and outcomes of disclosure across the four industries and within the industries and cases.

## ■ TA49

## Supply Chain and Facility Location

Sponsored: Energy, Natural Res & the Environment Environment & Sustainability

Sponsored Session

Chair: Yihsu Chen

### 1 - Issues and Challenges for Closed Loop Supply Chain Considering of Commodity Value and QCDE

Aya Ishigaki, Tokyo University of Science, Tokyo, Japan,  
Tetsuo Yamada, Ryuta Takashima

In recent years, it is known that the environmental impact by the product quality in manufacture and recovery phase and the energy mix (coal, natural gas, nuclear energy, etc.) of electric power changes with selections of the producing countries or the consuming countries. Furthermore, it is necessary to design and manage a supply chain, considering not only the current value of a product or parts but future value. This study discusses about an issue of closed loop supply chain considering commodity value and QCDE (quality, cost, delivery, and environment).

### 2 - A Mathematical Model for Real-time Pricing of Electricity to Control Supply and Demand in a Smart Community

Mihiro Sasaki, Nanzan University, 18 Yamazato, Showa, Nagoya, 466-8673, Japan

We consider a smart community consisting of smart houses in which each is equipped with a fuel cell (FC) system, a photovoltaic (PV) system and a power storage. The supplier of electricity (CEMS: Community Energy Management System) presents the electricity price varying with different time, and customers living in smart houses (HEMS: Home Energy Management System) determine their own optimal levels of buying/selling electricity in responding to the time-varying price. We formulate a problem of finding optimal pricing on the condition that each HEMS finds an optimal schedule to minimize its own total cost as a bilevel programming problem.

### 3 - Analysis for Maritime Transportation of Energy Resources using AIS Data

Shigeki Toriumi, Chuo University, 1-23-27 Kasuga, Bunkyo-ku, Tokyo, 112-8551, Japan, Yihsu Chen

In this research, we analyze maritime transportation of energy resources using "Automatic Identification System (AIS)" data. The AIS is an automatic tracking system used on ships. Using this data, we can identify each voyage which include origin, destination, route and speed, so on. Furthermore we can produce an animation which represents vessel movement in the world. We evaluate economic efficiency and risk for transportation of energy resources by comparing with our previous research.

### 4 - Multi-product Pickup and Delivery Supply Chain Design with Cross Dock Location and Direct Shipment

Vahid Azizi, Iowa State University, Ames, IA, United States,  
Guiping Hu

The cross docking process is important in supply chain management. Cross docking makes the material flow more efficient and reduces transportation and inventory holding costs and accelerates delivery. Although important, the decisions of locating cross-docks are considered separately from shipment routing. This paper presents a model that considers cross-dock location, pickup and delivery vehicle routing, and direct shipment together with cross docking. A mixed integer linear programming model has been formulated to address this problem. Computational experiments have been conducted to validate the proposed model.

## Healthcare/Service Systems in Applied Probability

Sponsored: Applied Probability

Sponsored Session

Chair: Lerzan E. Ormeci, Koc University, Rumeli Feneri Yolu, Sariyer, Istanbul, 34450, Turkey

### 1 - Optimal Control Policies in Systems that Include Batch Characteristics

Olga Bountali, Southern Methodist University, 4210 Fairmount Street, Apartment 3063, Dallas, TX, 75219, United States,  
Lerzan E. Ormeci

The control of a service system of interest becomes very complicated when the system operates under some notion of batches. The latter, regardless of whether it refers to the arrival or service patterns, creates intricate trade-offs, the resulting impact of whose can be either detrimental or beneficial. We shed more light to this impact by exploring optimal control policies for systems that operate under some notion of batches.

### 2 - Analysis of a Healthcare System Consisting of Public and Private Facilities

Seyedehsaloumeh Sadeghzadeh, Virginia Tech, Blacksburg, VA, 24060, United States, Lerzan E. Ormeci, Pelin Canbolat

We consider a setting where a healthcare service is provided by two facilities, one public, and one private. Each facility is represented by an M/M/1 queue with different service rates and fees. Customers strategically choose one of the two facilities to minimize their expected cost, which consists of waiting costs and fees, under two different conditions corresponding to observable and unobservable queues. We also analyze socially optimal policies under these conditions. We characterize key structural properties in each case, and consider how the government can use these results to decide on the compensation level for private services, and the investment on capacity expansion in public services.

### 3 - Admission Control in an Intensive Care Unit with Readmissions

Faruk Akin, Rumelifeneri Mah., Rumelifeneri Yolu, Sariyer, Istanbul, 34450, Turkey, Koc University, Koc University, Rumelifeneri Mah. Rumelifeneri Yolu, Sariyer, Istanbul, 34450, Turkey, Lerzan E. Ormeci

We consider an Intensive Care Unit (ICU) where we focus on the effects of early discharge decisions and possible readmissions on hospital bed management. The system may admit, reject or admit an arriving patient by early discharging a current patient in the ICU. To represent such a setting, we develop a discrete-time Markov Decision Process (MDP) with the aim of minimizing the total expected - discounted cost over an infinite horizon. We investigate the structure of the optimal admission control policy and propose some heuristic policies and evaluate their performances with respect to the optimal policy, which results from solving the MDP formulation.

## Joint Session OMS/Practice Curated: Scheduling with Applications

Emerging Topic: Project Management and Scheduling, in Memory of Joe Leung,

Emerging Topic Session

Chair: Marc E. Posner, Ohio State University, 296 Baker Systems Engineering, 1971 Neil Avenue, Columbus, OH, 43210-1271, United States

### 1 - AGV Control in Large-scale Parallel Transshipment Container Terminal

Qitong Zhao, National University of Singapore, Singapore, Chenhao Zhou, Lee Loo Hay

The AGV system in transshipment container terminal is characterized by a very large number of AGVs and complicated traffic conditions. To ensure deadlock- and conflict-free routing of the AGVs, we propose a modular concept, allowing the AGV control to be divided into two subproblems, the travel module generation problem and the inner module routing and scheduling problem. These two subproblems are integrated and tested in our discrete event simulation platform. Visualization of the solutions validate the deadlock- and conflict-free movements and numerical results show the efficiency of this two-stage event-trigger approach.

### 2 - AGV Routing in the Parallel Mega Automated Container Terminal Based on a Two-layer Network Structure

Chew Ek Peng, National University of Singapore, Computing Lab, E1-07-26, NUS Department of Eng, Singapore, 117578, Singapore, Zhipeng Qiu

To avoid conflicts and improve system efficiency in the mega-ACT, we propose an efficient routing scheme for large-scale AGVs based on a two-layer network structure. At the upper layer, a column-generation based algorithm is used in a sector-based graph for an integrated problem, which not only solve the path direction design to determine the directions for the links, but also solve the global routing to decide the sector-based routes for the AGVs. At the lower layer, a path planning algorithm is proposed for multi-AGVs within the sector to determine the real-time paths and schedules for AGVs with the guarantee of no conflicts. Finally, this study has used different cases for algorithm testing, and the results show that the scheme is efficient and effective for the routing of large-scale AGV systems.

### 3 - A New Approximation Algorithm for Unrelated Parallel Machine Scheduling Problem with Release Dates

Ziteng Wang, Assistant Professor, Northern Illinois University, 590 Garden Road, EB 240, DeKalb, IL, 60115, United States, Zhi Pei, Mingzhong Wan

We consider the unrelated parallel machine scheduling problem with release dates. A 4-approximation algorithm is devised and proved in comparison with the 16/3-approximation. The original scheduling problem is divided into several sub-problems based on the release dates. For each sub-problem, a convex quadratic

integer programming model is constructed in accordance with the specific problem structure. Then a semi-definite programming approach is implemented to produce a lower bound via the semi-definite relaxation of each sub-problem. Furthermore, a branch and bound based method and a local search strategy are applied separately to locate the integer solution of each sub-problem.

#### 4 - Approximation Algorithms for Stochastic Scheduling Problems with Few Different Types of Jobs

Lin Chen, University of Houston, 4800 Calhoun Road, Houston, TX, 77004, United States, Lei Xu, Weidong Shi

We consider the classical stochastic identical machine scheduling problem with the objective of minimizing weighted completion time. We show that there exists a quasi-polynomial time approximation scheme if there are a logarithmic number of different kinds of jobs.

### Joint Session SMA/Practice Curated: Social Media Analytics Methods, Tools and Platforms

Emerging Topic: Social Media Analytics

Emerging Topic Session

Chair: Tung Cu, Bloomsburg University of Pennsylvania, 400 E. 2nd Street, Bloomsburg, PA, 17815, United States

#### 1 - Does Emotional Arousal Boost or Discount Review Valence Impact? The Role of Purchase Stage

Anh Dang, Northern Kentucky University, Haile/US Bank College of Business, Highland Heights, KY, 41076, United States, Yuping Liu-Thompkins

Conflicting findings exist regarding the impact of review valence on consumers' decisions. The present paper aims to reconcile these findings by examining emotional arousal expressed in review texts as a moderator of review valence impact. Through two experiments and one field study involving clickstream and purchase data of a major UK online retailer, this paper shows that emotional arousal plays two opposing roles depending on which decision stage the consumer is at. During the search stage, it prevents consumers from relying on valence. Meanwhile, when consumers are about to make their purchase decision, negativity bias causes consumers to reject products with negatively high arousal reviews.

#### 2 - Social Media Network Analytics: Methods, Tools and Platforms

Tung Cu, Bloomsburg University of Pennsylvania, 932 Country Club Dr., Bloomsburg, PA, 17815, United States

Social networking media is built on the ideological and technological foundations of web and mobile, and that allow the creation and exchange of user generated content. Research in social media analytics focuses on innovative methods and practices of measuring, analyzing and interpreting user-generated content from a variety of online social media platforms, websites, and blogs to uncover hidden patterns and correlations to answer questions pertaining to organizational, educational, social as well as political issues. This paper presents a literature review in both theoretical and empirical variety of social network analytics methods, tools and platforms in different contexts.

#### 3 - Social Analytics Governance: A Literate Review of Practices

Tung Cu, Bloomsburg University of Pennsylvania, 932 Country Club Dr., Bloomsburg, PA, 17815, United States, Loreen Powell, Ken Hall, Kuo- Hao Lee, Hayden Wimmer

Over the last ten years, the number of businesses harnessing structured, semi-structured or unstructured data have exploded. Today, many businesses are quick to view social analytic data as evidence or arguments. Oftentimes, the evidence and arguments leads to faulty decisions and lost profit because their data are not properly managed and governed. Thus, a business' ability to deliver accurate analytics is essential to be built on the capabilities of its data and technology governance and practices. Given the increased importance in data governance, this presentation presents a literature review and highlights areas for future research.

## ■ TA53

North Bldg 232A

### Procurement Design

Sponsored: Auction and Marketing Design

Sponsored Session

Chair: Vitali Gretschko

#### 1 - Sequential Procurement without Commitment

Vitali Gretschko, Centre for European Economic Research, 68034 Mannheim, Mannheim, Germany, Nicolas Fugger, Martin Pollich

Renegotiation of contracts is anticipated by the suppliers and in turn influences

the initial procurement mechanism. We show that first-price auctions may perform poorly in this context as all cost-types may pool on high bids to conceal relevant information for the renegotiation. Second-price auctions in such a setting should retain its efficient equilibrium as the buyer merely learns that the cost of the winning supplier is lower than some threshold. Moreover we derive the optimal mechanism.

#### 2 - First-price Auction Design with Loss Averse Bidders

Nicolas Fugger, Centre for European Economic Research (ZEW), L7, 1, Mannheim, 68161, Germany, Philippe Gillen, Tobias Riehm

Loss aversion describes that subjects evaluate outcomes relative to reference points and suffer more from negative deviations (losses) than they benefit from positive deviations (gains) from reference points. As a consequence, the outcome equivalence of first-price auction formats breaks down. We show that an auction designer who faces loss averse bidders can increase her profit above that attainable with standard first-price auctions by implementing a multi-stage first-price auction which consists of a qualification stage and a final.

#### 3 - Supplier Scorecards in Competitive Sourcing

Elena Katok, University of Texas at Dallas, 800 W. Campbell Rd., Jindal School of Management (SM30), Richardson, TX, 75080, United States, Zhixi Wan, Sina Shokoohyar

In procurement interactions, the relationship between the buyer and the seller starts after the sourcing decision has been made. In this study we consider ways to design a scorecard to best incentivize the suppliers.

#### 4 - A Theoretical and Experimental Study of Open-bid Auctions Under Post-qualification Screening

Wen Zhang, University of Texas at Dallas, 800 W. Campbell Road, Richardson, TX, 75080, United States, Elena Katok, Qi Chen, Zhixi Wan

We study a procurement setting in which one qualified supplier (the incumbent) and multiple unqualified suppliers (the entrants) compete in an open-bid auction under post-qualification. We find that the incumbent follows a bid-down-to thresholds strategy in which the incumbent should stay in the auction until the auction price reaches a threshold. Our analysis also shows that after the incumbent drops out, all entrants will follow a similar strategy, but one entrant's thresholds can only be calculated sequentially after reviewing the last drop-out bids. We test our analytical results in the laboratory with human subjects and explain mismatches between experimental observations and theories.

### Behavioral Research on Sustainability and Environmental Operations

Sponsored: Behavioral Operations Management

Sponsored Session

Chair: Enno Siemsen, University of Wisconsin-Madison, Madison, WI, 53706, United States

Co-Chair: Mahdi Mahmoudzadeh, Georgia Institute of Technology, Atlanta, 30308, Georgia

#### 1 - Reliably Responsible: Structuring Supply Chains for Socially-responsible Behavior

Mahdi Mahmoudzadeh, Georgia Institute of Technology, Scheller College of Business, 800 West Peachtree Street NW, Atlanta, 30308, Georgia, Enno Siemsen

Social/environmental benefits of responsible sourcing in supply chains is well discussed in the literature and among practitioners. We extend the classical model of responsible sourcing with a behavioral decision-making process (BDM) for the manufacturer that sources from responsible and non-responsible suppliers. The BDM resolves some of inconsistencies in the classical model's predictions that limit providing straightforward recommendations. We validate our proposed BDM, against the classical decision-making, through incentivized experiments. The primary advantage of BDM is realized by structuring supply chains for different types of socially-responsible behavior in the market.

#### 2 - How Does Precision Affect the Adoption of Energy Efficiency Practices? - Evidence from the Field and Laboratory Data

Suresh Muthulingam, The Pennsylvania State University, Smeal College of Business, 460 Business Building, University Park, PA, 16802, United States, Saurabh Bansal

We investigate whether precision affects the adoption or non-adoption of energy efficiency practices. Specifically, we examine if the implementation of energy efficiency practices depends on whether the costs and savings associated with such practices are presented as precise (e.g., \$20,431) or round (e.g., \$20,400) numbers. Our empirical analysis and experimental results show that adoption rates are higher for those recommendations that have precise costs and precise savings. Additionally, the experiments demonstrate that such recommendations induce higher credibility with decision makers.

### 3 - The Effect of Visibility on Consumer Trust of Social Responsibility Disclosures

Leon Valdes, University of Pittsburgh, Joseph M. Katz Graduate School of Business, 119B Mervis Hall, Pittsburgh, PA, 15260, United States, Tim Kraft, Yanchong Zheng

We conduct an incentivized lab experiment to investigate the role of supply chain visibility on consumer trust of social responsibility (SR) communications. Specifically, we design a three-player game with the roles of Consumer, Seller, and Worker. The Worker's payment is private information, but the Seller observes a signal about this payment. The Seller can invest to improve this signal's quality, which captures the level of supply chain visibility. Finally, the Seller communicates with the Consumer about the observed signal. With this game, we study whether the level of visibility affects the Consumer's trust in the Seller's communication.

North Bldg 232C

### Joint Session Sports/Practice Curated: Sports Analytics IV

Sponsored: SpORts

Sponsored Session

Chair: Stephen Hill, University of North Carolina-Wilmington, 601 South College Road, Wilmington, NC, 28403-5611, United States

#### 1 - Optimizing Pitcher Rotations

Cody O'Brien, Slippery Rock University, Slippery Rock, PA, 16057, United States, Bradely Schweitzer, Justin Long

Replacing a starting pitcher with a relief pitcher is rarely backed by analytics. By taking an analytical approach, a manager may be able to detect when a pitcher's performance is starting to decline before it has a negative impact. Historical data is used to calculate multiple indicators of pitcher performance to create a baseline of how each individual pitcher should perform. During a game, current indicators will be calculated and compared to the baseline statistics to understand how the pitcher is performing. When his performance declines passed a set threshold, a relief pitcher will be called in. A fully-functioning GUI is implemented to make the model more accessible.

#### 2 - Simulating Major League Baseball Games

Brad Schweitzer, Slippery Rock University, Slippery Rock, PA, United States, Justin Long

The game of baseball can be explained as a Markov Process, as each state is independent of all states except the one immediately prior. Probabilities are calculated from historical data on every state transition from 2011 to 2016 for Major League Baseball games and are then grouped to account for home-field advantage, offensive player ability, and pitcher performance. Using the probabilities, transition matrices are developed and then used to simulate a game play-by-play. For a specific game, the results give the probability of a win as well as expected runs for each team.

#### 3 - Examination of Gambling Lines in College Football

Mikhail Gordon, Doctoral Candidate, University of Pittsburgh, Pittsburgh, PA, 15224, United States

An investigation of college football team characteristics in the context of gambling, using historical line information. An emphasis is placed on games with large spreads, defined as a spread greater than 15 points.

#### 4 - Social Network Analysis in Field Sports: Irish (Gaelic) Football

Vincent Hargaden, Associate Professor, University College Dublin, School of Mechanical & Materials Engineering, Engineering & Materials Science Centre, Belfield, Dublin 4, Ireland

Irish (Gaelic) football is a 15-a-side field sport played through a combination of hand and foot passing. Each year from May through September, the elite teams complete in conference and play-off games to determine the title winner. Similar to many team sports (basketball, soccer), it is of interest to analyse the players' cooperation from a network perspective. Using passing data between players from games involving the three-in-a-row title winning team (2015-2017), we take a social network analysis approach to identify interactions and team style of play.

West Bldg 101A

### Joint Session HAS/Practice Curated: Behavioral Drivers for Decision Making and Productivity: Empirical Evidence

Sponsored: Health Applications

Sponsored Session

Chair: Jónas Oddur Jónasson

#### 1 - Task Selection and Workload

Bradley R. Staats, University of North Carolina at Chapel Hill, Campus Box 3490, McColl 4720, Chapel Hill, NC, 27599-3490, United States, Diwas S. KC

How individuals manage their tasks is central to operations. Recent research focuses on how increasing workload individuals can increase service time. As the number of tasks increases workers may also manage their workload by a different process - task selection. We theorize and test that under conditions of increased workload individuals may choose to complete easier tasks to manage their load. We label this behavior Task Completion Bias (TCB). Using 2 years of data from an emergency department we find support for TCB and show it improves short-term productivity. However, we find that an overreliance on this task selection strategy hurts performance in the long run.

#### 2 - Heuristic Thinking in Patient Care

Diwas S. Kc, Emory University, 1300 Clifton Road, Goizueta Business School, Atlanta, GA, 30322, United States

This paper studies heuristic thinking and cognitive bias using a natural experiment from the field. The setting for the study is a set of acute care hospitals, where we examine the care process and discharge decisions for individual patients. Determining a patient's suitability for discharge is cognitively taxing, calling for the decision maker to draw on up-to-date clinical expertise and detailed information. We postulate that bounded rationality in decision making leads the care provider to substitute clinical readiness for discharge - a more cognitively complex attribute, with a more easily accessible heuristic.

#### 3 - Recovering from Distress: The Impact of Critical Incidents on Operational Performance

Jonas Oddur Jonasson, Assistant Professor, MIT Sloan School of Management, 30 Memorial Drive, E62-588, Cambridge, MA, 02142, United States, Hessam Bavafa

In service operations settings, where the difficulty of jobs can be unpredictable, workers sometimes encounter critical incidents (CIs) — tasks or situations which are sufficiently disturbing to challenge workers' usual coping mechanisms. In the context of ambulance services we find that encountering a CI negatively affects subsequent operational performance. The effect is strong for patient-pickup (a complex, non-standardized task) and weaker for patient handover to the hospital (a more standardized task).

#### 4 - Timeliness and Compliance with Standard Operating Procedures

Reidar Hagtvedt, University of Alberta School of Business, 2-43 Business Bldg, Edmonton, AB, T6G 2R6, Canada, Kenneth L. Schultz, Trish Reay, Sarah Forgeie

Compliance with standard operating procedures when looking ahead, or in the very short term, is notoriously difficult to measure. In this paper, we examine two previously ignored aspects of compliance with hand-hygiene regulations in a hospital setting. First, we allow teleological cues to prompt hand-hygiene by recoding the time of the cue forward. Second, we examine the time immediately after a disruption, to see if a reduction in hand-hygiene is measurable. We use data from a tertiary Canadian teaching hospital.

West Bldg 101B

### Joint Session HAS/Practice Curated: Dynamic Models of Patient Health

Sponsored: Health Applications

Sponsored Session

Chair: Maria Esther Mayorga, North Carolina State University, Raleigh, NC, 27695, United States

#### 1 - Dynamic Patient Routing with Nurse Workload Considerations

Siddhartha Nambiar, North Carolina State University, Raleigh, NC, 27606, United States, Maria Esther Mayorga, Muge Capan

We develop a multi-class, multi-server queueing model to route incoming patients to different server pools in an Emergency Department setting, to minimize their sojourn time and to manage the nurses' workload. There is a lack of consensus in analytics and decision science regarding how to quantify workload in healthcare and how to use it in an analytic framework. We first review literature to determine how to define workload, and to identify components, available in electronic health records data, that allow us to measure workload. Following this, we develop both analytic and simulation models to get optimal routing policies and compare them to other workable, realistic policies.

## 2 - Cost-effectiveness and Decision Analysis of Genetic Testing in Cholesterol Treatment Planning

Wesley J. Marrero, University of Michigan, Ann Arbor, MI, United States, Mariel Sofia Lavieri, Rodney A. Hayward, Suzanne C. Butler, Amit Khera, Sekar Kathiresan, James Burke, Jeremy B. Sussman

We present a simulation-based framework to estimate the risk of heart attacks due to clinical and genetic factors. Additionally, we develop cholesterol treatment plans using risk thresholds (current practice) and a Markov decision process (MDP). By simulating the health status of patients, we determined the cost-effectiveness of genetic testing to guide cholesterol treatment.

## 3 - Statin Initiation Decision Modeling for Prediabetes Patients

Shengfan Zhang, University of Arkansas, 4207 Bell Engineering Center, Department of Industrial Engineering, Fayetteville, AR, 72701, United States, Muhenned Abdulsahib

While there is much research on statin initiation policies on prevention of heart disease for diabetes, studies on statin initiation policies for prediabetic patients are limited. The goal of this research is to examine the tradeoffs between the risk of heart disease and risk of diabetes on the decision of statin therapy for prediabetes patients. We develop an optimal statin initiation policy to meet both the need to control cholesterol levels and the need to minimize the risk of diabetes, which will provide insights for future treatment guidelines for prediabetes.

## 4 - Modeling Comprehensive Medication Reviews for Complex Patients in Community Pharmacies

Kathryn N. Smith, North Carolina State University, Raleigh, NC, 27606, United States, Julie Simmons Ivy, Anita Vila-Parrish

Adherence to long-term medication therapies is approximately 50% in developed countries. Patient and provider engagement has been found to be a contributor to improved adherence. One enhanced service aimed at engaging patients is a comprehensive medication review (CMR) provided by pharmacists. CMRs allow a pharmacist to identify drug therapy problems that may be interfering with adherence. In order to incorporate CMRs into the workflow, pharmacies must streamline the CMR process and prioritize complex patients. We developed a simulation model and a dynamic programming model to analyze the integration of the operational and clinical workflows and determine how to prioritize patients.

## Joint Session HAS/Practice Curated: Healthcare Analytics II

Sponsored: Health Applications

Sponsored Session

Chair: Pinar Keskinocak, Georgia Institute of Technology, Atlanta, GA, 30332, United States

Co-Chair: Seyma Guven-Kocak, Georgia Institute of Technology, Atlanta, GA, 30340, United States

## 1 - One-class Adaptive Resonance for Radiotherapy Quality Assurance

Dionne Aleman, University of Toronto, 5 King's College Road, Toronto, ON, M5S 3G8, Canada, Hootan Kamran Habibkhani, Chris McIntosh, Thomas Purdie

Radiotherapy (RT) treatment plans, once designed, must undergo iterative refinements until they pass quality assurance (QA). Machine learning has promised to help automate such QA processes by learning from past data. However, RT plans are usually not recorded until they passed QA and are sent for delivery. Therefore, a clinically-recorded RT dataset is usually imbalanced in favour of the easily-recordable high-quality plans, and binary classifiers struggle to learn from it. Therefore, we develop an adaptive neural network for one-class classification. Our algorithm outperforms one-class SVMs and autoencoders on two RT datasets for breast and prostate patients.

## 2 - Updating Risk Assessment Tools for Unplanned Extubation in Pediatric Critical Care Patients

Zihao Li, Georgia Institute of Technology, Atlanta, GA, United States, Pinar Keskinocak, Atul Vats

The Risk assessment score (RAS) and revised RAS (rRAS) are scoring tools based on consensus opinion to assess pediatric patients' risk of unplanned extubation (UPE). We reviewed records of 5,749 patients from 2013 to 2017 in 5 ICUs and 2 freestanding children's hospitals and used logistic regression to improve the score. The new model identifies UPE history, weight, age, oral secretion and ventilation length as significant risk factors. The incident rates for low, moderate, high, and extreme risk patients are 0.69, 0.46, 1.14 and 3.01 per 100 vent days, respectively. The new model has a stronger association with UPE occurrence for patients with extreme risk compared to the RAS and rRAS.

## 3 - Calling for Care? The Risky Proposition of Teletriage for Healthcare Demand Management

Ozden Engin Cakici, American University, Washington, DC, United States, Alex Mills

We investigate the effect of adding teletriage to a healthcare system with traditional or open access primary care and an Emergency Department (ED). Using a partially observable Markov decision process model, we find that while teletriage would benefit patients, it could be costly for the payer and even increase ED usage. We conclude by providing conditions under which teletriage would be beneficial.

## 4 - Dynamic Personalized Patient Classification via Learning Progression in Chronic Diseases: Application to Glaucoma

Esmaeil Keyvanshokoo, University of Michigan, Ann Arbor, Ann Arbor, MI, 48108-1020, United States, Mark P. Van Oyen, Joshua Stein, Mariel Sofia Lavieri, Chris Andrews

We design a dynamic and personalized classification method for classifying a patient with Glaucoma at each visit as either a "fast" or "controlled" progressor. "Fast" refers to relatively rapid deterioration with respect to visual field mean deviation. To this aim, we combine a random forest algorithm with a classification method. We also develop online learning methods to help manage a patient's progression.

West Bldg 102A

## Joint Session HAS/DM: Aged Care Analytics: Models, Methods and Applications: Part I

Sponsored: Health Applications

Sponsored Session

Chair: Mingyang Li, Tampa, FL, 33647, United States

Co-Chair: Nan Kong, Purdue University, West Lafayette, IN, 47906-2032, United States

## 1 - Skilled Nursing Facility Service Utilization Modeling and Staffing Evaluation with Competing Discharge Disposition

Nazmus Sakib, University of South Florida, Tampa, FL, United States, Xuxue Sun, Nan Kong, Chris Masterson, Hongdao Meng, Kathryn Hyer, Mingyang Li

Skilled nursing facilities (SNFs) are major long-term care settings for older adults. It is important to accurately model SNF service demands so that an appropriate staffing level can be determined to ensure high quality care at a reduced cost. This work proposes a data analytics integrated simulation framework to evaluate the service demands of SNF residents and further investigate cost-effective staffing decisions under various resident census and acuity scenarios. The proposed work will serve as a decision support toolset for SNF administrators to improve their staffing decisions.

## 2 - A Novel Privacy-preserving Positive Transfer Learning Approach for Telemonitoring of Parkinson's Disease

Hyunsoo Yoon, Arizona State University, 699 S. Mill Ave, Tempe, AZ, 85281, United States, Jing Li

Telemonitoring of voice signals of Parkinson's Disease (PD) patients using an At-Home Testing Device is a cost-effective logistically-convenient way to monitor disease progression and optimize treatment. Key challenges in telemonitoring are patient heterogeneity and limited data for each patient. We propose a transfer learning approach, P3TL, which can leverage other patients' information when building a predictive model for a target patient. The unique features of P3TL include intelligent selection of patients to transfer to avoid negative transfer and maintain patient privacy preservation.

## 3 - A Novel Transfer Learning Model for Alzheimer's Disease(ad) Early Detection Using Incomplete Multimodality Image Data

Xiaonan Liu, Arizona State University, Tempe, AZ, United States, Kewei Chen, Teresa Wu, David Weidman, Fleming Lure, Jing Li

Early detection of AD is critically important for treatment of this devastating disease. Use of multimodality images has been shown to hold great promise. The challenge is that images of different modalities are not universally available to all patients due to cost and accessibility constraints. We propose a novel incomplete-modality transfer learning (IMTL) model that learns a diagnostic model for each patient sub-cohort with the same availability of image modalities while coupling the model training processes to allow knowledge transfer. IMTL achieves significantly better accuracy than existing single learning models on datasets collected by the AD Neuroimaging Initiative (ADNI).

#### 4 - A Deep Active Survival Analysis Approach for Precision Treatment Recommendations

Kai Yang, Wayne State University, 4815 Fourth Street, Detroit, MI, 48201, United States, Milad Zafar Nezhad,

Survival analysis has been developed and applied in the number of areas including manufacturing, finance, economics and healthcare. In healthcare domain, usually clinical data are high-dimensional, sparse and complex and sometimes there exists few amount of time-to-event (labeled) instances. Therefore building an accurate survival model from electronic health records is challenging. With this motivation, we address this issue and provide a new survival analysis framework using deep learning and active learning with a novel sampling strategy. In the experimental study, we apply our approach on SEER-Medicare data related to prostate cancer among African-Americans and white patients.

#### 5 - A Tensor Factorization Approach to Predicting Clinical Outcomes

Qingpeng Zhang, City University of Hong Kong, 83 Tat Chee Avenue, 6/F, Academic 1, Kowloon, 12180, Hong Kong,

In this talk, I am going to introduce the tensor factorization based models for the prediction of various clinical outcomes at the individual level. In particular, we focus on the prediction of chronic diseases and re-admissions of the elderly. Experiments with EHR data in Hong Kong will also be presented.

#### 1 - Data-driven Machine Learning Algorithm for High-priority Drug-drug Interactions Discovery

Ning Liu, Penn State University, 233 Leonhard Building, University Park, PA, 16802, United States, Qais Hatim, Soundar Kumara

Drug-drug interactions (DDIs) are the primary causes for adverse events and have become serious concerns for both drug discovery and pharmacovigilance. Unfortunately, the identification of DDIs is challenging and require domain knowledge and enormous efforts from experts. The FDA Adverse Event Reporting System routinely collects adverse event reports from patients and provides a rich data source to discover unknown DDIs. We propose a machine learning method to find patterns from known high-severity DDIs and predict pairs of drugs that may potentially interact and result in adverse events. Our data-driven approach incorporates domain knowledge and provides an option for detecting DDIs.

#### 2 - Outreach and Mobile Clinic Strategies for Vaccine Distribution

Yuwen Yang, PhD Candidate, University of Pittsburgh, 3700 O'Hara Street, Benedum Hall of Engineering, 1043A, Pittsburgh, PA, 15261, United States, Hoda Bidkhori, Jayant Rajgopal

In many low and middle income countries with geographically dispersed populations, last-mile vaccine delivery can be a complex process. Remote locations in these countries often do not have direct access to clinics/hospitals, and residents often face significant difficulty in obtaining routine vaccinations. An approach known as outreach is typically utilized to raise immunization rates in these situations. A set of these remote population centers are chosen as mobile clinics, and clinicians and support personnel are sent from a depot to each team to vaccinate people in the immediate surrounding area. We formulate this process as a mixed integer programming problem and discuss related issues.

#### 3 - The Determinants of Process Innovation in the Pharmaceutical Industry

Ivan Lugovoi, HEC Paris, 1 Square Theodore Judlin, Paris, 75015, France

Utilizing a unique dataset of the process - patent expert evaluations merged with the sales of 50 generic pharmaceutical products over a 10-year period across 4 countries, we observe that process innovation is associated with a significant increase in a firm's market share. To explain the origins of this effect we explore how market determinants: market concentration and growth, product lifecycle, and price elasticity, and technology determinants: vertical integration, technological diversification, and opportunity affect three dimensions (novelty, scope, and locus) of process innovation

#### 4 - Capacity Management in New Drug Development:

##### A Contract Research Organization Perspective

Sjors Jansen, PhD Candidate, Eindhoven University, P.O. Box 513, Paviljoen E13, Eindhoven, 5600MB, Netherlands

In recent years, pharmaceutical companies outsourced the development of new drugs to Contract Research Organizations (CROs). CROs conduct the development of a new drug for a fixed fee. CROs have a large research capacity, which they aim to fill with profitable research projects. Each project consists of multiple phases. Due to the uncertainty in the outcome of project phases, the

required capacity in the future is uncertain. Existing literature considers the problem from the perspective of a pharmaceutical company. CROs have different incentives and make different trade offs. Therefore, we model the capacity problem from a CRO's perspective to help a CRO to select projects from pharma companies.

#### Joint Session HAS/Practice Curated: Operations Research in Hospital Operations

Sponsored: Health Applications

Sponsored Session

Chair: Miao Bai, PhD, Mayo Clinic, Rochester, MN, 55904, United States

#### 1 - Dynamic Coordination of Exams in the Radiology Practice

Miao Bai, Mayo Clinic, Rochester, MN, 55904, United States, Mustafa Y. Sir, Kalyan Pasupathy

Radiology exams vary significantly in duration and technology requirements. Coordination between various exams with stochastic duration and requiring different scanner technology is challenging but essential to the timely fulfillment of demand and the efficient utilization of expensive scanner resources. Radiology exam coordination is further complicated by the great number of unscheduled exam requests that need to be completed within a specific time frame. To address this problem, we developed a real-time radiology exam coordination system based on a dynamic programming framework.

#### 2 - Generalizability Among Hospitals that Percentages of Surgical Cases During Weekends or Holidays Change Proportionally with Total Caseload Over Decade

Franklin Dexter, Professor, University of Iowa, 200 Hawkins Dr, 6JCP, Iowa City, IA, 52242, United States, Richard Epstein

Previous studies showed how to calculate weekend and holiday anesthesia staffing to assure no greater than a prespecified percentage of days with =1 surgical case waiting longer than at baseline. We used Iowa Hospital Association data, Jan 2007 - Jun 2017; N = 42 hospitals with =10 cases during weekends or holidays per period. We confirmed that over many (10) years hospitals' proportions of cases performed on weekends and holidays remain stable. The implication is that weekend and holiday staffing can be reevaluated annually, the interval over which changes in total caseloads are evident.

#### 3 - Mathematical Methods for Efficient Allocation and Utilization of Hospital Resources

Tracey Hong, Stanford University, Stanford, CA, United States, Emily Grimm, Michael Fairley, Steven Frick, David Scheinker, David Scheinker

The rising cost of healthcare is increasing pressure on hospitals to improve the value of care, but hospitals often lack access to modern quantitative methods to maximize the efficiency of resource allocation and utilization. Many mathematical models have been developed to better inform hospital decisions, but relatively few have been implemented. We describe examples of several models, designed and implemented, at Lucile Packard Children's Hospital Stanford, including optimal surgeon scheduling with integer programming, patient volume forecasting, bed assignments via simulation, and nurse staffing with a regression model. We emphasize the components that made implementation possible.

#### 4 - Analytics Systems to Improve the Value of Surgical Care

David Scheinker, Stanford - Lucile Packard Children's Hospital, Huang Engineering Center, 475 Via Ortega, Stanford, CA, 94305, United States

Variability in surgical supplies, procedure durations, operating room utilization, patient arrival rates to the PACU, and post-operative inpatient lengths of stay are associated with delays in care, staff frustration, and higher medical costs. Improving these processes with manual reviews and revisions can be prohibitively time consuming. We give an overview of the design and implementation of partially automated systems that use EMR data to reduce the variability, errors, and costs associated with these processes. The methods used include dynamic Bayesian networks, machine learning, causal inference, integer programming, and discrete event simulation.

### Mining Unstructured Data

Sponsored: Data Mining

Sponsored Session

Chair: Erhun Kundakcioglu, Ozyegin University, Istanbul, Turkey

Co-Chair: Mustafa Gokce Baydogan, Bogazici University, Istanbul, 34342, Turkey

#### 1 - Nested Gaussian Process for Unstructured Data Mining

Hui Yang, Pennsylvania State University, 310 Leonhard Building, Industrial and Manufacturing Engineering, University Park, PA, 16801, United States

Modern healthcare systems are increasingly investing in advanced sensing and information technology, leading to data-rich environments in hospitals. However, heterogeneous types of sensing and measurement methods often result in data uncertainty and incompleteness. Missing values are not uncommon for clinical variables pertinent to a patient's health conditions. This adversely affects data-driven decision making in the healthcare environment. This paper presents a novel nested Gaussian process (NGP) model that is tailored to represent multi-dimensional covariance structure of time, variable and patient for high-dimensional unstructured data mining in healthcare systems.

#### 2 - Understanding Student Enrollment through Unstructured Test Response Data Analysis

Petros Xanthopoulos, Stetson University, 421 Woodland Blvd, DeLand, FL, 32723, United States, Berry T. Cox

Free text response is very important in education analytics. Survey responses might encapsulate information and insights that could help an institution improve its services and adjust better to the needs of future students. In this presentation we present out analysis for understanding the connection between early post campus visit student surveys and university enrollment. In our study we incorporate natural language processing and machine learning in order to uncover markers that would help us predict factors of importance for predicting student enrollment.

#### 3 - A Sparse Graph-regularized Cox Model for Hot Spot Search on 3-D Radiation Dose Map in Cardiac Toxicity Assessment of Lung Cancer

Xiaonan Liu, Arizona State University, 699 S. Mill Avenue, Tempe, AZ, 85281, United States, Mirek Fatyga, Jing Li

Recent clinical trials on dose escalation in radiation therapy of lung cancer found decrease in overall survival (OS). This unexpected result has driven the research society to study potential damage of radiation to the heart, known as cardiac toxicity. Existing studies focus on finding features in dose-volume histogram (DVH) that are correlated with the toxicity or OS. However, DVH collapses the 3-D dose map into 2-D and thus losing spatial information of dose distribution. We propose a novel sparse graph-regularized cox model to find localized regions (hot spots) in the 3-D dose map of the heart to predict OS. This work enables better treatment planning for lung cancer with awareness of cardiac risk.

#### 4 - Maximizing Area Under Receiver Operator Characteristic Curve for Multi-Instance Learning

Erhun Kundakcioglu, Ozyegin University, Faculty of Engineering, Nisantep mah. Orman sok., Istanbul, 34794, Turkey

The purpose of this study is to solve the multi-instance classification problem by directly maximizing the area under ROC curve. We derive a mixed integer linear programming model that produces the best possible hyperplane-based classifier for multi-instance classification and present cross validation (CV) results for benchmark instances.

### Recent Advances in Structured and Non-convex Optimization for Machine Learning

Sponsored: Data Mining

Sponsored Session

Chair: Dzung Phan

#### 1 - Inexact SARAH for Solving Stochastic Optimization Problems

Lam Nguyen, IBM Thomas J. Watson Research Center, Yorktown Heights, NY, United States, Katya Scheinberg, Martin Takac

We consider a general stochastic optimization problem which is often at the core of supervised learning, such as deep learning and linear classification. It is not able to apply SVRG and SARAH for this problem since these algorithms require an exact gradient information. We consider Inexact SARAH, which does not require to compute an exact gradient at each outer iteration; and analyze it in

strongly convex, convex, and nonconvex cases. We also compare it with some existing stochastic algorithms.

#### 2 - Asynchronous Decentralized Accelerated Stochastic Gradient Descent

Yi Zhou, ISyE Georgia Tech, 755 Ferst Drive, NW, Atlanta, GA, 30332, United States, Guanghui Lan

In this work, we introduce an asynchronous decentralized accelerated stochastic gradient descent type of method for solving stochastic convex optimization problems defined over multiagent networks. Considering that communication and synchronization are the major bottlenecks in decentralized optimization, our main goal in this talk is to present algorithmic frameworks which can significantly reduce communication and synchronization costs. We established  $O(\frac{1}{\epsilon})$  (resp.  $O(\frac{1}{\sqrt{\epsilon}})$ ) rate of convergence for our proposed method when the problem is general convex (resp. strongly convex).

#### 3 - L0-regularized Sparsity for Probabilistic Mixture Models

Dzung Phan, IBM Research, 1101 Kitchawan Road, P.O. Box 218, Yorktown Heights, NY, 10598, United States, Tsuyoshi Ide

This talk revisits the task of learning probabilistic mixture models. Our major goal is to sparsely learn the mixture weights to automatically determine the right number of clusters. The key idea is to use a novel Bernoulli prior on the mixture weights in a Bayesian learning framework, and formalize the task of determining the mixture weights as an L0-regularized optimization problem. By leveraging a specific mathematical structure, we derive a quadratic time algorithm for efficiently solving the non-convex L0-based problem. In experiments, we evaluate the performance of our proposed approach over existing sparse methods in terms of accuracy and scalability on synthetic and real data sets.

#### 4 - Scaling Up Optimization Using Non-convexity, Provably

Anastasios Kyriillidis, 1616 Guadalupe Street, Austin, TX, 78701, United States

In this talk, I will focus on the problem of low rank matrix inference in large-scale settings. Such problems appear in fundamental applications such as structured inference, recommendation systems and multi-label classification problems. I will introduce a novel theoretical framework for analyzing the performance of non-convex first-order methods, often used as heuristics in practice. These methods lead to computational gains over classic convex approaches, but their analysis is unknown for most problems. This talk will provide precise theoretical guarantees, answering the long-standing question "why such non-convex techniques behave well in practice?" for a wide class of problems.

#### 1 - Study of Mobility in Private Homes

Yan Wang, University of South Florida, Industrial and Management Systems Engineering, 4202 E. Fowler Ave, ENB118, Tampa, FL, 33620, United States, Ali Yalcin, Carla VandeWeerd

Human mobility is shown to be fundamentally regular and potentially predictable based on the study of large-scale geo-location data available through cellular networks and mobile devices. In this work, we study the mobility of residents in private homes, as opposed to outdoor environments. Indoor mobility prediction has far-reaching applications in smart homes and ambient assisted living environments. Using data from ambient sensors, we represent the occupant's movement trajectory as a sequence of symbols and calculate its entropy and an upper bound of its predictability. Our results show that indoor mobility is also predictable and can be quantified.

#### 2 - Deep Neural Networks and Insurance Cross-selling

Xiaoguang Tian, University of North Texas, 1155 Union Circle, Denton, TX, 76203-5017, United States

In this study, we propose applying deep neural networks and ensemble approach to identify the customer who will purchase a new caravan insurance policy and improve the model performance through tuning the parameters. The results show that the approach is effective and outperforms the baseline model on multiple measurements, such as accuracy, sensitivity, and ROC.

### 3 - Forecasting Demand Distribution for New Products using Subjective Rankings

Marat Salikhov, PhD Student, INSEAD, 1 Ayer Rajah Ave, Singapore, 138676, Singapore, Nils Rudi

We present a framework for demand distribution forecasting for new products that combines historical data for similar products with subjective ranking inputs. The framework is based on the decomposition of a demand vector into aggregate, ordered proportion and ranking components, with historical data being used to forecast the first two components and subjective inputs for the last one. The component forecasts are then combined via a simulation-based method. We propose multiple specifications for each of the components. Finally, we evaluate the out-of-sample performance of the method using actual demand data and subjective inputs from a retail company.

### 4 - A Data Glove Based American Sign Language Interpreter

Sara Masoud, University of Arizona, 1127 E. James E. Rogers Way Room 111, Tucson, AZ, United States, Bijoy Dripta Barua Chowdhury, Young-Jun Son

Sign language recognition is a central research problem in computerized gesture detection for enabling hearing impaired people. In this work, a real-time hand gesture recognition framework is proposed to detect the 26 sign language alphabets. VMG 30 data gloves are utilized by which each hand gesture is reported as a 132-feature vector. Feature extraction is performed via a linear discriminant analysis to reduce the size of input vectors to a 25-feature vector and decrease the chance of overfitting. Decision tree models are developed to detect the 26 sign language alphabets based on the 25-feature vector values. The proposed framework has shown a success rate of 98.23% in a real-time environment.

### Reinforcement Learning for Supply Chain and Inventory Optimization

Sponsored: Artificial Intelligence

Sponsored Session

Chair: Afshin OroojlooyJadid, Lehigh University, 200 West Packer Ave, Bethlehem, PA, 18015, United States

Co-Chair: Mohammadreza Nazari, Lehigh University, Bethlehem, PA, 18015, United States

#### 1 - A Deep Q-network for the Beer Game: A Reinforcement Learning Algorithm to Solve Inventory Optimization Problems

Afshin OroojlooyJadid, Lehigh University, 15 Duh Drive, Bethlehem, PA, 18015, United States, Mohammad Reza Nazari, Lawrence V. Snyder, Martin Takac

Beer game is a multi-agent serial supply chain in which agents attempt to minimize the total cost of the network given that each agent only observes its own local information. We propose a Deep Q-Network to solve this problem. Our algorithm outperforms approaches from literature and unlike the majority of them does not impose restrictions on the problem parameters, and works well even if other agents do not follow rational policies. Moreover, we propose a transfer learning approach to quickly train new agents with new cost coefficients or action space. The algorithm can be extended to any decentralized multi-agent cooperative game with partial information, which is a common situation in supply chains.

### 2 - A Deep Reinforcement Learning Approach for Dual Sourcing Inventory Management

Joren Gijsbrechts, KU Leuven, Leuven, Belgium, Robert Boute, Dennis Zhang, Jan Van Mieghem

The optimal dual sourcing replenishment policy with non-consecutive lead times does not have a simple structure and is highly state dependent. We model the dual sourcing problem as a Markov Decision Process, and compare three machine learning algorithms based on deep reinforcement learning to solve this analytically intractable problem. Our results show that in the traditional settings our algorithms match (and slightly outperform) the current best-in-class heuristics. Additionally, we develop an experiment including more realistic constraints such as non-linear ordering costs and non-stationary demand showing how machine learning can be applied in a more generalized setting.

### 3 - Returns Optimization

Ajay Deshpande, IBM Research, 1101 Route 134 Kitchawan Rd, Yorktown Heights, NY, 10598, United States, Brian Quanz, Ali Koc, Yada Zhu, Jae-Eun Park

Growth in e-commerce has spurred growth in online returns. IBM Research developed a returns optimization solution which finds an optimal location in a network to maximize net expected recovery on returns. Using learning based optimization we demonstrated significant potential of incremental revenue and logistics cost savings for a large fashion retailer.

### Natural Language Processing and User Generated Content

Sponsored: Information Systems

Sponsored Session

Chair: Nicholas Sullivan, University of Utah

#### 1 - Understanding User Engagement in Social Media Through Neural Network-Based Text Mining

Michael Lee, University of Nevada Las Vegas, 1142 West 200 North, Unit A406, Centerville, UT, 84014, United States

Abstract not available.

#### 2 - How do Traditional Rivals Compete on Online Social Media Platforms? An Empirical Investigation

Mikhail Lysyakov, University of Maryland, Robert H. Smith School of Business, College Park, MD, 20783, United States, Kunpeng Zhang, Siva Viswanathan

The evolution of social media platforms has generated new channels for firms to compete with their rivals. There is very little research on how traditional rivals compete on social media and what the effects of such competition are for related outcomes. To address the gap, our paper examines how firms compete on Twitter. We focus on firms that are close competitors in the traditional context and examine whether these traditional rivals also compete closely (i.e. adopt similar strategies) on Twitter. We find evidence of both isomorphism and divergence among traditional rivals in their online social media content strategies. Interestingly, we find that divergence is linked to higher online engagement.

#### 3 - Master, Jedi, or Guru? Normalizing Job Titles in an Ever-Changing Environment

Nicholas Carson Sullivan, University of Utah, 5752 W. Kintail Ct, West Valley, UT, 84128, United States

In this project, we explore different ways to address the issue of job title normalization. This task has been addressed previously as a way to assess different text classification approaches or advanced word-embedding methods. However, we approach the issue in an attempt to create workable data that can be used to create a more effective job recommender system. Such a system would need to be built on a highly standardized and normalized dataset. Job title normalization is a difficult problem not only because there are often different names for very similar jobs (i.e. Software Developer vs. Software Engineer), but also because it is becoming a common practice to intentionally make up creative job titles for the same jobs (i.e. Java Jedi, Software Guru). Unlike previous work addressing similar tasks, we take advantage of the fact that job titles do not exist in isolation. Throughout a career, an individual will hold many different job titles in a sequential order. For any given job title, valuable information can be learned by looking at the job titles held by the individual before and after the given title. We leverage this information to propose new methods to address the task of job title normalization.

#### 4 - Exploring the True Meaning Behind Words: The Lexicon Creation for Investor Sentiment

Keli Xiao, Stony Brook University, College of Business,  
Stony Brook, NY, 11794, United States, Liang Zhang

We develop an effective lexicon based on multi-sources for accurately differing positive and negative sentiments of investors, and help direct financial comments to their actual meanings. Specifically, we apply an efficient prediction-based neural network model to produce domain-specific lexicons for short financial texts, such as bullish and bearish comments in tweets, blogs and news headlines. We evaluate the generated investor sentiment lexicon based on the performance in unsupervised classification and supervised linear classification, as well as in a nonlinear deep learning method for sentiment classification. Our results shows that new lexicons outperforms existing lexicons.

#### ■ TA68

West Bldg 105C

#### Advanced Maintenance Models

Sponsored: Quality, Statistics and Reliability

Sponsored Session

Chair: Yisha Xiang

#### 1 - Maintaining Systems with Heterogeneous Spare Parts

David Tarek Abdul-Malak, University of Pittsburgh,  
1702 Janney Street, Pittsburgh, PA, 15206-1146, United States,  
Jeffrey P. Kharoufeh

We present a periodic maintenance model for systems maintained with spares that originate from a heterogeneous population, i.e., one with multiple system qualities that are visually indistinguishable. At inspection epochs, a failed system can be correctively repaired or replaced, and a non-failed system can be preventively repaired, replaced, or allowed to continue operating. Repairs place the same system back into service, allowing an operator to update their belief about the active system's quality and utilize this information for decision making. A mixed observability Markov decision process model is formulated and structural results, as well as numerical illustrations, are presented.

#### 2 - Maintenance Model for a Stochastically Degrading System with Individually Repairable Components

Nooshin Yousefi, Rutgers University, Piscataway, NJ, United States,  
Jingyu Chen, David W. Coit

An optimal maintenance model is presented for systems with individually repairable components subject to degradation and random shocks. Previous research often focuses on individual components or one component systems, or systems of components that are replaced at the same time. In practice, it is more economical to repair individual components. However, when this happens, each component within the system can have a different age at the beginning of an inspection interval, and once the system gets into steady-state behavior, the component ages become independent. To minimize system cost rate, optimal on-condition thresholds and a system inspection interval are determined.

#### 3 - Condition-based Maintenance Optimization for Multi-component Systems: A Stochastic Programming Approach

Yisha Xiang, Lamar University, 2626 Cherry Engineering Building,  
Beaumont, TX, United States, Zhicheng Zhu

Condition-based maintenance (CBM) is an effective way to reduce system failure and operating costs with real-time information incorporated. However, most studies of CBM focus on single-component systems, which are not applicable to multi-component systems due to the various interactions between components. In this research, we propose a novel multi-stage model by using stochastic programming, which aims at providing optimal maintenance decisions for complex multi-component systems. Chance constraints are incorporated into this model to guarantee the satisfaction of predetermined budget and the requirement of system's reliability and availability.

#### 4 - Do Routine Breast Cancer Screenings Save Lives?

##### A Maintenance-based Model for Evaluating Current Screening

Suzan Alaswad, Zayed University, Khalifa City A, Office FF1-2-  
010, Abu Dhabi, United Arab Emirates, Sinan Salman

There is controversy regarding breast cancer screening - many scientists debate on the benefits of routine screenings on reducing deaths. In this paper, we evaluate the efficacy of current breast cancer screening policies using a condition-based maintenance model. Screening policies similar to inspection policies can be used to reduce cancer mortality rates. In this study, we model survival time from cancer diagnosis to breast cancer mortality using hypertabastic proportional hazards model. The progression of breast cancer is modeled using a partially observable Markov model. The combined model is used to find the reduction of breast cancer mortality under different screening policies.

Co-Chair: Kaibo Liu, UW-Madison, Madison, WI, 53706, United States

#### 1 - Radiomics 2.0: Integration of Machine Learning and Mechanistic Models for Brain Tumor Mapping Using Multiparametric Magnetic Resonance Imaging

Nathan B. Gaw, Graduate Research Associate, Arizona State  
University, 699 S. Mill Ave, Tempe, AZ, 85258, United States,  
Jing Li

Glioblastoma (GBM) is the most aggressive type of brain cancer. Using multiparametric Magnetic Resonance Imaging (MRI) to quantify intra-tumor cell density distribution for each patient is critical for precision treatment. This falls in the field of "radiomics". Both data-driven machine learning (ML) and cell-biology-based mechanistic models have been developed, but each model has its limitations. We develop a first-of-its-kind hybrid model that integrates semi-supervised ML and a mechanistic model of GBM cell proliferation and invasion (PI), namely the ML-PI model. ML-PI achieves higher accuracy than ML or PI used alone, and produces biologically compliant cell density maps.

#### 2 - A Generic Health Index Approach for Multisensor Degradation Modeling and Sensor Selection

Minhee Kim, University of Wisconsin-Madison, Madison, WI,  
United States, Changyue Song, Kaibo Liu

With recent development in sensor technology, multiple sensors have been widely adopted to monitor the degradation of a single unit simultaneously. This study proposes a novel data fusion method that constructs a one-dimensional health index via automatically selecting and combining multiple sensor signals to better characterize the degradation process. In particular, we develop a new latent linear model that constructs the health index and selects informative sensors in a unified manner. Simulation studies and a case study are presented to illustrate the effectiveness and evaluate the prognostic performance of the proposed method.

#### 3 - Causation-based Monitoring and Diagnosis for Multivariate Categorical Processes with Ordinal Information

Xiaochen Xian, Madison, WI, 53705, United States, Jian Li,  
Kaibo Liu

In this paper, we leverage Bayesian networks to characterize Multivariate Categorical Processes (MCPs) with a causal structure, where the categorical variables can be either nominal, ordinal, or a combination of both. We develop one general control chart and one directional control chart, both of which fully exploit the causal relationships and the ordinal information for better process monitoring and diagnosis. Numerical simulations have demonstrated the superiority and robustness of our method in detecting and diagnosing the conditional probability shifts of nominal factors as well as the conditional latent location shifts of ordinal factors.

#### 4 - Change Point Detection in a Multivariate Process

Rong Pan, Arizona State University, School of Computing  
Informatics & Decision Sys, P.O. Box 878809, Tempe, AZ, 85287-  
8809, United States, Steve Rigdon

In this talk we present a computational Bayesian method for change point detection and compare its performance with other traditional control charts.

### Estimation Issues in Frontier Estimation

Emerging Topic: Productivity, Efficiency and Data Envelopment Analysis

Emerging Topic Session

Chair: John Ruggiero, University of Dayton, Dayton, OH, 45469-2251, United States

#### 1 - A New Family of Copulas, with Application to Estimation of a Production Frontier System

Artem Prokhorov, University of Sydney Business School, Sydney, Australia

We consider a system of equations where one equation is a production function and the others are the first order conditions for cost minimization. The production function equation contains a one-sided error that represents technical inefficiency. The cost minimization equations contain errors that represent allocative inefficiency. If technical and allocative inefficiency are not independent, we encounter the issue that common copulas do not capture the type of dependence that the economic model implies. We design a new copula family that does capture the right type of dependence and illustrate how to use it in practice. This is joint work with C. Amsler and P. Schmidt.

#### 2 - Hinging Hyperplanes as a Nonparametric Estimator

Ole Bent Olesen, University of Southern Denmark, Campusvej 55, Odense M, DK-5230, Denmark, John Ruggiero

Nonparametric estimators with shape constraints of production functions/frontiers have recently received attention in the literature. In this paper we focus on the hinging hyperplane approach suggested by Breiman in 1993. An unknown function is approximated by a sum hinge functions, where each hinge function can be expressed as a sum of two hyperplanes. The intersection of the hyperplanes is denoted a hinge. Using simulation we show how well the hinging hyperplane approach performs compared to other nonparametric estimators. We define several types of hinges and discuss the possibility of using hinge finding algorithms to decide which types of hinges to use in a grid search.

#### 3 - The Half-Normal Normal Stochastic Frontier Model: An Improved Understanding

John Ruggiero, University of Dayton, Dayton, OH, United States

In this paper, we analyze an error structure defined by the convolution of a normal distribution and a half normal distribution. The resulting skewed normal distribution has been widely used in production economics, perhaps for mathematical convenience. The normal and half-normal distributions allow modeling of statistical noise and production efficiency, respectively. We will focus on estimation of this error structure given its relationship to other distributions.

#### 4 - Using DEA to Eliminate Unnecessary Greenhouse Gas Emissions and Save The Planet

Thomas R. Sexton, Stony Brook University, Stony Brook, NY, United States, Christine Pitocco

We use DEA to analyze the greenhouse gas emissions (GHG) of 172 countries using total GHG as an input, gross domestic product as an output, and human development index and population as site characteristics. Our preliminary analysis finds that 20 countries lie on the efficient frontier and that all countries can reduce their total greenhouse gases by approximately 37%.

### Time-Expanded Integer Programming

Sponsored: Computing

Sponsored Session

Chair: Natashaia Boland, Georgia Institute of Technology, Atlanta, GA

#### 1 - Solving Time-Dependent Path Problems with Dynamic Discretization Discovery

Natashaia Boland, Georgia Institute of Technology, Ferst Drive, Atlanta, GA, 30332, United States, Edward He, George L. Nemhauser, Martin W. P. Savelsbergh

Routing in congested networks prompts the need to find paths and associated departure times so as to minimize path duration, where arc travel time depends on the time at which the arc is traversed. We develop an exact dynamic discretization discovery method for the case of piecewise linear travel time functions. Dynamic discretization enables these problems to be solved to optimality by exploring only a small fraction of the breakpoints. Computational experiments show that this fraction decreases as key instance parameters increase, making the algorithm highly scalable. We also generalize the algorithm to minimize total travel time, and demonstrate that it has similar advantages.

#### 2 - Time-expanded Network for Space Mission Planning

Koki Ho, University of Illinois at Urbana-Champaign, 104 S. Wright Street, Talbot Laboratory, Urbana, IL, 61801, United States

This presentation develops a technique based on time-expanded network for human space mission planning and scheduling. As we explore distant destinations like Mars or asteroids, we need a series of flight missions to accomplish the objectives. Logistics and mission planning considerations are critical for those applications. This research will provide a unique solution to this problem using time-expanded network optimization.

#### 3 - Branch-cut-and-price for the Vehicle Routing Problem with Time Windows and Convex Node Costs

Qie He, University of Minnesota, 111 Church Street SE, Minneapolis, MN, 55455, United States, Stefan Irnich, Yongjia Song

Two critical yet frequently conflicting objectives for transportation service companies are improving customer satisfaction and reducing transportation cost. Given a network of customer requests with preferred service times, it is challenging to find vehicle routes and service schedules simultaneously that respect all operating constraints and minimize the total transportation and customers' inconvenience costs. We introduce the Vehicle Routing Problem with Time Windows and Convex Node Costs, in which we model a customer's inconvenience cost as a convex function of its service start time. We propose a branch-cut-and-price algorithm to solve the problem with general convex cost functions.

#### 4 - The Non-Homogeneous Time CIRP

Felipe Lagos, Georgia Institute of Technology, H. Milton Stewart School, 755 Ferst Drive NW, Atlanta, GA, 30332, United States, Natasha Boland, Martin Savelsbergh

We study a continuous time variant of the Inventory Routing Problem (CIRP). The CIRP is the problem of routing vehicles in space and time to deliver product to customers whose demand is a continuous function of time so that customers are never short of product and so that the total delivery cost is minimized. We propose new integer programming models to find good primal and dual bounds for this problem, using these to develop a Dynamic Discretization Discovery algorithm. We prove finite convergence of the algorithm and present computational results, which illustrate the behaviour of the algorithm under different instance characteristics.

### Joint Session INFORMS Prize/Practice: 2018 INFORMS Prize

Emerging Topic: INFORMS Prize

Emerging Topic Session

Chair: Tarun Mohan Lal, Mayo Clinic, 200 1st Street Sw, Rochester, MN, 55905, United States

#### 1 - BNSF -2018 INFORMS Prize Winner

Nathaniel O. Richmond, BNSF Railway, The Colony, TX, 75056, United States

BNSF Railway has more than 41,000 employees working to move freight across its sprawling 32,500-mile rail network. To support its complex operational challenges and drive efficiency, BNSF has embraced a data-driven mentality throughout its business. BNSF was awarded the 2018 INFORMS Prize for pioneering and integrating operations research and analytics programs into its organization. This presentation will highlight several innovative applications of these techniques in areas such as capacity expansion, crew management, and equipment maintenance at BNSF.

### Joint Session MCDM/Practice Curated: Novel Applications of Multiple Criteria Decision Technology

Sponsored: Multiple Criteria Decision Making

Sponsored Session

Chair: Jyrki Wallenius, Aalto University School of Business, Helsinki, Finland

#### 1 - A Stepwise Benchmarking Approach to DEA with Interval Scale Data

Jyrki Wallenius, Aalto University School of Business,  
Runeberginkatu 22-24, Helsinki, Finland, Nasim Nasrabadi, Akram Dehnohalaji, Pekka J. Korhonen

Conventional DEA models assume that all variables are measured on a ratio-scale. However, in many DEA applications we have to deal with interval-scale data. In an earlier paper, we proposed a model for efficiency analysis using interval-scale data. In this talk, we investigate the concept of benchmarking in the framework of interval-scale data. We propose an algorithm, which results in a path of targets for each inefficient unit.

#### 2 - Helping Atrial Fibrillation Patients with Adherence to Anticoagulation Therapy: Design Framework and Intervention Strategies

Wojtek Michalowski, University of Ottawa, Telfer School of Management, 55 Laurier Avenue E, Ottawa, ON, K1N 6N5, Canada, Mor Peleg, Szymon Wilk, Szymon Wilk, Dymna O'Sullivan, Martin Michalowski, Enea Parimbelli, Marc Carrier

Adherence to therapy is one of the main determinants of treatment success and its poor level leads to a substantial worsening of patient's condition. Research described here addresses issue of medication adherence of older adults with atrial fibrillation who are on anticoagulation therapy for primary stroke prevention. We present a design framework of mHealth solution that implements dominance-based rough set theory to identify behavioral triggers that might impact patients' adherence. We induce rules from patient records capturing and analyze these rules for behavioral triggers. We illustrate proposed approach with simple clinical scenario developed using patient vignettes.

#### 3 - Tradeoff Preservation in Inferring Objective Function Weights in Multiobjective Optimization

Taewoo Lee, University of Houston, E209 Engineering Bldg 2, 4722 Calhoun Rd, Houston, TX, 77204-4008, United States

Given an input solution that may not be Pareto optimal, we present a novel inverse optimization methodology for multi-objective optimization that determines a weight vector producing a weakly Pareto optimal solution that preserves the decision maker's trade-off intention encoded in the input solution.

We introduce a notion of trade-off preservation, which we use as a measure of similarity for approximating the input solution, and show its connection with minimizing an optimality gap. We demonstrate the proposed method using clinical data from prostate cancer radiation therapy.

#### 4 - Estimating the Form of a Decision Maker's Preference Function and Converging to Preferred Solutions

Murat Mustafa Koksalan, Middle East Technical University, Indus Engineering Department, Ankara, 06531, Turkey, Gulsah Karakaya

We estimate the form of an underlying preference function that is assumed to represent the preferences of a decision maker in a multi-objective environment. After estimating the form, we use an algorithm that utilizes the properties of the estimated form in order to efficiently converge to a preferred solution of the decision maker. We develop the necessary theory to estimate the form of the preference function. We test our approach on several instances and show that it works well.

### Joint Session MAS/Practice Curated: Personnel and Network Applications

Sponsored: Military and Security

Sponsored Session

Chair: Lee Evans, United States Military Academy, West Point, NY, 10996, United States

#### 1 - Utilizing Healthcare Systems Engineering Tools to Reduce Healthcare Associated Infections

Jose M. Jimenez, Assistant Professor, United States Military Academy, West Point, NY, United States

Healthcare acquired infections (HAIs) have decreased over the last decade. Nevertheless, HAIs are still a burden for healthcare systems all over the world. In addition to the increase in morbidity and mortality of patients that are already at risk, HAIs create economic for healthcare facilities. Although many clinical methods are being utilized to combat HAIs, it is also important to apply holistic, non-clinical solutions. Multidisciplinary approaches provide some of the best tools to gather data, analyze, determine solutions, and apply them. This presentation highlights some of the healthcare systems engineering tools that have assisted in the reduction of HAIs.

#### 2 - Operationalizing Open-source Intelligence on the Korean Peninsula

Steven Song, USMA, West Point, NY, United States

In today's information age, the amount of publicly available information has grown significantly faster than the U.S. Army's ability to fully exploit the potential of open-source intelligence (OSINT). While OSINT, or intelligence derived from publicly available information (PAI), has unique advantages, OSINT is still undervalued and underutilized. This presentation highlights the current state of the U.S. Army OSINT enterprise on the Korean peninsula, captures the gaps, and provides recommendations for better operationalizing OSINT. Key findings indicate additional personnel, training, and partnerships with Korean counterparts are necessary to harness the maximum potential of OSINT.

### Emergency Response (1)

Sponsored: Public Sector OR

Sponsored Session

Chair: Laura Albert, University of Wisconsin-Madison, Madison, WI, 53706, United States

Co-Chair: Forough Enayaty Ahangar

Co-Chair: Suzan Iloglu, University of Wisconsin-Madison, Madison, WI, 53705, United States

#### 1 - Ambulance Emergency Response Optimization in Developing Countries: Methodology

Justin J. Boutilier, University of Toronto, Toronto, ON, Canada, Timothy Chan

The lack of emergency medical transportation is viewed as the main barrier to the access and availability of emergency medical care in low and middle-income countries (LMICs). In this paper, we present a robust optimization approach to optimize both the location and routing of emergency response vehicles, accounting for uncertainty in travel times and spatial demand characteristic of LMICs. We then combine our robust optimization approach with two machine learning frameworks and real data from Dhaka, Bangladesh. The focus of this talk is to present our methodology and present insights on policy-related questions in LMICs.

## 2 - A Covering Model for Locating Ridesharing Depots for Hurricane Evacuation

Forough Enayaty Ahangar, University of Wisconsin-Madison, 3267 Mechanical Eng. Building, Madison, WI, 53706, United States, Laura Albert

We study a class of network optimization problems that enhance a hurricane evacuation system using ridesharing. Our research proposes ridesharing in which people with no proper vehicle or access to public transportation can travel to a safe location by vehicle owners willing to share rides. We formulate a model that identifies multiple depot locations among available public locations (e.g., public schools) and assigns available vehicles to travelers based on the vehicle capacities. The goal is to maximize the number of covered travelers needing rides. We conclude with a discussion of preliminary results demonstrating the performance of the proposed model.

## 3 - Dynamic Resource and Equipment Allocation for an Arctic Mass Rescue Event

Mustafa Can Camur, Rensselaer Polytechnic Institute, 66 13th St. BSMT, Troy, NY, 12180, United States, Thomas Sharkey, Martha Grabowski, Clare Dorsey

We present a mass rescue model containing dynamic logistics decisions for a large-scale maritime evacuation in the Arctic with the objectives of minimizing the impact of the event on the evacuees and the total evacuation time. We model the concept of deprivation costs by incorporating priority levels capturing the severeness of evacuees' current medical situation and period indicating the amount of time an evacuee has not received key relief resources. These costs increase with priority level and period. We will discuss experimental results with policy questions.

## 4 - Analyzing Competing EMSs in Emerging Economies

Jungeun Shin, University of Illinois Urbana-Champaign, Urbana, IL, United States, Jugal Garg, Lavanya Marla, Peter Christopher McGlaughlin

We consider Emergency Medical System (EMS) in non-cooperative settings where customers call multiple EMSs. The patient chooses the first ambulance to arrive, causing wastage and opportunity costs for others. We study a simplified setting of two EMSs located at either end of a unit line, and analyze the coverage strategies of the players under such customer behavior. We show this non-cooperative game has a unique symmetric pure Nash equilibrium, and analyze the Price of Non-Cooperation.

Sponsored Session

Chair: Sung Hoon Chung, Binghamton University, Binghamton, NY, 13902, United States

## 1 - Pseudo Node Insertion and Robust Optimization Approaches for Drone-Truck Combined Delivery

Jinkun Lee, East Carolina University, Greenville, NC, United States, Sung Hoon Chung

We consider a drone-truck combined delivery problem, the advantage of which can be summarized in two folds: 1) enabling faster delivery of items and 2) expanding delivery areas. We use vehicle routing models and algorithms as a basis for our research and add special features such as pseudo node insertion and robust optimization. The purpose of such added features is to resolve drone-truck synchronization issue and eventually to make the drone-truck combined routing more efficient. We formulate a mixed integer programming problem and apply a heuristic method to solve the model as well as the robust counterpart. We present case study examples and discuss efficacy and efficiency of our proposed approach.

## 2 - Waiting Strategy for the Dynamic Pickup and Delivery Problem with Time Windows in Food Delivery Service

Hyunjoon Kim, Pohang University of Science and Technology (POSTECH), 77 Cheongam-Ro, Nam-Gu, Pohang, Kyungbuk, 37673, Korea, Republic of, Byung-In Kim, Byeongmok Kim

We study a dynamic pickup and delivery problem with time windows in quick food delivery business. The problem has multiple objectives: (1) minimize the total delay time of orders, (2) maximize the number of delivered orders, and (3) balance the delivered orders among used vehicles to make income of drivers even. We propose an efficient solution approach for the problem. In addition, we test existing strategies such as drive-first, wait-first, and stochastic-wait and propose a new strategy to handle the dynamics of the problem. Experimental results demonstrate the effectiveness of the approach.

## 3 - Pothole Repair Using a MIP Approach for Scheduling Jobs with Degradation Rate

Fatemeh Aarabi, Amherst, NY, 14228, United States

We study the processing time scheduling of a network of jobs wherein the processing time of each job deteriorates with its start time. To better understanding, we consider one of the applications of this problem in transportation. Seeking to minimize the total process time of jobs, a MIP model is proposed. We present a model which not only accounts to process highly degraded jobs as soon as possible but also considers travel distances between them. Due to the NP-hard nature of the problem, greedy algorithm and chronological decomposition are presented. Different instances of the problem are examined on the transportation network of Buffalo, NY.

## 4 - Civic Engagement & Community Operational Research: A Case Study of Street Sweeping in Jersey City, NJ

EunSu Lee, New Jersey City University, 200 Hudson Street, Harborside 2, #234H, Jersey City, NJ, 07311, United States, Yi-Yu Chen

This presentation will demonstrate a practice of civic engagement and community operational research using the case study of street sweeping in Jersey City, NJ. New Jersey City University (NJCU) recently initiated a pedagogical framework of civic engagement to achieve a mission of urban public university in New Jersey. The presentation will discuss the procedure of developing a civic engagement course and student activities. The audience will be engaged and participated in discussion during the presentation.

Contributed Session

Chair: Ozgun Caliskan Demirag, Penn State Erie, The Behrend College, Black School of Business, 5101 Jordan Road Rm Redc 259, Erie, PA, 16563, United States

## 1 - Trust or Screening? A Study of Impacts of Information Asymmetry on Supply Chains

Xinghao Yan, Assistant Professor, The University of Toledo, 2801 W. Bancroft Street, Toledo, OH, 43606, United States, Meng Li

This paper studies the impacts of information asymmetry on the supply chain from the perspective of behavioral operations. A supplier receives demand information from a retailer's "cheap talk". The supplier has two options to deal with information asymmetry and information credibility: trust the information to some extent or information screening. We compare the two options and find that no option always dominates the other. Interestingly, there are cases where both supply chain members and the system are all better off if the supplier trusts the information without information screening.

## 2 - Boundedness and Complexity in Ethical Purchasing Decisions

Xingzhi Jia, PhD Student, Texas A&M University, Wehner Building, 4113 TAMU, 210 Olsen Blvd, College Station, TX, 77843, United States, Haipeng (Allan) Chen, Xenophon Koufteros

This study investigates purchasing manager's decision-making when both financial and ethical considerations are invoked. We empirically demonstrate that individuals exhibit bounded and complex behavioral patterns due to the interplay between financial benefits and ethical considerations. The observed outcome of ethical decision-making may therefore be driven by multiple mechanisms.

## 3 - Coordination of Make to Order Supply Chain with Volume Flexibility

Shan Chang, Huazhong University of Science & Technology, Wuhan, China, Bin Hu, Tingting Wang, Long Ding

We investigated the upstream manufacturer's investment decision of flexible production capacity in a two-stage supply chain with one downstream retailer, and designed a coordination mechanism, a combination of subsidy for the salvage value and punishment to the shortage, to make the both firms be better off.

## 4 - The Framework for Optimal Supplier Evaluation Based on DEA

JaeHyeok Jo, Undergraduate, Kyungpook National University, Daegu, Korea, Republic of, Sungsu Kim

This research's purpose is to propose the framework to evaluate focal company's shoring strategies. As globalization progresses, multinational companies are being exposed to risks of host countries for operations. Although overseas suppliers' assessment is appeared to be important, the evaluating process for shoring strategies have not been drawn enough attention. This study proposes a linear programming based DEA framework to assess foreign suppliers. Also, integer programming model is introduced to offer an optimal shoring strategy to assist management on shoring decisions.

### 5 - Retailers' Order Placement Timing under Competition and Demand Uncertainty

Ozgun Caliskan Demirag, Associate Professor of O&SCM, Penn State Erie, The Behrend College, Black School of Business, 5101 Jordan Road Rm Burke 259, Erie, PA, 16563, United States, Weili Xue

We consider a supply chain with two retailers and a common supplier. Retailers sell differentiated but substitutable products over a limited selling period and face demand uncertainty. We investigate the retailers' timing of their order placement with the supplier in relation to demand realization and identify the equilibrium strategies. Surprisingly, we find that asymmetric order placement strategies can arise as an equilibrium decision for symmetric retailers.

### ■ TA80

### Practice- Supply Chain Management VI

Contributed Session

Chair: Mike Sherwin, Mississippi State University, 1767 Independence Way, Valencia, PA, 16059, United States

#### 1 - Should the Manufacturer Offer an Emergency Order Opportunity with Uncertain Customer Demand

Meimei Zheng, Shanghai Jiao Tong University, Dongchuan Road 800,, Minhang District, Shanghai, 200240, China, Xue-Ming Yuan

We consider a manufacturer-retailer supply chain in the preselling and selling seasons, where the manufacturer can offer the retailer an emergency order opportunity with limited commitment quantity, in addition to the regular order from the retailer before the selling season. Through mathematical modeling and analyzing the supply chain, it is found that when the emergency order opportunity is provided, the manufacturer might be worse off although the retailer is always better off. We derive the conditions where both manufacturer and retailer can benefit from the emergency order, and the supply chain profit can be maximized.

#### 2 - Advertising in a Capital-constrained Supply Chain with Retailers' Different Market Shares

Haijun Wang, Shanghai Jiao Tong University, Huashan Road 1954, Xuhui, Shanghai, 200030, China

We consider a supply chain with a manufacturer (leader) and two retailers (followers), where both retailers advertise to stimulate ad-related demand. One retailer is capital-constrained and has access to bank financing. The retailer goes bankrupt if he cannot pay off his loan obligation. Each retailer has its own market share and unmet demand in one retailer's market share turn to the other retailer to purchase the product. We formulate the problem as a game theory model with the manufacturer and retailers' objective to maximize their own expected profits. Numerical examples are provided to illustrate the impact of advertising on retailers' capital allocation, and their expected profits.

#### 3 - Sourcing Under Multiple Attributes: Cost Sharing Mechanisms

Shivam Gupta, University of Nebraska Lincoln, P.O. Box 880491, Lincoln, NE, 68588, United States, Milind Dawande, Ganesh Janakiraman, Shouqiang Wang

We propose a simple cost-sharing mechanism for a principal procuring service to complete a project under information asymmetry on the agent's cost and non-cost estimate. We establish its near-optimality, and provide valuable insights into the nature of cost-sharing for its use in practice.

#### 4 - An Optimized Resource Allocation Approach to Identify and Mitigate Supply Chain Risks using Fault Tree Analysis

Mike Sherwin, Mississippi State University, Mississippi State, MS, United States, Hugh Medal, Cameron MacKenzie

Low volume high value (LVHV) supply chains such as airline manufacturing, power plant construction, and shipbuilding are characterized by long lead times and a limited number of suppliers that have both the technical know-how and manufacturing capabilities to deliver the requisite goods and services. In this research, we develop novel approaches that provide a set of tools for industry practitioners to predict supply chain risks, optimally choose which risks to mitigate, and make better informed decisions with respect to supplier selection and risk mitigation while avoiding costly delays due to disruptions in LVHV supply chains.

#### 1 - Community Resilience Planning Alternatives Generation

Kenneth Harrison, Operations Research Analyst, National Institute of Standards and Technology (NIST), 8701 Susanna Lane, Chevy Chase, MD, 20815-4713, United States

Math programming (MP) models will be presented that underpin a decision support tool in development at the National Institute of Standards and Technology (NIST). Most broadly, the models address the search for mitigation/preparedness actions at the community scale that shorten the recovery time from natural hazard events while addressing cost, social and political feasibility. Among the phenomena captured are the stochastic nature of disasters and the linkages between the mitigation decisions and post-event decisions. Important inputs include "interdependency networks", including a lines-of-defense, cascading failure, and recovery network.

#### 2 - Sustainable Energy Supply Planning Under the Impact of Climate Change

Cansu Agrali, PhD Student, Purdue University, West Lafayette, IN, United States, Seokcheon Lee, Roshanak Nateghi

Renewable sources (RS) are one of the main part of energy management environment. RS are known for their intermittent nature caused by weather and climate. If RS systems are able to adapt to and even take advantage of the vital climate change, it may be possible to greatly rely on renewable energy sources in the near future. In this study, we investigate a long-term climate-driven energy supply planning model. A mixed integer model is developed and data set is created by using forecasting methodologies. Because of long-term model nature, a heuristic algorithm is needed. Case studies will be conducted with both MILP model and a heuristic algorithm.

#### 3 - Offline Smart Appliance Scheduling in Smart Grid System

Nihat Oner, PhD Candidate, TOBB University of Economics and Technology, Ankara, Turkey, Cansu Agrali

Home energy management systems are seen as a need to reduce the electricity cost and make efficient the energy management. Coupled with the possibility to generate power at a residential level and the energy storage systems, the management of all devices has been getting more complex. In this work, a smart appliance scheduling in isolated smart grid problem is studied. In this network, renewable generators and energy storage systems are included. As a solution technique, 3 algorithms are designed and tested with benchmarks. The main contribution of this study is a cutting plane algorithm which yields an optimal solution in a reasonable time period.

#### 4 - Weighted P-Dispersion Problem

Saeed Chavoshi, NC State University, 3100 Kings Court, Apartment H, Raleigh, NC, 27606, United States, Yahya Fathi

Given a collection of  $p$  facilities with a weight  $w_i$  associated with each facility  $i$ , and a collection of  $n$  locations ( $n=p$ ) with a symmetric distance  $d_{ij}$  between each pair of locations  $i$  and  $j$ , we seek to establish a location for each facility so as to maximize the minimum weighted distance between all pairs of established facilities. We formulate an integer programming model for this problem and propose an effective method for solving the problem by exploiting its relationship with the well known node packing problem. We also present the results of a limited computational experiment.

#### 1 - The End User Trust Acceptance Model of Genetic Testing Services

Xinyu Wei, University of North Texas, Denton, TX, United States, Heng Xie, Xianghui (Richard) Peng, Victor R. Prybutok

This study investigates end user's perspectives on genetic health risk (GHR) testing services. GHR testing services have expanded dramatically and there is a need to study the trust challenges to end user acceptance of genetic testing services. We develop and test an integrated end user trust model that examines the relationships between trusting bases, trusting beliefs, and trusting intention.

## 2 - Secure Decentralized Decisions in Consolidated Hospital Systems: Intelligent Agents and Blockchain

Adrien Badr, Student, University of Oklahoma, Norman, OK, United States, Shima Mohebbi

Shared decision making and its security have become very important in consolidated healthcare systems. We propose a universal decentralized Decision-Making architecture utilizing trained artificial intelligence for illness detection and Blockchain technology to address the compelling need of coordination among healthcare providers-patients and secure transmission of medical transcripts. Agent-based simulation and optimization will be used to simulate patients' referral process in consolidated hospital systems. We demonstrate the feasibility of the proposed approach via extensive simulation analyses.

## 3 - The Impact of Implementing Full Capacity Protocol on the Operational Performance in an Emergency Department

Lu Wang, PhD Candidate, University of Kansas, Lawrence, KS, 66046, United States, Mazhar Arian, Suman Mallik

Full capacity protocol (FCP) is a set of guidelines that coordinates the patients flow when the emergency department (ED) is overcrowded. Utilizing data from a large urban teaching hospital, we show that the operational performance of the study ED is improved when the FCP is triggered. We propose recommendations to further improve the operational outcomes under FCP. We study how the detailed crowding levels impact patients' length of stay as well as sub-intervals (i.e. waiting time, in-service time and after-service time).

## 4 - Associations Between Hospital Readmission and Length of Stay with Post Acute Referral Following Coronary Artery Bypass Graft or Valve Replacement

Ineen Sultana, Graduate Research Assistant, Texas A&M University, Industrial and System Engineering, College Station, TX, 77843, United States

Hospital readmission and length of stay (LOS) are two key indicators of health care quality. Risk factors associated with hospital readmission and LOS were analyzed for Coronary Artery Bypass Graft and Valve Replacement patients. Results indicated non-uniform care across the U.S. census division and an inversely proportional relation between readmission and LOS. Hospital size, teaching facility, and comorbidity influence LOS, while demographic conditions and support infrastructure influence readmission. Although variation in PAC usage across different region indicates that higher LOS patients were subjected to PAC referral, no direct association of PAC type and readmission was observed.

## 5 - Global Budget Revenue Policy Impact on Emergency Department Efficiency in Maryland

Ai Ren, PhD Student, University of Maryland-College Park, Robert H. Smith School of Business, 3330 Van Munching Hall, College Park, MD, 20740, United States, Bruce L. Golden, Edward Andrew Wasil, Margret V. Bjarnadottir

We conduct an empirical analysis of the impact of Global Budget Revenue (GBR) implementation on Maryland Emergency Department (ED) efficiency measure ED1 from January 2014 to April 2016. We use public data from the Centers for Medicare & Medicaid Services and the Kaiser Family Foundation database. Our study uses Difference in Difference model with mixed effect. We find GBR has statistically significant negative impact on Maryland ED1 efficiency performance but not practically significant.

## 6 - Care-coordination: Gain-sharing Agreements in Bundled Payment Models

Salar Ghamat, Lazaridis School of Business and Economics, 75 University Ave W, Waterloo, ON, N2L 3C5, Canada, Hubert Pun, Greg Zanic

We study gain-sharing agreements, under a bundled payment model, between a hospital and a provider that may cooperate to achieve a desired cost and quality of care collectively. We characterize scenarios that lead to care-coordination between the two parties. We also provide evidence that a target price bundled payment model can be more effective in healthcare settings where the care providers have asymmetric capabilities. We further provide guidance, for the payer, regarding the impact of these models on the health outcome of patients and the total spending.

## 1 - Determining Effective and Practical Colonoscopy Screening and Surveillance Policies

Fatih Safa Erenay, University of Waterloo, Waterloo, ON, Canada, Gizem Sultan Nemutlu, Oguzhan Alagoz

Efficient colonoscopy screening and surveillance policies are desired to cost-effectively reduce colorectal cancer incidence and mortality. We developed a partially observable Markov decision process model to dynamically schedule colonoscopy operations based on accumulated risk of having advanced lesions and other risk-factors. However, clinicians may find such optimal policies too complex to adopt. Using a stochastic model, we derive simple yet effective dynamic colonoscopy policies which perform closely to the optimal policies and are easy-to-implement in clinical practice.

## 2 - A Bayesian Approach to Measuring Healthcare Intervention Impacts

Douglas A. Popken, SVP Analytics, NextHealth Technologies, Inc, 999 18th Street, Suite 2600, Denver, CO, 80202, United States

Measuring the impact of healthcare interventions is challenging due to the random, infrequent, and highly variable nature of follow-on cost and utilization data. While a randomized controlled trial approach reduces measurement bias, standard statistical techniques based on t-tests may not adequately separate signal and noise. Bayesian methods have the advantage of utilizing prior knowledge as well as providing richer output metrics to inform decision makers, both automated and human-in-the loop. We describe our implementation and provide comparative statistics from real-world experience.

## 3 - Economic Assessment of Policies to Prevent Childhood Lead Poisoning

George Miller, Institute Fellow, Altarum, 3520 Green Court, Suite 300, Ann Arbor, MI, 48105, United States, Corwin Rhyhan

Lowering current levels of lead exposure for young children has the potential to improve health, increase earnings, save government expenditures, and reduce disparities. We describe an analysis that estimated the annual economic burden of childhood lead exposure in the U.S. at \$84 billion dollars, including costs of reduced lifetime productivity, increased health care and social assistance spending, and premature mortality. The analysis also identified the potential for residential lead prevention and remediation policies to cut lead exposure levels for young children, resulting in significant long-term economic benefits and in many cases positive net societal returns.

## 4 - A Group Decision Making Approach for Risk Assessment in Distribution of Pharmaceutical Products

Shahrezad Faghil Roohi, Postdoctoral fellow, Eindhoven University of Technology, Eindhoven, Netherlands, Alp Akcay, Yingqian Zhang, Eelco De Jong

This paper presents a group decision making approach for risk assessment in distribution of pharmaceutical products. By using a new intuitionistic fuzzy hybrid TOPSIS approach, we prioritize the risks involved in pharmaceutical distribution. The aim is to overcome the current weaknesses of failure modes and effect analysis (FMEA) method by considering unequal weights of risk factors given by experts for different failure modes. A case study on air cargo distribution of pharmaceutical products is presented to demonstrate the potential applications of the proposed approach, and the merits are highlighted by comparing with the traditional FMEA.

## 5 - Managing Blood Inventory with Random Transfers

David C. Novak, Associate Professor, Grossman School of Business, University of Vermont, 310 Kalkin Hall, 55 Colchester Avenue, Burlington, VT, 05405-0157, United States, Marilyn Lucas, Karti Purnanam

We introduce a method to solve the fixed lifetime perishable inventory problem with a lifetime of  $m > 2$  periods, where there are two independent sources of supply. One source is blood deterministically ordered by the blood bank. The other source is blood that is randomly transferred to the blood bank from smaller, lower-usage hospitals in the health care network. We formulate a DP to solve the multi-period cost minimization problem and test our solution approach theoretically and empirically. We then present a novel heuristic approach for determining a near-optimal ordering policy for any perishable product where redistribution represents a second source of supply.

**1 - The Evolving Use of Patents as a Key Marketing Strategy by High-tech Companies**Fang Wan, University of Rochester, Rochester, NY, 14627,  
United States, Avi Seidmann

Advanced technological capabilities constitute a major recourse for firms trying to achieve and maintain competitive advantages. Patented innovations and efforts therefore may determine the firm's strategic direction. We analyze the impact of novel intellectual properties, especially the role of patents, on business strategies, and value creation. Our large-scale empirical research provides managerial suggestions on allocating firms' resources between technological innovations and traditional marketing.

**2 - Methods for Optimizing Technological Maturity in NASA's Small Business Innovation Research Program**Jeremy Eckhause, RAND Corporation, 1200 S. Hayes St.,  
Arlington, VA, 22202, United States, Andrea Belz, Richard Terrile,  
Aleksander Giga, Fernando Zapatero

Projects funded in NASA's two-stage Small Business Innovation Research (SBIR) program vary in their initial, intermediate and final Technology Readiness Level (TRL). From past performance data, we obtain realistic transition probability distributions, enabling us to optimize strategies and budget allocations under various objective functions, such as maximizing the number of projects attaining a desired TRL threshold or those with any TRL progression. We compare models to historic strategies, highlighting the importance of a real options portfolio approach to maximize program outcomes.

**3 - Growing and Developing Capabilities Along the Value Chain to Sustain Innovations in Emerging Markets**Anshuman Tripathy, Indian Institute of Management-Bangalore,  
Bannerghatta Main Road, Bilekahalli, Bangalore, 560076, India,  
Shikha Safaya

Developed markets are characterized by well defined value chains which consist of modular activities (with well defined interfaces) leading to the delivery of the value proposition to the customers. Thus innovations tend to be, in general, incremental and limited to an activity, adopting the existing interfaces to the value chain. Our study of product, process and social innovations in an emerging market shows that such value chains are nebulous and to ensure sustainability of their innovations, the firms need to integrate through the value chain for economic sustainability, often requiring them to invest in assets and capabilities that, though complementary, are unrelated to their innovation.

**4 - The Influence of a Firm's Supply Network on Its Innovation Capability**Shubhbrata Palit, Student, Georgia Institute of Technology, 800  
West Peachtree NW, Atlanta, GA, 30308, United States, Soumen  
Ghosh

In this research, we explore the role of a firm's supply network in driving its innovation capability. Using secondary data, we examine how the diversity and the intensity of the innovation expertise of suppliers as well as the technology overlap of a firm with its supply base impact a firm's innovation capability.

**5 - Exploring the Origins of Successful Ideas on a Open Innovation Setting**Nilam Kaushik, University College London, London,  
United Kingdom

We explore the factors affecting the successful evaluation of ideas on an open innovation platform, in particular, the role of an idea's genealogical sources. We leverage text mining and information retrieval techniques.

**6 - A Study on the Relationship Between Self-Sacrifice in Leadership and Employee Creativity and Its Impact in the Cross-level Regulation of Team Trust**Yi He, Tongji University, Room 2001, No 58 Songyuan Road,  
Shanghai, 200360, China

This research integrates the theory of social learning and existing research findings in order to find out how self-sacrificing leadership can influence the creativity of employees in an organization. The hypothesis was tested positively, (1) self-sacrificing leadership has significant positive predictive effects on the participation in creative processes and the general creativity of employees; (2) participation in creative processes plays an intermediary role in the relationship between self-sacrificing leadership and employee creativity; (3) cross-level team trust adjusts according to the inclusion in processes of participation and affects employee creativity.

**Plenary: Adopting a Risk-Based Approach to Passenger Screening**

Plenary Session

Chair: Ali E. Abbas, University of Southern California, 3650 McClintock  
Ave, OHE 310R, Los Angeles, CA, 90089, United States**1 - Adopting a Risk-Based Approach to Passenger Screening**  
Kenneth Fletcher, Kestrel Hawk Consulting, Inc., Gathersburg,  
MD, United States

In 2011, the Transportation Security Administration began piloting a risk-based approach to aviation passenger screening. This effort represented a fundamental change in the government's thinking about aviation security. Today, more than 350 million travelers receive expedited screening, and the approach is widely accepted. Adaptations of the U.S. program are functioning in Canada, Germany, Israel, Netherlands and the U.K. However, during the development of this initiative TSA leaders faced several policy decisions relating to accepting risk, treating passengers differently, and how to segment passengers into risk categories. This talk provides an insiders' perspective on TSA's efforts to implement risk-based security from one of the initiatives leading architects.

**Data-Driven and Robust Optimization II**

Sponsored: Optimization/Optimization Under Uncertainty

Sponsored Session

Chair: Phebe Vayanos, University of Southern California, Los Angeles,  
CA, 90089, United States**1 - Efficient Algorithms for Robust Markov Decision Processes**Clint Chin Pang Ho, Imperial College Business School, London,  
United Kingdom, Marek Petrik, Wolfram Wiesemann

Robust Markov decision processes (MDPs) seek for optimal policies in view of the worst transition kernel from within an ambiguity set that specifies the knowledge about the unknown true Markov process. Although robust MDPs have emerged as powerful modeling tools, robust MDPs have typically been considered to be intractable, except for special cases where the ambiguity sets are rectangular in both the states and the actions. In this talk, we develop tractable solution techniques for robust MDPs whose ambiguity sets are only required to be rectangular in the states.

**2 - Robust Reformulations of Ambiguous Chance Constraints with Discrete Probability Distributions**

Ihsan Yanikoglu

This paper proposes robust reformulations of ambiguous chance constraints when the underlying family of distributions is discrete and supported in a box or an ellipsoidal uncertainty set. Using the robust optimization paradigm, the deterministic counterparts of the (ambiguous) chance constraints are reformulated as mixed-integer programming problems which can be tackled by commercial solvers for moderately sized instances. The associated approach can be easily extended to joint chance constraints, nonlinear inequalities, and dependent data without introducing additional mathematical optimization complexity to that of the original robust reformulation.

**3 - An Iterative Algorithm for Robust Optimization with Decision-dependent Uncertainty Sets**Chrysanthos Gounaris, Carnegie Mellon University, Doherty Hall  
3107, Dept of Chemical Engineering, Pittsburgh, PA, 15213,  
United States, Nikolaos L. Lappas, Anirudh Subramanyam

Uncertain parameters whose realization can be affected by the decision maker, also known as endogenous uncertain parameters, could be modeled within the framework of robust optimization using decision-dependent uncertainty sets. However, existing solution methods that rely on classical duality-based reformulations pose known limitations. We propose a primal branch-and-bound algorithm that generalizes the well-known cutting plane method of Mutapcic and Boyd to the case of decision-dependent uncertainty sets. A comprehensive computational study showcases the advantages of the proposed algorithm over that of existing methods across a variety of applications.

#### 4 - Two-Stage Robust Optimization with Decision-Dependent Information Discovery

Phebe Vayanos, University of Southern California, OHE 310L, University Park Campus, USC, Viterbi School of Engineering, Los Angeles, CA, 90089, United States, Angelos Georgioui, Jiachuan Chen

We consider two-stage robust optimization problems in which part of the first stage variables decide on the uncertain parameters that will be observable in the second stage (as in sensor positioning, patrolling). The state of the art formulates the problem as a two-stage robust problem with decision-dependent non-anticipativity constraints and uses binary decision rules over a preselected partition of the uncertainty set resulting in very conservative solutions. We propose a novel min-max-min-max formulation and a solution method based on the K-adaptability idea. We reformulate the problem as an MLP solvable with off-the-shelf solvers and demonstrate its effectiveness on stylized problems.

#### Sparsity in Regression

Sponsored: Optimization/Optimization Under Uncertainty

Sponsored Session

Chair: Dimitris Bertsimas, Massachusetts Institute of Technology, Cambridge, MA, 02139, United States

##### 1 - A Scalable Algorithm for Sparse and Robust Portfolios

Ryan Cory-Wright, PhD Student, Massachusetts Institute of Technology, Cambridge, MA, United States, Dimitris Bertsimas

We present a cutting-plane method which solves the sparse Markowitz portfolio problem to provable optimality at scale, by exploiting a dual representation of the continuous problem to obtain a closed form representation of the problem's subgradients. We refine the cutting-plane method by deriving an efficient local-search heuristic which exploits these subgradients, embedding the heuristic within the cutting-plane method, and exploiting a correspondence between the convexified dual problem and a rotated QCQP to obtain a strong a priori lower bound. We illustrate the method's effectiveness by obtaining optimal sparse frontiers for major indices including the S&P 500 and the Wilshire 5000.

##### 2 - Sparse Regression Over Clusters: Sparclur

Lea Kapelevich, Massachusetts Institute of Technology, 77 Massachusetts Avenue, Bldg. E40-103, Cambridge, MA, United States, Dimitris Bertsimas, Jack W. Dunn, Rebecca Zhang

We aim to develop machine learning models that combine state of the art accuracy and interpretability. Sparse regression models and decision trees are machine learning methods that aspire to achieve both these properties. In this work, we generalize ideas from new developments in sparse regression and optimal regression trees. We present an integer programming approach for regression tasks arising in tree-based machine learning models, and apply it to prediction problems in healthcare.

##### 3 - Sparse Regression Scalable Algorithms and Empirical Performance

Jean Pauphilet, MIT, Cambridge, MA, 02139, United States, Dimitris Bertsimas, Bart Paul Gerard Van Parys

We address the problem of sparse linear and logistic regression from a discrete optimization perspective. We formulate the problem as a convex integer optimization problem and solve it efficiently using a cutting-plane algorithm. We also propose a fast sub-gradient algorithm to solve its Boolean relaxation and compare our approach with L1 regularization and two methods with non-convex penalties. We demonstrate empirically the performance of our methods in terms of accuracy, false detection rate and computational time, for different regimes of noise and correlation.

##### 4 - Optimistic Robust Optimization with Application to Sparse Regression and Classification

Matthew Norton, Naval Postgraduate School, 1 University Circle, Monterey, CA, 93943, United States

Robust Optimization has traditionally taken a pessimistic, or worst-case viewpoint of uncertainty. We explore an optimistic, or best-case view of uncertainty and show that it can be a fruitful approach to address a wide variety of problems. In the context of robust linear programming, we provide an intuitive method for reducing conservatism. We also find that many problems in machine learning and robust statistics can be interpreted as optimistic robust optimization problems. This includes popular sparsity inducing non-convex regularization schemes and outlier protection methods.

##### 1 - Soft Data Analytics with Fuzzy Cognitive Maps:

##### Modeling Health Technology Adoption by Elderly Women

Charles M. Weber, Portland State University, Engineering and Technology Management, P.O. Box 751, Portland, OR, 97207, United States,, Noshad Rahimi

Abstract Modeling how patients adopt personal health technology is a challenging problem: Decision-making processes are largely unknown, occur in complex, multi-stakeholder settings, and may play out differently for different products and users. This paper develops a soft analytics approach, based on Fuzzy Cognitive Maps, which is empirically grounded in a case study of how a group of elderly women adopts wearable devices. The approach leads to an adoption model that simulates different product configurations and scenarios that will most likely lead to successful adoption. The model can be used by product developers and rollout managers to support technology planning decisions.

##### 2 - Knowledge Modularity in Social Networks

Nitin Mayande, Tellagence, 6249 NE Carillion Drive, Unit 201, Hillsboro, OR, 97124-8097, United States, Charles Weber

Network Modularity has been used in many previous studies for community detection. The focus of these studies has mostly been on how people connect with each other to form communities. This exploratory study, instead of people, focuses on contextualized communication (knowledge) and explores to see if Network Modularity measure can be used to quantify Knowledge Modularity thereby identifying knowledge structures within a social network.

##### 3 - Uno or Duo? On Creation and Discovery Entrepreneurship Opportunities and Their Interactions

John N. Angelis, Elizabethtown College, Elizabethtown, PA, United States, Moren Levesque, Richard Arend

While the interaction process between opportunity and the entrepreneur who exploits it has been well researched, research on outcomes has been limited. We provide a formalized explanation of how the two main types of entrepreneurial opportunity (i.e., discovery and creation) interrelate across six specific cases. We provide analysis of a modified model of an established partial-equilibrium production chain. Via theory and simulation, we explain how exploitation of creation opportunities can lead to discovery opportunities; how creation (discovery) opportunities are less (more) likely to be profitable when paired with other opportunity type; and spillover and transfer payment scenarios.

##### 4 - Pricing and Service Bundling at a Smartphone Provider

Eric Bentzen, Copenhagen Business School, Frederiksberg, Denmark, Juliana Hsuan

Many of the attributes with respect to pricing services are implied by economic theory, could be modeled, and investigated using relevant data from a company. In this paper, we will study relationship that a large smartphone service provider should be aware of and use in the pricing of bundling services. From a smartphone company we have access to customers and their use of cell phone services, Internet access and other services provided by the company. The dataset has been collected during a period and includes the amount that a large number of customers are willing to pay for each service.

### Extended Formulations in Integer Programming and Combinatorial Optimization

Sponsored: Optimization/Integer and Discrete Optimization

Sponsored Session

Chair: Gonzalo Muñoz, Polytechnique Montr al, Montr al, QC, H3T 1N8, Canada

#### 1 - Extended Formulations for Unstructured Integer Programs

Akshay Gupte, Clemson University, Dept. of Mathematical Sciences, O-321 Martin Hall, Clemson, SC, 29634-0975, United States, Amin Khademi, Andrew J. Schaefer

We present a systematic procedure for constructing extended formulations for convex hulls of pure integer programs. Our technique relies on only the data for the LP relaxation, and does not depend on any particular structure of the IP feasible set. A key step in our construction is the use of subadditive duality for integer programming. If the original LP is represented by a totally dual integral system with integral right hand side, then our extension is exactly the LP polyhedron, as desired. Finally, we apply our result to packing and covering problems.

#### 2 - LP & SDP Hierarchies: How to Schedule?

Víctor Verdugo, Universidad de Chile & Ecole normale supérieure, Santiago, Chile

Convex hierarchies are systematic approaches to strengthen a relaxation. In this talk we will focus on how to construct extended formulations using LP and SDP hierarchies for the problem of scheduling identical machines starting from the configuration linear program, and how they fail to obtain gaps arbitrarily close to one even when they are exponentially sized. We then provide some ideas of how we can overcome this negative result in the context of identical machines and how to construct a new family of polynomial sized relaxations with gap arbitrarily close to one.

#### 3 - Formulations for Spanning Tree (and Related Problems) in Planar Graphs

Hamidreza Validi, Oklahoma State University, Stillwater, OK, 74075, United States, Austin Buchanan

In a 2002 Networks paper, Williams proposed an IP formulation for spanning trees of a planar graph. The formulation is remarkably small (using only  $O(n)$  variables) and remarkably strong (defining an integral polytope). In this talk, we show that Williams' formulation is incorrect as stated, providing a binary feasible solution that does not represent a spanning tree. We characterize when this can happen and show how to fix the formulation. We also propose generalizations of the fixed formulation for related problems.

#### 4 - Treewidth-based Extension Complexity Lower Bounds

Gonzalo Muñoz, Polytechnique Montr al, Montr al, QC, Canada, Yuri Faenza, Sebastian Pokutta

In this work, we study the extension complexity of 0/1 sets parametrized by treewidth: a graph-theoretical parameter that measures structured sparsity. If a 0/1 set can be formulated as the set of binary vectors that satisfy a certain system of constraints, and those constraints present a sparsity pattern whose treewidth is  $k$ , then it is known that the extension complexity of the convex hull of the set is  $O(n^2 k)$ . The goal of this work is to prove the existence of 0/1 sets that (nearly) meet this bound, for any arbitrary treewidth level  $k$ . To the best of our knowledge, this is the first work to provide parametric lower bounds on extension complexity based on the treewidth.

### Recent Developments and Methods in Nonconvex Optimization

Sponsored: Optimization/Linear and Conic Optimization

Sponsored Session

Chair: Brendan Ames, University of Alabama, Tuscaloosa, AL, United States

#### 1 - Non-convex Factorization Methods for the K-disjoint-clique Problem

Alexander Barnes, University of Alabama

Large-scale semidefinite programming has many applications, including optimal control, computer vision, and machine learning. However, current algorithms for solving semidefinite programs (SDPs) can be time consuming and memory intensive. We look at new heuristics for the solutions of SDPs based on non-convex factorization, the augmented Lagrangian method, and alternating minimization. In particular, we will focus on solutions of semidefinite relaxations for the  $k$ -clique and  $k$ -cluster programs. We will present numerical results illustrating the efficacy of our approach for clustering of real and simulated data.

#### 2 - Landscape of Neural Networks for Binary Classification

Ruoyu Sun, University of Illinois, Urbana-Champaign

We study the landscape of neural networks for binary classification and provide conditions under which the training error is zero at all local minima. Our results provide a few necessary and sufficient conditions; for example, for ReLU and sigmoid activation functions bad local minima exist, while for strictly increasing and convex functions bad local minima disappear. Other conditions include: the neural network should either be single-layered or is multi-layered with a shortcut-like connection, and the surrogate loss function should be a smooth version of hinge loss.

#### 3 - Foundations of Nonconvex and Nonsmooth Robust Subspace Recovery

Tyler Maunu, University of Minnesota

We present a mathematical analysis of a nonconvex energy landscape for Robust Subspace Recovery. We develop generic conditions that ensures recovery of an underlying subspace in corrupted datasets. We further show that if the generic condition is satisfied, a geodesic gradient descent method over the Grassmannian manifold can exactly recover the underlying subspace. We also examine the recovery limits in the case of arbitrary outliers.

#### 4 - Leave-one-out Analysis for Convex and Nonconvex Matrix Completion

Yudong Chen, Cornell University, 223 Frank H.T. Rhodes Hall, School of ORIE, Ithaca, NY, 14853, United States, Lijun Ding

We introduce a powerful technique, Leave-One-Out, to the analysis of matrix completion problems. This technique allows us to obtain entry-wise bounds for iterative stochastic procedures. We demonstrate its power in analyzing two quintessential algorithms for matrix completion: the non-convex approach Singular Value Projection (SVP), and the convex relaxation approach Nuclear Norm Minimization (NNM). For SVP, we prove for the first time that the unmodified form of this algorithm, without sample splitting, converges linearly in infinity norm. For NNM, we study its dual solution and establish the first sample complexity bound that depends optimally on the matrix dimension and condition number.

### Joint Session OPT/Practice Curated: Convex Optimization and Applications to Machine Learning

Sponsored: Optimization/Global Optimization

Sponsored Session

Chair: Georgina Hall, Princeton University, Princeton, NJ, 08544, United States

#### 1 - Time-varying Semidefinite Programs

Amir Ali Ahmadi, Princeton University, Dept. of Operations Research&Financial Eng., Sherrerd Hall (room 329), Charlton Street, Princeton, NJ, 08544, United States, Bachir El Khadir

Time-varying semidefinite programs (TV-SDPs) are semidefinite programs whose feasible set and objective function vary continuously over a bounded time interval and whose solution is a bounded measurable function of time. We show that the best polynomial solution of a given degree to a TV-SDP can be found by solving an SDP of tractable size. We also prove that under mild assumptions, polynomial solutions are as good as any bounded measurable solution. Joint work with Bachir El Khadir.

#### 2 - Nonnegative Polynomials and Applications to Learning

Georgina Hall, INSEAD Business School, Boulevard de Constance, Sherrerd Hall, Fontainebleau, 77300, France

In this talk, we show how techniques from sum of squares optimization can be applied to two problems at the interface of machine learning and polynomial optimization. In part (i), we study the problem of learning a monotone polynomial from data. This is motivated by regression problems where the underlying function to be learned is monotone (consider, e.g., the price of a car as a function of its fuel efficiency). In part (ii), we study the problem of optimally decomposing a multivariate polynomials as the difference of two convex polynomials. This is motivated by certain majorization-minimization algorithms used in nonconvex optimization that require such a decomposition.

#### 3 - Design of First-order Optimization Algorithms via Sum-of-squares Programming

Mahyar Fazlyab, University of Pennsylvania, Philadelphia, PA, United States, Manfred Morari, Victor M. Preciado

We use tools from sum-of-squares programming to design iterative first-order optimization algorithms for smooth and strongly convex problems. Our starting point is to develop a polynomial matrix inequality as a sufficient condition for exponential convergence of the algorithm. We then formulate a polynomial optimization, in which the objective is to optimize the exponential decay rate over the tunable parameters of the algorithm (e.g. stepsize, momentum coefficient, etc.). Finally, we use sum-of-squares programming as a tractable relaxation of the proposed polynomial optimization problem. We illustrate the utility of the proposed framework by designing an accelerated method.

#### 4 - Near-Optimal Joint Matching via Convex Relaxation

Yuxin Chen, Princeton University, NJ, United States

Joint matching over a collection of objects aims at aggregating information from a large collection of similar instances (e.g. images, graphs, shapes) to improve maps between pairs of them. Given multiple matches computed between a few object pairs in isolation, the goal is to recover an entire collection of maps that are (1) globally consistent, and (2) close to the provided maps – and under certain conditions provably the ground-truth maps. In this work, we develop a convex relaxation algorithm to jointly match multiple objects that exhibit only partial similarities, given a few pairwise matches that are densely corrupted. The algorithm provably exhibits near-optimal error-correction ability.

#### Networked Infrastructure Resiliency and Recovery

Sponsored: Optimization/Network Optimization

Sponsored Session

Chair: Sachin Mhatre, North Carolina A&T State University, North Carolina A&T State University, Greensboro, NC, 27408, United States

##### 1 - System Resilience Modeling Under Multi-hazard

Yao Cheng, Beihang University, 37 Xueyuan Road, Haidian District, Beijing, 100191, China

There has been significant development of complex engineered systems in the last two decades. The increasing natural and manmade hazards have caused significant performance disruption of such systems. In this presentation, we focus on one of the extended reliability metrics, namely resilience to assess the ability of such systems to withstand and recover when hazards occur. We propose quantifications of resilience for non-repairable and repairable systems under multi hazard. As restoration is conducted with limited resource under most circumstances, we recommend importance measures (IMs) to identify critical components in the system.

##### 2 - Resilience Investment in Supply Chain Network Under Stochastic Disruptions

Kedong Chen, University of Minnesota, Minneapolis, MN, 55454, United States,, Ankur Mani, Kevin W. Linderman

Supply chain disruptions are common yet costly. Companies are motivated to invest resilience resource in their supply chain networks to mitigate disruptions, but they face the question of which nodes to invest. This study characterizes the optimal strategies of resilience investment for generic layered supply chain networks. Through analyzing the stochastic network where resilience investment reduces the chance of a node being disrupted, we find node capacity and path characteristics (path length and flow) to be key factors in the investment decision. The frequency of disruptions determines the management focus between node and path. Managerial implications are provided.

##### 3 - Bi-objective Restoration Plan Optimization for Transportation Infrastructures Considering Both Total Travel Time and Unmet Demand

Tingting Zhao, University of South Florida, 4202 E. Fowler Avenue, ENB 118, Tampa, FL, 33612, United States

A bi-objective bi-level problem is formulated for restoration plan optimization of transportation infrastructure system after disruptions. The upper-level one is to maximize system resilience measured by total travel time and unmet demand with limited resources. The lower-level one is a network flow assignment problem considering unmet demand in the system after the event. The single objective problem can be linearized and then transformed to MILP problem. The bi-objective MILP problem is solved by Triangle Splitting Method. The proposed methodology is evaluated with a typical road network.

##### 4 - A Heuristic Approach to the Post-disturbance Microgrid Formation Problem

Xin Shi, Lehigh University, Bethlehem, PA, United States, Kwami Senam A. Sedzro, Alberto J. Lamadrid, Luis F. Zuluaga

Microgrid formation is a potential solution in post-disaster electric grid recovery efforts. Recent works propose distribution level microgrid formation models using MILP techniques. However, these models can only be solved for small and medium-size power systems due to their computational intractability. In this talk, we introduce a heuristic approach that allows to approximately solve the microgrid formation problem for medium to large, more realistic, instances. Furthermore, the proposed approach allows to approximately solve the stochastic version of the problem.

#### 5 - A Stochastic Optimization Model for Road Network Protection and Restoration During a Natural Disaster

Sachin Mhatre, Graduate Assistant, North Carolina Agricultural & Technical State University, 1601, E. Market St., Greensboro, NC, 27411, United States, Xiuli Qu

Natural disasters disrupt infrastructures, communities and thousands of individuals every year in the world. Effective protection and restoration of road transportation systems play an important role in disaster operations, such as rescuing and relief delivery. In this study, a stochastic integer linear programming model is developed to schedule road protection activities and locate road restoration resources when a hurricane approaches, and to plan road restoration activities and allocate resources after a hurricane. The model integrates the decisions for both preparedness and response activities during a disaster, which will improve decision making in disaster management.

Sponsored Session

Chair: Alec Koppel, U.S. Army Research Laboratory, Silver Spring, MD, 20910, United States

##### 1 - Models and Algorithms for Risk-sensitive Inverse Reinforcement Learning

Marco Pavone, Phd, Stanford University, Palo Alto, CA, 94305, United States

The literature on Inverse Reinforcement Learning (IRL) typically assumes that humans take actions in order to minimize the expected value of a cost function, i.e., that humans are risk neutral. Yet, in practice, humans are often far from being risk neutral. In this talk, I will present a framework for risk-sensitive IRL that can explicitly account for a human's risk sensitivity. Specifically, I will present non-parametric and semi-parametric algorithms for inferring a human's underlying risk measure and cost function for a rich class of static and dynamic decision-making settings.

##### 2 - Risk-averse Multi-armed Bandit Problems

Qing Zhao, Professor, Cornell University, 325 Rhodes Hall, Cornell University, Ithaca, NY, 14853, United States, Sattar Vakili

Risk-averse multi-armed bandit problems are studied under the measure of mean-variance. Compared with the risk-neutral objective of maximizing the expected cumulative reward, the mean-variance measure defined on the observed reward process leads to a regret that depends on high-order statistics of the random time spent on each arm and can no longer be written as a simple sum of certain immediate performance loss defined in isolation for each time instant. Regret lower bounds and order-optimal policies are established within both problem-specific and minimax frameworks.

##### 3 - Controlling the Bias-Variance Tradeoff via Coherent Risk for Robust Online Learning with Kernels

Alec Koppel, Phd, U.S. Army Research Laboratory, Adelphi, MD, 20783, United States

In supervised learning, we learn a statistical model by minimizing a merit of fitness averaged over data and ignore the variance, i.e., the gap between the optimal within a hypothesized function class and Bayes Risk. We account for \*both\* by incorporating coherent risk, which quantifies decision uncertainty. We develop the first solution to this problem when in reproducing kernel Hilbert spaces (RKHS) called Compositional Online Learning with Kernels (COLK). COLK uses stochastic quasi-gradient together with greedy projections to mitigate the per-iteration complexity of RKHSs. We establish COLK converges and that its complexity is at-worst finite. Experimentally, COLK overcomes overfitting.

##### 4 - Recursive Optimization of Convex Risk Measures: Mean-Semideviation Models

Dionysios Kalogerias, Postdoctoral Research Associate, Princeton University, Sherrerd Hall Room 119, 98 Charlton Street, Princeton, NJ, 08544, United States, Warren B. Powell

We develop and analyze stochastic subgradient methods for optimizing a new class of convex risk measures, termed as Mean-Semideviations. First, we study the basic properties of Mean-Semideviations, and constructively characterize them from a theoretical viewpoint. We then introduce the MESSAGEp algorithm, a compositional stochastic subgradient procedure for solving convex Mean-Semideviation risk-averse problems to optimality. Pathwise convergence of the MESSAGEp algorithm is established within a new, versatile and powerful theoretical framework, which reveals a fundamental tradeoff between the smoothness of the cost function and that of the particular risk measure of choice.

**Nonconvex Optimization in Machine Learning**

Sponsored: Optimization/Nonlinear Programming

Sponsored Session

Chair: Ruoyu Sun, UIUC, Minneapolis, MN, 55414, United States

**1 - Gradient Descent with Random Initialization: Fast Global Convergence for Solving Quadratic Systems of Equations**

Yuxin Chen, Princeton, Yuejie Chi, Jianqing Fan, Yuejie Chi

This talk considers the problem of solving systems of quadratic equations. We investigate the efficiency of gradient descent designed for the nonconvex least squares problem. We prove that under Gaussian designs, gradient descent when randomly initialized yields an  $\epsilon$ -accurate solution in a logarithmic number of iterations given nearly minimal samples, thus achieving near-optimal computational and sample complexities at once. This provides the first global convergence guarantee concerning vanilla gradient descent for phase retrieval, without the need of (i) carefully-designed initialization, (ii) sample splitting, or (iii) sophisticated saddle-point escaping schemes.

**2 - Planning for RL and RL for Planning**

Yuangdong Tian, Facebook, Menlo Park, CA, USA.

Agents trained with reinforcement learning (RL) are usually reactive: they take actions from the observations, perceive new observations and repeat. However, human doesn't behave this way. They plan by predicting what would be possible futures if some actions were taken, and pick the actions that lead to the best consequence. This involves a strong modeling of the world and its dynamics, which is non-trivial to obtain even for simulated situations such as games. In this talk, we introduce our recent works about how planning is done in RL, and how RL can help perform better planning

**3 - Understanding Landscape of Neural Networks for Binary Classification**

Ruoyu Sun, UIUC, IL, United States

We study the landscape of neural networks for binary classification and provide conditions under which the training error is zero at all local minima. We provide a rather comprehensive study on necessary conditions as well as sufficient conditions. For example, we show that while ReLU and sigmoid activations lead to bad local minima, strictly increasing and convex activation functions can eliminate bad local minima. Other conditions include: the neural network should either be single-layered or is multi-layered with a shortcut-like connection, and the surrogate loss function should be a smooth version of hinge loss.

**Market Design**

Sponsored: Manufacturing &amp; Service Oper Mgmt

Sponsored Session

Chair: Gabriel Weintraub, Stanford Graduate School of Business, Stanford, CA, 94304, United States

**1 - How (Not) to Allocate Affordable Housing**

Peng Shi, University of Southern California, USC Marshall School of Business, BRI 303D, 3670 Trousdale Pkwy, Los Angeles, CA, 90089, United States, Nicholas A. Arnosti

Motivated by affordable housing allocation in NYC, we study a stylized model in which items are dynamically assigned to waiting agents. The planner has two goals—to match each agent with the most fitting item, and to target the agents with the highest need. We find that the current practice of independent lotteries encourages agents to enter many lotteries, resulting in inefficient matching. The matching can be improved by limiting the number of lottery entries, but this can result in worse targeting. We prove that this tradeoff between matching and targeting cannot be avoided as long as the levels of need are private knowledge, and give guidance on which to prioritize to maximize utilitarian welfare.

**2 - Designing Framework Agreements: A Field Study in Government Procurement**

Marcelo Olivares, Associate Professor, Universidad de Chile, Santiago, Chile, Gabriel Weintraub, Daniela Saban, Eduardo Lara

Framework Agreements (FA) is a commonly used procurement mechanism by governments and large organizations. It is based on an auction-type design to select an assortment of products from multiple suppliers with posted prices, allowing some flexibility and variety to purchasing units. The design of FA requires balancing competition to enter the market with the variety offered inside the market. This paper conducts an empirical study of the FAs used by the Chilean government, identifying inefficiencies in the procurement market, providing improvements to design and conducting a field study to measure the actual effectiveness of the new implemented design.

**3 - Revenue Management versus Machine Learning in Product Assortment: Evidence from Large Field Experiments on Alibaba**

Dennis Zhang, University City, MO, 63124, United States, Jacob Feldman

We developed a personalized multinomial logit model to find the optimal set of products to display for each incoming customer. We deployed our model in Alibaba's online recommendation system and compared its performance against the state-of-art machine learning approach used in Alibaba by conducting a large-scale field experiments over more than 40 million customers. Our results show that, despite its low performance in prediction, the MNL-based approach generates higher revenue per customer.

**4 - Clearing Matching Markets Efficiently: Informative Signals Andmatch Recommendations**

Itai Ashlagi, Stanford University, Huang Engineering Center, 475 Via Ortega, Stanford, CA, 94305, United States

We study how to reduce congestion in two-sided matching markets with private preferences. We show that when the unobservable component of agent preferences satisfy certain natural assumptions, it is possible to recommend potential matches and encourage informative signals such that 1) the market reaches an equilibrium outcome, 2) the overall communication overhead is small. The main idea is to only recommend partners whom the agent has a non-negligible chance of both liking and being liked by, as estimated by the observable component of preferences and prior expression of interest by agents on the other side based on the unobservable component of their preferences.

Sponsored Session

Chair: Shawn Mankad, Cornell University, Cornell University

**1 - Credit Risk Propagation Along Supply Chains**

Jing Wu, City University of Hong Kong, Department of Management Sciences, Hong Kong, Senay Agca, Volodymyr O. Babich, John R. Birge

We find that credit risk propagates through multiple supply chain tiers for both positive and negative credit shocks. Specifically, we show sizeable rating and industry-adjusted CDS spread changes of 44-71 bps at the first tier, continuing for 2nd and 3rd tier supply chain partners. Credit risk contagion is more pronounced when supply chain partners are covered by the same analysts. The contagion disappears with inactive supply chain links. The contagion is magnified with longer-term supply-chain relations, trade credit, sales contribution, differentiated products, and customer leverage, while it is moderated when a customer is investment grade or has more inventory.

**2 - Inventory Financing Under Raroc**

Yuxuan Zhang, London Business School, London, United Kingdom, Simin Huang, S. Alex Yang

Starting from the 1990s, banks begin to adopt the Risk Adjusted Return On Capital (RAROC) criterion in loan pricing. In this paper, we study how this criterion influence the bank's decision on inventory financing, as well as the supply chain implication of this pricing mechanism.

**3 - Systemic Risk and Bank Holdings**

Shawn Mankad, Cornell University

The recent financial crisis has focused attention on identifying and measuring systemic risk. We propose a novel approach to estimate the portfolio composition of banks as function of daily interbank trades and stock returns. Our approach estimates bank asset holdings at higher frequencies allowing us to derive precise estimates of (i) portfolio concentration within each bank's measure of diversification and (ii) common holdings across banks's measure of market susceptibility to propagating shocks. We find evidence that systemic risk measures derived from our approach lead, in a forecasting sense, several commonly used systemic risk indicators.

**4 - Regularized Estimation of Factor-augmented Autoregressive Models**

George Michailidis, University of Florida, UF Informatics Institute, 432 Newell Drive, Gainesville, FL, 32611-8545, United States

We consider the factor-augmented vector autoregressive (FAVAR) model in the high dimensions, where the large observed block and the latent factor block jointly follow a vector autoregressive (VAR) model, with an additional information series linked to both of them contemporaneously through a linear model. We address model identifiability and estimation issues and examine the performance of the model through simulations. Further, we apply the model to an economic dataset involving commodity prices and macroeconomic sequences to investigate interlinkages amongst the former.

### Crowdfunding

Sponsored: Manufacturing & Service Oper Mgmt

Sponsored Session

Chair: Michael R. Wagner, University of Washington, Seattle, WA, 98195, United States

#### 1 - Signaling to the Crowd: Private Quality Information and Rewards-based Crowdfunding

Soudipta Chakraborty, Duke University, Durham, NC, United States, Robert Swinney

We consider the problem faced by a creator designing a rewards-based crowdfunding campaign via a platform like Kickstarter. The creator solicits pledges from backers, and if total pledges exceed a pre-determined threshold, the campaign is successful, the creator receives all pledges and each backer receives a reward. Otherwise, the campaign fails and backers are refunded their pledges. We determine how the creator should design her crowdfunding campaign when backers know less than her about the value of the reward.

#### 2 - Referral Timing and Fundraising Success in Crowdfunding

Diwakar Gupta, McCombs School of Business, Austin, TX, United States, Gordon Burtch

Entrepreneurs frequently leverage social contacts to generate traffic to a crowdfunding campaign. Considering campaign fundraising progress, we address the question of exactly when an entrepreneur should involve his or her social connections. The optimal strategy depends on whether the rich-get-richer or the crowding-out effect dominates contributor behavior after observing prior capital accumulation. We also report on a number of simulation analyses which speak to heterogeneity in the efficacy of the optimal referral policy under different situations, e.g., in the presence of seed money.

#### 3 - Crowdfunding via Revenue-sharing Contracts

Soraya Fatehi, University of Washington, Michael G. Foster School of Business, University of Washington, 358 Mackenzie Hall, Seattle, WA, 98195-3200, United States

We present a new model of crowdfunding where a platform acts as a matchmaker between a firm needing funds and a crowd of investors willing to provide capital. Once the firm is funded, it pays back the investors using revenue sharing contracts. The firm determines its optimal contract parameters to maximize its expected net present value (NPV), subject to investor participation constraints and platform fees. Parametrized on real data from Bolstr.com, we show that revenue-sharing contracts provide a higher NPV and a lower probability of bankruptcy than equity crowdfunding or a fixed-rate loan, for all levels of cash-flow uncertainty.

#### 4 - Does Crowdfunding Benefit Entrepreneurs and Venture Capital Investors?

Volodymyr Babich, Georgetown University, Washington, DC, United States, Simone Marinesi, Gerry Tsoukalas

We study how crowdfunding interacts with traditional financing sources (VC and bank). We model a multi-stage bargaining game, with a moral-hazard problem between entrepreneurs and banks, and a double-sided moral-hazard problem between entrepreneurs and VCs. Economic value of crowdfunding is generally shared between entrepreneurs and investors, benefiting both. Furthermore, crowdfunding can alleviate underinvestment due to financial frictions problem for some projects. However, crowdfunding can also harm the entrepreneur and the VC. The model provides a theoretical underpinning for recent empirical observations that some projects lose VC financing after successful crowdfunding campaigns.

#### 5 - Crowdfunding, Signaling, and Venture Capital

Jussi Keppo, National University of Singapore, Mochtar Riady Building, BIZ 1 8-69, 15 Kent Ridge Drive, Singapore, 119245, Singapore, Ming Hu, Yunnan Jin

We study how venture capital (VC) investments are affected by crowdfunding platforms. We find that VCs utilize crowdfunding as a signaling device on the quality of startups. Therefore, in industries where the crowdfunding option is available, startups become more strategic and VCs are more likely to delay their investment decisions after observing the information from the crowdfunding platform. We link our findings to VC investment data.

### Behavioral OM in Healthcare

Sponsored: Manufacturing & Service Oper Mgmt/Healthcare Operations

Sponsored Session

Chair: Mor Armony, New York University, New York, NY, 10012, United States

Co-Chair: Nan Liu, Boston College, Chestnut Hill, MA, 02467, United States

#### 1 - Load Balancing in Multi-featured Multi-class Multi-skill Service Systems

Nitzan Carmeli, Technion Israel Institute of Technology, Haifa, Israel, Galit B. Yom-Tov, Avishai Mandelbaum

Operational offered load, and its calculated agents utilization through queueing theory, support the design, staffing and routing of congestion-prone service systems. However, in many such systems, and healthcare in particular, agents experience additional features of load such as emotional and cognitive - these cause stress and fatigue even when the offered load is low. How does one balance such load among servers, in a way that accommodates its multi-features? In our research we develop a novel theoretical framework that supports answers to this question. More concretely, we consider a queueing system with skills-based routing, within which we optimally and fairly balance multi-feature load.

#### 2 - Improving the Use of Operating Rooms Using Surgeon Input

Song-Hee Kim, University of Southern California, Los Angeles, CA, United States, Rouba Ibrahim

When allocating operating room times to surgery cases, hospitals need to know how long the surgeries will take. Although the estimation of surgery case duration has been extensively studied, accurately predicting surgery case duration remains a challenge. We examine ways to systematically combine surgeons' forecasts with a model based on observed attributes to improve the accuracy of surgery case duration predictions, and hence the use of operating rooms.

#### 3 - Predicting Readmission Risk by Leveraging Connected Health Devices

Tan Lekwijit, The Wharton School, University of Pennsylvania, 3730 Walnut St, Ste 500, Philadelphia, PA, 19104, United States, Christian Terwiesch, Kevin Volpp

Hospital readmission of patients with chronic diseases is often viewed only as a sign of poor quality of care. However, a significant part of the risk can be attributed to the lack of medication adherence. We utilize daily adherence information obtained from electronic pill bottles and investigate the impact of long-term and short-term medication adherence in patients with coronary artery disease on the risk of readmission. We find that long-term adherence to Statin is associated with a 47% reduction in the likelihood of readmission on any given day. In an ongoing work, we are examining the impact of different levels of adherence interventions, such as messages, calls, and letters, on patient behavior.

#### 4 - Withholding Capacity from Strategic Patients

Yunchao Xu, New York University, New York, NY, 10012, United States, Mor Armony, Nan Liu

Common wisdom suggests that everything else being equal, seeing patients sooner rather than later is preferable. In particular health outcomes improve with reduced delay and so does patient satisfaction. At the same time, if the delay in access to care is reduced, patients may be more inclined not to show up for their appointments given that rescheduling will not result in excessive wait. We investigate how an outpatient care provider should manage capacity in the presence of such strategic behavior of patients. We find that under some circumstances, it is optimal for the service provider to withhold capacity from patients in order to elicit them to show up for their scheduled appointments.

**Behavioral Service Operations**

Sponsored: Manufacturing &amp; Service Oper Mgmt/Service Operations

Sponsored Session

Chair: Ilan Lobel, New York University, New York, NY, 10012, United States

Co-Chair: Yash Kanoria

**1 - Managing Customer Churn via Service Mode Control**

Jiaqi Lu, PhD Student, Columbia Business School, New York, NY, 10027, United States, Yash Kanoria, Ilan Lobel

Customer churn is an important issue for service firms. They are expensive to acquire and often leave quickly if disappointed with the service. We formulate an optimal control problem for a firm that needs to dynamically choose between service modes with different risk-reward profiles, faced with a customer that is likely to leave if unhappy with recent experiences. Our results reveal when the firm should deviate from a myopic strategy: prefer a low risk service mode if the customer is currently not a flight risk but may become one if unhappy with the next few services; prefer a high risk service mode if the customer is currently at a flight risk but may no longer be one if happy with the next few services.

**2 - Rewards or Discounts: Improving Fast Food Chain Operations**

Rim Hariss, MIT, Georgia Perakis, Yanchong Zheng

We empirically examine the joint effects of rewards program and price discounts on customer purchase behavior in a fast food chain setting. We use an instrumental variable approach to reliably estimate their joint impact on customer spent and company profit. Leveraging this empirical relationship between reward redemption and purchase on discount, we develop a parsimonious customer choice model to dynamically predict purchase behavior, which allows us to effectively evaluate alternative designs of rewards program and quantify their impacts on profitability. Insights from this analysis are offered to the fast food chain company to help with current efforts on redesigning its rewards program.

**3 - Inconvenience, Liquidity Constraints, and the Adoption of Off-Grid Lighting Solutions**

Bhavani Shanker Uppari, INSEAD, Singapore, Singapore, Serguei Netessine, Ioana Popescu, Rowan Clarke, Manuel Barron, Martine Visser

A significant proportion of world's population does not have access to electricity. Solar-based solutions are usually unaffordable due to consumers' poverty. There are alternative business models relying on rechargeable light bulbs that are sold at a subsidized price and require regular payments for recharges. We investigate the viability of these recharge-based models under poverty. In collaboration with a firm in Rwanda, we collected the bulb usage data from randomized experiments wherein the price and the bulb capacity were varied. We also build a structural model that incorporates the light consumption dynamics, and use it to evaluate theoretically-preferred changes to the existing model.

**4 - Modeling Customer Response to Service Quality Variability with Implications for Pricing**

Jordan Tong, University of Wisconsin, Gregory A. DeCroix

Given the same expected quality, customers tend to demand less when quality is more variable. How should firms price their service in light of this behavior? In a simple setting of repeat service under stationary but variable quality, we show that it is not necessary to model customers with a risk-averse utility function in order to generate a revenue penalty for quality variability. Instead, a simple and behaviorally robust learning-from-experience formulation - even with risk neutrality - can lead to a quality variability penalty. We study the structure of the optimal pricing policy under this relatively understudied mechanism to generate insight into pricing strategy under quality variability.

Sponsored Session

Chair: Georgia Perakis, Massachusetts Institute of Technology, Cambridge, MA, 02142-1347, United States

**1 - Optimizing Objective Functions Determined from Random Forests**

Max R. Biggs, Massachusetts Institute of Technology, 77 Massachusetts Ave NE49-40497, Cambridge, MA, 02139, United States, Rim Hariss

We study the problem of optimizing a tree-based ensemble objective with the feasible decisions in an arbitrary polyhedral set. We model it as a Mixed Integer

Linear Program and show it can be solved to optimality efficiently using Pareto optimal Benders cuts. For large problems, we consider a random forest approximation of only a subset of trees and prove analytical guarantees that this gives rise to near optimal solutions. The error of the approximation decays exponentially as the number of trees increases. We propose heuristics that optimize over smaller forests rather than one large one and showcase their performance on two case studies: a property investment problem and a jury selection problem.

**2 - Picking Multi-item Orders in the Warehouse of a Large Online Retailer: Data, Models and Simulations**

Chongli Daniel Chen, Massachusetts Institute of Technology, Cambridge, MA, 02142, United States, Mehmet Tolga Cezik, Retsef Levi, Georgia Perakis

We describe theoretical and data-driven work in collaboration with an online retailer. In a warehouse, multi-item orders take up capacity on a wall until all items are picked. To avoid exceeding capacity, the retailer must balance picking efficiency with completing orders quickly. We model a novel variant of the Traveling Repairman Problem to account for this tradeoff. We propose a picking policy and determine conditions under which it achieves a greater percentage decrease in order cycle time than the percentage increase in makespan compared to the optimal makespan path, when items lie on a line or grid. We build a data-driven simulation and test our policy, reducing wall utilization by 38%.

**3 - Joint Pricing and Production; A Distributionally Robust Approach**

Qinshen Tang, National University of Singapore, Singapore, Singapore, Georgia Perakis, Melvyn Sim, Peng Xiong

In this paper, we consider a two-period joint pricing and production problem for multiple fashion items. We take distributionally robust approach. By clustering the historical data, we construct a scenario-wise ambiguity set with the support and moment(s) information of the demand. We then reformulate the problem as a tractable MIP problem. Through an extensive numerical study, we get some interesting managerial insights. In particular, we compare policies that arise from different decision rules using various methods for the single (as well as two) product(s) problem.

**4 - The Practice of Bundling Under Competition**

Araz Khodabakhshian, UCLA, Los Angeles, CA, 90024, United States, Guillaume Roels, Uday S. Karmarkar

Bundles are common in many industries, but there are also several examples of firms that choose not to bundle when faced with competition. We study competitive bundling under two models of quantity and price competition. Our analysis shows that even with full symmetry assumptions, competition can give rise to non-symmetric equilibrium strategies among the firms. We study duopoly, as well as, oligopoly bundling and examine the implications of bundling on the entry game. We show equilibrium results given different customer utilities and firm cost structure, covering the full range of strategies for a two product market. Our results have implications for a wide range of service and product industries.

Sponsored Session

Chair: Yanchong Zheng, Massachusetts Institute of Technology, Cambridge, MA, 02139, United States

Co-Chair: Somya Singhvi, MIT, Cambridge, MA, 02139, United States

**1 - Knowledge Sharing and Learning Among Smallholders in Developing Economies: Implications, Incentives, and Reward Mechanisms**

Shihong Xiao, HKUST, Rm5569, IELM Dept., Clear Water Bay, Kowloon, Hong Kong, 999077, Ying-Ju Chen, Christopher S. Tang

NGOs and governments are advocating various knowledge-sharing platforms for farmers to exchange farming techniques. Putting altruism aside, we examine the overall economic implications for heterogeneous farmers to share their private knowledge voluntarily with others under (implicit) competition. By analyzing a multi-person sequential game, we provide a plausible explanation of why and conditions under which knowledge sharing can be beneficial even when each farmer's profit depends on the total output. We find that the voluntary shared level is inadequate in maximizing farmer welfare, and propose a quota-based reward mechanism that can entice farmers to share more knowledge.

## 2 - Incentive Mechanisms for Managing Hidden Rebates and Deceptive Quotes of a Procurement Service Provider

Xiaoshuai Fan, Hong Kong University of Science and Technology, Kowloon, Hong Kong, Ying-Ju Chen, Christopher S. Tang

When sourcing through a procurement service provider (PSP), the retailer may end up selecting an inefficient manufacturer due to conflicting interests and information asymmetry. PSPs may collect rebates from some willing manufacturers that are “hidden” from the retailer and have incentive to help them win the order by inflating or omitting quotes from those unwilling manufacturers. To reveal PSP’s private information, we explore a deterministic incentive mechanism based on a selection rule and a service fee structure. We show it is Pareto-improving for the retailer and the PSP. Furthermore, when the retailer can penalize the PSP for deceptive quote, we develop a stochastic incentive mechanism.

## 3 - Speculative Shortages in Agricultural Supply Chains: The Effect of Government Interventions

Somya Singhvi, MIT, 235 Albany Street, Cambridge, MA, 02139, United States, Retsef Levi, Yanchong Zheng

Speculative shortages that lead to exorbitant increases in retail prices of essential commodities are a matter of great concern for governments, who employ a range of strategies to mitigate this phenomenon and its impact. We develop analytical models to capture the dynamics of speculative shortages and the impact of government interventions on market behavior and prices. We validate our models using retail price data from India and highlight that to be effective, interventions need to be carefully designed while taking potential strategic responses of market players into account.

## 4 - Impact of Travel Delay in Queues

Wanyi Li, Stanford University, Stanford, CA, United States, Daniela Saban, Erica Plambeck

In service industry, customers have to travel to a server to join the queue. Our project studies the impact of travel delay on queue dynamics in a single server setting. When arrival to queue is not instantaneous, the phenomenon of queue length oscillation may arise. We analyze the welfare impact and waiting time impact that travel delay has on the system. We also identify the parameter regime under which the queue will be stable. We show that oscillation of queue length due to travel delays hurts customer welfare in general. Our theoretical results have important implications on the food processing industry and gives insights on waiting time announcement design in this industry.

## Managing Incentives to Improve Performance

Sponsored: Manufacturing & Service Oper Mgmt/Supply Chain

Sponsored Session

Chair: Izak Duenyas, University of Michigan-Ann Arbor, Ann Arbor, MI, 48109-1234, United States

## 1 - Audit and Remediation Strategies in the Presence of Evasion Capabilities

Shouqiang Wang, The University of Texas at Dallas, Naveen Jindal School of Management, 800 W. Campbell Rd, Richardson, TX, 75080, United States, Francis E. De Vericourt, Peng Sun

Firms often face negative externalities from privately observable stochastic events that occur at another party. To mitigate these externalities, the firm needs to know in time if such an event has occurred and hold the other party liable. The other party, however, prefers to conceal the event’s occurrence so as to evade its responsibility. The goal of this paper is to devise efficient strategies for firms to uncover the occurrence of stochastic events such as these.

## 2 - Procurement Mechanisms with Post-auction pre-selection Cost-reduction Investigations

George Chen, London Business School, London, United Kingdom, Damian Beil, Izak Duenyas

Consider the following procurement setting: After seeing suppliers’ bids, the buyer can choose to investigate some suppliers to identify cost-reduction opportunities; the investigated suppliers’ costs will decrease by the identified cost-reductions; the buyer then awards the contract. We characterize the optimal first-price sealed-bid mechanism, as well as an optimal mechanism among a wider class of mechanisms. For ex-ante symmetric suppliers, incorporating investigations create an ex ante win-win situation for everyone. The win-win may break down when suppliers are sufficiently asymmetric, but no supplier has the incentive to unilaterally block investigation.

## 3 - Optimal Contract for Machine Repairing and Maintenance

Feng Tian, University of Michigan, 2231 Stone Road, Ann Arbor, MI, 48105, United States, Peng Sun, Izak Duenyas

A principal hires an agent to repair a machine when it is down and maintain it when it is up. If the agent exerts effort, the downtime is shortened, and uptime is prolonged. The effort, however, is costly to the agent and unobservable to the principal. The principal intends to design the optimal dynamic contract, which involves payments and contract termination, to induce the agent to always exert effort. We formulate this problem as a stochastic optimal control model with incentive constraints in continuous time over an infinite horizon. Although we allow payments to take general forms to depend on all past public information, the optimal contract has a simple and intuitive structure.

## Networks, Matching and Platforms

Emerging Topic: Business Model Innovation

Emerging Topic Session

Chair: Yiangos Papanastasiou, University of California Berkeley, Berkeley, CA, 94720, United Kingdom

## 1 - Dynamic Allocation Without Money: An Equivalence Result

Nicholas A. Arnosti, Columbia Business School, 3022 Broadway, Uris Hall rm 402, New York, NY, 10027, United States

We consider a large-market model in which objects of different types are dynamically assigned to waiting agents, who have arbitrary preferences over object types. We find that using independent lotteries is equivalent to using a single waitlist in which applicants lose their position after rejecting an offer. Furthermore, these systems are equivalent to clearing the market with virtual currency. Finally, we show that using multiple waitlists is equivalent to using a single waitlist in which applicants are allowed to keep their position after rejecting an offer.

## 2 - Market for Personal Data?

Azarakhsh Malekian, University of Toronto, 35 Oak St., Somerville, MA, 02143, United States

With the increasing ease with which personal information can be accessed, the issue of privacy has become central for the functioning of various online platforms. In this talk, we study the privacy implications of market design for personal information.

## 3 - Platforms for Socially Responsible Operations

Daniela Saban, Stanford University, Palo Alto, NY, 94304, United States

Implementing socially responsible operational practices is becoming a priority for most organizations. Online platforms, if carefully designed, can be effective tools to implement such practices. We discuss two examples: a platform to increase transparency in government purchases (joint work with R. Beer and I. Rios), and a platform to increase traceability in the palm oil supply chain (joint work with S. Camelo, J de Zegher, and D. Iancu)

## 4 - When Bribes are Harmless: The Power and Limits of Collusion-resilient Mechanism Design

Artur Gorokh, Cornell University, Ithaca, NY, United States, Siddhartha Banerjee, Krishnamurthy Iyer

Many results in mechanism design break down when participating agents can collude. In particular, when monetary transfers are allowed between colluding agents, truthful revelation and efficiency are incompatible. We consider a relaxation for the problem, replacing truthful revelation with a property we call collusion dominance: all coalitions need to have dominant strategies. We prove an efficient, collusion-dominant mechanism exists for a large class of allocation problems that satisfy a surplus submodularity condition, and conversely, prove impossibilities when this condition fails.

**New Directions in Pricing and Revenue Management**

Sponsored: Revenue Management &amp; Pricing

Sponsored Session

Chair: Georgia Perakis, Massachusetts Institute of Technology, Cambridge, MA, 02142-1347, United States

**1 - Estimating Customer Trends to Target Promotions**

Lennart Baardman, Massachusetts Institute of Technology, Cambridge, MA, 02139, United States, Setareh Borjani Boroujeni, Tamar Cohen, Kiran V. Panchamgam, Georgia Perakis

Detecting trends in fashion can help retailers determine effective personalized promotion plans more easily. Social media data is valuable in understanding these trends, but it is often unavailable. We introduce a personalized demand model that captures customer trends from transaction data instead. We base our efficient estimation method on instrumental variables, which allows us to draw causal inference on the effects that targeted promotions have. The promotion targeting problem is NP-hard to solve, so we develop an efficient and provably-good greedy approach. Finally, with real fashion retail data, we estimate our customer trend model and test the promotion targeting algorithm.

**2 - Dynamic Pricing for Unknown Latent Class Models**

Divya Singhvi, MIT, 235 Albany Street, 5010 A, Cambridge, MA, 02139, United States, Pavithra Harsha, Georgia Perakis

We consider the problem of dynamic pricing when customers belong to unknown latent classes. Specifically, we consider a demand model in which a customer's demand response depends on her class. Neither the class, nor the demand functions of the customer class is known. We construct a dynamic pricing policy that is asymptotically optimal and show that it performs considerably better than other benchmark policies for the latent class case.

**3 - Dynamic Learning and Optimization for Online Advertising Portfolios Under Periodic Budgets**

Elaheh Fata, Massachusetts Institute of Technology, Cambridge, MA, 02139, United States, Lennart Baardman, Georgia Perakis, Abhishek Pani

The tremendous growth in online personalized data and ad channels enables publishers to auction off targeted advertising slots to advertisers. Everyday, advertisers bid on a portfolio of targets to maximize advertising revenue within their budget constraint. As the advertiser needs to learn the value of targets, we use an exploration-exploitation framework to model this online advertising portfolio optimization problem. We solve this problem using an optimistic-robust learning (ORL) algorithm based on UCB algorithms and robust optimization. Theoretically, we prove its expected regret is bounded, and computationally, we show its powerful performance on real-world data.

**4 - Markdown Policies for Demand Learning and Strategic Customer Behavior**

N. Bora Keskin, Duke University, Fuqua School of Business, 100 Fuqua Drive, Durham, NC, 27708-0120, United States, Hongfan Chen

We consider a firm selling a product to a finite population of myopic and strategic customers with heterogeneous valuations. The firm faces uncertainty about the market size and how strategic customers are. We develop guidelines for designing asymptotically optimal markdown policies for demand learning in the presence of strategic customers.

**Revenue Maximization Beyond Traditional Models**

Sponsored: Revenue Management &amp; Pricing

Sponsored Session

Chair: Emmanouil Pountourakis, University of Texas at Austin, Austin, TX, United States

**1 - Selling Partially-ordered Items: Exploring the Space Between Single- and Multi-dimensional Mechanism Design**

Kira Goldner, University of Washington, Box 352350, Seattle, WA, 98195, United States

With respect to optimal seller revenue, the single-dimensional (i.e. one item) setting and multi-dimensional (i.e. heterogeneous items) setting sit at extreme ends of a spectrum: from simple and fully characterized (single-dimensional) to complex and nebulous (multi-dimensional). In this paper, we study where various bundles of items are for sale, and a buyer is single-minded for some bundle (i.e. is satisfied if and only if he receives a superset of said bundle). We prove that this setting's optimal mechanism sits between the above extremes, both in menu size (here it is unbounded, but always finite) and in the known

characterization (here we give structural properties, but it is not closed-form).

**2 - Optimal Mechanism Design with Risk-loving Agents**

Emmanouil Pountourakis, University of Texas at Austin, Austin, TX, United States, Evdokia Velinova Nikolova, Ger Yang

One of the most celebrated results in mechanism design is Myerson's characterization of the revenue optimal auction. However, this result relies heavily on the assumption that buyers are indifferent to risk. In this paper we study the case where the buyers are risk-loving, i.e. they prefer gambling to deterministic rewards. We characterize the optimal auction and show that randomization can be used to extract more revenue than when buyers are risk-neutral. Most importantly, we show that the optimal auction is simple: the optimal revenue can be extracted using a randomized take-it-or-leave-it price for a single buyer and using a loser-pay auction, a variant of the all-pay auction, for multiple buyers.

**3 - Algorithmic Delegation**

Ali Khodabakhsh, University of Texas at Austin, Austin, TX, United States, Emmanouil Pountourakis, Sam Taggart

We initiate the study of delegation from an algorithmic perspective. An uninformed principal must consult an informed agent to make a decision over which both agent and principal have preferences that depend on the state of the world. The principal may commit to a mechanism, mapping agent's reports to actions. We derive measures of alignment and conflict between the principal and agent for each action in each state, and show that when alignment is insensitive to the state, it is optimal for the principal to select an action without consulting the agent. When conflict is insensitive to the state, it becomes approximately optimal for the principal to adopt a form of threshold policy.

**4 - On Low-rank (quasi-convex) Minimization for a Wide Class of Combinatorial Problems**

Orestis Papadigenopoulos, University of Texas at Austin, Austin, TX, 78705, United States, Swati Gupta, Evdokia Velinova Nikolova

The problem of non-linear, low-rank discrete minimization has been studied under the following similar assumptions: (a) the optimal solution lies on the Pareto-optimal front of a corresponding multi-objective optimization problem, or (b) the objective function is quasi-concave. In our attempt to relax these assumptions, we study minimization of quasi-convex objectives over combinatorial sets and propose efficient approximation schemes. Note that our problem is already NP-hard, even for the case where the rank of the quasi-convex objective is one, using a simple reduction from the exact spanning tree problem.

**Topics in Revenue Management and Assortment Optimization**

Sponsored: Revenue Management &amp; Pricing

Sponsored Session

Chair: Pelin Pekgun, University of South Carolina, Columbia, SC, 29205, United States

Co-Chair: Ovunc Yilmaz, University of Notre Dame, South Bend, IN, 46617, United States

**1 - Multi-location Assortment Optimization under Capacity Constraints**

Alper Sen, Bilkent University, Department of Industrial Engineering, Bilkent, Ankara, 06800, Turkey, Basak Bebitoglu, Philip Kaminsky

We study the assortment optimization problem of a retailer which uses multiple DCs to fulfill orders. Each DC can carry up to a pre-specified number of products and is responsible for a region whose customers' choice is governed by an MNL model. A DC can fulfill demand from another region, but at an additional cost. The retailer's problem is to determine the products carried in each DC and the assortment in each region so as to maximize its expected profit. We show that the problem is NP-complete and develop a conic MIP formulation. Numerical experiments show that large instances can be solved optimally using this approach. Finally, we study the effect of various factors on profits and assortment structure.

**2 - Finite-horizon Approximate Linear Programs for an Infinite-horizon Revenue Management Problem**

Fan You, University of Colorado-Boulder, 995 Regent Drive, Boulder, CO, 80302, United States, Thomas Vossen, Dan Zhang

We consider a rolling-horizon revenue management problem that is formulated as an infinite-horizon discounted cost Markov decision process. We propose a solution strategy based on approximate linear programming. Under affine and finite-horizon approximations, we show that the approximate linear programming formulations admit compact representations and therefore can be solved efficiently. The solutions provide revenue bounds and can be used to construct heuristic control policies. We conduct numerical study to evaluate bound and policy performance.

**3 - Correcting for Price Endogeneity in Demand Models:****Linear Regression v. Discrete Choice**

Stacey Mumbower, University of South Carolina, 1014 Greene Street, Columbia, SC, 29208, United States, Pelin Pekgun, Mark Ferguson

The combination of capacity controls and price changes in the airline industry results in fares that are heavily influenced by demand signals, leading to price endogeneity in demand models. Using an airline dataset to model flight-level demand as a function of daily prices, we demonstrate and compare two modeling approaches where price endogeneity can be corrected with instrumental variables. More specifically, we compare a linear regression modeling methodology to a discrete choice methodology and compare price elasticity estimates from both models. We highlight several key differences between the two approaches and discuss challenges that researchers encounter in model estimation.

**4 - A Product-focused Approach to Dynamic Programming Decomposition for the Network Revenue Management and Pricing Problems**

Ravi Kumar, PROS Inc, Houston, TX, United States, Wei Wang, Dariusz Walczak

We consider a dynamic programming formulation of the network revenue management problem. Due to the curse of dimensionality, various approximate dynamic programming methods based on the classical resource-based decomposition approach are used in practice. We revisit our earlier alternative idea of the product-based network decomposition and develop a novel dynamic model for the problem that relies on simultaneous solving of sub-problems. We present numerical analysis to compare the revenue and computation performance of the new method with the more classical ones.

**On-Demand Transportation Services**

Sponsored: Revenue Management & Pricing

Sponsored Session

Chair: Philipp Afeche, University of Toronto, Toronto, ON, M5S 3E6, Canada

Co-Chair: Costis Maglaras, Columbia University, New York, NY, 10027, United States

**1 - Ride Solo or Pool: The Impact of Sharing on Optimal Pricing of Ride-sharing Services**

Jagan Jacob, University of Rochester, Simon Business School, 4-349 Carol Simon Hall, Rochester, NY, 14627, United States, Ricky Roet-Green

Using on-demand ride-sharing service providers (RSPs) such as Uber and Lyft, passengers can either ride solo and pay full fare, or share the ride with a fellow passenger (pooling) and pay a reduced fare. Though pooling is less expensive, cost of sharing is incurred from sharing the space with a possible stranger. We use stochastic modeling to study the passengers' ride-choices at equilibrium, the RSP's revenue-maximizing pricing strategies, the impact of the number of cars available, and social welfare.

**2 - Economic Challenges in Designing a Sustainable Urban Mobility Marketplace**

Ragavendran Gopalakrishnan, Postdoctoral Associate, Cornell University, Ithaca, NY, United States, Chamsi Hssaine, Siddhartha Banerjee, Samitha Samaranayake

Mobility-as-a-Service is becoming increasingly more efficient, convenient, and ubiquitous in urban areas, with the proliferation of multiple service providers across several modes. Instead of private service providers operating independently, a centralized marketplace in which they participate along with a public transit agency to collectively clear demand using multi-modal trips would enjoy a better operational efficiency, by increasing the quality of the mobility solutions offered to commuters. In this talk, we discuss the challenging task of finding an efficient mechanism/contract structure that would stabilize such a centralized mobility marketplace from an economic perspective.

**3 - Fairness of Pricing and Service Priority in Last Mile Transportation Systems**

Yiwei Chen, University of Cincinnati, Cincinnati, OH, United States, Hai Wang

We consider a last-mile transportation system (LMTS) that consists of regular-type passengers and special-type passengers, such as senior. A special-type passenger who has a higher valuation of service usually has a lower waiting disutility. We show that with the objective of maximizing profit or social welfare, the LMTS operator always has incentive to give the special-type passengers the least service priority and charge them more than the regular-type passengers. This entails the necessity to impose fairness constraints on the price discount and service priority for the special-type passengers. We use real data in Singapore transportation system to quantify the analysis.

**4 - A Tale of Timescales: Surge Pricing and Matching for Hotspot Demand Shock in Ride-Hailing Networks**

Zhe Liu, Columbia Business School, 3022 Broadway, New York, NY, 10027, United States, Philipp Afeche, Costis Maglaras

We study a ride-hailing network that matches price- and delay-sensitive riders with strategic drivers. We consider surge pricing and spatial matching in response to an uncertain demand shock at a hotspot. We characterize optimal centralized and decentralized policies, and show how their performance depends on three key timescales, rider patience, shock duration, and drivers' travel delay to the hotspot.

Co-Chair: Abel Cadenillas, University of Alberta, Edmonton, AB, T6G 2G1, Canada

**1 - Bail-ins And Bailouts: Incentives, Connectivity, and Systemic Stability**

Benjamin Bernard, University of California, Los Angeles, 1440 Veteran Ave, Unit 344, Los Angeles, CA, 90024, United States, Agostino Capponi, Joseph E. Stiglitz

We develop a framework for analyzing how banks can be incentivized to make contributions to a voluntary bail-in consortium. At the heart of the issue lies the credibility of the regulator's threat to not bail out insolvent banks when no solvent bank agrees to contribute. We show that credible bail-in strategies exist if and only if the network hazard does not exceed a certain threshold. The threat is more credible and incentive-compatible contributions by banks are larger in more concentrated networks, making more them more desirable in the presence of bail-ins than more diversified networks.

**2 - The Optimal Government Debt Ceiling When Interventions Are Bounded**

Abel Cadenillas, University of Alberta, Department of Mathematical Sciences, Edmonton, AB, T6G 2G1, Canada

We develop a government debt management model to study the optimal government debt ceiling when the ability of the government to generate primary surpluses to reduce its debt ratio is bounded. We obtain an analytical solution for the optimal debt ceiling. [This is a joint work with Ricardo Huaman-Aguilar].

**3 - Contracting For Financial Execution**

Christoph Frei, University of Alberta, Mathematical and Statistical Sciences, CAB 621, Edmonton, AB, T6G 2G1, Canada, Markus Baldauf, Joshua Mollner

Financial contracts often specify reference prices whose values are undetermined at the time of contracting, which introduces the possibility that one side manipulates them to the detriment of the other. Motivated by this, we study a model of financial contracting with the potential for manipulation of this nature, finding that a simple contract based on the volume-weighted average price (VWAP) emerges as uniquely optimal solution to a principal-agent problem between a client and her broker. This result explains the popularity of guaranteed VWAP contracts in equity trading and suggests a direction for improvement upon the status quo in other asset classes.

**4 - Real Options With Performance-sensitive Debt**

Benoit Chevalier-Roignant, King's College London, 30 Aldwych, London, London, WC2B 4BG, United Kingdom, Alain Bensoussan, Alejandro Rivera

We consider a firm that decides on when and by how much to expand its production capacity. This firm is not financed solely by equity, but also by a performance-sensitive debt (PSD) instrument (Manso, Strulovici and Tchisti, 2010). Debt financing induces here the possibility for shareholders—to which benefits the management decides—to default on their debt obligations (Leland, 1994). We investigate the interactions between the performance-sensitive coupon and the firm's capacity expansion strategy as well as the extent to which PSD can mitigate the underinvestment problem on both the timing and sizing of the investment.

**1 - Users' Continuous Participation in the Online Weight-loss Communities**

Tongxin Zhou, University of Washington, 3927 Adams Lane NE, Seattle, WA, 98105, United States, Lu Yan, Yingfei Wang, Yong Tan

Many weight-loss communities are designed to provide individuals with community support and, thus, help with their weight management. However, it has been noticed that such communities suffer from high drop-out rate. Therefore, we are interested in finding what factors influence users' continuous participation. We adopt the Continuous-time Hidden Markov model to calibrate users' participation trend. The hidden state we modeled is users' commitment to weight-loss. We find that self-monitoring tools are effective for users with low commitment level. Social support tools such as friend and supporter functions exert different effects on users with different commitment levels.

**2 - To Mine or Not to Mine: An Analysis of Crypto-mining Profitability**

Vipul Aggarwal, University of Washington, Seattle, WA, 98105, United States, Yong Tan

In the cryptocurrency ecosystem, miners wield an inordinate amount of power as their participation can stagnate or extend a blockchain. Miners' participation is incentivized through block fees and rewards subject to finding the right hash value at some given difficulty level. We investigate their mining preferences after the Bitcoin fork of August 2017 which resulted in the creation of Bitcoin cash (BCH). Due to fluctuation in difficulty levels of BCH, miners move frequently between the chains. However, profitability ratios do not justify such frequent movements in the face of competition from other miners. We analyze their mining behavior using a structural model to ascertain their motivations.

**3 - Adaptive and Personalized Thermal Comfort Based HVAC Control**

Weilong Wang, Purdue University, 403 W. State Street, West Lafayette, IN, United States, Siliang Lu, Chaochao Lin

Throughout a person's whole life, he/she spends 90% of time indoors since buildings can provide satisfactory environments for human beings. As one of the key building systems, Heating, ventilation and air-conditioning (HVAC) system plays a key role in shaping the building performances. The effective and efficient HVAC operations not only achieve energy savings but also create a more comfortable environment for occupant indoors. We use Machine Learning technology to analyze differences of thermal sensation under the same conditions between different people with GMM clustering and then implement value iteration-based controller with the prediction model as the simulated environment.

**4 - The Substitution Effect of Sharing-bike on Ride-sharing Platform**

Juan Qin, Harbin Institute of Technology, 4138 Brooklyn Ave NE, WA 98105, Seattle, WA, 98105, United States

Sharing-bike was introduced to solve the "last-mile problem" whereas ride-sharing platform has been serving as a popular means for both short-distance and long-distance journeys. Does sharing-bike solve the "last-mile problem" and have a substitution effect on ride-sharing platform? Will geographic heterogeneity affect the way sharing-bike and ride-sharing platform compete? We take a natural experiment setting and conduct an RDD model to answer these research questions. We exploit granular order data from a leading ride-sharing platform in China and combine it with geographic information to look into the heterogeneous substitution effect.

**1 - A New Lp (0<p<1) Distance-based Similarity Measure for Collaborative Filtering to Preserve Item-wise Independence**

Shan Jiang, North Carolina State University, 1513 Collegeview Avenue, Unit 101, Raleigh, NC, 27606, United States, Shu-Cherng Fang, Qi An, Zheming Gao

In the field of recommendation systems, neighborhood-based collaborative filtering is one widely accepted method of making recommendations. The first and most crucial step of this method is to measure similarities between customers so that recommendations to a target user can be made based on the information from similar past users. In this paper, we propose an lp-distance-based similarity measure with  $0 < p < 1$ , which makes better use of rating values and is resistant to biases from some items. Numerical results show that the proposed similarity measure is able to generate more accurate predictions with general sparsely distributed datasets as well as with datasets having cold start conditions.

**2 - A Deep Choice Model for Hiring Prediction in Online Labor Markets**

Yixuan Ma, Beijing Jiaotong University, Beijing, China, Zhenji Zhang, Alexander Ihler

The fast-flouring online labor markets provide valuable opportunities to study hiring mechanism. We construct a relational dataset composed of 722,339 accomplished job posts that are tendered by multiple bidders from one of the largest real-world freelancer platform. We propose a Deep Choice Model (DCM) that extends the classical Conditional Logit Model (CLM) to learn the non-linear utility functions for hiring decision making. The DCM can be well-fitted in modern Deep Neural Network framework and be implemented using  $1 \times 1$  convolutional networks. We test the DCM on the 12 categories of job posts in the constructed dataset. Results show that the DCM outperforms the CLM.

**3 - Digital Goods Market Share as a Growth Problem**

Irfan Kanat, Assistant Professor, Ohio University, 123 Louise Lane, Athens, OH, 45701, United States

The market share of digital goods follow a distinct pattern. The market share grows rapidly for a short period after release, the growth first slows and then stops after a period. The exact shape of the growth curve is driven by product design, and promotions employed by the developer. Nature of digital goods (marginal cost, ownership structure, repeat purchases) create significant differences in the growth structure in comparison to more traditional physical goods, meriting a closer inspection. In this study we investigate the effects of product design and promotions on growth of market share utilizing a unique dataset obtained from one of the most popular digital distribution platforms (Steam).

**4 - Dynamic Pricing of New Products under Anticipatory Adoption Models**

Mehrnaz Amjadi, PhD Student, UIC College of Business, 601 S. Morgan St, UH2401, Chicago, IL, United States, Vijay Kamble, Theja Tulabandhula

Adoption of services or products is a critical concern for new businesses. Many of these products/services are characterized by strong network effects, i.e., an individual's utility for adoption depends on the total number of people who have adopted (e.g., Waze). From the perspective of a potential buyer, her decision of adoption thus depends on her speculated adoption level in the market, which is typically marked by uncertainty. In this work, we investigate the role of dynamic pricing in temporally controlling this uncertainty in the market in order to maximize the firm revenue.

**1 - Opportunities for Optimization and Automation in Intermodal Terminal Operations**

Steven Jay Tyber, General Electric, Chicago, IL, 60613, United States

The recent surge in intermodal volumes and truck driver shortage has pushed many rail terminals to their limits. In this talk, we survey the challenges faced by intermodal terminals and discuss the central role optimization and automation will play in driving operational efficiency and improved utilization of limited physical real-estate.

**2 - The Role Of Partial Information And Commitment In Dynamic Transportation Procurement**

Pol Boada-Collado, Northwestern University, Evanston, IL, United States, Karen Smilowitz, Sunil Chopra

We analyze decision processes related to commitment contracts in transportation procurement. We consider a novel setting motivated by industry with short-term demand visibility, adding additional dynamism. We model the decision process of selecting transportation modes when partial information is available and show how partial information fundamentally changes contracting policies.

**3 - Investigating the Capacity of Different Intermodal Terminal Layouts with AnyLogic**

Wesley Chen, University of Illinois Urbana-Champaign, 205 N. Mathews, Graduate Center, Urbana, IL, 61801, United States

Freight railways in the United States are currently transporting record volumes of containers and trailers in intermodal service. An efficient and reliable network of intermodal trains requires inland intermodal transloading facilities with sufficient capacity to handle growing traffic volumes. In this research, AnyLogic simulation is used to examine different terminal layouts and operating factors and their relationship to the overall capacity of an intermodal terminal.

**4 - Appointment Scheduling for Intermodal Dray Operations**

Lisa Tang, Schneider, Green Bay, WI, 54313, United States

Effective Appointment Setting (AS) is a key influencer in the success metrics of intermodal operations. While the primary objective of successful AS is to facilitate productive routing options for the subsequent driver dispatch process, decisions made at this level also impact other profit measures, such as driver capability for new order acceptance and ramp dwell. In this session, we will discuss Schneider's network model approach to providing optimal appointment suggestions, which takes into account shipment forecast, empty miles, ramp dwell and driver schedules. We will also review how model output can be used to provide feedback on driver capability.

Sponsored Session

Chair: Samitha Samaranyake, Cornell University, Ithaca, NY, 14853, United States

**1 - On-demand Multimodal Transit Systems: A Case Study**

Pascal Van Hentenryck, University of Michigan, 1813 IOE Building, 1205 Beal Avenue, Ann Arbor, MI, 48108-2117, United States

This talk describes the design and operations of an on-demand multimodal transit systems, combining different fleets of vehicles. A case study for the city of Ann Arbor is presented and offers key insights on a potential future for transit agencies.

**2 - On the Interaction between Autonomous Mobility-on-Demand and Public Transportation Systems**

Marco Pavone, Stanford University, Stanford, CA, United States

In this talk I will discuss models and algorithms to integrate autonomous mobility-on-demand systems with public transportation. In particular, I will discuss the design of socially-optimal control policies, present a real-world case study for New York City, and discuss a number of opportunities for future research.

**3 - Operational Challenges of using On-Demand Services as a First/Last Mile Solution – Some Insights from Ford**

Crystal Wang, Ford Motor Company, Detroit, MI, United States

Some city agencies are interested in integrating On-Demand service for the first/last mile solution and Mass-Transit for the rest of the trip. However, this solution does not work for all cities. We will present the simulation results of On-Demand first/last mile solution for different city types. On the other hand, Ford implemented On-Demand service for first/last mile solution in Shanghai in 2016. We will talk about some interesting observations and real challenges from this pilot, and encourage researchers for further investigation.

**4 - Integrating Mobility-on-demand Services with Mass Transit**

Samitha Samaranyake, Cornell University, School of Civil & Environmental Engineering, 220 Hollister Hall, Ithaca, NY, 14853, United States

While ride-hailing services provide a valuable service, as evident by their popularity, there are many questions regarding their scalability, efficiency, equity and externalities (e.g. congestion, pollution etc.). For these systems to be a comprehensive mobility solution, they need to be better integrated with higher capacity services such as mass-transit. Operationalizing such a system requires the ability to efficiently match riders across multiple services in real time, a computationally challenging task to solve at an urban scale. We present some models for operating such a multi-modal on-demand service and discuss some of the computational challenges including hardness results.

**Joint Session Smart Cities/MIF: Energy Aspects Towards a Smart City**

Emerging Topic: Smart Cities

Emerging Topic Session

Chair: Krystel Castillo, University of Texas-San Antonio, San Antonio, TX, 78249, United States

**1 - Optimal Sizing and Stochastic Control of a Micro-Grid Using Behind-the-meter Battery Storage and Photovoltaic Panels**

Ying Chen, PhD, UTSA - Texas Sustainable Energy Research Institute, San Antonio, TX, 78249, United States, Krystel Castillo, Bing Dong

We present an efficient building energy management system installed with a behind-the-meter battery energy storage (BES) system and photovoltaic panels. In this micro-grid system, BES system as a buffer is used to alleviate the stochastic nature from the solar energy and dynamic short-term demands from the building. In this study, we use wait-and-see idea from stochastic programming with the martingale model of forecast evolution method to achieve the averaged optimal battery size and power trading limit for this system. And then, we use myopic and lookahead policies with deterministic forecasts and stochastic forecasts to implement the control for this sequence problem, respectively.

**2 - A Simulation Approach to Allocating Microgrid Generation for Resilience Against Extreme Weather**

Tongdan Jin, Texas State University, 601 University Drive, Ingram School of Engineering, San Marcos, TX, 78666, United States, Priyadharshini Kumaravelan, Honggang Wang

Microgrid has the capability of enhancing grid resilience through defensive operations in contingency. We present a simulation model for designing resilient distribution network via distributed wind and solar integration. We strive to achieve three performance goals manifested as prevention, survivability and recovery.

**3 - Blockchain-Assisted Crowdsourced Energy Systems**

Ahmad F. Taha, PhD, The University of Texas at San Antonio, San Antonio, TX, 78249, United States

Crowdsourcing relies on people's contributions to meet certain objectives. This work explores a framework for Crowdsourced Energy Systems (CES), where small-scale energy generation or energy trading is crowdsourced from distributed energy resources. An operational model for CESs with different types of crowdsources is proposed. The model yields market equilibrium depicting distributed generation setpoints. Crowdsourcing incentives are designed to steer crowdsources to the equilibrium. As the number of crowdsources/transactions scales up, a secure energy trading platform is required. To that end, the presented research is integrated with a lightweight blockchain implementation.

#### 4 - A Two-stage Design and Analysis of Computer Experiments Approach for Optimizing a System of Electric Vehicle Charging Stations

Victoria C.P. Chen, The University of Texas at Arlington, Industrial, Manufacturing, & Systems Engr., Campus Box 19017, Arlington, TX, 76019-0017, United States, Ukesh Chawal, Jay Michael Rosenberger

A two-stage framework is developed to address the design of a system of electric vehicle (EV) charging stations. The first stage specifies the design of the system that maximizes expected profit. Profit incorporates costs for building stations and revenue evaluated by solving a system control problem in the second stage. The control problem is formulated as an infinite horizon, continuous-state stochastic dynamic programming problem. To obtain a system design solution using our two-stage framework, we propose an approach based on design and analysis of computer experiments (DACE).

#### 5 - Decision Analytic Framework for Evaluating Future Power Generation Pathways

Thushara De Silva, PhD Candidate, Vanderbilt University, 105 Jefferson Square, Nashville, TN, 37215, United States, George M. Hornberger, Hiba Baroud

Power generation planning objectives are reliable power system, economic efficiency, environmental sustainability, and social acceptability. Multiple alternatives, consists of different technologies and resources, must be assessed in multiple objectives. The objective of this study is to develop a multicriteria decision analysis model to select a power generation pathway for Sri Lanka by developing different alternative pathways, examining them across multiple objectives, and incorporating preferences of multiple stakeholders. A pathway; mix of renewable and fossil fuel resources aimed at achieving energy security can meet multiple criteria associated with future power generation.

#### 1 - On Machine Learning and Discrete Optimization: Predicting Blurred Solutions for ILPs in Intermodal Container Loading

Andrea Lodi, cole Polytechnique de Montr al, GERAD-HEC, 3000 Chemin de la Cote-Sainte-Catherine, Montr al, QC, H3T2A7, Canada

In this talk, we advocate a tight integration of Machine Learning and Discrete Optimization (among others) to deal with the challenges of decision-making in Data Science. For such an integration, we briefly review possible directions and then we propose a methodology to predict descriptions of solutions to discrete stochastic optimization problems in very short computing time. We approximate the solutions based on supervised learning and the training dataset consists of a large number of deterministic problems that have been solved independently (and offline). Uncertainty regarding a subset of the inputs is addressed through sampling and aggregation methods. Our motivating application concerns booking decisions of intermodal containers on doublestack trains. Under perfect information, this is the so-called load planning problem and it can be formulated by means of integer linear programming. However, the formulation cannot be used for the application at hand because of the restricted computational budget and unknown container weights. The results show that standard deep learning algorithms allow to predict descriptions of solutions with high accuracy in very short time (milliseconds or less). A careful comparison with alternative stochastic programming approaches is provided. (Joint work with Eric Larsen, S bastien Lachapelle, Yoshua Bengio, Emma Frejinger, Simon Lacoste-Julien.)

### Supply Chain Design and Operations I

Sponsored: TSL/Freight Transportation & Logistics

Sponsored Session

Chair: Burcu B. Keskin, University of Alabama, Tuscaloosa, AL, 35406, United States

#### 1 - Omni-channel Supply Chains with Unilateral Transshipments

Emily Barbee, University of Alabama, Tuscaloosa, AL, 35487-0226, United States, Burcu B. Keskin

Omni-channel supply chains integrate the brick-and-mortar and online sales channels of a company to achieve higher customer service and fill rates. Most

omni-channel supply chains facilitate unilateral transshipments to utilize in-store inventory to fulfill online demand. We quantify the impact of network design on inventory related costs and optimal order quantities. We maximize the profit of a newsvendor style problem and discuss concavity properties of the objective under different demand distributions.

#### 2 - Transportation Planning in the Beverage Container Recycling Industry

Robert Wiedmer, Arizona State University, Tempe, AZ, 85287, United States, Hakan Yildiz

In many U.S. states, empty beverage containers are returned to retail stores from where they are picked up and transported to processing facilities. Stochastic demand in the beverage industry challenges efficient routing of pick-up vehicles. We analyze data from a logistics service provider and present methods to optimize pick-up operations.

#### 3 - Strategic Network Design at the Polish Post

Maciek A. Nowak, Loyola University Chicago, Information Systems and Supply Chain Mgmt, Quinlan School of Business, Chicago, IL, 60611, United States, Mike Hewitt, Bogumil Kaminski, Michal Pliszka, Rahul C. Basole

Solving the Service Network Design (SND) problem assists a freight transportation firm by prescribing the choice of paths for shipments and the services or resources necessary to execute them, while achieving the economic and service-quality targets of the carrier. This research extends a previously developed SND algorithm while incorporating data visualization to assist the Polish Post in creating a more efficient and effective network.

#### 4 - The Strategic Value of Store Brands in a Common Retailer Channel

Hongseok Jang, University of Florida, Gainesville, FL, United States, Quan Zheng, Xiajun Amy Pan

In a common retailer channel with two asymmetric competing national brand manufacturers, we study whether the retailer should introduce a store brand. Our results reveal a continuum of boundary equilibria where the store brand with zero demand is offered so as to incentivize the manufacturers to lower the wholesale prices in a co-opetition manner.

**10:30 - 11:15 Frontline Systems, Inc/  
11:15 - 12:00 Artelys Corp.**

Vendor Demo Session

### 1 - Tutorial: Preview of Analytic Solver V2019 for Windows, Macintosh, and Office 365

Daniel H. Fylstra, Frontline Systems, Inc., P.O. Box 4288,  
Incline Village, NV, 89450-4288, United States

For many years, Frontline Systems has offered powerful data mining and machine learning, Monte Carlo simulation and risk analysis, and conventional and stochastic optimization in Analytic Solver<sup>®</sup> for Excel - on Windows. But use of Analytic Solver for Excel on Macintosh and the Web has involved challenges, due to differences within Excel. That's changing for the better in Analytic Solver V2019, which has been rewritten to work with new Excel internal APIs from Microsoft. Attend this session to see a preview of Analytic Solver V2019: uniformly powerful and easier to use than ever - on Excel for Windows, Macintosh, and Office 365.

### 2 - Introducing the New API and Conic Solver in Artelys Knitro 11.0

Richard Waltz, Artelys, 150 N. Michigan Avenue, Suite 800,  
Chicago, IL, 60601, United States

Artelys Knitro is the premier solver for nonlinear optimization problems. This software demonstration will highlight two key features in the new, major Knitro 11.0 release. First, we will demonstrate the new callable library API. This new API allows the user to build-up a model in pieces while providing special structures to Knitro. Second, we will introduce the new solver in Knitro 11.0 specially designed for models with cone constraints. Some benchmarking results will be provided.

### 1 - A Supervised Machine Learning Approach for Solving the Aircraft Recovery Problem

Navid Rashedi, Dartmouth College, 30.5 W. Wheelock Street, 1,  
Hanover, NH, 03755, United States, Vikrant Vaze

Commercial solvers have been used for solving aircraft recovery problems. However, obtaining high quality solutions within the limited time frames of online applications is challenging. We develop a data-driven approach to solve a broad class of aircraft recovery problems. This method can be applied to identify a near-optimal solution by using previously good solutions generated by decision-support tools, human experts, or a combination thereof. The performance of our method was tested by applying it to a set of real-world networks for a moderately large US carrier. The results showed that the obtained solutions were, on average, within a 5% optimality gap and were calculated within a few seconds.

### 2 - Characterization of Air Traffic Management Operations Based on Large-scale Flight Tracking Data

Lishuai Li, City University of Hong Kong, Tat Chee Avenue, P6606,  
AC1, Kowloon, Hong Kong, Pan Ren

Air Traffic Management (ATM) strategies and procedures vary by region. Comparing ATM in different regions could help us understand what works better and how to improve. However, few studies have done so due to lack of data. With Automatic Dependent Surveillance - Broadcast (ADS-B) adopted by many countries, it is possible for the first time to track and analyze aircraft movement data at global scale. I will present case studies to characterize actual ATM operations, i.e. network structure and dynamics, flow patterns, etc., via a data-driven approach. The result will enable us to understand current operations better, identify deficiencies, and provide recommendations for future improvement.

New Directions in Logistics**

Emerging Topic: Robotics, Drones and Autonomous Vehicles in Logistics

Emerging Topic Session

Chair: Dongdong Ge, Shanghai University of Finance and Economics

### 1 - An Efficient MILP Formulation for Real AGV Systems

Dongdong Ge, Shanghai University of Finance and Economics,  
School of Information Management and Eng, 777 Guoding Road,  
Shanghai, 200433, China

Running more than 100 robots in an AGV system is the main difficulty in most AGV warehouses. This project approaches this real time control problem by efficiently formulating its assignment part as an MILP problem, solving it efficiently, and combining it with intelligent partition system and vehicle routing algorithms. The implementation results in Beijing's large warehouse in 2017 showed a great success for 'double eleven' shopping rush.

### 2 - Last Mile Delivery using Trucks, Drones, and Ground-based Robots

John Gunnar Carlsson, University of Southern California, 3750  
McClintock Avenue, Los Angeles, CA, 90089, United States

We determine the efficiency of a delivery system in which a truck acts as a "moving warehouse" for a collection of drones or ground-based robots. Using a theoretical analysis in the Euclidean plane, we derive a closed-form expression describing the time to completion in terms of the number of drones or robots as well as the relative speeds of the vehicles.

### 1 - Data-integrated Stochastics: Models And Methods

George Shanthikumar, Purdue University, West Lafayette, IN,  
47906

This tutorial will review the current data integrated approaches for predictive and prescriptive analysis of stochastic systems. In particular we will review: 1) approaches such as Multi-Armed Bandit, Regularization in Sample Average Approximation and Data Driven Robust Optimization for generating prescriptive solutions to stochastic systems, and 2) some of the Machine Learning approaches used for predictive analysis of stochastic systems. We will then provide a framework for data integrated methodology for predictive and prescriptive analytics for stochastic systems. Specific attention will be paid to overcoming structural and statistical errors.

Co-Chair: Michael N. Katehakis, Rutgers University, Newark, NJ,  
07010, United States

### 1 - Non-parametric Up-and-down Experimentation Revisited

Flora Spieksma, Associate Professor, Leiden University, Niels  
Bohrweg 1, Leiden, 233CA, Netherlands, Michael N. Katehakis,  
Sheldon M. Ross

In many applications, it is of interest to estimate a value, the 'quantile', of a scalar control variable  $x$  that will cause a certain ratio  $\alpha$  of successes, or failures, in a binary output variable  $Y = Y(x)$ . We present a convergent algorithm for estimating the quantile  $x^*$  and we discuss applications in inventory control under unknown demand distribution, and drug dosage determination.

## 2 - Asymptotically Optimal Multi-armed Bandit Policies Under Side Constraints

Odysseas Kanavetas, Koc University, Koc University Campus, Istanbul, Turkey, Apostolos Burnetas, Michael N. Katehakis

We develop asymptotically optimal policies for the multi armed bandit (MAB), problem, under side constraints. Such models are applicable in situations where each sample (or activation) from a population (bandit) incurs known bandit dependent costs. We consider the class of feasible uniformly fast (UF) convergent policies, that satisfy sample path wise the constraints. We first establish a necessary asymptotic lower bound for the rate of increase of the regret function of UF policies. Then we provide conditions under which a simple class of UF policies attain this lower bound and are asymptotically optimal within the class of UF policies.

## 3 - Generative Networks for Data Modeling in Sequential Change Detection

George Moustakides, Professor, Rutgers University, 110 Frelinghuysen Road, Hill 359, Piscataway, NJ, 08854, United States

One of the most important problems in applications is data modeling. When data are time-dependent, we limit ourselves to linear AR or ARMA models therefore silently assuming that the data are Gaussian. Recently, in Machine Learning, nonlinear neural network, known as Generative Networks, were introduced that can be properly trained to capture non-Gaussian behavior. In this work we extend this idea to represent nonlinear time-dependencies instead of simple independent realizations which is the current practice. Our method is then applied to the problem of sequential change detection for the rapid detection of changes in the statistical behavior of observed processes.

## 4 - Reinforcement Learning: Connections Between MDPS and MAB Problems

Michael N. Katehakis, Distinguished Professor, Rutgers University, 100 Rockefeller Road, Piscataway, NJ, 08854, United States, Wesley Cowan, Daniel Pirutinsky

This talk considers a basic reinforcement learning model dealing with adaptively controlling an unknown Markov Decision Process (MDP), in order to maximize the long-term expected average value. We show how a factored representation of the MDP problem allows it to be decoupled into a set of individual MAB-problems on a state by state basis. Additionally, i) we show the construction of a simple UCB-type MDP policy, dramatically simplifying an earlier proof of its optimality, and ii) we discuss extensions to other MAB policies e.g., Thompson Sampling.

## 1 - On Policies for Single-leg Revenue Management with Limited Demand Information

Will Ma, Google, Cambridge, MA, United States, David Simchi-Levi, Chung-Piaw Teo

In this paper we study the single-leg revenue management problem, with no information given about the demand trajectory over time. The competitive ratio for this problem has been previously established under the assumption of independent demand, i.e. demand from higher fare classes do not spill over to lower fare classes. We extend these results to general demand, by using a price-skimming technique. That is, we derive price-skimming policies which stochastically-increase their price distributions as inventory decreases, in a way that yields the best-possible competitive ratio. A key technical ingredient in our paper is a new "valuation tracking" subroutine.

## 2 - Adaptive Policies for the Dynamic and Stochastic Knapsack Problem with Equal Values

Xinchang Xie, Duke University, 100 Fuqua Drive, Durham, NC, 27708, United States, Alessandro Arlotto

We study a dynamic and stochastic knapsack problem in which a decision maker is sequentially presented with  $n$  items and needs to select which items to include in a knapsack with fixed capacity. Arriving items have non-negative, independent sizes with common continuous distribution, and every decision is terminal upon arrival. The goal is to maximize the expected number of selections under capacity constraint. Under mild regularity conditions on the distribution, we propose adaptive online policies that are within  $O(\log n)$  of optimal. Moreover, the limiting distribution of the number of selections under such policies is the same as the distribution that one obtains by implementing an optimal policy.

## 3 - Uniformly Bounded Regret in the Multi-secretary Problem

Alessandro Arlotto, Duke University, 100 Fuqua Drive, Durham, NC, 27708, United States, Itai Gurvich

In the secretary problem of Cayley (1875) and Moser (1956),  $n$  non-negative, independent, random variables with common distribution are sequentially presented to a decision maker who decides when to stop and collect the most recent realization. The goal is to maximize the expected value of the collected element. In the  $k$ -choice variant, the decision maker is allowed to make  $k=n$  selections to maximize the expected total value of the selected elements. Assuming that the values are drawn from a known distribution with finite support, we prove that the regret-the expected gap between the optimal online policy and its offline counterpart-is uniformly bounded in the the number of candidates  $n$  and the budget  $k$ .

## 4 - The Bayesian Prophet Framework for Low Regret Online Decision-making

Siddhartha Banerjee, Cornell University, 229 Rhodes Hall, Ithaca, NY, 14853, United States

We propose a new framework for online policies for packing problems with stochastic arrivals, based on access to an oracle that provides statistical information regarding the offline optimal solution. Our policy, which we call the Bayes Selector, is a simple greedy policy for general online decision-making problems based on such an oracle. We provide a general technique for deriving expected regret bounds for this policy, and prove that in any online packing problem with a discrete type space, the Bayes Selector achieves an expected regret which is independent of the number of arrivals and the starting resource levels.

## 1 - A Comparison of Spatial and Random Failures when Simulating Network Outages

Benjamin Rachunok, Purdue University, 315 N. Grant Street, West Lafayette, IN, 47906, United States

In network-based analyses of infrastructure failures and recovery, small perturbations in initial outages can cascade through the system causing wildly differing end-stage outage patterns. Frequently in these analyses, random nodes are selected for removal to simulate the degradation of system due to tropical storms. In this case we evaluate this random node selection technique against outages which are spatially motivated by the actual outage patterns caused by tropical storms. The resulting outage and recovery patterns are analyzed for differences.

## 2 - Insights Revealed by the Value of Information in a Multiple-objective Decision: Brown Trout in the Grand Canyon

Michael C. Runge, USGS Patuxent Wildlife Research Center,  
12100 Beech Forest Rd, Laurel, MD, 20708, United States, Charles  
B. Yackulic, Lucas S. Bair, Theodore A. Kennedy, Richard A. Valdez

Brown trout (*Salmo trutta*) have expanded their range in the Colorado River ecosystem, possibly threatening a delicate balance among multiple objectives, including recovery of the endangered humpback chub (*Gila cypha*) and ecosystem restoration. We examined possible causal mechanisms for the expansion, and used an expected value of information analysis to evaluate potential management interventions. The EVPI analysis reveals there is important uncertainty impeding any response, with respect both to reducing the number of brown trout and to achieving other objectives. Some potential actions, however, are more robust to uncertainty than others, pointing toward initial interventions.

## 3 - Coastal Sustainability Management using Avulsion Mitigation Strategies in the Yellow River Delta under Climate Change

Liang Chen, Johns Hopkins University, Baltimore, MD, 21210, United States

Due to high in-channel sedimentation rates, China's Yellow River has changed course frequently, with huge socioeconomic impacts. We will address questions: What is the best timing and location of deliberate avulsions? Can use of temporary floodways lessen the cost and flooding impact, and if so where should they be located and how should they be operated? A simulation-based optimization model has been developed considering tradeoffs between cost of engineered construction and flooding risk. A robust adaptive decision model has been implemented to consider adaptive changes in operations as deep uncertainties in socioeconomic and climatic pressures evolve in the future.

## 4 - Value of Decision Analysis for Climate Adaptation Planning: Which Adaptation Decisions Can Benefit Most?

Rui Shi, Johns Hopkins University, Baltimore, MD, United States

Decision analysis, considering uncertainty and adaptability, can provide useful insights for climate adaptation planning. However, adaptation managers should conduct such analyses only when the expected improvement in performance justifies the expense of the analysis. We first develop a screening tool to assess if adaptation decisions could be significantly improved by a risk-based multistage decision analysis. We then propose a procedure which quantifies nine characteristics that are associated with problems that can benefit from decision analysis. We then use the framework to prioritize adaptation decisions in the Mid-Atlantic region that are candidates for applying decision analysis.

## 1 - Balanced Random Survival Forests for Mortality Prediction from Extremely Unbalanced, Right Censored Data

Kahkashan Afrin, Texas A&M University, College Station, TX, United States, Gurudev Illangovan, Sanjay S. Srivatsa, Satish Bukkapatnam

Accuracies of survival models are compromised due to the imbalance between the survival and mortality class sizes. Imbalanced datasets results in an underestimation (overestimation) of the hazard of the mortality (survival) classes. A balanced random survival forests (BRSF) model, based on training the RSF model with data generated from a synthetic minority sampling scheme is presented to address this gap. Benchmarking studies were conducted using five datasets from public repositories and a dataset of 267 patients, collected at the Heart, Artery, and Vein Center of Fresno. Investigations suggest that BRSF outperformed both Cox and RSF with an average reduction of 55% in the prediction error.

## 2 - Effects of Outliers and Robust Logistic Regression Tree

Doowon Choi, Texas A&M, College station, TX, United States, Li Zeng

This study investigates effects of outliers in logistic regression tree (LRT) modeling of binary outcome data in healthcare applications and develops a robust logistic regression tree (RLRT) approach that can alleviate those effects. The effectiveness and advantages of the proposed method is demonstrated in a case study using dataset on cardiac surgeries.

## 3 - A Semi-supervised AUC Optimization Model for Autism Risk Gene Prediction

Ying Lin, Houston, TX, United States

Autism is a constellation of neurodevelopmental presentations with high heritability. Prediction models, e.g. SVM and Random Forest, have been applied to automatically identified causal autism genes based on their expression patterns. But existing models are challenged by the limited training genes, imbalanced gene labels and the spatiotemporal correlations in gene expression. In this study, a semi-supervised AUC optimization model is developed to identified autism risk genes using brain specific gene expression value and their functional relationship network. It's applied to rank more than 25,000 unknown genes and the top ranked genes are potential to enrich the autism risk genes.

## 4 - Med-chi: Maximum Entropy Discrimination Based Contemporaneous Health Index for Degenerative Disease Monitoring

Aven Samareh, University of Washington, 4324 8th Ave NE, D7, Seattle, WA, 98105, United States, Shuai Huang

We developed a novel contemporaneous health index (MED-CHI) that builds on the theory of maximum entropy discrimination. MED-CHI aims to characterize the monotonic progression characteristic underlying the longitudinal measurements for degenerative disease monitoring. Intuitively, the MED-CHI approach embodies both the data integration power of Bayesian method and the computational power of convex optimization, to handle semi-supervised structure and transfer the learned knowledge to enhance the learning ability to a completely unsupervised source domain.

## 5 - Dynamic Inspection of Latent Variables in State-space Systems

Tianshu Feng, University of Washington, Seattle, WA, 98195, United States, Xiaoning Qian, Kaibo Liu, Shuai Huang

The state-space models are widely used in a variety of areas where a set of observable variables is used to track latent variables. While most existing works focus on the statistical inferences of the latent variables based entirely on the observable variables, it comes to our awareness that in many applications, the latent variables can be occasionally acquired to enhance the monitoring of the state-space system. In our work, novel dynamic inspection methods under a general framework of state-space models are developed to identify and inspect the latent variables that are most uncertain.

## 1 - A Scalable Computational Method for Security-constrained Unit Commitment with Energy Storage

Edward Quarm, The University of Texas at Arlington, Arlington, TX, United States, Fariba Zohrizadeh, Ramtin Madani

We introduce a computational method for finding feasible and near-globally optimal solutions for detailed security constrained unit commitment (SCUC) problems in the presence of energy storage units, uncertainties, and reserve requirements. The proposed method relies on conic optimization for solving mixed-integer nonlinear programming problems with large number of binary variables. Experimental results on benchmark test cases demonstrate superiority of the proposed method over off-the-shelf solvers for unit commitment.

## 2 - Energy Storage Planning in Presence of Topology Control

Mostafa Sahraei-Ardakani, University of Utah, Salt Lake City, UT, 84112, United States, Yuanrui Sang

Energy storage has the potential to alleviate the intermittency of renewable generation. One important factor in energy storage planning is the congestion patterns, which will affect the size and location of such facilities. The congestion patterns, however, are affected by topology control. This talk discusses how frequent utilization of topology control will influence the optimal location and size of energy storage facilities.

### 3 - Optimal Energy and Regulation Market Bidding Strategies for ESS-integrated Wind Power Producers

Duehee Lee, Konkuk University, Kwangjin Gu, Seoul, Korea,  
Republic of, Seungwoo Son, Sini Han, Jae Hyung Roh

We present the optimal bidding strategy for wind power producers (WPPs) in the day-ahead (DA) energy and regulation markets. WPPs integrate the energy storage system (ESS) with wind farms to mitigate the imbalance penalty in the real-time (RT) market and to earn extra profits in the regulation market. Our bidding strategies in the DA market is designed and represented as offer curves by considering the optimal operation of the ESS for 24 hours and wind power and RT price forecasts. The ESS operation is determined by solving the multi-stage stochastic optimization problem through the progressive hedging algorithm. We show that our bidding strategy can have higher profits than a near-sighted strategy.

#### 1 - Market Mechanism Design for Horizontal and Vertical Coordination of Power System Expansion: Distributed Optimization Approach

Sambuddha Chakrabarti, 2000 Pearl Street, Room 113, Austin, TX, 78705, United States

In this work, we will consider long term generation & transmission expansion & investment coordination problems, where there are multiple Transmission System Planners (TSPs) & Generation Companies (GenCos). Each agent acts only to maximize its own utility. To attain the optimal social surplus for the bigger geographical region, we will use Distributed Stochastic Optimization algorithm to design a market mechanism. We will demonstrate our method with numerical simulations for the Nordic grid.

#### 2 - Transmission Expansion Planning via Distributionally Robust Optimization

Antonio J. Conejo, The Ohio State University, Department of Integrated Systems Engineering, 210 Baker Systems Building, Columbus, OH, 43210, United States

This presentation addresses the transmission expansion planning problem under long- and short-term uncertainty. Long-term uncertainty pertains to changes across years, whereas short-term uncertainty pertains to changes within a year. This problem is formulated as a distributionally robust optimization model, and is solved via a tailored implementation of the primal Benders' decomposition algorithm. The effectiveness of the proposed algorithm is illustrated through a realistic case study.

#### 3 - Convex Relaxations of the Network Flow Problem Under Cycle Constraints with Application to Electric Power Systems

Madi Zholbaryssov, University of Illinois at Urbana Champaign, Urbana, IL, 61801, United States, Alejandro Dominguez-Garcia

We consider a variation of the minimum-cost network flow problem (NFP) with additional non-convex cycle constraints on nodal variables; this problem has relevance in the context of optimizing power flows in electric power networks. We propose one approach to tackle the NFP that relies on solving a convex approximation of the problem, obtained by augmenting the cost function with an entropy-like term to relax the non-convex constraints. We show that the approximation error can be made small enough for practical use. An alternative approach is to solve the NFP without the cycle constraints and solve a separate optimization problem in order to recover the actual flows satisfying the cycle constraints.

#### 4 - Distributed Optimization for Solving Nonconvex Optimal Power Flow

Kaizhao Sun, Georgia Tech, Atlanta, GA, United States

Motivated by the problem of coordination between ISO markets, we study distributed optimization algorithms for the AC optimal power flow problem. We first give an overview of the field of distributed optimization with an emphasis on applications to OPF. Then we propose distributed algorithms for solving the convexified as well as the nonconvex versions of the AC OPF problems with provable convergence guarantees. Numerical results show promising performance.

### 5 - Robustness of Primal-dual Dynamics and its Implications for Online, Data-driven Optimization

Jorge Cortes, PhD, University of California-San Diego, La Jolla, CA, 92093, United States

Primal-dual strategies are used extensively in the design and analysis of distributed feedback controllers and optimization algorithms in many applications. In large-scale optimization, an aggregate objective along with the local computability of the constraints make the dynamics amenable to distributed implementation. Here, we discuss progress on establishing stability and robustness properties of primal-dual dynamics, paying special attention to input-to-state stability, and illustrate the implications for online optimization and data-driven implementations with performance guarantees.

### 6 - Prosumer-based Decentralized Power Supply

Sleiman Mhanna, University of Sydney, School of EIE, EIE Building J03, The University of Sydney, 2006, Australia, Gregor Verbic, Archie Chapman

Traditionally, most optimization models used in power systems are computed in a centralized fashion. However, the large increase in the penetration of distributed energy resources (DERs) on the low voltage side of the distribution network will put the centralized approaches under strain. The talk will focus on distributed algorithms for solving the problem of prosumer orchestration. The problem is computationally challenging as it explicitly considers the nonconvex AC power flow constraints and because the DER models require the use of mixed-integer variables to model them accurately.

Chair: Yu Zhang, Santa Cruz, CA, 4592921, United States

Co-Chair: Yihsu Chen, UC Santa Cruz

#### 1 - Mechanism Design for Demand Response in Electricity Markets

Sepehr Ramyar, University of California-Santa Cruz, Santa Cruz, CA, United States, Yihsu Chen

Contrary to the current practice of trading demand response in wholesale power markets, we investigate the application of mechanism design theory as a new framework for designing a demand response market. The proposed mechanism is truth-revealing and would eliminate information asymmetries in the current market design. It also eases computational burden of the ISO, and guarantees participation of prospective agents. We show how the properties of the proposed mechanism can complement the existing regulatory context and eliminate opportunities for manipulation by market participants.

#### 2 - Asynchronous Large-scale Decentralized Unit Commitment

Paritosh Ramanan, Georgia Institute of Technology, Atlanta, GA, 30324, United States

The unit commitment problem for power networks is a critical and a computationally challenging problem especially for large-scale power systems. We propose an asynchronous decentralized solution to the unit commitment problem that is computationally more efficient and is driven by privacy preserving valid inequalities. We benchmark our algorithm against a state of the art synchronous and the centralized method. In both cases, we demonstrate that our method is highly scalable, improves solution times and provides a competitive and stable solution quality.

#### 3 - Optimal Load Shedding via Mixed-integer Bilinear Programming

Yu Zhang, UC Santa Cruz, 1156 High St SOE2, Santa Cruz, CA, 95064, United States, Atif Maqsood, Keith Corzine

In this work we propose a novel design of optimal load shedding schedules for power distribution networks with multiple load zones. A mixed-integer bilinear optimization problem is formulated, which aims at minimizing the system-wise load shedding cost while achieving a desired reliability for industrial and residential users. Numerical results corroborate the effectiveness and merits of the proposed approach.

#### 4 - Efficiently Solving Linear Bilevel Programming Problems using Off-the-Shelf Optimization Software

Salvador Pineda, University of Malaga, Málaga, Spain,  
Henrik Bylling, Juan Miguel Morales

Many optimization models are formulated as bilevel problems. Most solution methods reformulate the bilevel problem as a mathematical program with complementarity conditions (MPCC). MPCCs are single-level non-convex optimization problems that do not satisfy the standard constraint qualifications and therefore, nonlinear solvers may fail to provide even local optimal solutions. In this paper we propose a method that first solves iteratively a set of regularized MPCCs using NL solvers to find a local optimal solution. Local optimal information is then used to reduce the computational burden of solving the Fortuny-Amat reformulation of the MPCC to global optimality using MIP solvers.

#### Enhance Energy Infrastructure Resilience with Operations Research

Sponsored: Energy, Natural Res & the Environment/Energy  
Sponsored Session

Chair: Feng Qiu, Argonne National Laboratory, Lemont, IL, 60439, United States

Co-Chair: Matteo Spada, Paul Scherrer Institut, Villigen PSI, 5232, Switzerland

#### 1 - A Bayesian Framework for Spatial Multi-criteria Risk Assessment: An Application to Oil Tankers

Matteo Spada, Paul Scherrer Institut, OHSA/D19, Villigen PSI, 5232, Switzerland, Valentina Ferretti

In recent years, increasing attention has been paid to the spatial nature of risk, mainly in the environmental decision-making domain since it commonly involves spatial impacts, spatial vulnerabilities and spatial risk-mitigation alternatives. In this context, spatial risk assessment procedures have been developed but they generally neglect the multi-dimensional nature of spatial impacts. In this study, we propose a Bayesian framework for spatial multi-criteria risk assessment to integrate uncertainty, model probabilities and multiple impacts. The presented model is applied and tested for tanker oil spills due to their international relevance and strong spatial dimension.

#### 2 - Resilient Power Distribution Grids from Planning to Restoration

Zhaoyu Wang, Harpole-Pentair Assistant Professor, Iowa State University, 1113 Coover Hall, Ames, IA, 50011, United States, Shanshan Ma, Anmar Arif

This talk will present our recent works on enhancing power distribution grid resilience. Specifically, we will firstly propose a two-stage stochastic model for long-term resilience-oriented design via infrastructure hardening and adding smart grid technologies. Then we will develop a co-optimization model for real-time coordination of crew repairs and remedial operations to accelerate the service restoration.

#### 3 - Recovery Logistics Co-optimization of Power Systems Against Natural Disasters

Yunhe Hou, University of Hong Kong, CYC Building, Room 508, Hong Kong, Hong Kong, Shunbo Lei

Efficient service restoration and infrastructure recovery after a natural disaster are one of the most critical requirements. First, repair crews should be optimally scheduled to recover the damaged components. Second, the system may need to be reconfigured for service restoration. Third, in some cases, mobile power sources are available to supply critical loads. There are also some other resources or strategies. We propose a framework, models, and algorithms to co-optimize major resources and strategies involved in power system recovery logistics. We show that such co-optimization based on our proposed method leads to more effective restoration of power systems.

#### 4 - A Heuristic Approach for Integrated Infrastructure Network Restoration Crew Routing Problem

Nazanin Morshedlou, University of Oklahoma, Norman, OK, 73071, United States, Kash Barker, Andres David Gonzalez

In this research, we consider the problem of restorative capacity enhancement problem in an infrastructure network which is interconnected with a routing network through which restoration crews are dispatched, from the originate depots, towards disrupted locations. Noting the complicated nature of resilience routing problems, we further propose a constructive heuristic algorithm which use a heuristic algorithm to improve the coordinated routes obtained from the relaxed form of the original formulations.

#### How to Influence and Improve Decisions Through Optimization Models

Emerging Topic Session

Chair: Jorge A. Sefair, Arizona State University, 699 S. Mill Ave., Tempe, AZ, 85287-8809, United States

#### 1 - How to Influence and Improve Decisions Through Optimization Models

Jeffrey D. Camm, Wake Forest University, School of Business, P.O. 7897, Winston-Salem, NC, 27109, United States

Industry's recent increased focus on data driven-decision making and the use of analytics in all sectors from sports to financial services to technology and healthcare has led to a resurgence in the interest in traditional operations research tools such as optimization, simulation, and decision analysis. As organizations mature analytically, it seems likely that we will see a further increase in interest in prescriptive analytics, including optimization modeling, which is the focus of this tutorial. With massive amounts of data being routinely collected in real time and an increased awareness on the part of management of the value of data, the availability of data is typically no longer the bottleneck in the optimization modeling process. Increased computing speed, improved algorithms, parallel processing, and cloud computing have increased the size of optimization problems that can be solved to optimality. Considering better data availability and the dramatic increase in our ability to solve problems, what are the impediments to keeping us from having significant influence and impact on decision making? Going forward, it is possible that our ability to (1) structure a messy decision problem into a useful optimization framework, (2) properly use the model to deliver valuable insights for management, and (3) communicate to management the value proposition of our insights, will become the new reasons we might fail to have the impact we know is possible. In this tutorial, we review types of optimization models and the art of modeling, that is, the process of going from mess to model. We discuss how to use an optimization model to provide not simply "the answer but insights that will be useful to managers and influence their decision making. We discuss the importance of communication in influencing, and provide examples and best practices relevant for optimization. We conclude with thoughts on how optimization modeling is important to the bustling fields of data science and artificial intelligence.

#### Supply Chain Information Disclosure Workshop II

Sponsored: Energy, Natural Res & the Environment Environment & Sustainability

Sponsored Session

Chair: Donna Marshall, University College-Dublin, Dublin, Ireland

Co-Chair: Steve New, University of Oxford, Oxford, OX1 3BW, United Kingdom

#### 1 - The Missing Link? The Strategic Role of Procurement in Building Sustainable Supply Networks

Veronica H. Villena, Penn State University, 412 Business Building, Supply Chain and Information Systems, State College, PA, 16802, United States

Some multinational companies (MNCs) require their (tier-one) suppliers to comply with their sustainability requirements and often to "cascade such requirements to their own (second-tier) suppliers. This research investigates why this cascading effect often fails and how procurement processes are deployed to engage tier-one and tier-two suppliers in MNCs' sustainability agendas.

#### 2 - Collective Disclosure in Complex Supply Chains

Jury Gualandris

Considering supply chains as complex networks of firms that get organized to achieve (and benefit from) interlocked behaviours, we theorize supply chain structures under which collective disclosure is more likely to occur. Collective disclosure happens when most firms in a supply chain publicly disclose large amounts of information to describe social and environmental practices and performance. Supply chain structures are analyzed in terms of diverse complexities such as numerosity, heterogeneity, interconnectedness and dynamism. We test our hypotheses using a novel data set of 226 supply chains that, overall, involve 5118 manufacturing firms and 20680 buyer-supplier contracts.

### 3 - How Blockchain can Disrupt the Supply Chain

Sara Saberi, Worcester Polytechnic Institute (WPI), Washburn  
Rm 217, Foisie School of Business, Worcester, MA, 01609,  
United States

Blockchain technology is increasingly being used in supply chain networks and logistics. With the absence of a central authority, blockchain technology provides a transparent, immutable, and authenticated platform that has a potential to provide traceability to manage sustainability practices and address economic, environmental, and social facets. However, as a disruptive technology, blockchain implementation would change supply chain cross-functional, cross-firm processes and require preparation. We explore various barriers, which stem from system limitations, different level of organizational activities through supply chain, and external authorities.

### 4 - The Cloud Supply Chain: Cyber-security Implications of the Hidden Chain

Steve New, University of Oxford, Oxford, United Kingdom,  
Olusola Akinrolabu, Andrew Martin

Cloud computing has revolutionised IT - but the revolution has complex implications for organizations wishing to understand their place in the electronic ecosystem. For many managers, cloud computing is a release from having to worry about the mundane details, allowing a focus on core competencies. But the cloud offerings are often opaque and sometimes deceptive: how exactly is the IT service being delivered? What services and systems are involved? Which companies are involved? This discussion will explore the fundamental questions of transparency, and describe initial efforts towards methods of mapping and risk assessment of the Cloud Supply Chain.

### 5 - Exemplars of Supply Chain Disclosure Innovations

Donna Marshall, University College Dublin, Carysfort Road,  
Dublin, Jakob Rehme, Lucy McCarthy, Paul McGrath

This study examines exemplar companies and the different methods they use to gather, analyse and publish supply chain sustainability disclosure in the public domain. Some of the world's most recognisable companies in the food, fashion, electronics, personal care, healthcare and homeware industries are presented in order to understand innovations in supply chain sustainability information disclosure and how these can be adapted for companies who are beginning their disclosure journey.

## ■ TB49

North Bldg 230

### Joint Session ENRE/Practice Curated: Open Pit and Underground Mining Applications

Joint Session

Chair: Alexandra M. Newman, Colorado School of Mines, Golden, CO,  
80401, United States

#### 1 - Managing Production Incidents in Mining using Multistage Stochastic Programming

Bernardo Kulnig Pagnoncelli, Universidad Adolfo Ibanez, Diagonal  
Las Torres 2640 Penalolen Of. 533-C, Santiago, 7910000, Chile,  
Lorenzo Reus, Margaret Armstrong

In this work, we consider a long-term mine planning model in the presence of price uncertainty and production incidents. The decision maker must satisfy minimum production levels established by contracts and can hedge against uncertainty by stocking material at a cost. We solve a large scale multistage stochastic programming model using decomposition methods and derive an optimal policy for any realization of the uncertain parameters.

#### 2 - Dispatching Policies in Open Pit Mining

Amanda G. Smith, University of Wisconsin-Madison, 1513  
University Avenue, Mechanical Engineering Bldg, Madison, WI,  
53706, United States, Jeff T. Linderth, James Luedtke

The open pit mine truck dispatching problem seeks to determine how trucks should be routed through a mine. Among the challenges of the dispatching problem is the need to balance the distinct objectives of meeting production and quality targets in a dynamic mining environment. We propose an optimization-driven approach to solving the dispatching problem via a MIP model. We also propose two competing policies that match dispatching decisions to rate targets obtained from a nonlinear flow rate model. To evaluate the policies, we use a discrete-event simulation of an open-pit mine. We conclude with computational results demonstrating how each policy performs on mines with different characteristics.

### 3 - Optimal Selection of Support Pillars in an Underground Mine

Levente Sipeki, Colorado School of Mines,, Golden, CO, 80128,  
United States, Alexandra M. Newman, Candace Arai Yano

We address the design optimization problem for a mine utilizing the top-down open-stope retreat mining method. Earth below the surface is divided into three-dimensional rectangular blocks. The mine design specifies which blocks are left behind as pillars to provide geotechnical structural stability; the remainder are extracted and processed. We maximize profit subject to geotechnical stability constraints and develop an iterative heuristic in which violated constraints are incorporated into the formulation until all required geotechnical constraints are satisfied. Our approach provides solutions whose estimated profit is 5% better than what industry-standard methods provide.

### 4 - Adaptive Scheduling under Uncertainty: Application to Open Pit Mining

Patricio Andres Lamas, Universidad Adolfo Ibanez, Santiago, Chile,  
Marcos Goycoolea, Bernardo Kulnig Pagnoncelli

In the mining industry, schedules are executed under high levels of uncertainty. Traditional scheduling approaches dealing with uncertainty consist of initially fixing an (execution-) policy class and then finding an optimal policy within such a class. These approaches have been successful in making the problem computationally tractable. However, initially fixing a policy class has a negative impact on the optimality of the schedules. We propose a less restrictive approach, which creates schedules that adapt to the uncertainty that is partially realized during execution. The adaptive capability of our approach leads to schedules that dominate those derived from the existing approaches.

### Joint Session Practice/Practice Curated: O.R. Applications in Medicine

Sponsored: INFORMS Section on Practice (formerly CPMS)

Sponsored Session

Chair: Umit Deniz Tursun, University of Illinois, Champaign, IL, 61822,  
United States

#### 1 - Evaluation of Dexketoprofen Trometamol Ef?cacy in Postoperative Pain Management for Open Heart Surgery

Umit Deniz Tursun, University of Illinois, 3308 Sharp Drive,  
Champaign, IL, 61822, United States

To evaluate comparative statistical analgesic ef?cacy, opioid-sparing, and opioid-related adverse effects of intravenous dexketoprofen trometamol in combination with iv morphine postoperative open-heart surgery. Past data set and outcome predictions of different patient groups based on age and set of patient markers are presented. The opioid requirement is found to be lowered by %55 - 2.7 with %95 reliability. Routine addition of dexketoprofen trometamol to patient controlled analgesia morphine postoperative open-heart surgery is recommended as an alternative and ef?cacious method. The alternate postoperative pain therapy protocols are presented.

### Practice- Production & Scheduling I

Contributed Session

Chair: Carlos Monardes, Pontificia Universidad Catolica de Chile,  
Avenida Vi, Santiago, Chile,

#### 1 - Flexible Decisions and Flexible Resources: A Balance for Efficient Operations

Alejandro MacCawley, Catholic University of Chile, Santiago,  
Chile, Elbio Avanzini, Jorge R. Vera, Sergio Maturana

<Uncertainty in operational environments can be faced with operational flexibility in decisions as well as in resources. However, there are different costs involved, as well as the effects and operational consequences. In this work, we present a multi-stage stochastic optimization decision model, applied to a case in the agricultural industry. The model allows us to analyze the trade-offs between flexibility in the decision process as well as flexibility in the resources, like manpower skills. The analysis and conclusions help management to achieve a better operational planning under uncertainty.>

## 2 - A Column-generation Approach to Maximizing Angle Board Production

Samir Bhetwal, Northern Illinois University, Dekalb, IL, United States, Christine Vi Nguyen

The project focuses on providing a reliable solution to a paper production company producing angle boards. The company receives raw materials from the sister companies, and therefore has little control over the thickness of the paper that is used to create the angle boards. The column generation algorithm has been developed and a set of patterns are generated for each type of angle board product by which the production run can be maximized with the current available supply of raw materials. The model considers the current set of raw materials and its attributes in the production of good quality angle boards.

## 3 - Optimal Production and Inventory Planning with Inventory Based Financing

Renato E. de Matta, University of Iowa, 2360 Mulberry Street, Coralville, IA, 52241, United States, Vernon Hsu

We study a multi product, multi period production planning problem with restriction on the available working capital. We use cycle inventory as collateral to secure loans. We formulate the problem as a mixed integer programming model. The problem with one product is NP hard. We develop an efficient heuristic procedure to solve the multi product problem. We examine a variety of economic scenarios to show how the firm could significantly improve its profitability with the availability of inventory-based financing. We use real world data to validate our model and develop managerial insights.

## 4 - A Rhythm Wheel Approach for Production Planning and Batch Sizing

Gokhan Memisoglu, LLamasoft, Inc., 201 South Division St., Ann Arbor, MI, 48104, United States, Mike Bucci

In this study, we developed an optimization tool that includes line balancing, production cycle and sequencing. The intent of this tool is to create a high-level tactical solution which can guide a short-term production scheduling application. The tool uses Rhythm Wheel (RW) approach to estimate production cycles and creates a solution that balances setup and cycle stock costs. This tool has been used by a major pharmaceutical company in several project with great success.

## 5 - A Different Approach to Reduce Dimensionality in Planning Problems

Carlos Monardes, Pontificia Universidad Catolica de Chile, Avenida Vicuna Mackenna 4860, Macul, Santiago, Chile, Alejandro Francisco Mac Cawley, Jorge R. Vera, Susan C. Cholette, Sergio Maturana

Planning faces time dimensionality problems as instances size grows. In this work, we present a methodology to cope dimensionality. First, we defined a data structure to keep off time index in decision variables, which allowed us to construct a MIP model. Second, we solved the former problem using Constraint Generation. We tested this approach in winery industry, where model assists the assignment decision process of harvested grapes to fermentation tanks. This approach has shown interesting properties, increasing computational implementation efficiency.

## Joint Session SMA/Practice Curated: Medical Decision Support with Social Media Analytics

Emerging Topic: Social Media Analytics

Emerging Topic Session

Chair: Qingpeng Zhang, City University of Hong Kong, Kowloon, 12180, Hong Kong

### 1 - Using Search Query Data to Predict HIV New Diagnoses

Qingpeng Zhang, City University of Hong Kong, 83 Tat Chee Avenue, 6/F, Academic 1, Kowloon, 12180, Hong Kong

Objectives: Internet data are important sources of abundant information regarding HIV epidemics and risk factors. A number of case studies found an association between Internet searches and outbreaks of infectious diseases, including HIV. In this research, we examined the feasibility of using search query data to predict the number of new HIV diagnoses in China. Design: We identified a set of search queries that are associated with new HIV diagnoses in China. We developed statistical models (negative binomial generalised linear model and its Bayesian variants) to estimate the number of new HIV diagnoses by using data of search queries (Baidu) and official statistics (for the entire country and for Guangdong province) for 7 years (2010 to 2016). Results: Search query data were positively associated with the number of new HIV diagnoses in China and in Guangdong province. Experiments demonstrated that incorporating search query data could improve the prediction performance in nowcasting and forecasting

tasks. Conclusions: Baidu data can be used to predict the number of new HIV diagnoses in China up to the province level. This study demonstrates the feasibility of using search query data to predict new HIV diagnoses. Results could potentially facilitate timely evidence-based decision making and complement conventional programmes for HIV prevention.

## 2 - Social Support and User Churn Prediction for Online Health Communities – A Trajectory-based Deep Learning Method

Xiangyu Wang, University of Iowa, Iowa City, IA, United States, Apoorva Joshi, Kang Zhao, Xun Wang

Online Health Communities (OHCs) are a great source of social support for patients and their caregivers. Better predictions of user churns from OHCs can help to manage and sustain a successful OHC. We incorporate two methods into churn prediction for OHCs: identifying different types of social support activities from posts users have published via text mining, and using LSTM to learn from users' trajectories in different types of social support activities.

## ■ TB53

North Bldg 232A

## Joint Session AMD/RMP: Incentives, Dynamics and Learning

Sponsored: Auction and Marketing Design

Sponsored Session

Chair: Vasilis Syrgkanis, Microsoft Research, Cambridge, MA, 02139, United States

### 1 - Dynamic Pricing/Auctions by Multi-scale Online Learning

Rad Niazadeh, Stanford University, 353 Serra Mall, Gate Bldg., Office 484, Stanford, CA, 94305, United States, Sebastien Bubeck, Nikhil Devanur, Zhiyi Huang

In this talk, I explore dynamic pricing/auctions from the perspective of online adversarial learning, inspired by the cloud pricing application. The model we consider is simple: a seller sells an identical item in each period to a new buyer (or a new set of buyers) by posting a different price at each time (or by running one of the possible incentive compatible auctions). The goal is to extract a revenue that (almost) matches the revenue of best posted price (or auction) in hindsight. For the online posted pricing problem, we show regret bounds that scale with the best fixed price, rather than the range of the values (with a generalization to learning auctions). Moreover, we demonstrate a connection between the optimal regret bounds for this problem and offline sample complexity lower-bounds of approximating optimal revenue, studied in [Cole and Roughgarden, 2015]. Using this connection, we show our regret bounds are almost optimal as they match these information theoretic lower-bounds. Our online auctions and pricing are obtained by generalizing the classical learning from experts and multi-armed bandit problems to their "multi-scale versions", where the reward of each action is in a different range. Here the objective is to design online learning algorithms whose regret with respect to a given action scales with its own range, rather than the maximum range. We show how a variant of online mirror descent solves this learning problem.

### 2 - Non-clairvoyant Dynamic Mechanism Design

Song Zuo, Tsinghua University, Beijing, China, Vahab Mirrokni, Renato Paes Leme, Pingzhong Tang

Despite their better revenue and welfare guarantees for repeated auctions, dynamic mechanisms have not been widely adopted in practice. This is partly due to their implementation complexity and unrealistic use of forecasts. We address the shortcomings and present a new family of dynamic mechanisms that are simple to compute and require no future distribution knowledge. We introduce the concept of non-clairvoyance in dynamic mechanism design, which means the allocation and pricing rule does not depend on future type distributions. We develop a framework to characterize the revenue extraction power of non-clairvoyant mechanisms against mechanisms with future distributional knowledge.

### 3 - Learning to Bid Without Knowing Your Value

Chara Podimata, Harvard University, 33 Oxford St, Cambridge, MA, 02138, United States, Zhe Feng, Vasilis Syrgkanis

We address online learning in complex auction settings, where the value of the bidder is unknown to her, evolving in an arbitrary manner and observed only if the bidder wins an allocation. We leverage the structure of the utility of the bidder and the partial feedback that they typically receive in auctions, in order to provide algorithms with regret rates that are exponentially faster in terms of dependence on the action space, than generic bandit algorithms. For that, we analyze a new online learning setting with outcome-based feedback, generalizing learning with feedback graphs. Lastly, we verify experimentally the performance of our algorithm and its robustness to noise in the feedback received.

#### 4 - How to Make Envy Vanish Over Time

Christos-Alexandros Psomas, Carnegie Mellon University, 5000 Forbes Avenue, GHC 9116, Pittsburgh, PA, 15213, United States, Gerdus Benade, Aleksandr Mark Kazachkov, Ariel Procaccia

We study the dynamic fair division of indivisible goods. Suppose  $T$  items arrive online and must be allocated upon arrival to one of  $n$  agents, each of whom has a value in  $[0,1]$  for the current item. Our goal is to design allocation algorithms that minimize the maximum envy at time  $T$ , defined as the maximum difference between any agent's overall value for items allocated to another agent and to herself. An algorithm has vanishing envy if the ratio of envy over time goes to zero as  $T$  goes to infinity. We design a polynomial-time, deterministic algorithm that achieves vanishing envy, and show that it is asymptotically optimal. We also derive tight bounds for a more general setting where items arrive in batches.

North Bldg 232B

### Issues in Behavioral Operations

Sponsored: Behavioral Operations Management

Sponsored Session

Chair: Elena Katok, University of Texas at Dallas, Richardson, TX, 75080, United States

#### 1 - The Behavioral Traps of Making Multiple, Simultaneous, Newsvendor Decisions

Shan Li, City University of New York, Baruch College, 55 Lexington Avenue, New York, NY, 10010, United States, Kay-Yut Chen

This paper conducted an experimental study to explore behaviors of newsvendors who make order decisions for two products simultaneously. We find that the decision performance is significantly reduced if a high-margin product is grouped with a low-margin product, but not so if it's grouped with another high-margin product. Our study has implication on how multiple products should be grouped and managed.

#### 2 - Using Strategic Buckets for Aligning Managers' Decisions with Companies' Objectives

Ulrich Thonemann, Professor, Universitat zu Koln, Business School, Albertus Magnus Platz, Koeln, D-50923, Germany, Andreas Fuegener

From a company's perspective, managers tend to over-invest in incremental projects and to under-invest in innovative ones. We analyze how strategic buckets can be used for aligning the investment decisions of individual managers with the company's objectives. Strategic buckets have been implemented in practice, but it is unclear how managers respond to them and how companies should design them. We present a behavioral model and report the results of laboratory experiments on the effect of strategic buckets on project selection.

#### 3 - The Role of Numeracy in Forecast Compliance, Trust and Usability

Elena Katok, University of Texas at Dallas, 800 W. Campbell Rd., Jindal School of Management (SM30), Richardson, TX, 75080, United States, Tobias Stangl, Gary E. Bolton

In procurement interactions, the relationship between the buyer and the seller starts after the sourcing decision has been made. In this study we consider ways to design a scorecard to best incentivize the suppliers.

### Joint Session Sports/Practice Curated: Sports Analytics V

Sponsored: SpORts

Sponsored Session

Chair: Scott Nestler, University of Notre Dame, Granger, IN, 46530, United States

#### 1 - Analysis of Experimental Rule Changes in the 2018 National Invitation Tournament

Scott Nestler, University of Notre Dame, 51344 Pebble Beach Court, Granger, IN, 46530, United States

In recent years, the National Collegiate Athletic Association (NCAA) has used the National Invitation Tournament (NIT) as a test bed for rule changes under consideration. 2018 modifications included: (1) 3-point line extended by 20 inches; (2) lane expanded from 12 to 16 feet (NBA width); (3) 20-minute halves

split into two 10-minute quarters; and (4) resetting the shot clock to 20 (vs 30) seconds after an offensive rebound. In anticipation of the next possible rule change in 2019, this analysis quantifies the effect of these modifications on the college basketball game, through comparison with regular season and other post-season tournament games.

#### 2 - Age Effects in Mixed Martial Arts Competition

Thomas Robbins, East Carolina University, 3212 Bate Building, Greenville, NC, 27858, United States

The impact of age on sports performance has been analyzed in multiple sports including baseball, hockey, soccer, swimming, golf, track and field, and tennis. In this talk, we examine the impact age has on performance in mixed martial arts competition. We find that the age distribution varies significantly with weight class; as smaller more athletic weight classes are younger than the larger weight classes. We also quantify the impact age and age differential have on a fighter's probability of winning. Finally, we investigate whether the age distribution has been impacted by anti-doping policies and USADA testing.

#### 3 - MeetOpt: A Spreadsheet-based Decision Support System for Optimal Athlete-to-Event Assignment in Track and Field

Matthew Bailey, Bucknell University, School of Management, Taylor Hall, Lewisburg, PA, 17837, United States, Maciek A. Nowak

Nationally, track and field is second only to football in participation. Time-constrained track coaches primarily focus on the training and development of athletes. As a result, they overlook and underappreciate the competitive advantage of strategically assigning athletes to events. Working with local coaches, we developed a spreadsheet-based DSS, MeetOpt. MeetOpt is a generalization and extension of an assignment problem which determines an optimal athlete assignment to maximize the expected total team points. We illustrate the value of this model in comparison to commercially available tools and under a variety of scenarios, league rules, and preferences.

#### 4 - Team-specific Ticket Options

Ovunc Yilmaz, University of Notre Dame, South Bend, IN, 46617, United States, Mark Ferguson, Pelin Pekgun, Guangzhi Shang

Team-specific ticket options have recently gained popularity in the sports industry. In this study, we investigate the drivers of prices and transaction volumes in this market using social media data and detailed game/ranking information.

### HAS Distinguished Scholar Lecture – Stefan Scholtes

Sponsored: Health Applications

Sponsored Session

Chair: Ebru Korular Bish, Virginia Tech, Blacksburg, VA, 24060, United States

Co-Chair: Tinglong Dai, Johns Hopkins University, Baltimore, MD, 21202, United States

#### 1 - The Healthcare Management Department of Management Science: How Can we Create and Support Impactful Research?

Stefan Scholtes, University of Cambridge, Judge Business School, Trumpington Street, Cambridge, CB2 1AG, United Kingdom

In contrast to other Management Science departments, the new healthcare management department focuses on a specific industry. This should be attractive to authors because their papers do not need to address a general context or contribute to general theory. However, the luxury comes at a price: Papers in the department have to provide insights that are of immediate interest and relevance for senior leaders in the industry. I will discuss this challenge, provide a few illustrative examples of attempts from my own work, and would then like to hear from the audience how we can achieve more practical impact with our research, while maintaining the high methodological standards of Management Science.

## ■ TB57

West Bldg 101B

### Health Applications

Sponsored: Health Applications

Sponsored Session

Chair: Osman Ozaltin, North Carolina State University, Raleigh, NC, 27605, United States

#### 1 - Operating Room Capacity Allocation Among Indoctors and Outdoctors Under Uncertainty

Tonguc Yavuz, Ozyegin Universitesi, Istanbul, Turkey, Serhat Gul, Erhun Kundakcioglu

The hospitals that have high-tech equipments or specialize in specific areas improve their revenues by allowing the doctors that are not employed by the hospital to use their own operating rooms. We study the problem of OR capacity allocation among indoctors and outdoctors over a planning period. The problem is formulated as a two-stage stochastic mixed integer program. We exploit the structural properties of our model to improve the computational performance of the standard stochastic programming techniques. We conduct numerical experiments based on data from a major hospital.

#### 2 - Data Analytics on the Operations of a Radiology Workflow Platform: Statistical Evidence of Cherry-picking and its Impact on Service Level

Gonzalo Romero, Rotman, University of Toronto, 91 Ferrier Avenue, Toronto, ON, M4K 3H6, Canada, Timothy Chan, Nicholas Howard, Saman Lagzi

Most hospitals follow an unstructured process for assigning cases to radiologists, providing ample freedom to select the next case to work on. We analyze a large and unique dataset from the operations of a radiology workflow platform. In particular, we explore whether the point system that Medicare uses to measure complexity -and ultimately for compensating hospitals and radiologist- is aligned with the amount of work required to process each case. We find that there exist some misalignment, which opens the door for radiologists to process cases that give a higher bang-per-buck first. We provide the first statistical evidence of cherry-picking in the processing of radiological cases.

#### 3 - Improving Patient Safety in the External Beam Radiation Therapy

Osman Ozaltin, North Carolina State University, Raleigh, NC, United States

The risk for errors is high in radiation therapy as the planning and delivery processes involve numerous hand-offs, each person interpreting and entering information via multiple complex electronic systems. The use of safety barriers (SB) is a widely recognized method for detecting errors before they harm patients. Each SB checks one or more treatment elements related to the outcomes of previous steps to ensure that they are accurate and meet safety standards. We develop an optimization framework to determine the reliable design of SBs to improve patient safety.

#### 4 - Emergency Department Pharmacy Staffing using Priority-based Workload

Phichet Wutthisirisart, Senior Health Services Analyst, Mayo Clinic, 200 First Street SW, Rochester, MN, 55905, United States, Maria Rudis, Kalyan Pasupathy, Mustafa Y. Sir

Pharmacists normally prepare prescription medication on demand and provide consultation on medication usage. Pharmacists based in Emergency Departments (EDs), unlike outpatient pharmacists, work closely with physicians to decide treatment plans for patients and assist physicians in resuscitation events. This work presents a novel approach implemented in Mayo Clinic's ED in Rochester to determine block schedules for staffing the ED pharmacy, based on patient volume with respect to task priority levels and estimated task response times. The comparison of pharmacy coverage before and after implementation showed that the ED achieved around 30 percent improvement.

#### 1 - Advancements in Athletic Performance Using Bio-Sensors and Simulation Modeling

Dotan I. Shvorin, Clemson University, Clemson, SC, United States

A proof of concept research was constructed to test if the integration of bio-sensing technology with advance analytical tools could provide advantageous insights to human performance. The study integrated a step-wise design with an action research approach. Each phase of the study, which included tennis drill design, simulation modeling, capturing the player baseline and game performance, model calibration, and optimization modeling, was tested, revised, and validated. By evaluating decision making outcomes, the proposed model presented a predicted player performance improvement capability of 18%, 11%, and 4% at the amateur, intermediate and advance skill level of play.

#### 2 - Effect of the Designed Environment on Individuals with Behavioral Disorders

Meirav Goldhour, Professor, Converse College, Spartanburg, SC, 29681, United States

Elements within our built environment such as color, light, view, materials, and space planning, can have an impact on mental and physical wellbeing. By way of example, research supports that certain colors can increase or decrease blood pressure, light can have an impact on concentrations, and space organization can improve human performance. Some design features can trigger negative memories, create discomfort, and be translated adversely by individuals with elevated sensitivities, such as Trauma and PTSD sufferers. With this knowledge in progress, design guidelines taken from related multidisciplinary fields have been formed towards promoting mental healing and performance.

#### 3 - Understanding Interruptions, Multitasking, and Workflow in the Emergency Department

Allan Fong, Medstar Health, 3007 Tilden Street, NW, Suite 7L, Washington, DC, 20008, United States

Understanding clinician workflow in healthcare settings is important to the safety and timely delivery of care. The emergency department specifically is one of the most interruption laden and chaotic environments where physicians have little to no control of the volume and acuity of their patients. Interruptions in healthcare environments are particularly risky given the potential for medical error and patient harm. We discuss a time-motion study observing 24 emergency physicians highlighting results and factors surrounding multitasking and interruptions.

#### 4 - Experience and Fatigue in Emergency Medicine Physician Decision Making

Kevin M. Taaffe, Clemson University, Department of Industrial Engineering, 269 Freeman Hall, Clemson, SC, 29634, United States, Dotan Shvorin

Emergency medicine physicians work in highly uncertain and intense care settings. After collecting data from a wearable bio-marker device, initial findings indicate that physician experience plays a role in developing internal control mechanisms to cope with various treatment conditions in the emergency room. Our research aims to detect not only the physiological differences between attending physicians and resident physicians, but also to detect when these physicians should change their workflow decisions to achieve better outcomes. Our findings will demonstrate how experience and physiological awareness of the physician can affect performance and result in better decision making.

#### 5 - Thinking with Your Brain in Mind: Learning More About the Learning Machine

Sheldon Herring, Greenville Health System, 701 Grove Rd, Greenville, SC, 29605, United States

The brain is the most complex system in existence and exists in a state of "dynamic stability". The brain continues to grow in complexity and mature, and is usually able to incorporate new information without destabilizing and losing its core identity. One of the most unique aspects of the brain is its self-awareness. Damage can result in changes in instability and result in "systems errors" that are counter-intuitive and range from changes in self-awareness to deficits in information processing. This session will provide an overview of the brain as a complex, dynamic and self-aware system and examples of how injury can result in impaired information processing and overview of neurorehabilitation.

**Joint Session HAS/Practice Curated: Applications of Decision-Making Models in Healthcare**

Sponsored: Health Applications

Sponsored Session

Chair: Alireza Boloori, Arizona State University, Tempe, AZ, 85283, United States

**1 - Bias in Sensitivity Analysis of Comparative Analyses for Medical Decision Making**Michael J. Hintlian, University of Southern California,  
1029 South Westmoreland Avenue, #102, Los Angeles, CA, 90006,  
United States, Julia L. Higle

Comparative analyses for MDM are undertaken examine the cost/benefit impact of various treatment alternatives. These impacts are estimated via model-based analyses after which sensitivity to model parameters is examined. We illustrate the existence of bias in the sensitivity analysis that results from the methods used to select model parameters. We discuss methods for mitigating this bias.

**2 - Optimal Genetic Testing Schemes for Cystic Fibrosis**Hussein El Hajj, Virginia Tech, Blacksburg, VA, United States,  
Ebru Korular Bish, Douglas R. Bish

Cystic fibrosis (CF) is a highly prevalent life-threatening genetic disorder, but early diagnosis can save lives and reduce healthcare expenditures. To date, over 300 CF-causing mutations are identified, and all 50 states conduct newborn screening for CF, typically starting with a bio-marker test, followed by genetic testing on selected mutations for newborns with elevated bio-marker levels. We develop a stochastic optimization model to determine an optimal genetic testing scheme for CF that minimizes the probability of misclassification under a testing budget. Our case study for California shows that the optimal scheme can substantially reduce misclassification over current practices.

**3 - Incentive-Driven Readmission Management with Patients Facing Compliance Barriers**Aditya Mahadev Prakash, University of Florida, Gainesville, FL,  
32608, United States, Qiaochu He, Xiang Zhong

We aim to quantify the impact of non-compliance of patients on their post-acute care management, and assist healthcare stakeholders in improving the overall well-being of patients through the most efficient and effective allocation of resources. We establish a game-theoretic model where patients' lack of compliance is modeled by incorporating their heterogeneous and bounded rationality in the context of a congested service system. The optimal structure of subsidies that can monetarily incentivize patients and result in a minimum overall cost for an insurer is developed. The insights obtained from this study would support clinical and operational decision-making by health practitioners.

**4 - Impact of Physician's Ambiguity on Management of Medications**Alireza Boloori, Arizona State University, Tempe, AZ, 85283,  
United States, Soroush Saghaian, Harini A. Chakkerla,  
Curtiss B. Cook

Patients after organ transplantations receive high amounts of immunosuppressive drugs (e.g., tacrolimus) to reduce the risk of organ rejection. However, this practice has been shown to increase the risk of New-Onset Diabetes After Transplantation (NODAT). We propose an ambiguous POMDP framework to generate effective medication management strategies for tacrolimus and insulin. Our approach increases the patient's quality of life while reducing the effect of transition probability estimation errors. We also provide several managerial and medical implications for policy makers and physicians.

**Scheduling in Healthcare Operations**

Sponsored: Health Applications

Sponsored Session

Chair: Jin Qi, Hong Kong University of Science and Technology  
Hong Kong**1 - A Predictive Analytics Framework for Personalizing Patient Encounters for Diabetes Care**Han Ye, U. of Illinois at Urbana-Champaign, 350 Wohlers Hall,  
1206 South Sixth Street, Champaign, IL, 61820, United States,  
Ujjal Kumar Mukherjee, Dilip Chhajed

In this paper, we develop a two stage decision framework that considers predicted diabetes risks of individual patients as inputs, which healthcare organizations can implement for optimally scheduling patient encounters for management of diabetes care.

**2 - Dynamic Appointment Scheduling of Elective Surgeries Under Bed Capacity Constraint**Chengyu Wu, Duke University, Durham, NC, 27705,  
United States, Li Chen, Jing-Sheng Jeannette Song

Both elective surgery patients and emergency surgery patients, after leaving operating room, need to enter the ICU that has a limited bed capacity. We study the problem of optimally scheduling elective surgeries in advance by taking into account the ICU capacity and occupancy. In doing so, we derive structural results and develop a heuristic which is validated using real-world hospital data.

**3 - Appointment Scheduling with a Waiting Time Target**Xing Liu, City University of Hong Kong, CITYU, Hong Kong,  
Frank Y. Chen, Jin Qi, Han Zhu

This work is motivated by the appointment booking of a care center, which accepts only advanced booking and patients should receive consultations within a stipulated target waiting time. We propose a heuristic for this advance booking problem through the policies of an allocation scheduling counterpart of the problem.

**4 - Operating Theater Scheduling Under Uncertainty with an Entropic Index**Xiaojin Fu, Hong Kong University of Science and Technology,  
Hong Kong, Jin Qi, Han Ye

We consider a surgery scheduling problem in an operating theater with uncertain surgery durations. We introduce the Entropic Tardiness Index (ETI) to quantify both the frequency and intensity of surgery delay or OR overtime. A mathematical model is formulated to find a sequencing decision which minimizes the ETI criterion, and an algorithm based on benders decomposition is developed to find the optimal solution. Inspired by a heuristic, we propose an index Entropic Deviation (ED) to account for both variation and skewness of surgery durations. Numerical study shows that sequencing decision obtained by sorting the EDs of the surgeries in the ascending order achieves a relatively good performance.

**Optimization Society Award Session I**

Sponsored: Optimization

Sponsored Session

Chair: David Morton, Northwestern University, IEMS Department,  
2145 Sheridan Road, Evanston, IL, 60208, United States**1 - A Brief Tour of Logic and Optimization**John Hooker, Carnegie Mellon University, Tepper School of  
Business, Pittsburgh, PA, 15213, United States

This talk conducts a brief tour of the remarkable connections between logic and optimization, some of which have led to substantial improvements in solution technology. They include the fundamental role of logic in optimization duality and how it leads to logic-based Benders decomposition; the deep relationship between cutting planes and logical inference methods; linear and integer programming models for probabilistic, nonmonotonic, and belief logics; the role of logic's famous Herbrand Theorem in infinite-dimensional integer programming; binary decision diagrams as a discrete optimization tool; and how concepts of consistency in constraint programming relate to cutting plane theory.

**2 - A Simple Nearly-Optimal Restart Scheme for First-Order Methods**

James Renegar, Cornell University, Ithaca, NY, United States

I was lucky as a researcher to be coming of age when the "interior-point method revolution" was beginning to unfold, lucky to be in position to make a research contribution that was quickly and widely appreciated, a contribution that has played a significant role in now being honored with the Khachiyan Prize. The talk, however, focuses on recent research, presenting a simple restart scheme for first-order methods, which for rich classes of convex optimization problems results in algorithms with complexity bounds nearly matching lower bounds established by Nemirovski and Nesterov in the 1980's.

**3 - Stochastic Programming: Approximations and Scenarios**

Werner Roemisch, Humboldt Universitat, Berlin, Germany

Solving a stochastic program requires approximating a probability distribution with a finite set of scenarios. First, we review scenario generation using stability and probability metrics. Second, we describe a stability- and problem-based method to generate scenarios. For two-stage SPs this requires solving a generalized semi-infinite program, which reduces to a standard convex semi-infinite program in special cases. Third, we review quadrature using Monte Carlo, Quasi-Monte Carlo and sparse grid, and the method of moments, including convergence properties. We discuss numerical results.

**4 - Optimization Society's Khachiyan Prize**

David Morton, Northwestern University, IEMS Department,  
2145 Sheridan Road, Evanston, IL, 60208, United States

Winners of the Optimization Society's Khachiyan Prize will present their work.

Co-Chair: Miaolin Fan, Boston, MA, 02115, United States

**1 - A Novel Framework for Multimodal Physiological Data Fusion: Network Models of Nonlinear Dynamic Coupling Systems**

Miaolin Fan, Northeastern University, 360 Huntington Avenue,  
Boston, MA, 02115, United States

The human body is considered as a complex dynamic system of multiple physiological subsystems. A novel framework was proposed to present the system as a directed network, and the interrelationship among subsystems was quantified by fusing multimodal physiological time series. Each time series is projected onto a reconstructed state space, where the temporal dependency among system's states is captured. Then, a directed network model is formulated to characterize the coupling relationship between physiological subsystems with a temporally variable structure. We also discuss how the directed coupling can be assessed in the context of specific tasks, e.g. interpersonal communication.

**2 - Cost-sensitive Feature Selection using Mixed Integer Programming**

Daehan Won, Binghamton University, R4, Eng. Bldg, L2, Vestal,  
NY, 13902, United States, Shun Cao

Feature selection aims to select a subset of highly informative features that are capable of discriminating observations. Herein we consider the cost components in the selection since the traditional way may result in good selection in theory but not in practical applications. We are developing cost-sensitive classifier that minimizes the error caused by misclassification as well as maintaining the maximum amount of the cost to select the important features. To impose the cost directly, we construct two Mixed Integer Programming (MIP) models. To demonstrate the effectiveness, empirical experiments are conducted while showing that ours are capable of selecting a low-cost subset of features.

**3 - A General Embedding Framework for Heterogeneous Information Learning in Large-scale Networks**

Na Zou, Texas A&M University, 101 Bizzell Street, 4018 Emerging  
Technology Building, College Station, TX, 77845, United States

Network analysis has been widely applied in many real-world tasks. To extract features for these tasks, network embedding automatically learns a low-dimensional vector representation. However, it remains challenging to jointly embed the geometrical structure with heterogeneous information as well as problem of scalability. To bridge the gap, we propose a Heterogeneous Information Learning in Large-scale networks (HILL) to accelerate the joint learning. It decomposes the complex modeling into many simple and independent sub-problems. We illustrate the generalizability of HILL by applying it to perform attributed network embedding and second-order proximity learning.

**4 - A Low Rank Model for Estimation of Response Function in fMRI Data**

Minh Pham, Rochester Institute of Technology, Rochester, NY,  
22911, United States

The focus of this paper is on evaluating brain responses to different stimuli and identifying brain regions with different responses using multi-subject, stimulus-evoked functional magnetic resonance imaging (fMRI) data. To jointly model many brain voxels' responses to designed stimuli, we present a new low-rank multivariate general linear model (LRMGLM) for stimulus-evoked fMRI data. The new model not only is flexible to characterize variation in hemodynamic response functions (HRFs) across different regions and stimulus types, but also enables information "borrowing across voxels and uses much fewer parameters than typical nonparametric models for HRFs.

**1 - Using Predictive Analytics to Forecast Litigation Outcomes**

Mohammad Javad Feizollahi, Georgia State University, 755 First  
Drive NW, Atlanta, GA, 30332, United States, Charlotte Alexander

Text mining and predictive analytics are increasingly being used to analyze and forecast the outcome of lawsuits. In this project, we parse the text of thousands of court documents filed in federal employment law cases to discover features of the plaintiffs, defendants, lawyers, and judges, and the legal claims made in each case. Together, these features help construct a model that can be deployed at different phases of litigation to predict a case's outcome. We describe the methodology and results of this litigation prediction project.

**2 - A Sensor-driven Anomaly Detection Model with a Bayesian Hierarchical Framework**

Ramin Moghaddass, University of Miami, McArthur Engineering  
Building, Coral Gables, FL, 33146, United States

In this work, a new Bayesian hierarchical framework is presented that can be used to (a) model systems' response variables in terms of system's inputs (features) without imposing strong distributional assumptions, and (b) detect anomalies regardless of whether or not such anomalies have been observed before based on a trade-off between performance measures, such as true detection rate and false alarms. Using a Bayesian hierarchical setting, the model utilizes only a subset of important features and training samples in the training process.

**3 - A Two Objective Linear Programming Approach for Data Classification**

Elaheh Jafarigol, University of Oklahoma, Norman, OK, 73071,  
United States, Theodore B. Trafalis

Multi-objective optimization techniques are a useful tool for designing and analyzing supervised learning systems. This paper presents an optimization model to find support vector hyperplanes to classify large datasets with non-separable classes with modifications to the objective function in traditional support vector machine. To solve this optimization problem, parametric simplex for two-objective LPs is used. The model is implemented in Gurobi through Python to optimize the two-objective model.

**4 - Predictive Analytics in Humanitarian Supply Chain using Deep Learning**

Donovan Fuqua, New Mexico State University, 4208 Escondido  
Lane, Las Cruces, NM, 88005, United States, Talayeh Razzaghi

In this work, we propose the use of deep neural networks to predict shipment arrivals and system bottlenecks using multi-channel time series data. We use US Military transportation data from 2004-2015 for humanitarian relief supply chains. Although the research focuses on humanitarian operations, we will discuss multiple applications for supply chains and transportation optimization.

**1 - Effect of Mimicking News Title on Sponsored Article Engagement**

Quan Wang, LinkedIn, 880 W. Maude Ave, Sunnyvale, CA, 94085,  
United States

Media companies are incorporating sponsored articles in the news feeds which used to be dedicated to editorial news articles. Using a large-scale novel dataset from a leading news website, we investigate whether mimicking news style affects the user engagement with the sponsored article. We employ a combination of human evaluation, natural language processing, binary classification models and econometrics models. We find evidence that mimicking the style of news title could lift the click probabilities by over 100% and increase conversion probability by 40%. Sub-analyses indicate that contextual congruity might be the driving force of the engagement lift.

## 2 - Using Omnichannel Sales Data Analytics to Decide Between Store and Distribution Center Fulfillment Options

Jingran Zhang, New Jersey Institute of Technology, University Height, Newark, NJ, 07102, United States, Jingran Zhang, Marshall University, Lewis College of Business, One John Marshall Drive, Corbly Hall 423, Huntington, WV, 25755, United States, Sanchoy Das

A brick-and-mortar retailer can fulfill online customer orders in two ways (i) Buy Online Fulfill from Store (BOFS) - Picked from store inventory, and (ii) Fulfill from Distribution Center (FDC) - Picked from DC or warehouse inventory. The fulfillment decision is made in real time for each order, with the primary goal of maximizing the revenue value of the store inventory. Analysis of sales data in both online and store channels is used to forecast the value of the dispersed inventory, and then develop a prescriptive model for making a fulfillment decision.

## 3 - Google Tells What Happens When Shadow Economy Meets Bitcoin

Zhesi Chen, First and Responding, Harbin Institute of Technology, Management Building 612, West Dazhi Street, Harbin, Heilongjiang China, Harbin, 150001, China, Wenjun Sun, Qiang Ye

In this study, we find striking positive correlations between Bitcoin's key financial indicators and the level of shadow economy, based on the geographic distribution of interests on Google Trend keyword "Bitcoin", along with the corresponding Shadow Economy Index data. Our results indicate that the shadow economy may be one of the key implicit factors driving Bitcoin's prosperity. Our study also shows that Google Trend can be an effective detector of economic and social drivers of Bitcoin.

## 4 - Identifying Companies with Prospects of Adopting Blockchain

Hamidreza Ahady Dolatsara, Auburn University, 227 Lowder Hall, 405 W. Glenn Ave., Auburn, AL, 36830, United States, Ashish Gupta, Alireza Farnoush, Gelareh Ahadi Dolatsara

This research identifies companies that may adopt blockchain technology based on their similarities to the companies that have already demonstrated an intention to use this technology. Long term financial performance of companies that intended to use blockchain technology is investigated for understanding the characteristics of such companies. Semi-supervised classification method is subsequently employed to identify similar companies.

## 5 - Smart Contract Execution – The (+)-Biased Ballot Problem

Lin Chen, University of Houston, 4800 Calhoun Road, Houston, TX, 77004, United States, Lei Xu, Zhimin Gao, Nolan Shah, Yang Lu, Weidong Shi

Transaction system build on top of blockchain, especially smart contract, is becoming an important part of world economy. We consider a blockchain-based smart contract system and study how the behavior of users would affect the consensus. We connect this problem to the classical Ballot problem in combinatorics and establish a more general (+)-Biased Ballot Problem to model it. We give an asymptotic analysis of this new model.

## 1 - The Role of Community-based Norms in Carbon Emissions: A Machine Learning Exploration

Zhasmina Tacheva, SUNY at Buffalo, Buffalo, NY, 14210, United States, Anton Ivanov

Through the use of advanced machine learning and text mining techniques, this study analyzes a massive body of unstructured Twitter data in order to uncover patterns of common needs and values across all 3,007 counties in the U.S. The detected personality characteristics are then used to predict household carbon emissions at the county level. Concrete policy implications and important insights about ways to reduce carbon emissions through modifying consumer behavior at the local level are made.

## 2 - Embedding Machine Learning Into SAP Hana Applications

Sricharan Poundarikapuram, SAP America, 2996 N. 83rd Place, Scottsdale, AZ, 85251, United States, Doug Freud

The next wave of computing builds upon the Tabulation era that started in the 1900's and the Programmatic Computing era that started in the 1950's. The new class of analytic solutions leverage data combined with ML and other technologies to transform and automate tasks typically performed by humans. The SAP point of view is that next generation applications need to evolve from simple rules based programs into solutions that are powered by ML. Instead of hard coding

rules into applications, next generation solutions will be a combination of rules and probabilities dynamically generated via ML. In this session we will cover an overview of ML powered application that we built in SAP HANA and Cloud Platform.

## 3 - Data Driven Portfolio Optimization Utilizing Machine Learning

Meng-Chen Hsieh, Rider University, 2083 Lawrenceville Rd, Lawrence Township, NJ, 08648, United States

In practice, data-driven optimal portfolio decisions are derived using the time series data of underlying asset returns. Such data-driven optimal portfolio tends to have inferior out-of-sample performance due to estimation errors of parameters. In the 'big data' era, correlations between asset returns and auxiliary variables are frequently observed. In this talk, several machine learning methods are applied to derive the optimal portfolio leveraging the association between the underlying asset returns and auxiliary variables. A comparison study on the out-of-sample performance of the optimal portfolio with and without utilizing machine learning methods is conducted.

## 4 - A DQN Method for Progressive Generation of Solutions of VRPTW

Xiaodong Zhang, Artificial Intelligence Department, Zhejiang Cainiao Supply Chain Management Co., Ltd, Hang Zhou, China

We present a 'like-heuristic' framework for solving Vehicle Routing Problem with Time Window using Deep Q-learning Network. In this approach, instead of defining a specific heuristic policy to search the huge solution space, we make decisions according to the probability distribution of all customers to make progressive generation, by observing the reward signals and following feasibility rules.

## 5 - Fast and Provable Algorithms for Learning Two-layer Polynomial Neural Networks

Mohammadreza Soltani, Iowa State University, 3201 Coover Hall, Ames, IA, 50011, United States, Chinmay Hegde

We study the problem of (provably) learning of a two-layer neural network with quadratic activations. We focus on the under-parametrized regime where the number of neurons in the hidden layer is smaller than the dimension of the input. Our main approach is to "lift the learning problem into a higher dimension, which enables us to borrow techniques from low-rank matrix estimation. Using this intuition, we propose three novel, non-convex algorithms. We support our algorithms with rigorous theoretical analysis, and show that all three enjoy a linear convergence, fast running time per iteration, and near-optimal sample complexity. We complement our theoretical results with some experiments.

Sponsored: Artificial Intelligence

Sponsored Session

Chair: Yongcheng Zhan, The University of Arizona, Tucson, AZ

## 1 - Learning User Age via Locality and its Applications in Regulatory Science: A Deep Learning-Based Approach

Zhipeng Chen, The University of Arizona, Tucson, AZ, United States, Daniel Dajun Zeng

The development of regulatory science requires researchers to utilize multiple data sources for assessing the safety, efficacy, quality and performance of all regulated products. The large quantity of social media data provides an opportunity to characterize public attitudes in real time. However, the lack of demographic data induces data biases and diminishes the utility of social media data. Our research mitigates this weakness by building a deep learning model to predict user age. The experiment shows the locality is a strong predictor and achieve a satisfiable prediction accuracy. Then we apply the prediction model to an e-cigarette dataset in an e-cigarette brand analysis. The analysis results indicate strong public health implications of demographics prediction.

## 2 - Illicit and Prescription Drug Street Name Detection using Social Media

Yongcheng Zhan, The University of Arizona, Tucson, AZ, 85719, United States, Zhu Zhang, Scott J. Leischow, Daniel Dajun Zeng

Recent years have observed the spread of America's drug overdose epidemic. Much effort has been made in public health surveillance to realize the potential of early detection and targeted intervention. However, because of the ever-changing drug street names, it is increasingly difficult for researchers and public health practitioners to keep up with the terms. We proposed an innovative method to automatically detect illicit and prescription drug street names by using rich text information from social media. Our method showed its potential by enriching NIH opioid street name list with emerging terms.

**3 - Detection of Prejudice from Social Media Streams**

Haimonti Dutta, University at Buffalo, 325P Jacobs Management Center, Buffalo, NY, 14260, United States

Multicultural societies are characterized by frequent contact and communication between different social groups. Prejudices, or beliefs about a particular social group, affect the nature and quality of interactions with members of that group. It finds expression in social media platforms when a group of people express anger, resentment and dissent towards another. It is heightened during crises or threat. This paper develops a framework for detection of prejudice from social media streams using deep learning methods. Empirical results presented on a Twitter data stream show that our framework is capable of out-performing state-of-the-art batch systems for prejudice detection.

**4 - Forecasting Collective Action using Social Media**

Rostyslav Korolov, Rensselaer Polytechnic Institute, 110 Eighth Street, Troy, NY, 12180, United States, David Mendonca, William A. Wallace

We demonstrate the potential of online social media for large-scale behavioral research by developing a multi-disciplinary approach to predicting collective action using social media data. We report three case studies: one concerning charitable donations and two concerning social unrest. Through these case studies we demonstrate the utility of social media data for predictions of different kinds of collective action. We utilize Twitter data (approximately 20 million messages) to predict the volume of disaster response donations, and occurrences of protests.

**5 - Predicting Gasoline Shortage in Florida During Irma using Tweets**

Abhinav Khare, University at Buffalo, Buffalo, New York, NY, United States, Rajan Batta, Qing He

Shortage of supplies during a disaster is a common issue. Social media usage during disasters also surges. We developed a model to infer demand of supplies during disaster using Twitter and tested it to infer gasoline demand that occurred in Florida during Irma. We built a support vector machine model combined with n-grams and topic models to classify tweets regarding demand and modelled the arrival of tweets as a Space-Time Poisson Process to infer the spatiotemporal demand. The model was tested on a database of 1.4 million tweets around Hurricane Irma in Florida. Our classification accuracy is high with f-score of 0.879 and the predicted demand correlates highly with the ground truth.

Sponsored Session

Chair: Yuheng Hu, University of Illinois-Chicago, Chicago, IL, 60607, United States

**1 - Can (s)he Code? Gender Bias in an Open Source Software Community**

Tingting Nian, University of California, Irvine, UCI, Irvine, CA, United States

It is well-documented that women are underrepresented across all STEM fields and particularly in computing. Previous research identifies the negative stereotype about women's abilities is one of the leading reason. In order to scientifically examine the issue of gender bias in online open source software communities, our study investigates whether and to what extent there exists a gender bias in the programming question-and-answer site, Stack Overflow. Our results reveal a net discrimination of 0.4 votes per month against female participants, statistically significant at the one percent level. We also found evidence suggestive of the statistical discrimination at work.

**2 - Impact of Free Shipping Threshold on Different Channels: Evidence from an Online Retailer**

Fujie Jin, Kelley School of Business, Indiana University, 1309 E. Tenth Street, HH 4100, Bloomington, IN, 47401, United States, Fei Gao, Jianbin Li

In this working project, we use a unique data from an online retailer to look at customer padding behavior, with respect to a shipping fee change. Our preliminary evidence suggest that customers using the PC channel are more likely to pad their shopping cart to meet the minimum shipping fee, compared with customers using the mobile channel. We suggest that difference in search cost across the two channels is a main contribute to such different user behavior.

**3 - Visualizing Cybersecurity Risk Factors**

Arion Cheong, Rutgers University, Newark, NJ, United States, Won Gyun No, Soohyun Cho

The destructive nature of cyber threats makes it crucial for stakeholders of a firm to understand the cybersecurity risks that the firm faces. To outline a firm's known cybersecurity risks and identify its specific risks as compared to its industry peers, we utilize text mining to extract and analyze risk factor disclosures that firms report on Form 10-K. Since a comparison of cybersecurity risks through textual analysis is statistically infeasible, our approach visualizes each firm's

cybersecurity risks as an image in the comparison process. This visualization enables stakeholders' decision-making processes to easily access and compare cybersecurity risks.

**4 - Fun Shopping - A Randomized Field Experiment of Gamification**

Yi-Jen (Ian) Ho, Pennsylvania State University, 465 Business Building, Smeal College of Business, University Park, PA, 16802, United States, Siyuan Liu, Lei Wang

In this research, we conduct a large-scale randomized field experiment at one of the largest Asian shopping mall to investigate the impact of gamification on customer engagement. The results shows gamification not only user engagement in terms of time spent and distance walked, but increase stores' sales. We further benchmark this impact with the effect of traditional couponing. This study provides important implications on how firms can take advantages of gamification.

**5 - The Effect of Search Costs and Stockouts on Consumer Search Behavior and Price Competition**

Xingyue (Luna) Zhang, University of Washington Tacoma, 621 Taylor Street, Tacoma, WA, 98402, United States, James Dearden, Yuliang Yao

Consumers face various costs during shopping: the travel costs to visit stores and the search cost to examine product attributes once at a store. We build game-theoretic models and examine the interaction between store pricing and consumer search behavior with different costs. Our findings suggest that: 1) stores set equilibrium prices higher than marginal costs with the existence of the travel and search costs as well as stockout probabilities, 2) following product stockouts, stores are better off by giving up consumers when the attribute search cost is high, and 3) consumers are less likely to visit a store when the costs and/or stockout probabilities are high such that the prices are lower.

**1 - Minimizing Negative Transfer of Knowledge in Multivariate Gaussian Processes: A Scalable and Regularized Approach**

Raed Al Kontar, University of Wisconsin-Madison, Madison, WI, 53706, United States

We propose a regularized and scalable modeling approach for the multivariate Gaussian process established using a convolution process. The key feature of our approach is the ability to minimize the negative transfer of knowledge between uncorrelated output through penalizing latent functions that facilitate information sharing. Statistical guarantees for the proposed method are studied and its advantageous features are demonstrated through numerical studies.

**2 - A Multiplex Network Modeling Approach for Online Process Monitoring**

Chenang Liu, 845 Claytor Square, Blacksburg, VA, 24060, United States, Zhenyu Kong

The objective of this research is to implement a new online monitoring method for complex systems using high dimensional sensing data. To achieve this objective, a multiplex network-based modeling approach is proposed in this study. The novelty of this method is to describe the sensing data using an effective multiplex network structure. Case studies in manufacturing and healthcare applications demonstrate that the proposed method can significantly enhance the monitoring sensitivity compared to the conventional methods.

**3 - Deterministic and Stochastic Data Decomposition for Analytics of Complex Systems**

Xiaowei Yue, Georgia Institute of Technology, 755 Ferst Drive NW, ISYE, Atlanta, GA, 30332, United States, Jianjun Shi

Data decomposition is an important step for high-dimensional data analytics of complex systems. This paper summarizes the key techniques for data decomposition, and separates them into two categories. One is deterministic decomposition, and the other is stochastic decomposition. The deterministic decomposition captures geometric or algebraic shape from the high-dimensional datasets directly, which is efficient for feature extraction and dimensionality reduction; while the stochastic decomposition provides probabilistic descriptions, and statistical distributions are estimated from the datasets.

#### 4 - Wavelet-based Profile Monitoring using Order-thresholding Recursive CUSUM Schemes

Ruizhi Zhang, Georgia Institute of Technology, Atlanta, GA,  
United States, Yajun Mei, Jianjun Shi

With the rapid development of advanced sensing technologies, rich and complex real-time profile or curve data are available in many manufacturing processes. These profile data provide valuable intrinsic information about the performance of the process, subject or product, and it is often desirable to utilize them to develop efficient methodologies for process monitoring and fault diagnosing. In this article, we propose a novel wavelet-based profile monitoring procedure that is based on the order-thresholding transformation of recursive CUSUM statistics of multiple wavelet coefficients. Simulation and case study are conducted to illustrate the usefulness of our proposed procedure.

#### Large Scale Statistical Learning

General Session

Chair: Meisam Razaviyayn, University of Southern California,  
Los Angeles, CA, 90089, United States

##### 1 - Learning Bounds for Greedy Approximation with Multiple Explicit Feature Maps

Shahin Shahrampour, Texas A&M University, College Station, TX,  
United States

Large-scale Mercer kernels can be approximated using low-dimensional feature maps for efficient risk minimization. Due to the inherent trade-off between the feature map sparsity and the approximation accuracy, the key problem is to identify promising feature map components (bases) leading to satisfactory out-of-sample performance. In this work, we tackle this problem by efficiently choosing such bases from multiple kernels in a greedy fashion. Our method sequentially selects these bases from a set of candidate bases using a correlation metric. We prove that the out-of-sample performance depends on three types of errors, one of which (spectral error) relates to spectral properties of the best model in the Hilbert space associated to the combined kernel. The result verifies that when the underlying data model is sparse enough, i.e., the spectral error is negligible, one can control the test error with a small number of bases, scaling poly-logarithmically with data. Our empirical results show that given a fixed number of bases, the method can achieve a lower test error with a smaller time cost, compared to the state-of-the-art in data-dependent random features.

##### 2 - Valid p-values from Adaptively Collected Data

Yash Deshpande, Massachusetts Institute of Technology,  
Cambridge, MA, United States

Data collection in many scientific and engineering applications is inherently adaptive. For instance, sequential or multi-stage clinical trials may reallocate patients among different treatments based on data gleaned from previous stages. In e-commerce applications, most user behavior data is collected under feedback from recommendation algorithms that are continuously trained. Such adaptivity is problematic for ex post inference, causing standard statistical techniques to fail. We propose a novel decorrelating procedure that correct standard estimators for adaptivity. The procedure is model-free: it requires only coarse information about the data-collection algorithm, in comparison with competing procedures like propensity scores. Therefore, it enables computing ex post valid p-values and confidence intervals on adaptively collected data.

##### 3 - On the Importance of Being Improper in ML

Karthik Sridharan, Cornell University, Ithaca, NY, United States

This talk will focus on the benefits of improper learning (where predictor can lie outside model class) when dealing with machine learning problems. Be it from the perspective of computational efficiency, sample complexity or both. The first part of the talk will focus on sample complexity. We will specifically focus on logistic regression and starting with the simple observation that the logistic loss is 1-mixable, we design a new efficient improper learning algorithm for online logistic regression that circumvents the aforementioned lower bound with a regret bound exhibiting a doubly-exponential improvement in dependence on the predictor norm. This provides a positive resolution to a variant of the COLT 2012 open problem of McMahan and Streeter (2012) when improper learning is allowed. The second part of the talk will focus on computational advantages of improper learning.

##### 4 - Randomized Algorithms for Infinite Dimensional Optimization Problems

Cameron Musco, Massachusetts Institute of Technology,  
Cambridge, MA, United States

We will discuss recent advances in randomized algorithms for infinite dimensional optimization problems that arise in kernel-based machine learning. Kernel-based learning is notoriously difficult to scale to large datasets because the runtime of exact methods typically scales quadratically in the number of data points. Many techniques have been suggested to reduce this cost, including Rahimi and Recht's random Fourier features method and the Nyström method, which both rely on random sampling to obtain approximately optimal solutions.

#### Joint Session DEA/Practice Curated: Theoretical issues in DEA

Emerging Topic: Productivity, Efficiency and Data Envelopment Analysis

Emerging Topic Session

Chair: Peter Bogetoft, Frederiksberg, 2000, Denmark

##### 1 - Rate Design and Grid Efficiency

Jung Sook You, Assistant Professor, California State University-East Bay, 25800 Carlos Bee Blvd, Hayward, CA, 94542, United States

Time-dependent consumer preferences combined with intermittent renewable energy sources may result in excess demand fluctuations on a power grid network. Assuming consumers and generators can be price-anticipating strategic players, this paper derives the optimal locational marginal prices on the power grid with conventional and renewable generators and provides theoretical prediction of price volatility. Then, the paper simulates the extent to which the optimal locational prices respond to the volatility of renewable sources and consumer demands, using California wholesale market data.

##### 2 - Benchmarking, Contracting, and Incentive Power

Peter Bogetoft, Copenhagen Business School, Porcelaenshaven 16 A, Frederiksberg, 2000, Denmark

Benchmarking is a popular management tool. It is used both to facilitate decision making and incentive provision. In this paper, we show that different benchmarking measures react differently to changes in performance. Therefore, the optimal design of benchmarking based performance contract requires an explicit analysis of the data generation process of the benchmarking approach. As an illustrative application, we investigate the use of Data Envelopment Analysis (DEA), Stochastic Frontier Analysis (SFA) and combinations thereof in revenue cap incentive schemes. Such schemes are applied in the regulation of network companies in many countries.

##### 1 - Fortification Against Cascade Propagation Under Uncertainty

Colin P. Gillen, University of Pittsburgh, 1025 Benedum Hall, 3700 O'Hara Street, Pittsburgh, PA, 15261, United States

Network cascades represent a number of real-life applications: social influence, electrical grid failures, viral spread, etc. The commonality between these phenomena is that they begin from a set of seed nodes and spread to other regions of the network. We consider a critical elements detection problem where the decision-maker wishes to limit cascading behavior via node threshold modification (within a budget). The arc weights - how much influence one node has on another - are uncertain. The solution approaches include robust mixed-integer programming, an expand-and-cut algorithm, and centrality-based heuristics. Extensive computational experiments demonstrate the value of these methods.

##### 2 - V-Polyhedral Disjunctive Cuts

Aleksandr M. Kazachkov, Carnegie Mellon University, Tepper School of Business, 5000 Forbes Avenue, Pittsburgh, PA, 15213-3890, United States

We introduce V-polyhedral cuts (VPCs) for generating strong disjunctive inequalities, with the goal of mitigating numerical issues in existing cuts by avoiding recursion. The VPC framework involves collecting a properly selected set of points and rays. This affords computational advantages over existing methods and enables testing strong multiterm disjunctions arising from partial branch-and-bound trees. Our computational and theoretical results suggest the potential practical benefits of VPCs, while motivating future work on better understanding the interaction between branching and cutting.

### 3 - Asymptotically Optimal Exact Solution of Sparse Linear Systems via Left-Looking Roundoff-Error-Free LU Factorization

Christopher Lourenco, Texas A&M University, 999 West Villa Maria Road, Apt 607, Bryan, TX, 77801, United States

LU factorizations are the key tool used to solve sparse systems of linear equations (SLEs) arising in linear/integer programming. However, roundoff errors, accrued while solving SLEs, may lead solvers to claim suboptimal bases as optimal, feasible problems as infeasible, or vice versa. To address this, we develop an exact LU factorization with 3 key properties: 1) only integral operations, 2) polynomially bounded entry size in L and U, and 3) asymptotically optimal computational complexity. Also we computationally show that the new LU factorization outclasses a modern rational solver for SLEs.

#### 1 - Detecting Cyber Threats in Non-english Dark Net Markets: A Cross-lingual Deep Learning Approach

Mohammadreza Ebrahimi, University of Arizona, Tucson, AZ, 85719, United States, Hsinchu Chen

Dark Net Markets (DNMs) provide hackers with highly-specialized tools that may not be found in other platforms in hacker community. While text classification techniques have been used for cyber threat detection in English DNMs, the task is hindered in non-English platforms due to the language barrier and lack of ground-truth data. Current methods use machine translation with monolingual models to address these challenges. However, the translation errors can deteriorate the classification results. We show that a cross-lingual model that uses two languages, significantly outperforms a monolingual model learned on machine translated data for detecting cyber threats in non-English DNMs.

#### 2 - Avatar Image Role in Developing Trust in an Intelligent Cybersecurity Agent

Troy Adams, University of Arizona, Tempe, AZ, United States, Gondy Leroy

Intelligent agents are used in a variety of applications and have made their appearance in modern networking and security technologies. In cybersecurity, these agents provide alerts and solutions for mitigating threats to a network, as well as training. This study aims to understand the development of trust in an intelligent cybersecurity agent (ICA), based on the image displaying its avatar. Results indicate that an avatar image had an impact on trust development for an ICA, especially for women. This research adds to IS literature by highlighting the role appearance has in improving HCI.

#### 3 - Deep Learning for Text-based Social BOT Detection

Victor Benjamin, Arizona State University, Tempe, AZ, United States, Raghu Santanam

Dark Net Markets (DNMs) provide hackers with highly-specialized tools that may not be found in other platforms in hacker community. While text classification techniques have been used for cyber threat detection in non-English DNMs, the task is hindered in non-English platforms due to the language barrier and lack of ground-truth data. Current methods use machine translation with monolingual models to address these challenges. However, the translation errors can deteriorate the classification results. ### Joint Session MCDM/Practice Curated: Multi-Objective Simulation Optimization and its Applications

Sponsored: Multiple Criteria Decision Making

Sponsored Session

Chair: Susan R. Hunter, Purdue University, West Lafayette, IN, 47907-2023, United States

#### 1 - Digital Twin for the Smart System

Loo Hay Lee, National University of Singapore, 10 Kent Ridge Crescent, Industrial and Systems Engineering, Singapore, 119260, Singapore

In this talk, we will share the digital twin system we have built for the port system and warehouse system, and will discuss how the simulation optimization technique is able to help to design the system.

#### 2 - Indifference Zones in Multi-Objective Ranking & Selection

Juergen Branke, University of Warwick, UK, Warwick Business School, Orms Group, Coventry, CV4 7AL, United Kingdom, Wen Zhang

Multi-objective ranking and selection so far has mostly focused on probability of correct selection as criterion. However, this creates problems if there are two very similar solutions, as many samples would be needed to correctly classify them. Thus, people have proposed to allow for an indifference zone, describing a decision maker's indifference between very similar solutions. We demonstrate that a previously proposed concept of indifference zones in multi-objective problems has some drawbacks, and propose an alternative definition. We also show how this can be used as part of a myopic ranking and selection technique.

#### 3 - Bi-objective Simulation Optimization on Integer Lattices using the Epsilon-constraint Method in a Retrospective Approximation Framework

Susan R. Hunter, Purdue University, School of Industrial Engineering, Grissom Hall, 315 N. Grant Street, West Lafayette, IN, 47907-2023, United States, Kyle Cooper, Kyle Cooper, Kalyani S. Nagaraj

We propose the Retrospective Partitioned Epsilon-constraint with Relaxed Local Enumeration (R-PerLE) algorithm to solve the bi-objective simulation optimization problem on integer lattices. R-PerLE uses a retrospective approximation (RA) framework to repeatedly call the PerLE algorithm at a sequence of increasing sample sizes. Within an RA iteration, the PerLE algorithm uses the e-constraint method to add new sample-path local efficient points to the estimated local efficient set (LES). Then, it certifies the estimated LES is approximately a sample-path LES. As the number of RA iterations increases, R-PerLE provably converges to a LES wpl.

#### 4 - Multiple Objective Probabilistic Branch and Bound for Multi-fidelity Simulation Optimization

Hao Huang, Yuan Ze University, IEM Department, Yuan Ze University, 135 Yuan-Tung Road, Chung-Li, Taoyuan, 32003, Taiwan,

Multi-fidelity framework involves simulation optimization problems involving multiple models with different fidelities, such as an accurate but costly simulation and a quick approximation. A multiple objective simulation algorithm is proposed in this study for the multi-fidelity framework, named Multi-Fidelity and Multi-Objective Probabilistic Branch and Bound (MFOPBnB). MFOPBnB incorporates Multiple Objective Probabilistic Branch and Bound (MOPBnB), a partition-based simulation optimization algorithm approximates the Pareto optimal set. Using information from low fidelity model, MFOPBnB approximates the a Pareto optimal set with statistical quality derived.

## 5 - Simulation-based Optimization in Outpatient Appointment Scheduling

Payman Jula, Associate Professor, Simon Fraser University,  
Faculty of Business, Vancouver, BC, V5A 1S6, Canada

This talk addresses the challenges of outpatient scheduling in multi-stage healthcare facilities. We consider stochastic service times, the availability and compatibility of resources, and the presence of a variety of patient types. The proposed methods are based on integrating simulation with mathematical programming, and meta-heuristics algorithms to achieve multi objectives of minimizing the waiting time of patients, the completion time of the facility, and the procedures cancellation. The performance of proposed approaches are analyzed an reported.

## Operations Research at USAFA

General Session

Chair: Megan Muniz, USAFA, Monument, CO, 80132, United States

### 1 - Air Force Business Process Automation

Mark J. Williams, USAFA

The Air Force has numerous processes operated by humans where modern service management systems could streamline their execution. This research analyzes processes used throughout the Air Force to develop improved workflows, identify areas to automate, and implement them using a modern service management system. The overarching goals of this research effort are to streamline Air Force business processes into a single, consistent look and feel, eliminate duplicate licenses and associated licensing costs, save manpower through improved process automation, and improve business process tracking and transparency.

### 2 - Cadet Summer Research Program

Drew X. Richardson, Colorado Springs, CO, 80920, United States

At the United States Air Force Academy, elite students are chosen to participate in the competitive Cadet Summer Research Program. What makes the program selective is that a cadet can only participate between his/her junior and senior year. Those selected are granted the opportunity to do research at military installations such as the Pentagon or Hickam Air Force Base, HI, as well as work with non-DoD agencies such as the NSA or the DHS. In addition, cadets can also work for defense contractors such as the Institute for Defense Analysis or with companies like Facebook. This talk provides an overview of the selective CSRP process, and a snapshot at some of the high quality research performed by USAFA cadets.

### 3 - Analysis From the United States Air Force Academy's Operations Research Capstone Course

Gregory Steeger, USAFA, 16932 Park Trail Drive, Monument, CO, 80132, United States

At USAFA, OR Majors take a year-long Capstone. In this culminating course, students analyze and solve problems faced by real clients, using the analytical skills they have acquired over the previous three years. Last year, 36 students worked in teams of four for nine clients. Clients included a tissue bank; Air Force Reserve Command Recruiting Service; Air Force Special Operations Command; Air Mobility Command; the Children's Hospital of Colorado; Lockheed Martin; the National Geospatial Intelligence Agency; Sandia National Labs; and USAF Personnel. This talk provides an overview of the nine problems these 36 students analyzed and discusses the results they delivered to their clients.

### 4 - Optimal Configurations for Mountain Switchbacks

Kristopher Pruitt, United States Air Force Academy, 2 Grass Song Place, Monument, CO, 80132, United States

The purpose of this research is to determine the configuration (number, length, and gradient) of paths (i.e., switchbacks) that minimizes the time or energy required for a hiker to ascend a mountain face. We present a mathematical model of the possible path configurations and nonlinear optimization problems which select the optimal paths. The model is parameterized according to the dimensions of the mountain face and the physiological capabilities of the hiker. Subject to these parameters, the optimization problems return the path-gradient and length required for a hiker to minimize either the time or energy to ascend the face.

### 5 - Faculty Summer Research

Megan Muniz, USAFA, CO Springs, CO, United States

Currently, the Air Force (AF) is experiencing a pilot shortage, where the operational tempo's demand for combat pilots exceeds supply. Retention efforts to date have been insufficient to solve this problem. Pilot Training Next (PTN) is the AF's experimental investigation into two possible responses to the current pilot shortage: increasing Undergraduate Pilot Training throughput and increasing the pool of qualified pilot candidates. A group of pilots will go through a modified training syllabus; IDA and USAFA faculty member is analyzing the data to determine what factors facilitated more efficient learning and skill acquisition with the aim of creating a model of pilot training effectiveness.

## Joint Session PSOR/Practice Curated: OR Applications in Humanitarian Logistics

Sponsored: Public Sector OR

Sponsored Session

Chair: Hafizul Islam, North Carolina State University, Raleigh, NC, 27695, United States

### 1 - Modeling the Logistics Capabilities of Home Health Agencies to Provide In-home Dispensing to Vulnerable Populations During Public Health Emergencies

Ashlea Bennett Milburn, University of Arkansas, 4207 Bell Engineering Center, Fayetteville, AR, 72701, United States,  
Emre Kirac, Charleen McNeill

Public health emergencies may call for medical countermeasures dispensing to affected populations. Many people can visit established dispensing locations en masse, but this is impractical for vulnerable homebound populations. Home health agencies (HHAs) have potential to act as private dispensing entities in this situation, treating homebound persons and their families in their homes. This research establishes the comparative effectiveness of centralized and decentralized operational models of in-home dispensing via HHAs. Results are presented for a mixed urban/rural case study area.

### 2 - An Integer L-shaped Algorithm for the Integrated Location and Network Restoration Problem in Humanitarian Relief

Ece Sanci, University of Michigan, Ann Arbor, MI, United States,  
Mark Stephen Daskin

Prepositioning emergency relief items before an anticipated disaster is a common strategy to increase the effectiveness of relief distribution. In this study, we assume that relief distribution is hampered due to damaged roads. We present a two-stage stochastic programming model integrating facility location and network restoration decisions. We propose an integer L-shaped algorithm which deploys lower and upper bounds to solve our model efficiently. Our computational results show significant improvement in unmet demand and cost measures by integrating location and network restoration models.

### 3 - Dynamic Network Flow Problems Having ARC Setup Costs

Rob Curry, Clemson University, Cole Smith

Some network applications require dynamic flows to be transmitted according to a non-simultaneous schedule. In this talk, we consider a dynamic network flow problem that considers the presence of arc setup costs that may exist whenever an arc begins transmitting flow. This problem can be modeled by the minimum cost flow problem having arc-activation costs (MCF-A), in which an arc (i,j) is said to be activated on a path p when (i,j) is included on p but not on p-1. As an alternative to this mixed-integer programming approach, we employ a relaxation-based algorithm for obtaining upper and lower bounds that increases the number paths in a schedule, as needed.

### 4 - Robust Optimization Approaches for the Equitable and Effective Distribution of Donated Food

Irem Sengul Orgut, Lenovo, 8209 Pritchett Farm Lane, Raleigh, NC, 27606, United States, Julie Simmons Ivy, Reha Uzsoy, Charlie Hale

Motivated by our partnership with a local food bank, we present a robust optimization model to support the equitable and effective distribution of donated food over the service area. Our model addresses uncertainty in the amount of donated food counties can receive. Letting the capacity of each county vary within a range, the model seeks to maximize total food distribution while enforcing a user-specified level of robustness. We derive structural properties and develop an efficient exact solution algorithm. We illustrate our model using historical data obtained from our food bank partner, summarize the policy implications of our results and examine the impact of uncertainty on outcomes.

### 5 - A Dynamic Programming Approach for Equitable and Effective Distribution under Uncertain Supply

Md Hafizul Islam, North Carolina State University, 111 Lampe Drive, Daniel Hall 373, Raleigh, NC, 27695, United States,  
Julie Simmons Ivy

Food banks in the United States serve people in hunger need within their respective service regions with donated food. Food banks receive donations from various sources and distribute them in an equitable and effective manner. Uncertainty in food donations is a big challenge for food banks in planning the distributions of food donations for future periods. In this work, we present a Markov decision process model and a dynamic programming solution approach of the model to deal with the uncertain supply for a local food bank over a finite number of periods with an aim to make an equitable and effective distribution of donated food.

### Emergency Response II

Sponsored: Public Sector OR

Sponsored Session

Chair: Forough Enayaty Ahangar, University of Wisconsin-Madison, Madison, WI, 53706, United States

Co-Chair: Laura Albert, University of Wisconsin-Madison, Industrial & Systems Engineering, 1513 University Avenue, Madison, WI, 53706, United States

#### 1 - Improving the Resiliency of a State Trauma System

Eric DuBois, University of Wisconsin-Madison, Industrial & Systems Engineering, 1513 University Avenue, Madison, WI, 53706, United States, Benjamin Morris, Laura Albert

On average, rural trauma patients can currently expect longer average pre-hospital times and worse outcomes compared to their urban counterparts. In addition, rural responders are more easily overwhelmed by surges in demand. To address these concerns, we develop a stochastic capacitated coverage model to examine where to deploy and upgrade resources with a goal of decreasing pre-hospital times, providing greater access to high-level trauma care, and ensuring adequate backup coverage in the event of mass-casualty incidents. Computational examples drawn from motor vehicle crash data are used to demonstrate the model.

#### 2 - Maximal Multiple Coverage and Network Restoration Problem for Disaster Recovery

Suzan Iloglu, Graduate Student, University of Wisconsin-Madison, 1611 Monroe St Apt 410, Madison, WI, 53711, United States

Repairing network damage in road infrastructure is important for enabling the delivery of time-sensitive response services after a disaster. To address this issue, we present an extension of the maximal multiple coverage problem that coordinates the services of network recovery crews and emergency responders. The proposed model is composed of three components: (1) network restoration, (2) relocation of emergency responders with restricted access and (3) coverage of emergency demand. The objective maximizes the coverage of emergency demand over the time horizon. Two different heuristics are presented to construct high quality feasible solutions to the problem and tested using real world data.

#### 3 - Modeling and Analysis in Tele-ICU Setting: Intervention with Preemptive Priorities

Xuanjing Li, Tsinghua University, Room 519, ShunDe, Beijing, China, Xiaolei Xie, Muer Yang, Michael Fry, Dacheng Liu, Corey Scurlock

Tele-ICU is a novel approach to provide critical care remotely along with the bedside ICU team. We investigate optimal staff capacity and scheduling policies using both analytical and simulation models based on a real case. We also provide managerial insights regarding dedicated staff and flexible staff in the Tele-ICU.

### Alternative-Fuel Vehicles Refueling and Routing Problems I

Sponsored: Location Analysis

Sponsored Session

Chair: Ismail Capar, Texas A&M University, College Station, TX, 77843-3367, United States

Co-Chair: Yudai Honma, The University of Tokyo, Tokyo, 153-8505, Japan

#### 1 - Bender Decomposition for Large-scale Flow-refueling Location Model

Ibrahim Capar, Bowling Green State University, Department of ASOR, 355 Business Administration Building, Bowling Green, OH, 43403, United States, Ismail Capar

In this research, we propose a Bender Decomposition formulation to solve flow-refueling location model for alternative fuel vehicles. We improve the standard formulation through a multi-cut reformulation that uses a path based clustering to accelerate its convergence. We discuss the performance of the method in detail and share the results from extended numerical experiments.

#### 2 - Deviation Distance and Sufficient Density of Alternative Fuel Stations

Masashi Miyagawa, University of Yamanashi, 4-4-37, Takeda, Kofu, 400-8510, Japan

This paper presents a model for determining the sufficient density of alternative fuel stations. To incorporate both flow demand and the deviation distance, the service level is represented as the probability that the vehicle can make the repeated round trip between randomly selected origin and destination within a specified deviation distance. The density of stations required to achieve a certain level of service is obtained for three cases of the refueling availability at origin and destination. The result shows how the deviation distance, the vehicle range, the trip length, and the refueling availability at origin and destination affect the sufficient density of stations.

#### 3 - Routing Management Strategy for New Collaborative Platform for Japanese Municipalities

Tsuyoshi Nobata, Tokyo University of Tokyo, Ce-408, 4-6-1, Komaba, Tokyo, Japan, Shuto Tsuchiya, Yudai Honma

New collaborative platform for Japanese municipalities has been developed to integrate both the worker's and citizen's knowledge. As one of the functions in the platform, optimal schedule management tool has been implemented. In this presentation, we discuss the optimal routing strategies to determine day tour routes for multiple maintenance vehicles. The formulation is based on multiple traveling salesmen problems, so has high similarities with AFV routing behaviors.

#### 4 - An Exact Solution to Profit Maximizing Electric Vehicle Routing Problem

Isil Koyuncu, The University of Alabama, Tuscaioosa, AL, 35406, United States, Mesut Yavuz

This talk presents a maximum profit mixed fleet electric vehicle routing problem. A mixed fleet consists of traditional gasoline or diesel and electric vehicles. Electric vehicles enable the fleet operator to reduce their operating costs as well as carbon emissions. In addition, a set of customers are willing to pay a premium to receive service by electric vehicles to reduce their supply chain carbon footprint. We formulate the emerging problem as a mixed integer linear program and present an exact solution methodology as well as their computational evaluation from our preliminary experiment.

### Supply Chain Management III

Contributed Session

Chair: Sima Sabahi, North Carolina A&T State University, 704-1C Granite Street, Greensboro, NC, 27403, United States

#### 1 - Multi-product Supply Network with an Intermediary

Omkar D. Palsule-Desai, Faculty, Indian Institute of Management Indore, Indore, 453331, India

We develop game theoretic models to characterize equilibrium outcomes for competing firms in a decentralized network setting with diverse objectives. We examine implications for maintaining private products while supplying a shared product in a geographically segregated market. The firms respond to both horizontal and vertical competition in the network. Our significant contribution to the existing literature is in showing that a supply network of competing firms can survive under certain situations with the firms simultaneously supplying to their private products along with the shared product of the network.

#### 2 - Negotiation under Competition Comparison between Nash and Kalai Smorodinsky Bargaining Framework

Yuanchen Li, Purdue University, 2192 Tortuga Lane, West Lafayette, IN, 47906, United States, Qi Feng, J. George Shanthikumar

We study the difference between the Kalai-Smorodinsky (KS) and Nash Bargaining (NB) framework in a two-tier supply chain. We find that the KS solution can lead to a more reliable negotiation outcome when contingency terms are imposed, compared to the NB solution.

#### 3 - Investigating the Relationship Between Supply Chain Resilience and Innovation Through Fuzzy Cognitive Mapping

Sima Sabahi, PhD Candidate, North Carolina A&T State University, 1601 East Market St., Greensboro, NC, 27411, United States, Paul M. Stanfield

In today's turbulent environment, an understanding of how firms can manage supply chain disruptions and improve their resiliency has become a critical subject. One of the capabilities enabling companies to overcome disruptions, and adapt to rapid changes in the environment is allocating priority and resources to innovation. Although innovation has been viewed as a key component of a firm's long-term survival and development, the impact of innovation in improving resiliency in supply chain has been relatively disregarded. This study provides a flexible, quantitative model of the causal relationship between supply chain resilience and innovation capability through fuzzy cognitive mapping.

#### 4 - A General Dual Sourcing Inventory Model: Trading off Lead Time and Cost Differences

Zhe Liu, Columbia Business School, 3022 Broadway, New York, NY, 10027, United States, Awi Federgruen, Lijian Lu

We study a single product, periodic review inventory system with two suppliers and salvage options. A regular supplier has a longer lead time but is cheaper than an expedited supplier. Salvage options allow for bilateral inventory adjustments. All inventory adjustments involve a fixed cost component in addition to variable costs or revenues and may be capacitated. We show that the optimal order sizes and/or salvage quantity follow a relatively simple structure. This applies when the lead times of the two suppliers differ by a single period. However, our structural results suggest effective heuristics for general lead times and demonstrate the significant benefits of dual sourcing.

#### 5 - Inventory Inaccuracies and Radio Frequency Identification Technology: Risk Analysis and Coordination

Tingting Wang, Huazhong University of Science & Technology, No. 1037, Luoyu Road, Hongshan District, Wuhan, 430074, China

We study the adoption of RFID to reduce the inventory shrinkage and misplacement in the supply chain, which consists of a risk-neutral manufacturer and a risk-averse retailer. The Conditional Value at Risk criterion is adapted to measure the retailer's risk attitude. We focus on exploring how the risk attitude affects the agents' incentives and show that the incentives to adopt RFID depend on the risk attitude. Further, when the tag cost is sufficiently low, the agents' incentives increase with the risk-averse level increasing. Additionally, the supply chain can afford higher tag cost (fixed cost) if the retailer is more risk-neutral. Finally, we also identify the coordination mechanism under RFID.

#### 1 - Reduce Carbon Emissions Across Supply Chain: The Role of Information Sharing

Sijie Zhou, Doctoral Student, University of Science and Technology of China, No.96 JinZhai Road, Baohe District, Hefei, 230026, China, Yugang Yu

This study is motivated by a few international retailers (like, Walmart and H&M) cooperating with their suppliers to reduce carbon emissions across the supply chains. Our paper investigates the operations associated with information sharing and studies its influence on environment under the real condition. We show that with Bayesian updating of demand, information sharing will benefit supplier but possibly hurt retailer. We reveal the conditions favoring information sharing: information sharing doesn't always benefit the environment, which contradicts to the popular thoughts about the advantage of collaborative contracts between retailers and suppliers.

#### 2 - Does Vertical Integration Allow for More Sustainable Supply Chain? Comparative Analysis within the Apparel Manufacturing Industry

Suri Gurumurthi, Hong Kong University of Science and Technology, Clearwater Bay Road, Kowloon, Hong Kong, HK, Ronald Lau

Through this research, we aim to investigate whether the vertically integrated supply chain can perform better along limited sustainability metrics, as compared to the network or decentralized model of sustainability. We also explore the linkage between vertical integration and targeted technology investment towards sustainability performance. We also comment on how incentives are relatively harder to align in decentralized structures, and the specific role of incentives in sustainability performance.

#### 3 - Impact of Social and Environmental Performance Assessment of Suppliers on Buyer Supplier Relationship and Purchasing Performance

Sivamanikarthy Rajendran, Research Scholar, Indian Institute of Technology Madras, Sardar Patel Road, Opposite to C.L.R.I, Adyar, Chennai, 600036, India, Arshinder Kaur

In this study, we contribute to the existing line of literature by identifying the key social and environmental factors in the Indian context based on an exhaustive review of literature and analyzing the impact of social and environmental performance assessment of suppliers on the purchasing performance of the buying firm. We also study this impact when the focal firm is utilizing supply chain analytics (which acts as a moderating variable). Finally, we develop a conceptual framework based on the underlying relationships between the above mentioned variables which will aid the managers in understanding how social and environmental performance evaluation influences the purchasing performance.

#### 4 - Freight Consolidation Problem with Pickup and Delivery Sequence and Loading Constraints

Devaraja Vignesh Radha Krishnan, Oklahoma State University, Stillwater, OK, 74075, United States, Tieming Liu

In Pickup and Delivery problem (PDP), if multiple shipments are consolidated and placed in a vehicle, then the loading order of shipments is a major cost factor along with the trip distance. We address the PDP with the Last-In-First-Out (LIFO) order for pickup and delivery of shipments. In addition, we relax the LIFO constraints and present an exact formulation and algorithms for PDP with LIFO violation penalties.

#### 1 - Integrating Nesting and Cutting Path Determination Problems

Larissa Oliveira, University of Sao Paulo, 400 Trabalhador São-carlense Avenue, Sao Carlos, 13566-590, Brazil, Franklina Toledo, Jos Fernando Oliveira

The nesting problem consists of finding a layout for small irregular shaped pieces that must be cut from a larger object with fixed height and infinite length, minimizing the length required to cut all the pieces. In some industries, after a solution of this problem has been defined, a second problem arises: the determination of the cutting path, i.e. to determine the shortest path length required to cut all the pieces. The solution of the first problem strongly influences the resolution of the second. To tackle this joint problem, we propose an integrated approach.

#### 2 - Synchronizing Last Trains of Urban Rail Transit System to Better Serve Passengers from Late Trains of High-Speed Railway Lines

Sihui Long, Beijing Jiaotong University, Beijing, China, Lingyun Meng, Xi Jiang, Yuyan Tan, Francesco Corman

This paper develops a bi-objective mixed-integer linear model for the problem of last-train timetable synchronization of urban rail transit (URT) system to better serve passengers from late trains of high-speed railway lines in late night. The bi-objective optimization problem is to maximize the number of passengers who can arrive their destinations successfully and to minimize the total operation-ending time for last trains of URT system. This model can deliver both a last-train transfer scheme solution and a last-train timetable of URT system at the same time. The  $\epsilon$ -constraint method is used to find the Pareto optimal solutions for the proposed bi-objective model.

#### 3 - Developing a Continuous Location Routing Model

Ali Sarabi, Arizona State University, Tempe, AZ, United States, Adolfo Raphael Escobedo

Generally, the costs of logistics and distribution make up a significant share of a product's price. As a result, integration of location and routing decisions has great potential to reduce total costs. How these decisions can be made simultaneously has been widely studied for locations in a discretized space but few works have considered a continuous space. In this study, we develop an MIP model and solution methodology for the capacitated location routing problem (CLRP) for this context. Specifically, the space is segmented and location priorities are considered by allocating construction costs by zones, and then impossible location cases are removed from the potential decisions.

#### 4 - Math Models and Heuristic Methods for Constructing Fair Political Districts

Roya Ghorashi, PhD Candidate, University of Wisconsin-Milwaukee, 2615 N. Cramer Street, # 39, Milwaukee, WI, 53211, United States, Matthew E. Petering

Political district maps are crucial to a fair distribution of political power. This study attempts to find a solution to form fair political districts considering various criteria. We propose several exact and heuristic methods for creating fair political districts. Preliminary results indicate that these methods produce political district maps of high quality.

**1 - Modeling the Containment Behavior of Interacting Populations in Response to an Epidemic**

Marzieh Soltanolkottabi, Student, Kansas State University,  
1601 Roof Dr #G25, Manhattan, KS, 66502, United States,  
David Ben-Arieh

Epidemic disease outbreaks are among the major threats to the sustenance and health of human societies. Modeling the dynamics of epidemic disease outbreaks and the corresponding social response to it is one of the techniques that can help public health policy makers make better decisions and devise better policies. The aim of this study is to use spatial games under public goods policies and explore efficient strategies for containment and control of large scale epidemics. The public goods game enables players to choose not to be vaccinated and thus to not contribute to the public common defense.

**2 - Spillover Success in Healthcare Information Technology**

Ankita Srivastava, Graduate Teaching Assistant, Oklahoma State University, Stillwater, OK, 74074, United States,  
Surya B. Ayyalasomayajula, Taha Havakhor

The looming retirement crisis has led US federal government to take immediate measures to fix the exorbitant healthcare system. Since HITECH, there is a significant increase in the adoption & meaningful use of certified EHR's and therefore understanding business value of IT in healthcare is gaining research interest. American Hospital Association annual survey data from 2012 to 2016 is used to test the hypothesis that IT investments of geographically proximal hospital have spillover effects on the revenue of the focal hospital. Our results have implications for both literature and practice.

**3 - Cost-effective Evaluation of Public Health Policies for Cervical Cancer**

Karen Angulo, Universidad de los Andes, Cra 1 N. 18A-12, Bogotá,  
110111, Colombia, Ivan Mura

Predicting the long-term effects of vaccination and screening programs against Cervical Cancer (CC) is not trivial at all, as it builds upon the ability to compound the uncertainties associated with the results of interventions. We propose compartmentalized epidemiological simulation models based on differential equations, which represent population dynamics, HPV transmission, likelihood of infection clearance, virus induced precancerous lesions and eventually appearance of CC. Models are implemented into an open software tool that allows predicting the effects of public health policies for CC prevention and surveillance, providing valuable support to healthcare decision-makers.

**4 - Evaluating Network Based Interventions for Opioid Abuse using Agent Based Modeling**

Lesley Clack, University of Georgia, Athens, GA, United States,  
Aaron Schecter

While there is research available on the efficacy of predicting intervention strategies in a variety of contexts, this type of modeling has not been tested in rural/underserved opioid populations. While many potential interventions for treating substance abuse exist, their efficacy can vary greatly across locations, populations, and types of addictions. The goal of this research study was to explore and rigorously define the spectrum of available intervention strategies for opioid abusers in rural/underserved communities, and evaluate the potential effectiveness of each intervention strategy using statistical tools and relevant empirical evidence.

**5 - Dynamic Task Assignment for Coordination of Inpatient Operations in Hospitals**

Najibe Sadatjafarkalaei, Wayne State University, 4815 Fourth Street, Detroit, MI, 48202, United States, Evrim Dalkiran, Alper E. Murat, Ratna Babu Chinnam

Most hospital systems in the U.S. have employed some form of an Electronic Health Record (EHR) system in recent years to improve health outcomes. While EHR systems form a critical data backbone for improving operational efficiencies, there is a need for platforms that can promote situational awareness, predictive operational intelligence, and eventually coordinated orchestration. We present a real-time resource and task assignment model to coordinate inpatient operations to reduce patient waiting times, focusing on bed assignment, environmental services, and patient transport.

**1 - Improving Outpatient Process with Multi Fidelity Models**

Bowen Pang, Tsinghua University, Tsinghua Univ. Zijing 14#,  
Beijing, 100084, China, Xiaolei Xie, Yijie Peng, Bernd Heidergott

Physicians with outpatient departments in large Chinese hospitals face tremendous amount of workload. The limited time spent with each patient contribute to dissatisfaction while it is costly to increase the number of nurses and doctors. We develop a simulation model to analyze the outpatient process in the Department of Ophthalmology in Beijing Tongren Hospital. Using simulation output, we estimate the parameters of the queuing model with tandem MMC queues which balances the system performance and the costs incurred by increased staffing level. The optimal solution obtained by the queuing model is used to find improved settings via simulation model.

**2 - Optimizing a High Volume Surgical Center Through Improved Team Dynamics: An Application of Social Network Modeling in Healthcare Operations**

Scott T. DeNegre, Vice President, Hospital for Special Surgery, 535 East 70th Street, New York, NY, 10021, United States, Nathaniel Hupert, Mayu Sasaki, Jingyan Yang, Justin Do, Abigail Schmucker, David Grace, Meghan Kirksey, Alexander McLawhorn, Stephen Lyman, Steve Magid

Increasing operating room (OR) capacity provides greater access for patients, improves the financial sustainability of health systems, and is a health policy priority here and abroad. Traditional methods for increasing capacity require multiyear, multimillion dollar capital projects; in this paper, we explore methods for increasing OR capacity through improved team dynamics and develop a novel approach to quantifying team consistency using network models. Results from a high volume surgical center are presented, demonstrating that consistent surgical teams deliver improved efficiency and suggesting that OR capacity can be increased by approximately 20% through improved staffing models.

**3 - The Influence of Operational Proximity on Hospitals' Post-acquisition Service-mix Strategies**

Yueqiao Cheng, University of Houston, 4800 Calhoun Rd, Houston, TX, 77004, United States, Xiaosong David Peng, Yuan Ye

The study examines whether acquired hospitals reconfigure their service-mix to become more focused after acquisitions. If so, is the enhanced focus associated with improved post-acquisition performance (i.e., cost and quality), and do more common service lines and a shorter geographic distance between acquired and acquirer hospitals enable an acquired hospital to implement a more focused strategy?

**4 - How Philanthropic are They? The Impacts of Directors' Professional Background on the Performance of Nonprofit Private Hospitals**

Ajit Appari, Worcester Polytechnic Institute, Worcester, MA, United States, Milly Wang

The widening healthcare disparity in the US raises concern on the philanthropic intent of nonprofit private hospitals (NPPHs), and whether they provide charity care to community to satisfy legal threshold or engage in beyond the legal requirements. Building on the Upper Echelon and Corporate Governance literature, we examine whether philanthropic performance of NPPHs vary by professional background of their board of directors; and if this relationship differs by market competition. We report findings from the analysis of 215 NPPHs in California during 2007-2012 using hierarchical linear model.

**1 - Performance of Alternative Linear Objective Functions in Effectiveness Fairness Trade Off**

Gokalp Erbeyoglu, Bogazici University, Bogazi i Universitesi Endustri, Muhendisligi Bolumu Bebek, Istanbul, Turkey, Umit Bilge

The quality of a humanitarian response plan is judged by two contradicting objectives: timely and fair satisfaction of demand. In this study, we provide alternative objectives that can focus on effectiveness and fairness to distribute relief items in disaster response. In our multi-depot multi-vehicle routing model with split deliveries, tours are open. Also, the demand occurrences are not limited to the initial period. The proposed objective functions capture both the timeliness and satisfaction levels in a way that their progression is important, rather than their final values. The performance is investigated in comparison to various related performance measures in the literature.

**2 - Applying Backup Agreements with Penalty Scheme under Credit Guarantee Mechanism**

Cheng-feng Wu, Hubei University of Economics, No. 8 Yangqiaohu Road Jiang-xia Wuchang, Wuhan, Hubei, 430205, China

This study examines the issue of the strait of capital shortage in SME supplier and supply risks from the buyer's perspective. The buyer builds a credit guarantee mechanism in which a SME supplier is guaranteed to finance the shortfall in capital from the financial institution. This study considers the backup agreement with penalty scheme in which the buyer places the reservation quantity at the backup supplier and pays the penalty for the reservation that has not been ordered. The buyer considers the backup agreement with penalty scheme as its sourcing strategy to manage its supply basis and increase its profits under credit guarantee mechanism.

**3 - A Methodology for Infrastructure Resilience Metric Assessment**

Mohammad Najarian, University of Houston, 4722 Calhoun Road, Engineering Building 2, Houston, TX, 77204-4008, United States, Gino J. Lim

Natural and manmade disasters are unavoidable and they may incur extravagant costs. Resilience enhancement activities, which aim at reducing the disasters' impact, rely on resilience metrics to find areas for improvement and measure the effectiveness of enhancements. Several resilience metrics have been suggested. However, the question is that whether they reveal the characteristics determined by the underlying framework or not. We address this question by defining a valid resilience metric and a novel methodology for assessing the validity. This methodology combines the experimental design methods and statistical analysis techniques that can be utilized to examine the resilience metrics.

**4 - How Supply Chains Break**

Shawn Bhimani, University of Leicester, England, 37922, United Kingdom

We present an enhanced framework of supply chain vulnerability through an analysis of 200 years of supply chain failures. This builds on previous literature in supply chain management, disruptions and risk mitigation. Through our extensive analysis of past failure types and causes, we offer an updated framework to better understand, prevent and predict catastrophic supply chain failures. This is useful for continuity of operations in corporate, military, and humanitarian supply chains, which can save money and lives. It also has implications for supply chain resiliency, robustness and the potential inducement of disruptions.

**Data-driven Distributionally Robust Optimization**

Sponsored: Optimization/Optimization Under Uncertainty

Sponsored Session

Chair: Rui Gao, Georgia Institute of Technology, Atlanta, GA, 30332-0205, United States

**1 - Enhancing Statistical Performances in Extreme Event Analysis via Distributionally Robust Optimization**

Xinyu Zhang, Columbia University, NYC, NY, 10025, United States, Henry Lam, Clementine Mottet

One bottleneck in analyzing extreme events is that, by its own definition, tail data is often scarce. Conventional approaches fit data using justified parametric distributions, but the inherent bias-variance tradeoff in the parametric fitting can hinder the estimation reliability. We discuss approaches using distributionally robust optimization as a nonparametric alternative that, through a different conservativeness-variance tradeoff, can mitigate some of the statistical challenges in estimating tails. We discuss the solution approaches and statistical performances compared to the conventional methods.

**2 - Distributionally Robust Expectation using Dominance Information**

Ruiwei Jiang, University of Michigan, 1205 Beal Ave., Ann Arbor, MI, 48109, United States, Yuan Yuan Guo

This talk discusses the expectation of a random function when the distributional information of the uncertain parameters consists of moment (e.g., mean, covariance, support) and probabilistic dominance information. We find that the expectation in this setting can be bounded using conic programming. Finally, we demonstrate the theoretical results via case studies on appointment scheduling.

**3 - Faster Rates of Convergence of Stochastic Gradient Descent for Wasserstein Distributionally Robust Optimization**

Karthik Murthy, Columbia University, Department of IEOR, 500 West 120th Street, New York, NY, 10027, United States, Jose Blanchet, Fan Zhang

Among the various notions of distributionally robust optimization (DRO) schemes being investigated to beat "optimizer's curse" when performing optimization under uncertainty, Wasserstein distance based DRO has gained much attention recently because of its relationship with machine learning algorithms that successfully employ regularization. In this talk, we shall see how these Wasserstein based DRO formulations can be solved almost as fast, and in some cases even faster(!) than, the respective nonrobust schemes for a large class of useful models. Specifically, we establish faster rates of convergence by studying the strong convexity of robust objective functions.

**4 - Distributionally Robust Hypothesis Testing**

Rui Gao, Georgia Institute of Technology, 755 Ferst Drive NW, ISyE Main Building, Atlanta, GA, 30332-0205, United States

We develop an approach to hypothesis testing problems that find the optimal test for deciding an observation belongs to a certain family of distributions. Such family of distributions is a non-parametric data-driven set of hypotheses based on Wasserstein distance. Leveraging tools from distributionally robust optimization and chance-constrained optimization, we provide convex reformulations of such problems which render a nearly optimal test.

**1 - Stochastic Programming Models for Coordinated and Non-Coordinated Natural Gas and Power Systems**

Dan Hu, Iowa State University, Ames, IA, 50010, United States, Sarah M. Ryan

With the growing proportion of electric power generated from natural gas, greater coordination between the two energy systems is gaining importance. We formulate separate but interacting stochastic programs to model the existing non-coordinated daily operations of the natural gas and electric power systems and a single stochastic program for a coordinated alternative. Variable renewable energy generation and demand for gas other than for electric power generation are the uncertain quantities. Through numerical studies we assess the benefits of coordination in terms of the distribution of the daily operational cost.

**2 - Polyhedral Analysis of the Single-node Fixed-charge Network Flow Problem under Uncertainty**

David Mildebrath, Rice University, Houston, TX, United States, Victor Gonzalez, Mehdi Hemmati, Andrew J. Schaefer

We consider a two-stage extension of the single-node fixed-charge network flow (SNFCNF) problem with uncertain demands and capacities. The stochastic SNFCNF problem is an important problem arising throughout the fields of network design, vehicle routing, and elsewhere. We present the first polyhedral results for the associated polytope, and establish fundamental connections between facets of the single-scenario (i.e. deterministic) SNFCNF polytope and its stochastic extension. Finally, we provide computational examples to quantify the degree to which knowledge of the structure of each single-scenario sub-problem improves the solution to the extensive form of the stochastic problem.

### 3 - Robust Multi-product Newsvendor Model with Substitution under Cardinality-constrained Uncertainty

Jie Zhang, Virginia Tech, 820 Newport Terrace, Blacksburg, VA, 24060, United States, Weijun Xie

This paper studies robust multi-product newsvendor model with product substitutions (RMNMPs). The objective of RMNMPs is to determine the optimal order quantities, which maximize the worst-case total profits against budget uncertainty set of the demand. Although RMNMPs is in general nonconvex and NP-hard, we are able to identify several special cases, where the optimal order quantities can be completely characterized, and interesting managerial insights are drawn. For a general RMNMPs, we develop an efficient cutting plane based solution approach by exploring the submodularity of inner minimization problem. The numerical study demonstrates the effectiveness of the proposed algorithm.

### 4 - A Finite E-convergence Algorithm for Two-stage Convex 0-1 Mixed-integer Nonlinear Stochastic Programs with Mixed-integer First and Second Stage Variables

Can Li, Carnegie Mellon University, Pittsburgh, PA, United States, Ignacio E. Grossmann

We propose a generalized Benders decomposition-based branch and bound algorithm, GBDDBAB, to solve two-stage convex 0-1 mixed-integer nonlinear stochastic programs with mixed-integer variables in both first and second stage decisions. We construct the convex hull of each subproblem by applying basic steps to convert each subproblem from conjunctive normal form (CNF) to disjunctive normal form (DNF). We prove the algorithm has finite  $\epsilon$ -convergence if we branch on the continuous first stage variables. Since constructing the convex hull can be expensive, we propose a sequential convexification scheme that progressively applies basic steps to the CNF.

### 5 - Computational Evaluation of New Dual Bounding Techniques for Sparse PCA

Guanyi Wang, Georgia Institute of Technology, Atlanta, GA, United States, Santanu Subhas Dey, Rahul Mazumder

Principal component analysis (PCA) is one of the most widely used dimensionality reduction method in statistics. For additional interpretability, it is desirable to require cardinality constraint, known as the sparse principal component analysis (SPCA). However, the SPCA problem and its  $\ell_1$  relaxation are hard to compute. We give a framework (convex integer program, IP) that certifies the optimality of solutions of SPCA problem, via dual bounds. We show that, in theoretical, the dual bound obtained from convex IP problem is affinely upper bounded by the optimal value of the SPCA problem, and in practical, plausible dual bounds are obtained via the convex IP method in acceptable time.

### Product and Process Innovation in Healthcare and Energy Industries

Sponsored: Technology, Innovation Management & Entrepreneurship

Sponsored Session

Chair: Zhili Tian, Florida International University, Weston, FL, 33327-2444, United States

#### 1 - Capacity Planning with Probabilistic Outcome Ambiguity

Heejung Kim, University of California, Berkeley, Albany, CA, 94706, United States, Philip Kaminsky

We consider a capacity planning model where demand in each period is determined by the outcome of series of binary events, such as clinical trials in pharmaceutical industries. The outcome of these events is often uncertain, and estimating exact probability of outcome is difficult. We develop approaches to solve capacity expansion planning models that are robust to ambiguities in probability of success for different objectives - minimizing expected cost, value at risk and conditional value at risk. We formulate these models as (stochastic) robust integer programs with scenario trees. We develop and test a variety of heuristics for this setting.

#### 2 - Operating Room Scheduling with Sequential Tasks and Defined Wait Intervals

James W. Hamister, Wright State University, Raj Soin College of Business, Dayton, OH, 45435, United States, Michael Magazine, George Polak

We develop an optimization model for scheduling paired tasks subject to intervening procedures in an operating room environment. The durations of the intervening procedures are bounded from below and above. The objective is to minimize overall makespan. The model is tested with empirical data from a tissue bank service.

### 3 - Optimal Investment in Product Development and Marketing Communication in Pharmaceuticals

Zhili Tian, Coastal Carolina University, 1305 Harvester Cir, Myrtle Beach, SC, 33327-2444, United States

Marketing spending on drugs is often close to that for developing a new drug. Only around 20 new drugs are approved every year for the pharmaceutical industry. The low rate of new drug development stems from the financing constraints at many firms because such high investments from both marketing and new drug development. Because of high risk in new drug development, firms have to use internal funding to support their drug development. We develop models to address the investment in the current drugs and development of new drugs where the funding comes from the internal source. Our methods optimally allocate the fund between marketing and new drug development while considering financing constraints.

### 4 - Evaluating Emerging Energy Technology Lifecycles using Mixed Integer Programming

Joshua Pearson, Colorado School of Mines, Golden, CO, 80401, United States

We develop methodologies to evaluate the feasibility of market penetration for new technologies based economic viability. We use as a case study a concentrated solar power device. With an existing piece of engineering software, the System Advisory Model, we examine the financial implications of various industry-standard designs. For each design, we employ a mixed-integer program to determine a cost-minimizing operational strategy for the device under certain market conditions. Finally, we assess long-term economic viability of the device, and draw conclusions about the types of methodologies that can predict the success of investment strategies for emerging technologies.

#### 1 - Home Healthcare Integrated Staffing and Scheduling

Louis-Martin Rousseau, Ecole Polytechnique de Montreal, Cp 6079 Succ Centre-Ville, Montreal, QC, H3C 3A7, Canada, Maria Isabel Restrepo Ruiz

Workforce planning for home healthcare represents an important and challenging task involving complex factors associated with labour regulations, caregivers' preferences, and demand uncertainties. Motivated by these challenges, we present a two-stage stochastic programming model for employee staffing and scheduling which relies on Context-free Grammars hyper-graphs. The proposed model is tested on real-world instances, where we evaluate the impact in costs, caregiver utilization, and service level, by using different scheduling policies and recourse actions.

#### 2 - Consistency for Mixed Integer Programming

John Hooker, Carnegie Mellon University, Tepper School of Business, Pittsburgh, PA, 15213, United States, Danial Davarnia

Concepts of consistency have long played a key role in constraint programming but have not arisen in mathematical programming. Consistency is fundamental, because problems that satisfy consistency properties can be solved with less backtracking. We show how a basic type of consistency can be adapted to mixed integer programming (MIP) by taking linear relaxations into account. This novel perspective on MIP helps explain why certain cuts are effective and suggests new techniques for accelerating search.

#### 3 - Optimizing Trip Sharing in Community-based Urban Commuting

Pascal Van Hentenryck, University of Michigan, 1813 IOE Building, 1205 Beal Avenue, Ann Arbor, MI, 48108-2117, United States, Mohd Hafiz Hasan

We describe optimization techniques for optimizing trip sharing in urban commuting. The starting point is the identification of important properties that must be satisfied by any successful trip-sharing platform, which give rise to complex optimization problems. The presentation describes potential solution techniques and evaluates them on a real case study.

#### 4 - A Local Search Framework for Compiling Relaxed Decision Diagrams

Michael Roemer, Martin Luther University, Universitätsring 3,  
Halle, Saale, 06108, Germany, Andre Augusto Cire,  
Louis-Martin Rousseau

We presents a local search framework for compiling relaxed decision diagrams (DDs). It consists of a set of elementary DD manipulation operations including a redirect operation introduced in this paper and a general algorithmic scheme. We show that the framework can be used to reproduce standard DD compilation schemes and to create new compilation strategies. In experiments for the knapsack problem, the multidimensional knapsack problem and the set covering problem we compare different compilation methods. It turns out that a new strategy based on our framework consistently yields better bounds, for limited-width DDs than previously published heuristic strategies.

##### 1 - Robust Quadratic Programming with Mixed-integer Uncertainty

Areesh Mittal, University of Texas at Austin, Austin, TX, 78703,  
United States, Can Gokalp, Grani Adiweni Hanasusanto

We study robust convex quadratic programs where the uncertain problem parameters can contain both continuous and integer components. We show that these problems can be reformulated as copositive programs of polynomial size. These convex optimization problems admit a tractable semidefinite programming approximation. We prove that the popular approximate S-Lemma method, valid only in the case of continuous uncertainty, is weaker than our approximation. We extend the results to the two-stage robust quadratic optimization problem if the problem has complete recourse. We demonstrate the superiority of our proposed method over the state-of-the-art solution schemes on several problem instances.

##### 2 - Solving Robust Counterparts of Risk-Averse Stochastic Optimization Problems as Second-Order Cone Programs

Jonathan Li, Telfer School of Management, University of Ottawa,  
Ottawa, ON, K1N 6N5, Canada

We show how robust solutions can be derived for risk-averse stochastic optimization problems when only the mean-covariance information is available for the uncertain parameters. We prove that for any such problem that employs a coherent risk measure, the robust solution can always be obtained by solving certain second-order cone programs. Moreover, we identify the corresponding worst-case scenario (distribution) in closed-form, which sheds light on the connection between one's risk aversion attitude and the worst-case distribution.

##### 3 - Risk-averse Two-stage Stochastic Convex Optimization with First-stage Mixed Integer Problem

Ricardo A. Collado, Stevens Institute of Technology, 36 Gates Ave.,  
Gillette, NJ, 007933, United States, Somayeh Moazeni

We formulate a risk-averse two-stage stochastic optimization problem and present solution strategies based on methods such as L-shape and the cutting-plane method. We extend our formulation to a general two-stage risk-averse convex stochastic optimization problem and discuss regularized cutting-plane methods for solution and approximation. Next we extend our results to the case where the first-stage variables are mixed integer but the recourse variables are continuous. Finally, we present results obtained from applying our methods to a problem on resource allocation for contingency planning.

##### 4 - Preference Elicitation and Robust Optimization with Multi-attribute Quasi-concave Choice Functions

Wenjie Huang, National University of Singapore, Singapore,  
William Haskell, Huifu Xu

In this paper, we consider ambiguity in choice functions over a multi-attribute prospect space. Our main result is a robust preference model where the optimal decision is based on the worst-case choice function from an ambiguity set constructed through preference elicitation with pairwise comparisons of prospects. Differing from existing works in the area, our focus is on quasi-concave choice functions which enables us to cover a wide range of utility/risk preference problems. We propose two approaches based respectively on the support functions and level functions of quasi-concave functions to develop tractable formulations of the maximin preference robust optimization model.

##### 1 - A Minor Perspective on Rank Constrained Optimization

Shixuan Zhang, Georgia Institute of Technology, Atlanta, GA,  
United States, Andy Sun

Many combinatorial and mixed-integer nonlinear optimization problems can be formulated with constraints on matrix ranks. We propose a new perspective on dealing with rank constraints by reformulations using matrix minors. We investigate the implications of this minor perspective on generating convexification hierarchy and strong valid inequalities for the cut polytope and some QCQPs in complex variables such as AC optimal power flow.

##### 2 - Preprocessing Algorithms and Tightening Constraints for Multiperiod Blend Scheduling Problem

Yifu Chen, University of Wisconsin-Madison, Madison, WI,  
United States, Christos T. Maravelias

The multiperiod blend scheduling problem (MBSP) considers the scheduling in a production environment that includes blending processes. MBSP can be considered as a scheduling extension of the pooling problem. In this work, we first introduce novel preprocessing algorithms to calculate bounds on critical variables in MBSP. The bounds obtained from the preprocessing algorithms, along with the new variables we defined to address the product specific features in MSBP, are used to generate tightening constraints. The methods are applicable to previously proposed MINLP models for MBSP, as well as MILP models obtained using different linear relaxation/approximation methods.

##### 3 - A Compact Linear Programming Formulation of the Steiner Tree Problem for a Fixed Number of Terminals

Matias Siebert, Georgia Institute of Technology, Atlanta, GA,  
United States, Shabbir Ahmed, George L. Nemhauser

Given an undirected graph  $G=(V,E)$  with non-negative edge weights, and a subset  $R$  of the vertices  $V$ , the Steiner tree problem seeks to find the minimum weighted tree  $T$  that connects all vertices in  $R$ . This problem can be equivalently stated as selecting an arbitrary node  $r$  in  $R$ , and finding the minimum weighted arborescence rooted in  $r$ , whose leaves correspond to nodes in  $R \setminus \{r\}$ , in the directed version of graph  $G$ . We observe that in any of those  $r$ -arborescences, the paths connecting  $r$  to the nodes in  $R \setminus \{r\}$  form a Laminar family. This fact leads to a new linear programming formulation of polynomial size for fixed  $|R|$ , whose extreme points are integer and whose optimal solution is an optimal Steiner tree.

##### 4 - New SOCP Relaxation and Branching Rules for Bipartite Bilinear Programs

Asteroide Santana, Georgia Tech, Atlanta, GA, 30318,  
United States

The bipartite bilinear program (BBP) is a QCQP where the variables can be partitioned into two sets such that fixing the variables in any one of the sets results in a linear program. We propose a new second order cone representable (SOCP) relaxation for BBP, which we show is stronger than the standard SDP relaxation intersected with the boolean quadratic polytope. We then propose a new branching rule inspired by the construction of the SOCP relaxation and show that our approach outperforms the commercial solver BARON in obtaining dual bounds for instances of a new application of BBP.

**1 - Fireline Construction in a Heterogeneous Forest Landscape**

Xu Yang, Northeastern University, 360 Huntington Avenue,  
Snell Engineering, Boston, MA, 02115, United States,  
Emanuel Melachrinoudis

Most often wildfires are contained with a construction of fireline around the fire perimeter by clearing of combustible material or sufficiently wetting to prevent fire spread. Existing models in the literature assume homogeneous fire environment. This paper presents a novel way of generating an optimal fireline construction through heterogeneous landscape using a network approach. Voronoi Polygons are utilized to represent the homogeneous areas. Dijkstra's algorithm is used to find the fastest paths at a safe distance for two crews who work simultaneously in opposite directions to encircle and contain the fire.

**2 - Locomotive Assignment Problem: Integrating the Strategic, Tactical and Operational Level Aspects**

Prashant Premkumar, Doctoral Student, Indian Institute of  
Management Kozhikode, IIM Kozhikode P.O., Kozhikode, 673570,  
India, Ram Kumar P. N

Over the past couple of centuries, with the increase in the significance of the railways to the economy, the complexity of the railway network and consequently the decision making involved has only increased. Among the host of problems in railways management, we attempt to integrate the strategic, tactical and operational level aspects of one of the most important problems, which is the Locomotive Assignment Problem (LAP). We also demonstrate that by innovatively modelling the problem through the addition of a valid equality, the lower bounds can be improved substantially, thereby reducing the solution time.

**3 - Blood Bank Mergers from a Supply Chain Perspective: A Case Study**

Amir H. Masoumi, Assistant Professor of Management, Manhattan  
College, O'Malley School of Business, Riverdale, NY, 10471,  
United States, Jan Hoffmann, Min Yu

We utilize a supply chain network model to analyze a recent case of merger between two blood banks in California. Our methodological framework evaluates the synergy associated with the merger from a total cost perspective. The proposed model takes into account the operational cost, discarding cost of waste, as well as the potential capacity coverage penalty throughout the blood supply chain. For the case study, clustered blood collection zones are considered in addition to aggregated demand regions representing the hospitals served by the two blood banks. Solution to the proposed models yields the optimal link flows and the link capacity coverages corresponding to the pre- and post-merger problems.

**4 - Societal Networks in Smart City**

Rupe Xu, The University of Texas at Dallas, Richardson, TX,  
75081, United States, Andras Farago

In the modern city, societal networks, such as transportation network, communication network, gas pipeline network, delivery network etc., play an important role for the convenience of citizens. Adopting artificial intelligence and Internet of Things (IoT) to societal networks would lead to better technological services. These networks, however, are usually of extremely large scale and vary frequently, thus bringing a lot of new computational challenges. In this research, we apply new computation techniques to handle computational challenges for societal networks in the smart city, providing efficient and practical solutions.

**5 - Using Spreadsheet Maps for Heuristic Site-selection Algorithms**

Larry J. LeBlanc, Vanderbilt University, Owen Graduate School of  
Mgmt, Nashville, TN, 37203, United States, Michael Bartolacci,  
Thomas A. Grossman

Because of the well-known difficulty of finding exact solutions to large scale 0-1 location models, heuristic algorithms are often used. We show how to use 3D maps in Excel and Tableau to guide the selection of sites to open in a global setting from a large set of potential sites. Formulas for a different customer service radius for each site are given. Possible heuristics are discussed.

**Primal-Dual Methods for Stochastic Optimization**

Sponsored: Optimization/Nonlinear Programming

Sponsored Session

Chair: Qihang Lin, The University of Iowa, Iowa City, IA, 52245, United States

**1 - Structured Nonconvex Optimization Models: Algorithms and Iteration Complexity Analysis**

Tianyi Lin, University of California, Berkeley, 407, Cornell Avenue,  
Unit 11, Albany, CA, 94706, United States, Bo Jiang, Shiqian Ma,  
Shuzhong Zhang

Nonconvex and nonsmooth optimization problems are encountered in statistics, business and engineering, but are not widely recognized as a technology in the sense of scalability. This paper aims to take one step in this direction. Indeed, we consider some constrained nonconvex models in block variables with coupled affine constraints, and introduce the  $\epsilon$ -stationarity conditions. We develop two proximal-type variants of the ADMM, assuming the proximal updates can be implemented for all the block variables except for the last block, for which either a gradient step or a majorization-minimization step is implemented. We also establish an iteration complexity bound of  $\mathcal{O}(1/\epsilon^2)$ .

**2 - Randomized Primal-Dual Algorithms for Semi-Infinite Programming**

William Haskell, National University of Singapore, Singapore,  
Singapore

This paper presents a novel algorithm for semi-infinite programming which combines random constraint sampling with the classical primal-dual method. We show that this algorithm achieves an  $\mathcal{O}(1/T^{1/2})$  and  $\mathcal{O}(1/T^{1/4})$  rate of convergence for bounds in probability, in terms of the optimality gap and constraint violation, respectively, where  $T$  is the number of iterations.

**3 - Iteration Complexity of Collaborative Subgradient Method under Error Bound Condition and Weak Convexity**

Runchao Ma, The University of Iowa, 21 E. Market St, S380,  
Pappajohn Business Building, Iowa City, IA, 52242, United States,  
Qihang Lin

Collaborative subgradient descent (CSGD) method is a generic optimization algorithm for general nonlinear constrained continuous optimization. In this work, we consider using the CSGD method for two important classes of non-smooth constrained optimization problems: (1) convex problem satisfying error bound conditions; (2) non-convex problem with weak convexity. We analyze the iteration complexity of the CSGD method for finding an  $\epsilon$ -optimal or  $\epsilon$ -stationary point under each scenario, respectively.

**4 - Scalable Bilinear  $\pi$  Learning using State and Action Features**

Yichen Chen, Princeton University, Princeton, NJ, 08540,  
United States, Lihong Li, Mengdi Wang

In this work, we develop a scalable, model-free algorithm called bilinear  $\pi$  learning for reinforcement learning when a sampling oracle is provided. The algorithm has several advantages. First, it adopts (bi)linear models to represent the high-dimensional value function and state-action distributions, using state and action features. Its run-time complexity depends on the number of features, not the size of the underlying MDPs. Second, it operates in a fully online fashion without having to store any sample, thus having minimal memory footprint. Third, we prove that it is sample-efficient, solving for the optimal policy with a sample complexity linear in the dimension of the parameter space.

Chair: Raghu Bollapragada, Northwestern University, Evanston, IL, 60201, United States

**1 - Randomness and Permutations in Coordinate Descent**

Mert Gurbuzbalaban, Rutgers, New Brunswick, NJ, United States

We consider coordinate descent (CD) methods with exact line search on convex quadratic problems. Our main focus is to study the performance of the CD method that use random permutations in each epoch and compare it to the performance of the CD methods that use deterministic orders and random sampling with replacement. We focus on a class of convex quadratic problems with a diagonally dominant Hessian matrix, for which we show that using random permutations instead of random with-replacement sampling improves the performance of the CD method in the worst-case. This is joint work with Asu Ozdaglar, Nuri Denizcan Vanli and Stephen Wright.

**2 - A Progressive Batching L-BFGS Method for Machine Learning**

Raghu Bollapragada, Northwestern University, 2145 Sheridan Road, Evanston, IL, 60201, United States, Jorge Nocedal, Hao-Jun M. Shi, Dheevatsa Mudigere, Ping T. Peter-Tang

We present a new version of the L-BFGS algorithm for machine learning that combines three basic components - progressive batching, a stochastic line search, and stable quasi-Newton updating. The motivation for this approach is to combine the early efficiency and good generalization properties of the SGD method and the fast convergence, stability and parallelization opportunities offered by large batches. We illustrate the performance of the method on logistic regression and deep neural network models.

**3 - Inexact Non-convex Newton-type Methods**

Fred Roosta, University of Queensland, Brisbane, Australia

For solving large-scale non-convex problems, we propose inexact variants of trust region and adaptive cubic regularization methods, which incorporate various approximations. In particular, in addition to inexact sub-problem solves, both the Hessian and the gradient are suitably approximated. Using mild conditions on such approximations, we show that our proposed inexact methods achieve similar optimal worst-case iteration complexities as the exact counterparts. Our proposed algorithms do not require knowledge of any unknowable problem-related quantities and are implementable in practice. We also examine the empirical performance of our algorithms on some real datasets.

**4 - Random Projections for Faster Non-convex Optimization**

Mert Pilanci, Stanford University, Stanford, CA, United States

Randomized dimension reduction has recently become a powerful tool in machine learning. We consider random projection methods in the context of non-convex optimization problems. First, we introduce a statistical model where the maximum likelihood estimator reduces to fitting a single layer neural network. We show that a second order optimization method with a suitable initialization recovers the global optimum under certain assumptions on the data. We then introduce random projection and sampling strategies that enables faster convergence in terms of clock time. Our results suggest that the proposed method can outperform existing stochastic methods in large scale non-convex optimization.

Chair: Lars Moench, University of Hagen, University of Hagen, Hagen, 58097, Germany

**1 - Factory Logistics: Material Handling Performance in a Semiconductor Fab**

Gwangjae Yu, Arizona State University, AZ, United States, John W. Fowler

We study a facility layout problem of a semiconductor manufacturing system (SMS). The objective function in facility layout problems usually is to minimize the material flow distance. However, there is a question if this is still valid for an SMS, which is characterized by re-entrant flow and heavy traffic. As a consequence, an SMS often suffers significant traffic congestion throughout the

material handling system. In our study, we simulate different facility layout scenarios to empirically derive a multi-objective function to capture the traffic issue in addition to the distance. Finally, we test the performance of the new objective function by comparing with previous results.

**2 - Algorithms for Short-term Demand Supply Matching in Semiconductor Supply Chains**

Lars Moench, University of Hagen, Enterprise-wide Software Systems, Universitaetsstrasse 1, TGZ, Hagen, 58097, Germany, Raphael Herding, Thomas Ponsignon, Alexander Seitz, Hans Ehm

We propose algorithms for short-term demand supply matching in semiconductor supply chains. The algorithms can be used to simultaneously re-promise orders in demand fulfillment processes. The resulting mixed integer programming formulations are solved using time-based decomposition approaches. The algorithms are assessed in a rolling horizon setting including master planning and order promising activities. We compare the obtained results with results for a rule-based order repromising algorithm. The results demonstrate that the novel short-term demand supply matching algorithms outperform the rule-based approaches.

**3 - A Review of Product Ramping Models in Semiconductor Manufacturing**

Atchuta B. Manda, Doctoral Student, North Carolina State University, Campus Box 7906, Raleigh, NC, 27695-7906, United States, Reha Uzsoy

We review the state of the art in modelling the ramping up of new products in semiconductor wafer fabrication facilities. We present a taxonomy of different problem formulations, learning models, capacity models and related yield and process learning, and suggest directions for future research.

**4 - Intel Minifab and Observations on Operational Control**

Leon McGinnis, Georgia Institute of Technology, Atlanta, GA, 30332-0205, United States

This famous but aging case study comes to life again to demonstrate some fundamental truths—that our analysis models must clearly distinguish plant and control (which they don't today), that operational control is implemented through material handling, and that there is no such thing as a “queue” in the factory. If we simulate queues, we are not simulating the factory, and thus cannot evaluate implementable operational control (scheduling) policies.

**Stochastic Inventory Control: Asymptotics and Approximations**

Sponsored: Manufacturing &amp; Service Oper Mgmt

Sponsored Session

Chair: Linwei Xin, University of Chicago, Chicago, IL, 60637, United States

**1 - Exploiting Random Lead Times in Inventory Systems**

Alexander Stolyar, University of Illinois at Urbana-Champaign, 1308 W. Main Street, 156CSL, Urbana, IL, 61801, United States, Qiong Wang

We study the classical single-item inventory system with random replenishment lead times and order crossovers, and propose a new policy that exploits the lead time randomness. Instead of focusing on the inventory position, our policy uses the net inventory level to set a dynamic target for inventory in-transit, and places orders to follow that target. The policy provides a potentially infinite inventory cost reduction compared with the classical Constant Base Stock (CBS) policy. In the case of exponentially distributed lead times, we prove that, as the demand rate becomes large, the expected (absolute) inventory level under our policy vanishes relatively to that under CBS policy.

**2 - LP-based Order-up-To Control for Stochastic Inventory Systems with Sequential Probabilistic Service Level Constraints**

Linwei Xin, University of Chicago, 5807 S. Woodlawn Avenue, Chicago, IL, 60637, United States, Lai Wei, Stefanus Jasim

We consider a stochastic inventory model with non-stationary demands, positive lead time, and sequential probabilistic service level constraints. This is a notoriously difficult problem to solve and, to date, not much progress has been made in understanding the structure of its optimal control, especially for the lost-sales inventory system. In this paper, we propose a simple order-up-to control, whose parameters can be calculated using the optimal solution of a deterministic approximation of the backorder inventory system, and show that it is asymptotically optimal for both the backorder and lost-sales systems in the regime of high service level requirement.

**3 - A Primal-dual Approach to Analyzing Assemble-to-Order Systems**

Levi DeValve, Duke University, 716 Turmeric Lane, Durham, NC, 27713, United States, Sasa Pekec, Yehua Wei

Assemble-to-order (ATO) problems with general structure and integrality constraints are well known to be difficult to solve. We provide new approximation guarantees by approaching the ATO problem from a primal-dual perspective. We design an LP rounding algorithm for the one-period problem that achieves both asymptotic optimality as demand grows large, and a constant factor approximation of 1.8 for any problem instance. We apply our LP rounding analysis to design an asymptotically optimal integral policy in a related dynamic model.

**4 - On the Performance of Tailored Base-surge Policies: Theory and Application at Walmart.com**

Linwei Xin, University of Chicago, 5807 S. Woodlawn Avenue, Chicago, IL, 60637, United States, Long He, Jagtej S. Bewli, John Bowman, Huijun Feng, Zhiwei Qin

We consider the following dual-sourcing inventory problem: one supplier is reliable but has a longer lead time; the other one is not always reliable but has a shorter lead time. It is motivated by a real-world problem at Walmart.com and the lead time differences of many import items could be as large as 12 weeks. We prove that a Tailored-Base Surge (TBS) policy is asymptotically optimal as the lead time difference grows. We also test the performance of TBS by using data from Walmart.com. Our result shows that Tailored-Base Surge outperforms other heuristics.

**1 - A Reinforcement Learning Approach for Hotel Revenue Management**

Jun Zhang, Fudan University, School of Management, Fudan University, Shanghai, 200433, China, Ji Chen, Yifan Xu, Peiwen Yu

We develop a data-driven approach for hotel revenue management. In this approach, the dynamic capacity allocation problem for multiple class customers is solved in two steps: First, a recommended average price is computed, and then the capacity allocation decision is made based on the average price. The recommended average price is computed with a reinforcement learning algorithm. The capacity allocation decision is made based on a linear programming model taking into account a hotel's preference for different classes of customers.

**2 - Can Leanness Predict Financial Distress?**

Feng Mai, Stevens Institute of Technology, 1 Castle Point Terrace, Hoboken, NJ, United States, Nagihan Comez-Dolgan, Xuying Zhao

We investigate whether operational slack can predict financial distress. We use quarterly panel data of US manufacturing firms for the period from 1980-2016. Using Merton's distance to default model, we identify a sample of financial distress firm. We then apply LASSO regression to assess the relative importance of operational slack variables as predictors for financial distress. Our results show that operational slack can complement financial ratios commonly used in the existing credit risk literature.

**3 - Product Quality, Consumer Returns, and the Moderating Role of Salesperson**

Xiaojing Dong, Santa Clara University, Marketing Department, Lucas Hall, Santa Clara, CA, 95053, United States, Necati Ertekin

The literature has rigorously explored the relationship between product quality and consumer returns through analytical frameworks under the assumption that improving quality reduces consumer returns. We empirically (1) investigate this relationship with respect to two product quality dimensions, namely objective quality and perceived quality, that have been the focus of operations management and marketing, respectively, and (2) examine the moderating role of salesperson.

**4 - Data-Driven Pricing and Assortment Decisions for Soybean Seeds**

Durai Sundaramoorthi, Washington University in Saint Louis, 10352 Conway Road, Saint Louis, MO, 63131, United States, Lingxiu Dong, Iva Petrova Rashkova

Offering vertical and horizontal assortments is a common and a strategic practice of firms to expand their share of the market. We introduce a hierarchical-ensemble of machine learning and optimization for product assortment in the agricultural context. We optimize the assortment of soybean varieties to grow in the mid-west of the USA. The hierarchical-ensemble framework created in this research paves way to optimize the assortment of seeds of other crops like corn, rice, and wheat. We present the data utilized, the data-driven methodology utilized, and results obtained in our presentation.

**TC13**

**1 - Bayesian Social Learning with Heterogeneous Preferences: Effects of Diversity**

Ali Makhdoumi, MIT, 77 Massachusetts Ave. 32D-640, Cambridge, MA, 02139, United States

Two opposite forces are present in social learning with heterogeneity. First, heterogeneity will make social learning more difficult as the actions of others become less informative. Second, each individual uses more of her information in making decisions and "herds" become less likely. In this talk, we study the interplay between these two forces and characterize the effect of heterogeneity on social learning and its speed.

**2 - Information and Learning in Contests: An Experimental Study**

Mohamed Mostagir, University of Michigan, 701 Tappan Ave, Ann Arbor, MI, 48109, United States, Yan Chen, Iman Yekkehzaare

Contests are a common mechanism for extracting effort from participants. Their use is widespread in a variety of settings like workplace promotions or crowdsourcing. One of the pivotal aspects of contest design is the contest's information structure: what information should the contest designer provide to participants and when should this information be revealed? The answers to these questions have important implications to how players behave and the overall outcome of the contest. We show how the behavior of players significantly deviates from theory predictions and provide recommendations for how these information mechanisms should be designed in light of these experimental findings.

**3 - Impatience and Learning In Services**

Senthil Veeraraghavan, University of Pennsylvania, Wharton School OPIM Department, 545 3730 Walnut Street, Philadelphia, PA, 19104, United States, Hanqin Zhang, Xiao Li

Customers often abandon waiting in queues when they get impatient. Prior literature on Markovian queues shows that it is not rational to quit "midway": it is rational for customers to quit either immediately on arrival (balk) or wait till the completion of their service. We show how abandonment behavior may occur when customers wait and learn in Markovian queues. We model the learning and abandonment behavior of customer who arrives to a system without full knowledge about the service rate but learns more about service rate. Our work reveals interesting features in waiting behavior, showing that customers can be (rationally) more patient in slower shorter queues, than in faster longer queues.

**4 - Technology Adoption and Information Acquisition in a Partnership**

Sasa Pekec, Duke University, Durham, NC, United States

We study technology adoption decisions under uncertainty in a partnership. This requires coordination among partners with non-identical objectives. We show that classical results for a single decision-maker (SDM policy) do not extend to and do not provide guidance for optimal decision-making in a partnership. We also show that it could be optimal for the partnership to prematurely adopt/reject the technology as compared to the SDM policy, and that anticipating premature decisions in a later period could trigger unraveling which leads to a series of premature decisions in earlier periods.

Sponsored: Manufacturing &amp; Service Oper Mgmt/Service Operations

Sponsored Session

Chair: David Goldberg, Cornell University, Ithaca, NY, 14850, United States

**1 - On the Design of Service Systems when Servers are Strategic**

Ragavendran Gopalakrishnan, Postdoctoral Associate, Cornell University, Ithaca, NY, United States

We study the impact of strategic server behavior on the optimal design of a service system, which involves the choice of system configuration (pooled with one central queue or dedicated with multiple parallel queues), the routing policy (e.g., Random routing or Fastest Server First), and the staffing policy (how many servers to hire). In this talk, we present key results from jointly optimizing the routing policy (over a large class of rate-based routing policies) and the system configuration (pooled vs. dedicated) at equilibrium and discuss implications for optimizing the staffing policy. We also identify an interesting trade-off between the system performance and server utility at equilibrium.

**2 - Asymptotic Optimality and Heuristics of Base-stock Policies for Perishable Inventory Systems**

Jinzhi Bu, The Chinese University of Hong Kong, Hong Kong NT, Shatin, Shatin, Hong Kong, Xiting Gong, Xiuli Chao

In this paper, we study the asymptotic properties of the performance of the base-stock policies for a classical perishable inventory system with fixed lifetime. We prove that the best base-stock policy is asymptotically optimal with large product lifetime, large demand size, and large unit penalty cost. Moreover, the optimality gap of the best base-stock policy decays exponentially fast to zero in the lifetime and demand size. We also construct a class of simple heuristic base-stock policies with the same asymptotic properties as the best base-stock policy. Finally, we conduct a numerical study to show the effectiveness of the best and heuristic base-stock policies.

**3 - Dual Sourcing and Smoothing under Non-stationary Demand Time Series: Re-shoring with Speedfactories**

Jan A. Van Mieghem, Professor, Northwestern University, Evanston, IL, United States, Robert Boute, Stephen Disney

We investigate the emerging trend of near-shoring a small part of the global production back to local SpeedFactories. The short lead time of the responsive SpeedFactory reduces the risk of making large volumes in advance, yet it does not involve a complete re-shoring of demand. Using a breakeven analysis we investigate the lead time, demand, and cost characteristics that make dual sourcing with a SpeedFactory desirable compared to off-shoring to a single supplier. We extend the celebrated order-up-to replenishment policy to settings where capacity costs exist and demonstrate their excellent performance. We highlight the significant impact of autocorrelated and non-stationary demand series

**4 - Queue Joining Decisions when there is a Prerequisite Condition for Receiving Service**

Tim Huh, University of British Columbia, Vancouver, BC, Canada, Mona Imanpoor Yourdshahy, Steven Shechter

We consider an M/M/1 queueing system in which a customer requires some prerequisite conditions to be met prior to receiving service. We investigate whether an individual arriving to this system should join the queue at that time, wait to join at some future time, or leave the system. We formulate the problem as a Markov decision process and show how the structure of the optimal policy depends on in-queue and out-of-queue waiting costs, the arrival and service rates, as well as the time until the prerequisite condition is satisfied. We present the structural results of an individual's optimal policy.

**5 - New Product Diffusion in Closed-loop Supply Chains**

Emre Nadar, Bilkent University, Department of Industrial Engineering, Bilkent University, Ankara, 06800, Turkey, Baris Emre Kaya, Kemal Guler

We study the sales planning problem of a manufacturer who sells new and remanufactured versions of a product over a finite life cycle. We develop a dynamic model in which demand arrives according to a slightly modified Bass diffusion process and end-of-use product returns required for remanufacturing are constrained by the earlier sales. We show the optimality of partial demand fulfillment in certain time periods when innovators significantly contribute to the diffusion process or an unmet demand is likely to be backlogged to be satisfied with a remanufactured product. Our findings suggest that curbing the initial sales may be desirable for remanufacturable products in fast-clockspeed industries.

**1 - Dynamic Pricing for Parking**

Maokai Lin, Smarking Inc., San Francisco, CA, United States, Yingxiang Yang

Parking is an industry with 30 billion dollar annual revenue in the US, and more than 100 billion dollar worldwide. With the popularization of smartphones, more and more people search and reserve parking spaces online, leading to great opportunities for dynamic pricing and revenue management. At Smarking, we work with our industry partners to dynamically change prices online in real-time for multiple parking locations in Boston and Chicago. In this talk, we will introduce patterns in real-world parking data, approaches we use for dynamic pricing, and results we achieve.

**2 - A Re-solving Heuristic with Uniformly Bounded Loss for Network Revenue Management**

Pornpawee Bumpensanti, Georgia Institute of Technology, 755 Ferst Drive NW, Atlanta, GA, 30332, United States, He Wang

We consider a network revenue management problem. The goal is to find a customer admission policy that maximizes expected revenue over a fixed finite horizon. We study a class of re-solving heuristics. These heuristics periodically re-solve the deterministic linear program (DLP), where random customer arrivals are replaced by their expectations. We find that frequently re-solving the DLP produces the same order of revenue loss as one would get without re-solving. However, by re-solving the DLP at a few selected time points and applying thresholds to the customer acceptance probabilities, we design a new algorithm that has a revenue loss bounded by a constant that is independent of the horizon length.

**3 - Assortment Optimization for Parallel Flights under a Multinomial Logit Choice Model with Cheapest Fare Spikes**

Yufeng Cao, Georgia Institute of Technology, Atlanta, GA, United States, Anton J. Kleywegt, He Wang

The classical multinomial logit (MNL) choice model does not capture the phenomenon that airline customers tend to choose the cheapest fare classes. We study an assortment optimization problem for parallel flights under an extended spiked-MNL model, which introduces a separate attractiveness parameter for the cheapest available fare class on each flight. We show that the corresponding optimal assortment policy selects revenue-ordered assortments. We also propose static booking limit heuristics based on deterministic approximations of the problem. We evaluate different assortment policies in numerical experiments using both synthetic and real-world data provided by an airline partner.

**4 - Online Ad Allocation with Temporally Asymmetric Learning**

Hanzhang Qin, Massachusetts Institute of Technology, 100 Memorial Drive, 8-10 A, Cambridge, MA, 02142, United States, David Simchi-Levi, Xinshang Wang, Yang Sen, Shenghuo Zhu

We study an online resource allocation problem in which heterogeneous customers arrive at time-varying rates. Customer purchase probabilities are unknown and need to be learned in an online fashion. We devise online algorithms that reserve resources for future customers when (i) the total arrival rate of each customer type is known but (ii) the purchase probabilities of different customer types are learned at time-varying speeds due to non-stationary arrivals. We prove performance guarantees for the proposed algorithms. We test the algorithms using huge industrial datasets.

### Sustainable and Socially Responsible Operations

Sponsored: Manufacturing & Service Oper Mgmt/Sustainable Operations

Sponsored Session

Chair: Can Zhang, Georgia Institute of Technology, Atlanta, GA, 30309, United States

#### 1 - Designing Platforms for the First Mile

Joann de Zegher, MIT Sloan, Cambridge, MA, 02142, United States, Sergio Camelo, Dan Andrei Iancu, Daniela Saban

Smallholder farmers in developing and emerging economies supply over 50% of global calories. This first mile of global supply chains typically operates inefficiently, is non-traceable, and is difficult to study because smallholder farmers sell through informal networks. We first share how we quantify inefficiencies in such informal first-mile supply chains of Indonesia by integrating large-scale field work and optimization. We then provide an overview of how platforms can alleviate such inefficiencies, and create traceability as a by-product. Finally, we propose a framed field experiment to estimate how much value a proposed platform can create in such resource-constrained environments.

#### 2 - Dynamic Volunteer Staffing in Multicrop Gleaning Operations

Erkut Sonmez, University of Nebraska Lincoln, 730 N. 14th Street, College of Business, University of Nebraska, Lincoln, NE, 68588, United States, Baris Ata, Deishin Lee

Gleaning programs organize volunteer gleaners to harvest leftover crops that are donated by farmers for the purpose of feeding food-insecure individuals and reducing food waste. We develop a dynamic volunteer staffing policy that maximizes the long run average volume of food gleaned.

#### 3 - Tracing Quality to its Source: Quality and Compliance Issues in Distributed Supply Chains

Philippe Blaettchen, INSEAD, Fontainebleau, France, Andre Du Pin Calmon, Sameer Hasija

Modern technologies like blockchain enable unprecedented levels of visibility into multi-tiered supply chains. We investigate the effect of traceability on supply chain quality, compliance, and efficiency for different supply chain structures. We also analyse the optimal deployment strategy of a traceability system, and we model the decision of adopting a traceability technology as a game between the members of a supply chain. While we are motivated by food supply chains, which have traditionally been fraught with waste as well as difficulties in effectively certifying origins and processes, our results are applicable in a general context.

#### 4 - Consistent Allocation of Emission Responsibility in Energy Supply Chains

Sanjith Gopalakrishnan, University of British Columbia, 2053 Main Mall, Vancouver, BC, V6T1Z2, Canada, Daniel Granot, Frieda Granot

Canada's federal government, since 2016, factors in upstream emissions during the environmental impact assessment of energy projects. Motivated by the regulation, we adopt a cooperative game model and propose the nucleolus as a mechanism to apportion upstream emissions. It avoids the distortionary effects of double counting and exhibits a consistency property that is significant in a context wherein energy supply chains span multiple legal jurisdictions. We develop a polynomial-time algorithm and further, derive it as the unique subgame perfect equilibrium to a non-cooperative game induced by two easily stated and verifiable policies, thereby lending a self-implementing policy framework.

### Sourcing and Innovation

Sponsored: Manufacturing & Service Oper Mgmt/Supply Chain Sponsored Session

Chair: Cuihong Li, University of Connecticut, Storrs, CT, 06269, United States

Co-Chair: Leon Zhu, University of Southern California, Los Angeles, CA, 90089, United States

#### 1 - The Role of Problem Specifications in Crowdsourced Innovation Contests: Theoretical Analysis and Data Evidence

Zoey Jiang, Stephen M. Ross School of Business, University of Michigan, Ann Arbor, MI, 48104, United States, Yan Huang, Damian Beil

We investigate the role of seekers' problem specifications in crowdsourcing contests to solve design problems. We propose and empirically test a theoretical model featuring different types of information in problem specifications

(conceptual goals, execution guidelines), and the corresponding designer decisions. We solve the model for seekers' optimal decisions: While more execution guidelines always benefit the seeker, more conceptual goals do not. Finally, we discuss a quasi-natural experiment, providing further empirical evidence for our predictions and recommendations.

#### 2 - Sourcing Complex Innovation: Integrated System or Individual Components?

Zhi Chen, INSEAD, 1 Ayer Rajah Avenue, Singapore, Jurgen Mihm, Jochen Schlapp

Many purchasing projects involve buying complex systems, which require the suppliers to perform some custom product or technology development regardless of whether they win the project or not. Viewing such a procurement setting through the lens of contest, we study under which circumstances a buying firm should source an integrated system or individual components.

#### 3 - Strategic Benefit of Request for Quotation

Ying Rong, Shanghai Jiao Tong University, No. 1 Lane 9, Yunwushan Road, Shanghai, 200051, China, Leon Zhu, Huan Zheng

We study how a buyer may reduce cost by combining a procurement process with (the threat of) exclusion clauses, the latter of which has been commonly adopted in contracting but rarely executed. We analyze the equilibrium outcomes when the buyer simultaneously or sequentially negotiates with imperfectly substitutable suppliers under a dual-sourcing setting. Surprisingly, the buyer can benefit from a request for quotation (RFQ) stage that precedes the negotiation stage even under a full information setting. Specifically, by endogenizing the sequence of negotiations via the quotations submitted, the buyer's equilibrium profit with an RFQ is (weakly) higher than the profit without an RFQ.

#### 4 - Supplier Competition and Investment: An Experimental Investigation

Cuihong Li, University of Connecticut, School of Business, 2100 Hillside Road, Storrs, CT, 06269, United States, Elena Katok, Zhixi Wan

We consider a buyer facing two suppliers who invest in cost reduction before bidding for contracts. Using laboratory experiments, we investigate how supplier competition and investment observability affect suppliers' cost-reduction and buyer's reserve price decisions.

## ■ TC18

North Bldg 128A

### Operations/ Marketing Interface I

Contributed Session

Chair: Franco Berbeglia, Tepper School of Business, 5000 Forbes Avenue, Pittsburgh, PA, 15213, United States

#### 1 - Channel-level Benefit-cost Analysis in Investment Decision

Yasamin Salmani, PhD Student, Drexel University, Philadelphia, PA, United States, Fariborz Partovi, Avijit Banerjee

Companies provide multiple sales channels for their customers, to compete in the marketplace. The model proposed in this study, helps the managers to have a channel-level profit analysis to improve these established sales channels.

#### 2 - Online Retailer Competition with Referral Services

Kihoon Kim, Korea University, Korea University Business School, LG-POSCO #316, Anam-dong, Seongbuk-gu, Seoul, 136701, Korea, Republic of

We investigate when two competing online retailers can be better off by adopting a referral service. We show that the proportion of the strongly loyal consumers of the referral-offering retailer in the group of its all consumers mainly determines the chance that the referral service will be adopted. As a main result, when the market shares of both the retailers are not significantly different, the referral service is likely to be adopted unless the degree of the loyalty among their loyal consumers is weak and there exist some comparison consumers.

#### 3 - The Strategic Impacts of Advertising on Crowdfunding

Zhixin Chen, Doctor, University of Technology and Science of China, Jinzhai RD 96#, Hefei, 230026, China, Jie Wu

Previous literature on crowdfunding paid rare attention to how advertising affects crowdfunding. To fill in this gap, we apply a stylized game-theoretical model to analyze interactions between firm's advertising decisions and crowdfunding decisions. As a result of our research, we obtained several managerial insights for the balance of the potential tension. The advertising is meaningless and the creator would choose to do no advertising when the fundraising target is relatively high, and the advertising can reduce the high price in menu pricing strategy, however, the menu pricing strategy can only work when the target is not too high.

**4 - Dynamic Salesforce Compensation**

Long Gao, University of California-Riverside, 900 University Avenue, 221 Anderson Hall, AGSM, Riverside, CA, 92521, United States

We study a salesforce compensation problem in a dynamic setting, where the salespeople have evolving skills and can learn over time. We characterize the optimal contract and derive the managerial implications.

**5 - Should Network Television Enable Consumer Binge Watching?**

Franco Berbeglia, PhD Candidate, Carnegie Mellon University, Tepper School of Business, 5000 Forbes Avenue, Pittsburgh, PA, 15213, United States, Timothy Derdenger, Kannan Srinivasan, Joseph Xu

With the broadcast television industry facing new forms of competition, networks have searched for new methods to distribute shows. Through the networks' online interfaces shows are able to match the new competitors and offer all-at-once releases rather than follow the traditional linear strategy. This lowers consumers' viewing costs, but also diminishes the viewer's responsiveness to advertising. This paper studies the impact of this new channel on network shows with a signaling model. We find the adoption of this channel is highly profitable for low quality shows, reducing the necessity of costly signaling through advertising for the high quality shows, which results in a more efficient market.

**Topics in Dynamic Pricing and Revenue Management**

Sponsored: Revenue Management & Pricing

Sponsored Session

Chair: Vineet Goyal, Columbia University, New York, NY, 10027, United States

**1 - Aggregation Bias in Demand Estimation**

Zizhuo Wang, University of Minnesota, 1009 5th Street SE, Minneapolis, MN, 55414, United States, Chaolin Yang, Hongsong Yuan, Yaowu Zhang, Ruqing Jiang

Demand estimation is a core challenge in many industrial problems. In practice, companies often only have aggregate demand data in daily granularity, even though they may have changed prices within each day. A common approach in that case is to take a simple/weighted average of prices and use it as the price for each day (and the total demand as the demand for that day). However, such an approach may result in bias in demand estimation. In this work, we investigate under what conditions using such aggregate approach will result in an underestimation or an overestimation of price sensitivities. We also examine practical data from Alibaba to see the practical effects of demand estimation using aggregate data.

**2 - Customized Individual Promotions: Model, Optimization, and Prediction**

Srikanth Jagabathula, NYU Stern School of Business, 44 W. 4th St, Kmc Rm 8-74, New York, NY, 10012, United States, Dmitry Mitrofanov, Gustavo J. Vulcano

We propose a back-to-back procedure for running personalized promotions in retail operations contexts, from the construction of a nonparametric choice model where customer preferences are represented by directed acyclic graphs (DAGs) to the design of such promotions. We fit the models to historical purchases tagged by customer id, product availability and promotion data for a category of products. We provide new bounds for the likelihood of a DAG and show how to conduct the MNL estimation. We test our model to predict purchases at the customer individual level on real retail data. Finally, we illustrate how to use it to run personalized promotions.

**3 - Impact of Network Structure on New Service Pricing**

Vahideh Manshadi, Yale University, 165 Whitney Ave, Rm 3473, New Haven, CT, 06511, United States, Saed Alizamir, Ningyuan Chen, Sang-Hyun Kim

We analyze a firm's optimal pricing of a new service offering when the firm faces consumers who interact among themselves in a network and exert positive externality on each other. In order to maximize the long-run revenue generated from network externality, the firm provides its service for free initially to promote usage growth, raising the price when a sufficient level of consumer interactions is established. We study the impact of network structure on the firm's optimal pricing policy and revenue.

**4 - Dynamic Influence Maximization in Social Networks**

Shatian Wang, Columbia University, New York, NY, United States, Van-Anh Truong, Zhen Xu

We study algorithms for dynamically learning and spreading influence over social networks, by selecting the influencers in the network to incentivize.

**■ TC20**

North Bldg 129A

**Learning in Online Markets**

Sponsored: Revenue Management & Pricing

Sponsored Session

Chair: Negin Golrezaei, Massachusetts Institute of Technology, Cambridge, MA, 02142, United States

Chair: Santiago Balseiro, Columbia University, Columbia University, New York, NY, 10027, United States

**1 - Discontinuous Demand Functions: Estimation and Pricing**

N. Bora Keskin, Duke University, Fuqua School of Business, 100 Fuqua Drive, Durham, NC, 27708-0120, United States, Arnoud Victor den Boer

Price-rankings in online marketplaces and price comparison websites create discontinuities in demand functions. Motivated by this, we consider a dynamic pricing-and-estimation problem with an unknown and discontinuous demand function. We show that ignoring such discontinuities results in substantial loss of revenues, and construct near-optimal policies that can handle demand discontinuities.

**2 - Robust Repeated Auctions under Heterogeneous Buyer Behavior**

Shipra Agrawal, Columbia University, 500 West 120th Street, Mudd 423, New York, NY, 10027, United States, Konstantinos Daskalakis, Vahab Mirrokni, Balasubramanian Sivan

We study revenue optimization in a repeated auction between a single seller and a single buyer. Traditionally, the design of repeated auctions requires strong modeling assumptions about the bidder behavior, such as it being myopic, infinite lookahead, or some specific form of learning behavior. Is it possible to design mechanisms which are simultaneously optimal against a multitude of possible buyer behaviors? We answer this question by designing a simple state-based mechanism that is simultaneously approximately optimal against a k-lookahead buyer for all k, a buyer who is a no-regret learner, and a buyer who is a policy-regret learner.

**3 - Contextual Bandits with Cross-learning**

Jon Schneider, Google Research, New York, NY, United States, Santiago Balseiro, Negin Golrezaei, Mohammad Mahdian, Vahab Mirrokni

In the contextual bandits problem, in each round  $t$ , a learner observes some context  $c$ , chooses some action  $a$  to perform, and receives some reward  $r_{a,t}(c)$ . We study the variant of this problem where the learner also learns the values of  $r_{a,t}(c')$  for all other contexts  $c'$ . This variant arises in several strategic settings, such as learning how to bid in non-truthful repeated auctions. The best algorithms for the classical contextual bandits problem achieve  $O(\sqrt{CKT})$  regret against all stationary policies, where  $C$  is the number of contexts,  $K$  the number of actions, and  $T$  the number of rounds. We demonstrate algorithms for our variant that remove the dependence on  $C$  and achieve improved regret bounds.

**4 - Dynamic Pricing with Demand Learning and Reference Effects**

Arnoud den Boer, University of Amsterdam, Science Park 107, room F3.33, Amsterdam, Netherlands, N. Bora Keskin

We consider a dynamic pricing problem with demand learning and reference effects. Customers are loss averse: they have a reference price that can vary over time, and the demand reduction when the selling price exceeds the reference price dominates the demand increase when the selling price falls behind the reference price by the same amount. Consequently, the demand function has a time-varying "kink" and is not differentiable everywhere. The seller neither knows the underlying demand function nor observes the reference prices. We consider several variants of this problem and design asymptotically optimal pricing policies.

### Joint Session RMP/Practice Curated: Data-driven Applications and Dynamic Learning in Revenue Management

Sponsored: Revenue Management & Pricing

Sponsored Session

Chair: N. Bora Keskin, Duke University, Durham, NC, 27708-0120, United States

#### 1 - The Exponential Choice Model: Assortment Optimization and Data-driven Applications

Jacob Feldman, Olin Business School, 6 Portland Court, Saint Louis, MO, 63108-1291, United States, Mohammed Ali Aouad, Danny Segev

We study the assortment optimization problem under the Exponential choice model. In this problem, a retailer seeks the revenue maximizing set of products to offer to each arriving customer. Our main contribution comes in the form of the first polynomial time approximation scheme with a provable guarantee for the assortment problem under the Exponential choice model. We follow up this result with a series of estimation studies using real data, which show that the predictive power of the Exponential model is on par with the classic MNL model.

#### 2 - Personalized Advertising and Learning Through High-dimensional Data with Limited Samples

Mingcheng Wei, University at Buffalo, 326C Jacobs Management Center, Buffalo, NY, 14260, United States, Xue Wang, Tao Yao

In this paper, we propose a Minimax Concave Penalized Multi-Armed Bandit algorithm for a decision-maker facing high-dimensional data with latent sparse structure in an online learning and decision-making process. This algorithm performs favorably compared to other algorithms, especially when there is a high level of data sparsity or when the sample size is not too large.

#### 3 - Data-driven Pricing for a New Product

Mengzhenyu Zhang, University of Michigan, Ross School of Business, Ann Arbor, MI, 48105, United States, Hyun-Soo Ahn, Joline Uichanco

Decisions regarding new products are difficult to make, and mistakes can have grave consequences to a firm's bottom line. Firms have little foresight on information about new product demand such as the potential market size, the rate of customers' adoption. We study the interplay between pricing and learning to maximize the expected revenue of a new product over a finite time horizon. We consider a setting where a firm can learn by observing sales data. To capture the stochastic adoption process, we develop a continuous-time Markovian Bass model. We derive the optimal pricing policy with learning and propose two simple and computationally tractable pricing policies that are provably near-optimal.

#### 4 - Dynamic Pricing-and-Learning Strategies in Service Operations

Yuan-Mao Kao, Duke University, Durham, NC, 27708, United States, N. Bora Keskin, Kevin Shang

We consider a firm providing a service to its customers under limited information about demand and service requirements. The firm can obtain more information by offering the service over multiple periods. In this setting, we formulate how pricing strategies affect the firm's learning, and we study the performance of near-optimal dynamic pricing strategies.

### Marketplace Innovation: Field and Empirical Studies

Sponsored: Revenue Management & Pricing

Sponsored Session

Chair: Chiara Farronato, Harvard Business School, Soldiers Field Road, Morgan Hall 412, Boston, MA, 02163, United States

#### 1 - Consumer Protection in an Online World: When Does Occupational Licensing Matter?

Chiara Farronato, Andrey Fradkin, Bradley Larsen, Erik Brynjolfsson

This paper studies the effects of occupational licensing on outcomes in a large online platform for home services, where professional service providers bid on consumers' projects. We exploit exogenous variation in the time at which licenses are displayed on the platform to identify the causal effects of licensing information and reviews on consumer choices. We find that platform verified licensing status is not valued by consumers but digital reputation is. Next, we use zip-code by job category variation in licensing stringency to measure the effects of licensing on aggregate market outcomes. Our results show that more stringent licensing leads to less competition and higher prices, but does not improve customer satisfaction.

#### 2 - Customer Preference and Station Network in the London Bike Share System

Pu He, Columbia University, Uris Hall, Cub 4H, New York, NY, 10027, United States, Fanyin Zheng, Elena Belavina, Karan Girotra

We study customer preference for the bike share system in the city of London. We estimate a structural demand model on the station network to learn the preference parameters and use the estimated model to provide insights on the design and expansion of the bike share system. We highlight the importance of network effects in understanding customer demand and evaluating expansion strategies of transportation networks. We develop a new method to deal with the endogeneity problem of the choice set in estimating demand for network products. Our method can be applied to other settings, in which the available set of products or services depends on demand.

## ■ TC23

### Algorithmic Trading

Sponsored: Finance

Sponsored Session

Chair: Sebastian Jaimungal, University of Toronto, Toronto, ON, M5S3G3, Canada

#### 1 - Mean Field Games with Differing Beliefs for Algorithmic Trading

Sebastian Jaimungal, University of Toronto, Toronto, ON, Canada, Philippe Casgrain

Even when confronted with the same data, agents often disagree on a model of the real-world. Here, we address the question of how interacting heterogeneous agents, who disagree on what model the real-world follows, optimize their trading actions. The market has latent factors that drive prices, and agents account for the permanent impact they have on prices. This leads to a large stochastic game, where each agents' performance criteria is computed under a different probability measure. We analyse the mean-field game (MFG) limit of the stochastic game and show that the Nash equilibria is given by the solution to a non-standard vector-valued forward-backward stochastic differential equation. Under some mild assumptions, we construct the solution in terms of expectations of the filtered states. We prove the MFG strategy forms an  $\epsilon$ -Nash equilibrium for the finite player game. Lastly, we present a least-squares Monte Carlo based algorithm for computing the optimal control and illustrate the results through simulation in market where agents disagree on the model.

#### 2 - A Mathematical Analysis of Technical Analysis

Bin Zou, University of Connecticut, Storrs, CT, United States, Matthew Lorig, Zhou Zhou

In this paper, we study trading strategies based on exponential moving averages (ExpMA), an important indicator in technical analysis. We seek optimal ExpMA strategies when the drift of the underlying is modeled by either an Ornstein-Uhlenbeck process or a two-state continuous-time Markov chain. Closed-form solutions are obtained under the logarithm utility maximization and the long-term growth rate maximization.

#### 3 - Hedging Non-Tradable Risks with Transaction Costs and Price Impact

Ryan Donnelly, University of Washington, Seattle, WA, United States, Alvaro Cartea, Sebastian Jaimungal

An agent hedges exposure to a non-tradable risk factor  $U$  using a correlated traded asset  $S$  and accounts for the impact of trades on both factors. We obtain in closed-form the optimal strategy when the agent holds a linear position in  $U$ . With non-linear exposure to  $U$ , we provide an approximation to the optimal strategy in closed-form, and prove that the value function is correctly approximated when cross-impact and risk-aversion are small. With non-linear exposure, the approximate optimal strategy can be written in terms of the optimal strategy for linear exposure with the size of the position changing dynamically according to the exposure's "Delta" under a particular probability measure.

#### 4 - The Shadow Price of Latency: Improving Intraday Fill Ratios in Foreign Exchange Markets

Alvaro Cartea, University of Oxford, Oxford, United Kingdom, Leandro Sánchez-Betancourt, Philippe Casgrain

Liquidity takers face a moving target problem because of their latency. They send marketable orders that aim at a price and quantity they observed in the LOB, and by the time their order is processed, prices could have worsened (improved), so the order may not be filled (be filled at a better price). We show how to choose the discretion of orders to walk the LOB to increase the chances of filling them. The strategy balances the tradeoff between the costs of walking the LOB and targeting a percentage of filled orders. We employ prop data of FX trades to analyze the performance of the strategy and compute the price of latency that a trader would be willing to pay for co-location and hardware to reduce their latency.

## ■ TC24

Sponsored: EBusiness

Sponsored Session

Chair: Ajit Sharma, Wayne State University, Rochester Hills, MI, 48307, United States

**1 - Signaling Quality with Return Insurance**

Chong Zhang, Tsinghua University, Beijing, China., Man Yu, Jian Chen

Motivated by sellers' practices on various shopping platforms such as Taobao.com and JD.com, we examine the informational role of a return insurance, which compensates consumers for their cost of returning the items. We characterize the conditions under which the return insurance can serve as an effective signal of high-quality products.

**2 - The Role of Filtered Search in Matching: Evidence From an Online Dating Platform**

Kyungmin Park, University of Washington, Seattle, WA, United States, Elina Hwang, Soo-Haeng Cho

Does filtered search really increase the matching probability in online dating market? Many online dating websites have utilized individual preference based filtering to improve their mate recommendation system. However, the effectiveness of the filtered search is questionable since stated and real preferences are often different. Based on the dataset from a Korean online dating website, we empirically examine the role of the filtered search on the matching probability in online dating market. Male users show a U-shaped pattern in the relationship between their mate search pool size and matching probability. Whereas, female users do not show any strong pattern.

**3 - Sponsor-Partner Relationship in Social Media Sponsored Contents**

Shahryar Doosti, University of Washington, Foster School of Business, Mackenzie Hall, Seattle, WA, 98195, United States, Stephanie Lee

Sponsored contents on social media have been major outlets for companies to advertise based on the targeted audience and popularity of the creators. We utilize a rich data set on sponsored videos on a large scaled social media to study the partnership between the sponsors and creators. We found that sponsors tend to keep the partnership over time despite the decaying efficiency in number of views.

**4 - The Role of Customer Images in Product Understanding**

Yue Guan, Tsinghua University, Beijing, China

Multimedia content has attracted increasing attention from customers, retailers and ecommerce platform managers. Compared with product images posted by retailers, images from customers are more trustworthy as a kind of UGC (User Generated Content). Drawing on the theory of consumer psychology, we aim to investigate the mechanism and elements in customer images that contribute to customers' product understanding. Empirical tests are conducted with real world data, and the significant effects of customer images are verified.

**1 - Does Feedback Make You Try Less Hard? A Study of Automotive Telematics**

Vivek Choudhary, INSEAD Business School, 1 Ayer Rajah Avenue, Singapore, Masha Shunko, Serguei Netessine

Internet of things devices and mobile connectivity in general increasingly enabling to track user behavior that was not possible before. In this paper we focus on insurance provided using automotive Telematics devices that track users' behavior while driving which is currently the most disruptive technology in the auto insurance industry. Using a novel dataset obtained through a collaboration with a startup, we find that contrary to the feedback and feedback-seeking literature, telematics feedback does not necessarily improve driving behavior.

**2 - Strategically Giving Service: The Effect of Real-time Information on Service Efficiency**

Nil Karacaoglu, Kellogg School of Management, Northwestern University, Antonio Moreno, Can Ozkan

The use of real-time information in on-demand services provides agents with access to an unprecedented amount of information about their competitors. We study the impact of the increased availability of real-time information on the behavior of strategic agents and the implications of this phenomenon for service efficiency using data from one of the leading e-hailing taxi platforms in South America

**3 - When More is Less: Staffing Level and Flexibility in a Restaurant Chain**

Masoud Kamalahmadi, Indiana University, 1309 E. 10th Street, Bloomington, IN, 47405, United States, Qiuping Yu, Yong-Pin Zhou

We empirically explore how staffing level and flexibility (created through unpredictable scheduling such as call-in and holdover overtime) impact worker and customer behavior, and subsequently the firm's current and future revenue. We find that working on holdover overtime negatively impacts worker productivity, whereas working on call-in doesn't impact worker productivity. Moreover, staffing decisions impact customers' current and future purchasing behaviors.

**4 - Ratings and Version Updates in the Mobile App Market**

Gad Allon, University of Pennsylvania, 3730 Walnut Street, Philadelphia, PA, 19104, United States, Kenneth Moon, Amandeep Singh

Mobile apps have become an economy with a projected market size of \$77 Billion in 2017. One of the key features that distinguishes mobile apps from other types of digital goods (such as movies, songs or books) is that they have versions. A developer can release an app into a mobile app store, and can then keep adding, removing, or editing features of the app with subsequent version updates. We characterize the optimal strategy for timing such updates and structurally estimate the extent to which developers respond to demand-side incentives in a ratings-sensitive environment. We discuss implications for platforms and developers.

Sponsored: Service Science

Sponsored Session

Chair: Kejia Hu, Vanderbilt University, Nashville, TN, 37215, United States

**1 - Shaping Demand Peaks and Valleys in Service Industries Through Online Deals**

Simin Li, Kellogg School of Management, Northwestern University, 2211 Campus Drive, Evanston, IL, 60208, United States, Kejia Hu, Martin Lariviere

Using data from three leading online platforms in offering deals, we empirically study how service providers strategically design deals to facilitate demand-supply coordination during holiday demand swings. In particular, using our structural model, we find that service providers strategically design the deal discount and launch date based on their operating margin and foreseeable holiday demand change. Building on the estimation of deal customers' sensitivities to the discount and launch date, we propose an optimal deal strategy to shape demand and therefore increase profit. Moreover, we substantiate the importance of selecting a launch date wisely to manage demand and maximize profit.

**2 - The Impact of Waiting on Customer Response Delay**

Guangzhi Shang, Florida State University, College of Business, Tallahassee, FL, 32306, United States, Noyan Ilk

We study the impact of waiting times on customer response behavior in the context of online service centers. Using a unique operational data set, we show that waiting before service (i.e., queue wait) accelerates customer engagement, whereas waiting during service (i.e., in-service wait) slows down customer responses. These findings contribute to the service operations literature by showing the significance of the feedback from waiting to (customer-instigated) service time. We discuss the implications of these findings on customer admission decisions and agent workload levels.

**3 - Understanding Customers' Retrials in Call Centers: Preferences of Service Speed and Service Quality**

Kejia Hu, Vanderbilt University, 300 Ashcroft Pl, Nashville, TN, 37215, United States, Gad Allon, Achal Bassamboo

Using a call-by-call customers contact dataset, we want to understand how customers' preferences of service speed and quality impact their retrial behavior (calling back for the same issue) in the call center.

#### 4 - Need for Speed: The Impact of Website Performance on Online Retailers

Nil Karacaoglu, Kellogg School of Management, Evanston, IL, 60201, United States, Santiago Gallino, Antonio Moreno

In 2016, total online retail sales reached \$402.3 billion. Moreover, 49% of offline transactions are influenced by online channels. As the importance of online channels increased, the cost of webpage performance issues increased as well. In this environment, it is paramount for companies to understand how website performance impacts customer behavior and to determine the right balance between perceived website content quality and website performance. In this paper, we focus on how consumer behavior is affected by the performance of retailers' website. In particular, we analyze how website speed impacts conversion rates and online channel revenues.

#### 5 - Does Competition Improve Service Quality? The Case of Nursing Homes Where Public and Private Payers Coexist

Susan F. Lu, Purdue University, Krannert 441, West Lafayette, IN, 47907, United States, Konstantinos Serfes, Gerard Wedig, Bingxiao Wu

Competition plays an ambiguous role in markets for credence goods, where public and private payers coexist. Using nursing home data with a wide range of market structures, we find a U-shaped relationship between competition and service quality when nursing homes serve a mix of private and public segments, and a monotonic relationship when providers only serve the public segment. The outcomes can be explained by the interplay of two opposing effects of competition: the reputation building effect whereby competing firms choose high quality to build a good reputation and the rent extraction effect whereby competition hinders investment for quality improvements by eliminating price premia.

### Non-Monetary Mechanisms for Resource Allocation

Sponsored: Applied Probability

Sponsored Session

Chair: Siddhartha Banerjee, Cornell University, Ithaca, NY, 14853, United States

Co-Chair: Artur Gorokh, Cornell University, Ithaca, NY, 14850, United States

#### 1 - Bargaining and Maxmin Fairness

Anilesh Krishnaswamy, Stanford University, Stanford, CA, 94305, United States, Ashish Goel

While maxmin fairness is a well-known notion of fairness in many resource allocation problems, there is no known mechanism for its implementation in the standard bargaining setting. We construct a mechanism that implements the maxmin fair solution as the unique subgame perfect equilibrium in the n-player bargaining problem. We use the standard assumption, motivated in part by resource allocation problems, that any player can grab the entire surplus. Our mechanism consists of a binary game tree, with each node corresponding to a subgame where the players are allowed to choose between two outcomes. Our design crucially depends on novel combinatorial properties of the maxmin fair solution.

#### 2 - Multi-agent Mechanism Design Without Money

Huseyin Gurkan, Duke University, Fuqua School of Business, P.O. Box:337, Durham, NC, 27708, United States, Santiago Balseiro, Peng Sun

We consider a principal repeatedly allocating a single resource in each period to one of multiple agents, whose values are private, without relying on monetary payments over an infinite horizon with discounting. We design a dynamic mechanism without monetary transfers, which induces agents to report their values truthfully in each period via promises/threats of future favorable/unfavorable allocations. We show that our mechanism asymptotically achieves the first-best efficient allocation (the welfare-maximizing allocation as if values are public) as agents become more patient and provide sharp characterizations of convergence rates to first best as a function of the discount factor.

#### 3 - Dynamic Proportional Sharing: A Game-theoretic Approach

Seyed Majid Zahedi, Duke University, Durham, NC, United States

When agents pool their resources, each becomes entitled to a portion of the pool. In this talk, we show that mechanisms based on max-min fail to guarantee entitlements, strategy-proofness (SP) or both. We propose the flexible lending mechanism and show that it satisfies SP and guarantees at least half of the utility from static allocations while providing an asymptotic efficiency guarantee. Our results show that the performance of our mechanism is comparable to that of state-of-the-art mechanisms, providing agents with at least 0.98x, and on average 15x, of their utility from static allocations. Finally, we propose the T-period mechanism and prove that it guarantees SP and entitlements.

#### 4 - Non-Monetary Mechanism Design via Artificial Currencies

Artur Gorokh, Cornell University, Ithaca, NY, 14850, United States, Siddhartha Banerjee, Krishnamurthy Iyer

Non-monetary mechanisms for repeated resource allocation are gaining widespread use in many real-world settings. Our aim in this work is to study the allocative efficiency and incentive properties of simple repeated mechanisms based on artificial currencies. Our main result in this framework is a general black-box technique to convert any static monetary mechanism to a dynamic mechanism with artificial currency, that simultaneously guarantees vanishing loss in efficiency, and vanishing gains from non-truthful bidding over time.

**Modeling and Analysis of Emerging Mobility Services and Systems**

Sponsored: TSL/Urban Transportation

Sponsored Session

Chair: Yafeng Yin, University of Michigan, Ann Arbor, MI, 48109, United States

Co-Chair: Yu Nie, Northwestern University, Evanston, IL, 60208, United States

**1 - On the Supply Function of Ride-sourcing Systems**

Zhengtian Xu, University of Michigan, 2489 Stone Rd, Ann Arbor, MI, 48105-2540, United States, Yafeng Yin

For shared-use systems, an increasing number of users usually brings about positive network effects, by improving the efficiency on utilizing the shared resources. However, Castillo et al. (2017) identified a matching failure that may arise in a ride-sourcing system when experiencing surge of demand. It is shown that under the stated condition, the platform may match scarce idle drivers with those requesting customers very far away and thus waste substantial supply on picking them up. To better understand and measure the system performance, this study seeks to build up a supply function to associate the performance measures with other basic macro-indicators of a ride-sourcing system.

**2 - A Reservation Mechanism for Parking Slots Sharing Problems under Incomplete Information Setting**

Pengyu Yan, University of Electronic Science and Technology of China, Qingshuihe Campus: No.2006, Xiyuan Ave, West H, Chengdu, China, Heng He, Feng Chu, Debing Ni

Parking sharing applications have been launched to deal with parking challenges in many metropolitans. Motivated by industry and literature, this study addresses a novel reservation mechanism for parking sharing services under a real-time and incomplete information setting. A polynomial heuristic algorithm is developed to match and schedule parking resources for drivers. It is shown that self-interested drivers manipulate the reservation system via misreporting their demands with a parking-time-based pricing. Thus, a truth-telling pricing method based on VCG is designed, which achieve allocation efficiency, individual rationality, and budget balance economic properties as well.

**3 - An EABC Approach with Exact Loading and Unloading Strategies for Static Bike Repositioning Problem**C.S. Shui, University of Hong Kong, Composite Building, Seat 16, LG 208, Hong Kong, Hong Kong  
C.S. Shui, The University of Hong Kong Shenzhen Institute of Research and Innovation, Shenzhen, China, W. y. Szeto

This study investigates a bike repositioning problem (BRP) that determines the routes of the repositioning vehicles and the loading and unloading quantities at each bike station to firstly minimize the total demand dissatisfaction and then service time. To reduce the computation time to solve the loading and unloading sub-problem of the BRP, a novel set of loading and unloading strategies is proposed, proved to be optimal for a given route, and then embedded into an enhanced artificial bee colony algorithm to solve the BRP. Numerical studies show the computation efficiency of the proposed solution method and the trade-off between total demand dissatisfaction and the service time.

**4 - Street-hailing vs E-hailing: Modeling the Passenger Waiting Time of Personal Mobility Services**

Yu Nie, Northwestern University, A328 Technological Institute, 2145 Sheridan Road, Evanston, IL, 60208, United States, Kenan Zhang, Hongyu Chen

Mobile computing technologies have triggered the rapid development of Transportation Network Companies (TNC) in recent years. Although the e-hailing service provided by TNCs is normally believed to feature a higher matching efficiency, little is known about the underlying physics of passenger-driver meeting process. Based on the model developed in the previous work, this study investigates the passenger waiting time of both street-hailing and e-hailing. Taxi trajectories and TNC operating data collected in Shenzhen, China are used to validate the model and to compare the passenger waiting time under various scenarios.

Sponsored: TSL/Intelligent Transportation Systems (ITS)

Sponsored Session

Chair: Goktug Islamoglu, Captura ITS, Cengelkoy Mah. Kalantor Sok., 16/3 Uskudar, Istanbul, 34680, Turkey

**1 - Efficient Collection of Connected Vehicles Data with Precision Guarantees**

Negin Alemazkoo, University of Illinois at Urbana-Champaign, Champaign, IL, United States, Hadi Meidani

Connected vehicles disseminate detailed data with a very high frequency. Therefore, efficient collection of data is critical to prevent overburdening the communication systems. We propose an efficient data collection scheme that selects and transmits only a small subset of data. We have tested the proposed approach to select data points to be transmitted from 10,000 connected vehicles trips. Results show that collection ratio can be as small as 0.05. A simulation study was also performed to evaluate travel time estimation accuracy using the proposed data collection approach. Results show that the proposed approach can significantly improve travel time estimation accuracy.

**2 - Inferring High Resolution Individual Activity and Trip Purpose From GPS Trajectories Data Collected from a Navigation App**

Shin-Yu Lin, Metropia, 1790 E. River Rd., Suite 140, Tucson, AZ, 85718, United States, Ali Arian, Ali Arian, Alireza Ermagun, Yi-Chang Chiu

Traditionally human mobility patterns and space activities are studied using recall-based travel diaries. Following the ubiquity of location-based technologies, transportation researchers are revisiting the methods of classifying travel activity patterns using geo-location data. The current study contributes to this research line by leveraging granular and detailed activity information collected from a navigation app, Metropia.

**3 - Traffic Synchronization Protocol: Ising Model Phase Transitions in Hyperbolic Lattices of Accidents**

Goktug Islamoglu, Pamir, Cengelkoy Mah. Kalantor Sok. 16/3 Uskudar, Istanbul, 34680, Turkey

When Turkey's annual accident-vehicle graph is plotted from 1986 to 2016, the points form a spiral expanding around the regression line. Spiral symmetry breaks for all vehicle types except for LCVs (light commercial vehicles), implying a nonlinear dynamic behavior coexisting with the strong linear dependence of accidents to the number of vehicles. Its projection on a 2D cellular automaton through hyperbolic geometry exhibits a Tracy-Widom distribution and provides closed form solutions of the Ising Model. Emergence of accident formations in non-human sources of error suggest the need for a "synchronization protocol of autonomous vehicles, which are developed with the human error assumption.

**1 - Designing a Centralized Distribution System for Omnichannel Retailing**

Jia Guo, University of Alabama, Tuscaloosa, AL, 35487-0226, United States, Burcu B. Keskin

We focus on supply chain design and omnichannel strategies with demand segmentation, cost structure, and more importantly, the company's execution ability. We formulate our problem as a two-stage stochastic programming model and use first-order optimality conditions to study the optimal inventory replenishment decisions. The omnichannel strategy decisions are made by analyzing the expected profit. We show that omnichannel strategies are not necessarily profitable for all retailers. Imperfect demand may result in losing the inventory pooling benefits when running omnichannel strategies.

**2 - Try Before You Buy: Membership Program of Competing E-retailers**

Amy Pan, University of Florida, FL, United States, Gang Li, Ming Jin

With the increasingly convenience of online shopping, more and more consumers prefer to make purchases from e-retailers. However, the disadvantage of the inability to try on and the need to wait for delivery still exists. Some e-retailers have implemented the try-before-you-buy (TBYB) program, which allows consumers to try on products at home to resolve the valuation uncertainty before making a purchase. We develop a theoretical model where two e-retailers may opt for TBYB program and find that the TBYB can soften the competition and increase consumer surplus.

**3 - Benders Decomposition for Supply Chain Network Design**

Simon Belieres, LAAS-CNRS, 7 Avenue du Colonel Roche, Toulouse, 31400, France, Mike Hewitt, Tom Van Woensel, Nicolas Jozefowicz, Frederic Semet

We consider a large-scale supply chain that must satisfy recurring customer

requests for products, wherein the sizes of products are small enough for consolidation to be an option. To serve these requests, the carrier can solve a variant of the Service Network Design problem wherein each commodity has multiple potential origins. Industrial instances involve a significant number of products, which in turn yields a model that is larger than an off-the-shelf solver can handle. We present a Benders method with a master problem defined over aggregated products. We augment this approach with valid inequalities and heuristics, and with an extensive computational study illustrating its effectiveness.

### Big Data and Machine Learning for Advanced Manufacturing

Emerging Topic: OR and Advanced Manufacturing

Emerging Topic Session

Chair: Guha Manogharan, Pennsylvania State University, University Park, PA, United States

Co-Chair: Michael G. Kay, North Carolina State University, Raleigh, NC, 27695, United States

#### 1 - Uncertainty Quantification for Integrated Simulation Models with Unobservable Variables Using Bayesian Networks

Mohamad Mahmoudi, Texas A&M University, 1221 April Bloom, A, College Station, TX, 77840, United States, Alaa Elwany

In this work we investigate the problem of uncertainty quantification for a system of computer models which are integrated in a hierarchical fashion. We consider the assumption of existence of unobservable outputs in our system. The proposed methodology employs Bayesian networks to conduct uncertainty quantification. To evaluate the performance of the proposed method, a case study of simulation models used in metal additive manufacturing is presented where two high-fidelity models are integrated and uncertainty sources for each model is identified. The results of using the Bayesian network for uncertainty quantification is the presented and thoroughly discussed.

#### 2 - Revitalizing Sand-Casting Supply Chain in the United States: A Study on Locating 3D-Sand Printer Hubs to Support Metal Foundries

Michael Kay, Pennsylvania State University, 232 Reber Building, State College, PA, 16802, United States, Ramin Ahmed, Casey Bates, Paul Lynch, Guha Prasanna Manogharan

Additive manufacturing (AM), over the past few years, has played a revolutionary role in the field of manufacturing, mainly in the casting process. In casting industries, sand casting provides huge scope due to its expandability and ability to create complex metal parts of almost any alloy. Recent research has determined various benefits of 3D printing sand molds including time efficiency, minimizing product and development delay, the ability to form very intricate castings, reduction in the need for inventory and so on. While all these benefits are apparent, traditional manufacturers are still not encouraged to adopt only due to its high fixed cost and lack of expertise. On the other hand, there are so much demand over the U.S it is hard only a handful of dedicated AM firms to the demand points. This is due to the fact that, the transportation cost will become prohibitive due to the fragile nature of the sand molds. In this paper, we investigate a system of strategically-located AM hubs which can encompass all the demand points. Using North American Industry Classification System (NAICS) data for the foundries in the U.S., we have used an uncapacitated facility location model to determine the optimal locations for AM hubs where we considered the geographic data and demand and strategically identified the fixed cost using various data like AM machine cost, packaging cost, employee salaries, rent and other consumables which were obtained through personal communication. Results from this study will identify: (a) candidate US counties to build AM hubs, (b) total cost (fixed, operational and transportation). We also noticed that over the past years the demand has been increasing, which would mean an increased capacity to satisfy those demand. We hope to address this issue with a sensitivity analysis in 3 levels: (low, medium, high). With each such level of increase, we aim to demonstrate how and where the additional hubs should be added.

Chair: Peng Wei, Iowa State University, Ames, IA, 50011, United States

#### 1 - Energy Optimal Speed Profile for Arrival of Tandem Tilt-Wing eVTOL Aircraft with RTA Constraint

Priyank Pradeep, Iowa State University, Ames, IA, 50011, United States, Peng Wei

The electric vertical takeoff and landing (eVTOL) aircraft can alleviate transportation congestion on the ground by utilizing three-dimensional airspace efficiently. However, the endurance of Lithium-ion Polymer (Li-Po) batteries imposes severe constraints on the operational time span of an eVTOL on urban air mobility (UAM) passenger transportation mission. This research focuses on the problem formulation and numerical solution of a fixed final time multiphase optimal control problem with energy consumption as the performance index for a tandem tilt-wing eVTOL.

#### 2 - Adaptive Arrival Sequencing and Scheduling for Mixed Fleet eVTOL Aircraft in On-Demand Urban Air Mobility

Priyank Pradeep, Iowa State University, Ames, IA, 50011, United States

Our current research is focussed on solving Aircraft Sequencing and Scheduling (ASS) problem for eVTOL aircraft in Urban Air Mobility (UAM) environment. The concept of operations (CONOPs) for both types of eVTOL aircraft (wingless and winged) is assumed to be cruising at constant altitude followed by the vertical descent. To compute the set of RTAs, first, the sequencing order of landing of the eVTOL aircraft will be calculated using heuristic methods, such as Genetic Algorithm (GA). Once we determine an arrival sequencing order, the arrival scheduling sub-problem can be formulated as mixed integer linear programming (MILP) problem and will be solved using open source MILP solver Gurobi Optimizer.

#### 3 - Autonomous On-Demand Free Flight Operations in Urban Air Mobility using Monte Carlo Tree Search

Xuxi Yang, Iowa State University, Ames, IA, 50011, United States, Peng Wei

Vertical takeoff and landing (VTOL) aircraft for on-demand air taxi will bring fundamental changes to daily commutes. NASA, Uber, and Airbus have been exploring the exciting concept of Urban Air Mobility (UAM). In order to enable safe and efficient autonomous on-demand free flight operations in this UAM concept, a computational guidance algorithm was designed and analyzed with collision avoidance capability. The approach is to formulate this problem as a Markov Decision Process and solve it using Monte Carlo Tree Search. A simplified numerical experiment was created and results show that this algorithm can help aircraft quickly reach the trip destination and avoid conflicts with other aircraft.

#### 4 - Innovating Airline Operations Centers to Support New Fleet Demands

Victoria C. Nneji, Duke University, Durham, NC, 27708, United States

Several manufacturers are developing new vehicles for high-speed intra-city air taxi on-demand mobility (ODM) services. With diverse vehicle design requirements, how might airline operations centers need to innovate to support these new fleet demands? We used task- and time-based data from a collective case study of dispatchers to develop a discrete event simulation to serve as a predictive model of human-system performance in these air operations centers. With this tool, companies can rapidly prototype future ODM concepts of operations to make better informed strategic, tactical, and operational decisions in staffing and designing centers.

#### 5 - A Progressive Trajectory Planning Algorithm for High-Density 2D Traffic

Yanchao Liu, Wayne State University, Detroit, MI, United States

This talk presents a trajectory planning algorithm based on nonlinear optimization techniques. The model centrally coordinates trajectories for all vehicles traversing a shared two-dimensional space. To avoid path deadlocks associated with local optima, a progressive solution algorithm is developed. In addition, a set of new metrics is proposed to measure traffic flow efficiency of 2D transit systems. Simulation results will be demonstrated.

**Joint Session Drones/Practice Curated:  
Operations Research Applications in Drones**

Emerging Topic: Robotics, Drones and Autonomous Vehicles in Logistics

Emerging Topic Session

Chair: Gino Lim, University of Houston, Houston TX

Co-Chair: Seon Jin Kim, University of Houston, Houston, TX, 77094, United States

**1 - A Hybrid Approach for Extending Drone Flight Duration in Real Time**

Seon Jin Kim, University of Houston, 422 Cypress Vista, Houston, TX, 77094, United States, Gino J. Lim

This study focuses on continuous flight missions using battery powered drones. There are two types of battery charging techniques: stationary and dynamic wireless charging systems. However, the stationary system requires frequent visits of drones to the ground control center to replace or charge the batteries, while the dynamic system does not have reliable battery charging efficiency. To overcome both of these issues in a battery charging system, a hybrid battery charging system combining stationary and dynamic wireless charging systems has been proposed.

**2 - Carrier-drone Vehicle Routing Problem: Multiple Deliveries by a Single Flight**

Ho-Young Jeong, Purdue University, 315 N. Grant St, West Lafayette, IN, 47907, United States, Seokcheon Lee

A carrier-drone hybrid delivery vehicle uses a truck as a station for delivery drones. The truck with a larger cargo capacity carries and launches drones to customers in locations where traffic congestions or physical obstructions are present. Because of its significant advantages, various hybrid routing models have recently been proposed and researched. We'd like to introduce a new model that allows drones to make multiple deliveries by a single flight. This property is expected to further enhance logistical efficiency compared to existing models limited to single delivery per flight. In this study, this new hybrid vehicle routing problem is presented along with evidence of its practicality.

**3 - Operation Based Vehicle Routing Problem for Drone Assisted Truck Delivery**

Jinkun Lee, East Carolina University, Greenville, NC, United States, Sung Hoon Chung

We consider a drone assisted truck delivery problem where the truck serves as a mobile station of single or multiple drones while delivering items to customers at the same time. We formulate the model as a mixed integer programming problem where the objective is to minimize the total delivery time. We describe the pre-process of the exact algorithm where the possible operations, defined as drone-truck delivery combination units, are identified to reduce the overall computational complexity. We present case studies and discuss efficacy and efficiency of the proposed approach.

**4 - Deliver or Not?: Revenue and Capacity Management for Drone-based Delivery Services**

Zhangchen Hu, University of Massachusetts Amherst, Amherst, MA, 01003, United States, Heng Chen, Senay Solak

Drones are expected to become a key component of commercial delivery services for retailers and courier companies in the near future. Using currently available data, we develop both queueing-based and dynamic programming-based models to determine when drone delivery options should be enabled by retailers. Both analytical and numerical analyses are provided.

**5 - An Unmanned Aircraft System Path Planning Model for Inspecting Wind Turbines**

Hyeoncheol Baik, PhD Candidate, Auburn University, Shelby 3301, Auburn, AL, 36849, United States, Jorge F. Valenzuela

Rope access is a common technique for maintaining and servicing wind turbines. This technique is risky and inefficient. An alternative approach is to use an unmanned aircraft system (UAS). The challenge is to determine an efficient way to deploy the UAS over a region with multiple wind turbines. In this presentation, we describe a mathematical programming path planning model for a UAS that works cooperatively with a ground vehicle. The objective of the model is to minimize the total inspection time. We use a real wind farm to test our model.

## ■ TC37

**Recent Advances in Applied Probability**

Sponsored: Applied Probability

Sponsored Session

Chair: Jose Blanchet, Columbia University, New York, NY, 10027, United States

**1 - Nonconvex Optimization via Accelerated Langevin Diffusion**

Yi Chen, Northwestern University, Evanston, IL, United States

Nonconvex optimization arises from numerous machine learning problems. However, due to the existence of spurious local minima, nonconvex optimization remains challenging in both theory and practice. We investigate the method of solving optimization via Langevin diffusion. We consider some techniques accelerating the convergence, which enable us to obtain a better solution within a shorter time.

**2 - Even Faster Algorithms for Optimal Transport**

Carson Kent, Stanford University

Over the past decade, optimal transport and Wasserstein metrics have come to play a major role in a wide variety of tasks throughout optimization and machine learning- e.g. resource allocation problems, unsupervised learning, distributionally-robust optimization, etc. Typically, a major bottleneck for these applications is the computation of a transportation plan between discretized measures. Recent algorithmic advances have resulted in a bevy of new methods for this problem which have linear-time complexity guarantees and can scale to large problem sizes. In this work, we will present several new developments in this lineage of results which obtain superior complexity/performance. Additionally, we will provide perspective for where further computational improvements for this problem are likely and unlikely to be found.

**3 - Space-filling Design for Nonlinear Models**

Chang-Han Rhee, Centrum Wiskunde and Informatica, Jakoba Mulderplein 164, Amsterdam, 1018 MZ, Netherlands, Enlu Zhou, Peng Qiu

Traditional space-filling designs for computer experiments aim to fill the parameter space with design points that are as "uniform as possible. However, the resulting design points may be non-uniform in the model output space failing to provide a reliable representation of the output manifold, and becoming highly inefficient or even misleading in case the computer experiments are non-linear. In this talk, we propose and analyze an iterative algorithm that fills in the model output manifold uniformly rather than the parameter space uniformly so that one could obtain a reliable understanding of the model behaviors with the minimal number of design points.

**4 - Approximating Performance Measures for Non-stationary Markov Chains**

Zeyu Zheng, Stanford University, Stanford, CA, 94305, United States, Harsha Honnappa, Peter W. Glynn

Non-stationarity naturally arises in realistic modeling of many problems in operations research and operations management. Unfortunately, the development of closed-form theory for the great majority of stochastic models requires an assumption of stationary dynamics. We develop rigorous approximations to various expectations associated with generic non-stationary Markov models. These approximations are typically no harder to compute, either analytically or numerically, than are the linear systems associated with the stationary case. Asymptotic validity is established with slowly changing transition probabilities (which is only required over a small portion of the entire horizon).

## Probability Models in a Shared Economy

Sponsored: Applied Probability

Sponsored Session

Chair: Mariana Olvera-Cravioto, University of California-Berkeley, Berkeley, CA, 94720, United States

### 1 - Last-mile Shared Delivery: A Discrete Sequential Packing Approach

Junyu Cao, University of California-Berkeley, Berkeley, CA, 94720, United States, Mariana Olvera-Cravioto, Max Shen, Max Shen

We propose a model for optimizing the last-mile delivery of  $n$  packages from a distribution center to their final recipients, using a strategy that combines the use of ride-sharing platforms (e.g. Uber or Lyft) with a traditional van infrastructure. Our technical approach is based on the formulation of a discrete sequential packing problem, which is closely related to Renyi's parking problem. The main objective is to compute the optimal reward offered to private drivers for each individual package in a way that minimizes the total expected cost for delivering all packages. We show that under natural assumptions our mixed strategy can achieve significant improvements compared to a van-only strategy.

### 2 - Taxi-customer Queues with Delayed Matching

Lu Wang, University of North Carolina at Chapel Hill, B52 Hanes Hall, Chapel Hill, NC, 27599, United States, Vidyadhar Kulkarni

We consider a network of taxis and customers with Poisson arrivals and exponential patience times. We assume that there are exponentially distributed delays in matching the taxis with customers. We establish two methods to compute the fluid and diffusion approximations for the queue lengths and compare their performance.

### 3 - Customer Preference and Station Network in the London Bike Share System

Pu He, Columbia University, Uris Hall, Cub 4H, New York, NY, 10027, United States, Fanyin Zheng, Elena Belavina, Karan Girotra

We study customer preference for the bike share system in the city of London. We estimate a structural demand model on the station network to learn the preference parameters and use the estimated model to provide insights on the design and expansion of the bike share system. We highlight the importance of network effects in understanding customer demand and evaluating expansion strategies of transportation networks. We develop a new method to deal with the endogeneity problem of the choice set in estimating demand for network products. Our method can be applied to other settings, in which the available set of products or services depends on demand.

### 4 - Managing Services with Dependent Valuations and Service times

Achal Bassamboo, Ohad Perry, Chenguang Wu

The valuation for service of an arriving customer often depends on his individual service requirement; in this work we consider a queueing model in which these two random variables are stochastically dependent. Specifically, customers are price and delay sensitive, and decide whether to queue for service based on their service valuations, waiting cost and the price of service. Employing a general dependence order, we show that the provider's optimal revenue decreases with the strength of the dependence. Moreover, considering the valuation and service requirement to be independent when they are in fact dependent can lead to substantial revenue losses.

## Risk and Decision Analysis for the Resilience of Infrastructure Systems and Communities

Sponsored: Decision Analysis

Sponsored Session

Chair: Hiba Baroud, Vanderbilt University, Nashville, TN, 37235, United States

### 1 - Modeling Risks of Extreme Weather Induced Power Outages

Sayanti Mukherjee, Assistant Professor, University at Buffalo, Buffalo, NY, 14260, United States

Weather extremes cause sustained power outages that affect millions of people, causing extensive economic losses every year. The importance of building electricity sector's resilience, and thereby enhancing its service-security and long-term economic benefits is well established. To characterize the key predictors of such power outages, we propose a multihazard risk estimation approach. Our model suggests that power outage risk is a function of hazard types, expanse of overhead power systems, expanse of rural or urban areas, and levels of investment in operations/maintenance activities. The proposed model can help utility regulators to make risk-informed resilience investment decisions.

### 2 - A Multiple Decision-maker Approach to Allocating Resources for

## Disruptive Events

Cameron MacKenzie, Iowa State University, 3029 Black Engineering, Industrial and Manufacturing Systems Eng, Ames, IA, 50011, United States, Brandon Landowski

Most decision-making models for disruptive events and resilience consider a single decision maker. However, building community resilience and preparing and responding to disruptive events involve multiple stakeholders and different decision makers. We create different resource allocation models for different decision makers preparing and responding to a disruptive event. The decision makers include the federal government, state government, private sector, and non-governmental organization. We explore how the benefits of cooperating among these decision makers can increase the effectiveness of allocating resources to prepare and respond to disruptive events.

### 3 - Climate Analysis Support Tool for Community Resilience Assessment & Adaptation Planning

Leslie Gillespie-Marthaler, Vanderbilt University, 512 Cedar Cove, Nashville, TN, 37209, United States, Hiba Baroud

Communities require methods to aid in use of data related to climate change, as well as means to apply scenario-based alternatives to current and future decision making processes. To this end, we have developed a scalable tool using downscaled CMIP5 multi-model ensemble outputs, Rstudio, and local data to assess how extreme events may change in the future. The tool can be used to develop possible scenarios related to changes in frequency and magnitude for extreme precipitation (100, 200, 500 year) events. Outputs from the tool will be used in assessing community resilience to flood for a test community to build strategies that enhance current and future survival, wellbeing, and sustainable resilience.

### 4 - Optimal Inspection Strategies for Turbine Runners in Hydropower Plants

Andreas Kleiven, PhD Student, Norwegian University of Science and Technology, Alfred Getz vei 3, Trondheim, 7491, Norway, Stein-Erik Fleten, Carl Ullrich, Benjamin Fram

We develop a model for stochastically deteriorating turbine runners in hydropower plants with the purpose of finding the implied cost of inspections. Unscheduled downtime caused by failure of critical components in a hydropower plant may cause huge revenue losses. Inspections give information about the system state, and maintenance actions can be planned accordingly. In this work we simulate and analyze an inspection and replacement strategy based on turbine data from Norwegian hydropower plants.

## Participatory Modeling

Sponsored: Decision Analysis

Sponsored Session

Chair: Karen Jenni, U.S. Geological Survey, DFC, MS 939, Denver, CO, 80225, United States

Co-Chair: Antonie Jetter, Portland State University, Portland, OR, United States

### 1 - Tools and Methods in Participatory Modeling

Karen Jenni, U.S. Geological Survey, DFC, MS 939, Denver, CO, 80225, United States, Alexey Voinov, Steven Gray, Pierre Glynn, National SESYNC Participatory Modeling Working Group

The diversity of tools and methods used in participatory modeling can create challenges for stakeholders and modelers when selecting the ones most appropriate for their projects. We offer a systematic overview, assessment, and categorization of methods to assist modelers and stakeholders with their choices and decisions. Based on the results of our Participatory Modeling Working Group, and a survey of modelers engaged in participatory processes, we offer practical guidelines to improve decisions about method selection at different stages of the participatory modeling process.

### 2 - Participatory Exploratory Modelling and Analysis with Fuzzy Cognitive Maps

Antonie J. Jetter, Portland State University, ETM Department, 1900 SW 4th Ave, Portland, OR, 97207, United States

Participatory modelling pools participants' partial system knowledge, often resulting in "deep uncertainty" because some aspects of the system structure remain unknown. Exploratory modeling and analysis (EMA) simulates system behavior for multiple unknown inputs and alternative system structures. We illustrate a novel approach to combine EMA with Fuzzy Cognitive Mapping with two studies, which used different methods to determine the range of "deep uncertainty", namely content analysis and expert surveys. We present data collection and EMA approaches, computational challenges, results, and lessons learned for these strategies.

### 3 - A Participatory Model for Improving Safety Culture in Oil and Gas Operations

Antonie J. Jetter, Portland State University, ETM Department,  
1900 SW 4th Ave, Portland, OR, 97207, United States,  
Ahmed Alibage

Participatory modeling often occurs when the system under study is poorly understood and quantified. A case in point is safety culture, which describes the values, routines, and work processes that allow an organization to prevent disasters by avoiding and quickly bouncing back from mistakes. It is particularly relevant in oil and gas industry, where initially small errors can have devastating impacts. Relevant quantitative data on safety culture is virtually non-existent and practitioners have to rely on research findings in other context and their own observations: our work uses thematic analysis, t-coefficient, and Fuzzy Cognitive Mapping to create a model based on these knowledge sources.

#### 4 - Twelve Questions for the Participatory Modeling Community

Steven Gray, Michigan State University, Amherst, MI,  
United States, Antonie J. Jetter, Karen Jenni

Participatory modeling engages the implicit and explicit knowledge of stakeholders to create formalized and shared representations of reality, and has evolved into a field of study as well as a practice. Participatory modeling researchers and practitioners who focus specifically on environmental resources met at the National Socio-Environmental Synthesis Center (SESYN) in Annapolis, Maryland, over the course of two years to discuss the state of the field and future directions for participatory modeling. We will present a description of 12 overarching groups of questions that could guide future inquiry.

### Joint Session Analytics/Practice Curated: Impactful Applications of Analytics in Industry

Sponsored: Analytics

Sponsored Session

Chair: Subrat Sahu, Caterpillar Inc, Peoria, IL, United States

#### 1 - Operationalizing a Customer Retention Framework in Logistics Industry

Swapnil Srivastava

No Abstract Available.

#### 2 - Operations Research and Mathematical Sciences becomes Pervasive on a Networked, Collaborative Platform

Ben Amaba, IBM

Ben Amaba, University of Miami, Miami, FL, United States

Mathematical modeling has provided a competitive advantage for institutions to aid in understanding, learning, decision making, forecasting and operations. As the number of sensors, smart phones, Internet of Things (IoT), robots, blockchain and other data sources grow, the discipline and methods become foundational on a platform to manage complexity. The power of processors, better networks, less expensive memory and disk space, and better user interfaces are making data sciences accessible to more individuals on an open, secured platform where reuse and collaboration allows users to combine artificial intelligence and other technologies to advance operations research application.

### Machine Learning to Facilitate Renewable Integration in Power Grids

Emerging Topic: Energy and Climate

Emerging Topic Session

Chair: Vaidyanathan Krishnamurthy, University of Pittsburgh, PA, United States

Co- Chair: Jeff Manning, MSEE, University of Texas, Austin, TX, 78750, United States

#### 1 - Multi Energy Storage Systems Control Using Multi Agent Reinforcement Learning

Heechang Ryu, Korea Advanced Institute of Science and Technology, 3120 Ho, E2-2., KAIST, 291, Daehak-Ro, Daejeon, 34141, Korea, Republic of, Jinkyoo Park

Energy storage systems (ESSs) can resolve the temporary imbalance in microgrid with a renewable energy source. Finding the optimal charging and discharging schedule of an ESS is essential. In particular, it is very challenging to optimally control each ESS when multiple households have their own ESSs and renewable energy sources. In this study, we show that these ESSs are controlled by using multi-agent reinforcement learning as a data-driven method. In addition, it is validated through a numerical simulation study with real data.

#### 2 - Multi-Tasks Bayesian Optimization Approach to Demand Response Management in Smart Grid

Jinkyoo Park, PhD, Korea Advanced Institute of Science and Technology, Daejeon, 34141, Korea, Republic of

No abstract available.

#### 3 - Forecasting Variability in Local Area Photovoltaic Power Generation by Sparse Identification Nonlinear Dynamics of Cumulus Clouds

Jeff Manning, University of Texas, RASTRAC, 13809 Research Boulevard, Austin, TX, 78750, United States

We propose and investigate the tractability of prediction of the temporospatial evolution of fair-weather cumulus clouds affecting the power production of a local photovoltaic generation site, by discovering a governing partial differential equation from data alone, in a convenient sequential photographic measurement basis. Clouds in such conditions have lifetimes ranging from five to thirty minutes, so a predictor must account for cloud evolution in addition to mere horizontal advection. The design is challenged by observability limitations, so we investigate alternative, but similar approaches.

### Improving System Flexibility and Robustness Through Advanced Computation

Sponsored: Energy, Natural Res & the Environment/Electricity

Sponsored Session

Chair: Shmuel S. Oren, University of California-Berkeley, Berkeley, CA, 94720-1777, United States

Co-Chair: Georgios Patsakis, University of California Berkeley, Berkeley, CA, 94702, United States

#### 1 - Recovery of Locally Optimal Solutions From Convex Relaxations of the AC Optimal Power Flow

Andreas Venzke, Technical University of Denmark, Kgs. Lyngby, Denmark, Daniel K. Molzahn, Spyros Chatzivasileiadis

Convex relaxations of the AC optimal power flow (OPF) have recently attained significant interest as in several test cases they provably yield the global optimum to the original non-convex problem. If the relaxation is inexact, i.e. it is infeasible to the original non-convex problem, it is observed that the optimality gap is often small, and the obtained solution is close to feasibility. We propose a method based on sequential quadratic programming to recover a locally optimal solution from the solution of the inexact convex relaxation and show the benefits compared to penalization techniques. We evaluate the applicability of our method for security and chance constrained AC-OPF formulations.

#### 2 - Solving Large-scale Unit Commitment with Asynchronous Parallel Decomposition

Anthony Papavasiliou, CORE, UCL, Voie du Roman Pays 34, L1.03.01, Office b.114, Louvain la Neuve, 1348, Belgium

We present an asynchronous algorithm for solving a large-scale unit commitment problem. Dual iterations are performed using a block-coordinate subgradient method that works with delayed information, while primal solutions are recovered from the solutions of scenario subproblems using heuristics. We implement the algorithm in a high performance computing cluster and we conduct numerical experiments for instances of the Western Electricity Coordinating Council system and of the Central Western European system. The algorithm solves all instances within operationally acceptable tolerances and time limits.

#### 3 - Mobilizing Grid Flexibility for Renewables Integration through Topology Control and Dynamic Line Ratings

Shmuel S. Oren, University of California-Berkeley, Etcheverry Hall, Room 4119, Berkeley, CA, 94720-1777, United States, Jiaying Shi

We propose an optimization model that mobilizes the inherent flexibility in the transmission grid through topology control and dynamic line ratings. We determine, in a stochastic unit commitment framework, when and which lines should be switched off or adopt temporarily higher ratings as part of the recourse actions. Such recourse actions in the second stage help mitigate the adverse impact of renewable resources uncertainty and enable less conservative first stage commitments. The potential gains are demonstrated for the IEEE 118 bus test case and a more realistic test system representing the central European grid.

#### 4 - Mobilizing Renewable Resources for Power System Restoration

Georgios Patsakis, University of California Berkeley, 1460 Cedar St, Berkeley, CA, 94702, United States, Deepak Rajan, Ignacio Aravena, Shmuel S. Oren

Renewable energy currently serves a significant proportion of the electricity demand in the US. However, power system restoration is still considered predominantly a task for conventional generation, due to the intermittent nature

of many renewables and the lack of provision for algorithms that would ensure a successful operation of the renewable plants during extreme conditions. We explore the technical capabilities of hybrid (renewable and storage) units to be used as Black Start resources. We develop an optimization-based model that will recommend such systems to maximize system resilience. We illustrate our approach in a number of test power systems.

Co-Chair: Clayton Barrows, NREL, Golden, CO, 80401, United States

#### 1 - Energy Storage Siting And Sizing for Economic Power Dispatch Considering Battery Degradation

Liu Su, University of South Florida, ENG 302, Tampa, FL, 33620, United States, Kibaek Kim, Audun Botterud, Changhyun Kwon

Energy storage can alleviate the uncertainty of energy resources, provide flexible power system scheduling and reduce the costs of energy generation for power grids. We propose a long-term planning model for siting and sizing of energy storage under the consideration of battery degradation and formulate it as a mixed-integer programming (MIP) problem. To solve the large-scale MIP, we implement the temporal decomposition in the parallel decomposition framework. We will present the computational results on Reliability Test System - Grid Modernization Lab Consortium.

#### 2 - Scalable Capacity Expansion for Explicit Representation of Intermittent Generation

Devon Sigler, National Renewable Energy Laboratory, Golden, CO, United States, Gord Stephen, Bethany Frew, Wesley Jones

Capacity expansion models inform power system infrastructure planning decisions so future electrical power demand on the grid is met economically and reliably. With a growing amount of intermittent renewable energy being used on the grid, the number of operational scenarios that must be considered to meet these goals is growing. Historically, the number of operational scenarios considered has been limited due to the resulting increase in problem complexity from doing so. We present a scalable capacity expansion model which uses progressive hedging to solve the model via parallel computing. Planning decisions computed considering a large number of operation scenarios are presented.

#### 3 - Improving the Fidelity of Large Electric System Production Cost Models

Clayton Barrows, NREL, 15013 Denver West Parkway, Golden, CO, 80401, United States

The evolution of electrical power systems is driven by analysis using power system planning and design software tools. Many of these tools involve production cost models for optimizing scheduling decisions. This presentation highlights a suite of four interrelated Grid Modernization Laboratory Consortium projects that involve improving the fidelity and computational efficiency of production cost models, and using those improvements to gain insights into infrastructure plans and market design.

#### 4 - Warm Starting for Security Constrained Deterministic Unit Commitment

Suresh Bolusani, Lehigh University, 200 West Packer Avenue, Bethlehem, PA, 18015, United States, Feng Qiu, Ted K. Ralphs, Audun Botterud, Kibaek Kim

The deterministic unit commitment problem is usually formulated as a mixed integer linear optimization problem and solved from scratch multiple times a day resulting in a loss of useful information from previous solution processes. This loss can be avoided by warm starting the solution process. Warm starting is a process of collecting information from the solution process of one instance and reusing this information to accelerate the solution process of a closely related instance. In this talk, we present a warm starting methodology for solving deterministic unit commitment problem with transmission line constraints. We also present our computational results with an open-source implementation.

### Bayesian Optimization

Emerging Topic Session

Chair: Amy R. Ward, University of Southern California, Marshall School of Business, Bridge Hall BRI 401H, Los Angeles, CA, 90089-0809, United States

#### 1 - Bayesian Optimization

Peter Frazier, Cornell University, School of Operations Research, and Information Engineering, Ithaca, NY, 14853, United States

Bayesian optimization is widely used for tuning deep neural networks and optimizing other black-box objective functions that take a long time to evaluate. In this tutorial, we describe how Bayesian optimization works, including the Bayesian machine learning model it uses to model the objective function, Gaussian process regression, and three common acquisition functions: expected improvement, entropy search, and knowledge gradient. We then describe applications at Yelp and Uber, explain techniques important for making it work well in practice, and survey techniques for solving "exotic" Bayesian optimization problems.

### Sustainability

Sponsored: Energy, Natural Res & the Environment Environment & Sustainability

Sponsored Session

Chair: Gulver Karamemis, University of Rhode Island, Kingston, RI, 02881, United States

#### 1 - Modeling Economic Impacts of Climate Change Induced Weather Events to Natural Gas Sector in California

Duan Zhang, University of California, Santa Cruz, CA, 95062, United States, Yihsu Chen

We studied the regional economic impacts of weather events such as sea level rise and wildfire with a focus on natural gas sector. A computable general equilibrium (CGE) model with bilateral trade flow was constructed. The model integrates county-level details for California and state-level data for the rest of US. We used IMPLAN data to acquire social account matrices that characterize different sectors and regions. Several cases were simulated to represent impacts of sea level rise on downstream consumption of natural gas and impacts of wildfire on upstream supply.

#### 2 - Manufacturers' Competition and Cooperation in Sustainability: Stable Recycling Alliances

Fang Tian, Pepperdine University, 2720 Kensington Ave, Thousand Oaks, CA, 91362, United States, Greys Sosic, Laurens G. Debo

We study the stability of producers' strategies emerging under Extended Producer Responsibility. In our paper, the producers compete with multiple, differentiated products in consumer markets, but may consider cooperating when recycling

those products to benefit from economies of scale. Products made by different producers or sold in different markets might still be considered for joint recycling. Our main question is when and whether firm-based recycling strategies or market-based recycling strategies emerge as stable outcomes. We show that with intense market competition and differentiated market sizes, producers may recycle their products on their own without cooperating with others.

### 3 - Integration of Industry 4.0 Into Supply Chain Management to Increase Value Creation Towards Sustainability

Ozden Tozanli, PhD Candidate, University of Bridgeport,  
Engineering & Technology Building, 126 Park Ave, Bridgeport, CT,  
06604, United States, Elif Kongar

Today's dynamic market environment dramatically triggers the growing demand for customized products conjointly with the expanding operational layers in value chains. To address this, companies need to realign their long-term business strategies to adopt to the vision of future-oriented technologies. With this aim, this case study discusses the utilization of Industry 4.0 in supply chain management towards sustainability in order to increase the value-adding capability of a recycling company. The proposed results aim at delivering a new perspective to the traditional value chain in terms of economically, environmentally, socially, and technologically adaptable infrastructures.

### 4 - A Balanced Scorecard-based Approach to Integrate Sustainability Into the Operational Performance: A Food Industry Case Study

Gazi Duman, University of Bridgeport, CT, United States,  
Elif Kongar

Increasing environmental and social awareness and accompanying governmental legislations are now requiring companies to integrate these two aspects into their performance evaluations. With this motivation, this study proposes a Balanced Scorecard (BSC)-based approach combining Decision-Making Trial and Evaluation Laboratory (DEMATEL) and Analytic Network Process (ANP) methodologies for performance evaluation. To demonstrate the functionality of the approach, a case study is conducted on a U.S.-based food franchise.

### 5 - Resource Conservation vs. Waste Reduction: An Investigation

Avinash Geda, University of Florida, 361B Stuzin Hall, Gainesville,  
FL, 32611, United States, Vashkar Ghosh, Gulver Karamemis,  
Asoo J. Vakharia

This research examines whether the use of recycling to promote resource conservation, also reduces landfill waste. By analyzing a two-stage (OEM-waste management firm) supply chain, conditions under which these environmental objectives are in conflict are characterized.

### Joint Session ENRE/Practice Curated: Underground Applications

Joint Session

Chair: Alexandra M. Newman, Colorado School of Mines, Golden, CO, 80401, United States

#### 1 - Production Scheduling in Underground Mine Operations Incorporating Heat Loads

Oluwaseun Babatunde Ogunmodede, Colorado School of Mines,  
7216 Winter Ridge Drive, Castle Pines, CO, 80108, United States

Mine production scheduling determines when, if ever, notional three-dimensional blocks of ore should be extracted. The accumulation of heat in the tunnels where operators are extracting ore is a major consideration when designing a ventilation system and, often, the production scheduling and ventilation decisions are not made in concert. Rather, heat limitations are largely ignored. Our model maximizes net present value subject to additional constraints on precedence, and mill and extraction capacities. The model produces more realistic schedules that could increase revenue by lowering ventilation costs for the mine—specifically, refrigeration costs influenced by fans in the mine.

#### 2 - Hybrid Design and Scheduling for Underground Mining

Peter Nesbitt, MS, Colorado School of Mines, Golden, CO, 80401,  
United States, Levente Sipeki, Alexandra M. Newman

Underground mine design is inextricably intertwined with the corresponding production schedules. For deposits that extend deep underground, the mining direction that dictates a most profitable extraction sequence at the highest vertical level may not correspond to that at the deepest level. We formulate a mixed-integer program that determines a design and corresponding production schedule by exploiting the underlying mathematical structure. Solutions yield a more realistic production profile than a traditional one, resulting in an increased quantity of gold ounces pulled forward in the schedule and, hence, higher net present value.

#### 3 - Risk Adverse Optimization for the Ultimate Pit Problem

Gianpiero Canessa, Universidad Adolfo Ibanez, 2540 Diagonal  
Las Torres, Santiago, Chile, Bernardo Kulnig Pagnoncelli,  
Eduardo Moreno

In this work we discuss different risk averse approaches for the ultimate pit problem. We consider two sources of uncertainty, ore grade and price, and analyze the solutions using different risk measures. We compare the results of our experiments using the risk neutral case as a benchmark, and discuss the advantages of incorporating risk aversion in the construction of an ultimate pit.

### 4 - Does Supply Chain Visibility Affect Operating Performance? Evidence from Conflict Minerals Disclosures

Caroline Swift, The Pennsylvania State University, University Park,  
PA, United States, V. Daniel R. Guide, Suresh Muthulingam

Firms are increasingly held accountable for their suppliers' transgressions. Consequently, firms need to develop supply chain visibility (SCV) to exercise control and mitigate risks in their supply chains. We use data from the U.S. conflict minerals disclosure legislation to assess firms' SCV. Then, we compare the operating performance and market value of firms with high SCV against those with low SCV. We find that firms with high SCV achieve higher profitability, productivity, and market valuation than comparable firms with low SCV. We find no discernible difference in sales between firms with high SCV and firms with low SCV.

Contributed Session

Chair: Emre Eryigit, UMass, 336 East Hadley Road, Amherst, MA,  
01002, United States

#### 1 - Optimal Structure of Joint Inventory and Pricing Management with Dual Suppliers

Xiaoyi Feng, AMSS, Beijing, China, Yangyang Xie, Houmin Yan

We consider a joint inventory-pricing control problem for a single-product, periodic-review, dual-supplier problem. We assume stochastic supply and demand. By extending the definition of stochastically linear in mid-point to a multidimensional setting, we prove the joint concavity of the profit functions and characterize the optimal expedited order as a state-dependent almost-threshold policy. We further clarify the forms of the stochastic supply and demand functions that guarantee the antimultimodularity of profit functions. With the antimultimodular structure, we characterize the optimal regular order and list price policies as monotone with ordered changing rates.

#### 2 - Operations Research Approaches to Mitigate Ergonomic Risks in Manufacturing Systems

Olga Batta a, ISAE-Supaero, 10 av Belin, Toulouse, 31400, France,  
Alena Otto

To reduce ergonomic risks at workplaces, most companies take the workers' task assignment as given and look for introducing specialized equipment and support tools. However, such policies have limited impact in many cases. The use of operations research approaches allows incorporating ergonomics aspects in the work assignment and scheduling and shows a high potential for improving working conditions in manufacturing systems. In this talk, we review the available modelling approaches that consider ergonomics in operational planning of manufacturing systems and outline future research directions.

#### 3 - A Data-driven Approach to Test Center Scheduling

Nickolas K. Freeman, University of Alabama, 14485 Griffin St,  
Tuscaloosa, AL, 35405, United States, John Mittenenthal

In this paper, we present a data-driven approach for scheduling students at an academic testing center. In addition to describing the approach, we present results from a benchmarking experiment based on real data. The results show that the proposed scheduling method can improve the utilization of the testing center

substantially.

#### 4 - Scheduling Meter Readings for Utility Companies in Turkey

Emre Eryigit, PhD Candidate, University of Massachusetts  
Amherst, 336 East Hadley Road, Amherst, MA, 01002,  
United States, Ahmed Ghoniem

We examine a meter reading scheduling problem that impacts the quality of the power consumption forecast made by electricity distribution companies in Turkey. The problem is modeled as a 0-1 integer program with constraints related to manpower capacity and other industry restrictions. Exact and heuristic solutions are reported in our computational study for large-scale instances involving several thousand meter groups.

#### 5 - Scheduling Meter Readings for Utility Companies in Turkey

Emre Eryigit, PhD Candidate, University of Massachusetts-  
Amherst, Amherst, MA, USA, Ahmed Ghoniem

We examine a meter reading scheduling problem that impacts the quality of the power consumption forecast made by electricity distribution companies in Turkey. The problem is modeled as a 0-1 integer program with constraints related to manpower capacity and other industry restrictions. Exact and heuristic solutions are reported in our computational study for large-scale instances involving several thousand meter groups.

### Flash Session I

General Session

Chair: INFORMS, 5521 Research Park Drive, Suite 200, Catonsville,  
MD, 21228, United States

#### 1 - Multiple Floors Healthcare Facility Layout Problem

Ling Gai, Shanghai University, Office 432, Management Science,  
School, No. 599 Shangda Road, Shanghai, 201444

We consider a multiple attributes group decision making problem for the multi-floor healthcare facility layout problem (MHFLP). Several feasible alternatives are produced first by solving a mixed-integer programming with the objective of minimizing flow costs. These alternatives are then evaluated according to their qualitative criteria by a group of experts. Given the facts that each alternative has several qualitative attributes, and the experts have different specialties on these attributes, we propose an method to determine the proper attributes weight and the experts weight (on different attributes), if they are only partially known in advance.

#### 2 - Credit Risk Assessment for Mortgage Lending by Artificial Intelligent Underwriter

Jian-Bo Yang, Professor, Director of DCSRC, The University of  
Manchester, AMBS East Building, Booth Street East, Manchester,  
M13 9SS, United Kingdom, Swati Sachan, Dong-Ling Xu

Underwriting for offering mortgage loans consists of assessment on affordability, credit, repayment, security, etc. This enables precise estimation of risk or ability of borrower to repay the loans. Prevalent decision-making approaches adopted by most lenders follow pre-established rules and utilities historical data. This paper discusses a novel belief-rule-based AI model and a probabilistic machine learning process to mimic human underwriters' inference and decision making process for improvement of productivity and quality. A case study is provided to show its potential wide applicability.

#### 3 - Interpretable Machine Learning Algorithm via the Belief Rule Based Expert System

Dong-Ling Xu, Chair Professor in Decision Science and Systems,  
Manchester University, Alliance Manchester Business School, F37  
MBS East, Manchester, M15 6PB, United Kingdom, Jian-Bo Yang

Some most popular machine learning algorithms, such as neural network, are not interpretable. In practice, however, there is an increasing need for transparent and interpretable machine learning algorithms. Our theoretical and applied research shows that the Belief Rule Based (BRB) expert system has a powerful learning ability which is capable of approximate complex nonlinear relationship arbitrarily close. In this presentation we outline the outcomes of the theoretical research and demonstrate the learning capability and the transparent property of the BRB system using examples.

#### 4 - The Relationship between Environmental Innovation and Environmental Productivity

JiangJiang Yang, University of Science and Technology of China,  
HeFei City, Anhui province, China

Environmental innovation has been recognized as an efficient way to alleviate environmental problem. However, how environmental innovation effect environmental productivity and the whether the impact differs from various area. We used DEA approach to investigate the relationship between environmental innovation and environmental productivity.

#### 5 - Online Customer Purchase Prediction Based on Machine Learning

Cheng Chen, Huazhong University of Science and Technology,  
Wuhan, 430074, China, Xianhao Xu

Accurate prediction of online customers' purchase behavior is of great significance to the distribution and inventory management of online retailers. Machine learning algorithm is widely concerned and applied due to its high prediction ability. In this paper, we use click stream data to predict the online customer's purchase behavior by using five supervised learning algorithms in machine learning. Detailed result analysis validated the effectiveness of the proposed machine learning methods.

#### 6 - Using Consumer Behavioral Data to Optimize Self-collection Points for Online Retailers

Yaohan Shen, Huazhong University of Science and Technology,  
Luoyu Road, Wuhan, 430074, China, Xianhao Xu

We proposed a procedure to optimize self-collection points for online retailers. Our research shows an optimal way to locate self-collection points in potential points and decide the number of self-collection points to trade off consumer service level and the total logistics cost for online retailers. We first cluster customers addresses, and predict the purchasing frequencies for each period from user behavioral data. Then we propose a mathematical model to optimize the location of self-collection points, based on customers' information.

#### 7 - Vessel Movement Labeling with Machine Learning and Dashboard Implication

Burak Cankaya, Assistant Professor, Embry-Riddle Aeronautics  
University, 600 S. Clyde Morris Blvd., Daytona Beach, FL, 32114,  
United States, Berna Eren Tokgoz, Ali Dag

This presentation proposes a machine learning based automatic labeling methodology for chemical tanker activities. The proposed methodology utilizes three machine learning algorithms to classify chemical tanker activities. The findings in this study can be used by port authorities, shipping companies, vessel operators and other stakeholders for decision support with tableau dashboard.

#### 8 - Resource-constrained Routing With Deadlock Detection for Large-scale AGV System

V Jorge Leon, Texas A&M University, College Station, TX,  
77843-3367, United States, Ek Peng Chew, Loo Hay Lee

A methodology that detects deadlocks while generating AGV routings is presented. The AGV transit layout is modeled as a capacitated-resource graph and used to make vehicle assignments and path decisions while generating routings. A new connected acyclic-and-transpose graph is proposed to detect a special case of cyclic-deadlocks during routing generation. The routing procedure runs in polynomial time.

#### 9 - Exploring Dependencies Across Multiple Online Social Network Platforms

Hwang Kim, Assistant Professor, Chinese University of Hong Kong,  
11F Cheng Yu Tung Building, # 12, Room 1134, Shatin,  
Hong Kong, Vithala R. Rao

Users' interplay among these various social networking platforms implies that several sources may induce interrelationships among the platforms. To understand this, we propose an integrated visit model that accommodates networking activities across social network platforms and test the model using data from two social network gaming platforms. The model discovers a new source of dependencies that stems from communications with friends overlapping in different network platforms. The simulation study provides the managerial implications of how firms manage networks by discovering that the proportions of overlapping friends cause asymmetric spillover effects across network platforms.

#### 10 - Pricing vs Targeting in a Reward-based Crowdfunding

lei xu, Prof., Tianjin University of Technology, Tianjin, China

Abstract not available.

#### 11 - Real-time Prediction of the Optimal Configuration of an Intelligent Gate-line System Using Queueing Theory

Eric Enkele Longomo, University of Portsmouth, Yorke Street,  
Southsea, Portsmouth, PO5 4EL, United Kingdom,  
Djamila Ouelhaj, Mark Dyne

This research paper builds on existing knowledge in the field of Queueing Theory and proposes a mathematical model that considers a Discrete Event Simulation (DES) of passengers arriving or/and in the process of exiting a train station. The mathematical model is implemented in order to compute in real-time the optimal configuration of a self-reconfiguring intelligent gateline system at an actual overground or underground train station. The DES used in this paper, models the operation of the intelligent gateline as a discrete sequence of events in time. Each event is assumed to occur at a particular instant in time and marks a potential change of states - number of passengers and gateline configuration, in the system. Overhead sensors were used to record passengers' timestamps, coordinates, average speeds and arrival at the gateline in both directions of the flow in real-time. Maximising individual gate throughput and the average gateline throughput, walkways utilisation, cutting the overall passenger waiting time, safely managing passengers' flow to prevent platform overcrowding (and potential station closure), increasing station capacity, reducing queueing in both arrival and departure and relieving station staffs from manually operating the SCU (Station

Control Unit -which controls the gateline) to occupy a more customers' engaging role represent the most important outcome of this study. Using the Queueing Theory, the minimisation of the overall customers waiting times will be considered as the objective function of the optimisation model while some of the remaining key performance indicators will be placed as constraints. In order to reduce the mathematical complexity, the convexity of the mathematical model of the objective function is established. The objective function of the gateline con?guration being convex, the global optimum is found by computing the minima.

## 12 - Analysis of Economic Resiliency for Disaster Recovery

Hulya Julie Yazici, Professor of Operations & Supply Chain Management, Florida Gulf Coast University, 10501 FGCU South Blvd, Fort Myers, FL, 33957, United States, Chris Westley, Anushka Chang

This research is based on the last twenty- six years of hurricane activity at the state of Florida and the economic indicators affecting resiliency. The analysis is conducted at prior, during and post disaster years. This presentation describes the research variables, data collection and research hypotheses. At the time of the presentation, preliminary analysis results will be available and shared with the audience for their feedback. Analysis results are expected to improve disaster recovery and help businesses find sustainable solutions.

Sponsored: Auction and Marketing Design

Sponsored Session

Chair: Ozan Candogan, University of Chicago, Chicago, IL, 27708, United States

#### 1 - Pricing and Optimization in Shared Vehicle Systems: An Approximation Framework

Thodoris Lykouris, PhD Candidate, Cornell University, 107 Hoy Road, Gates 336, Ithaca, NY, 14853, United States, Siddhartha Banerjee, Daniel Freund

Optimizing shared vehicle systems is more challenging compared to traditional resource allocation due to complex network externalities. In particular, pricing/rebalancing in any location affects future supply throughout the system within short timescales. Such externalities are captured by steady-state Markovian models. However, using such models to design control policies is computationally difficult since the resulting optimization problems are high-dimensional and non-convex. To this end, we develop a general approximation framework that provides the first efficient algorithms with rigorous approximation guarantees for a wide range of objective functions and controls.

#### 2 - Revenue Management on an On-demand Service Platform

Vijay Kamble, University of Illinois at Chicago, 405 N. Wabash Ave, Unit 3511, Chicago, IL, 60611, United States

I consider the optimal pricing problem faced by a worker on an on-demand service platform. Service requests arriving while the worker is busy are lost. Thus, the optimal hourly prices need to capture the hourly opportunity costs incurred by accepting jobs. Due to potential asymmetries in these costs, price discrimination across jobs may be necessary for optimality, even if the customers' preferences are identically distributed. I first establish that such price discrimination is not necessary if the customer arrival process is Poisson. I then consider the case of multiple customer classes. I present a simple procedure to compute the optimal prices in this case under standard regularity assumptions.

#### 3 - Optimal Monitoring Schedule in Dynamic Contracts

Mingliu Chen, Duke University, Durham, NC, United States, Peng Sun, Yongbo Xiao

A principal induces effort from an agent to reduce the arrival rate of a Poisson process of adverse events. The effort is costly to the agent, and unobservable to the principal, unless the principal is monitoring the agent. Monitoring ensures effort but is costly to the principal. The optimal contract involves monetary payments and monitoring sessions that depend on past arrival times. The optimal schedules of payment and monitoring demonstrate different structures depending on model parameters, and may involve monitoring for a random period of time. Overall, the optimal dynamic contracts are simple to describe, easy to compute and implement, and intuitive to explain.

#### 4 - Optimal Forecast Disclosure in Ride-sharing Platforms

Peng Shi, University of Southern California, USC Marshall School of Business, BRI 303D, 3670 Trousdale Pkwy, Los Angeles, CA, 90089, United States, Hao Sun

We study whether ride-sharing platforms such as Uber and Lyft should share their forecast of demand with drivers, if the goal is to maximize platform profit. In a stylized model, we show that the optimal forecast disclosure policy is tied to the accuracy of the forecast and the flexibility of the pricing system. When forecast is inaccurate and pricing is fixed, the platform has incentives to hide forecast from

drivers. However, as the forecast improves, the incentive to hide disappears. In the extreme case of perfect accuracy, it is always optimal to fully reveal the forecast. Full revelation is also optimal under imperfect forecasts if the platform can do forecast-contingent dynamic pricing.

### Behavioral Operations with Societal Impact

Sponsored: Behavioral Operations Management

Sponsored Session

Chair: Leon Valdes, University of Pittsburgh, Pittsburgh, PA, 15260, United States

#### 1 - Risk and Fairness

Paola Mallucci, University of Wisconsin, Madison, WI, United States, Jordan D. Tong, Cuiyly Emilio

Vertical negotiations often fail because firms fail to agree on how to fairly compensate the party that faces the higher risk leading to large efficiency losses. While both preferences for fairness and for risk have been studied separately in vertical negotiation, little attention has been given to their combined effect. We address this gap by solving and testing a model where suppliers decide on the price of a good. We make predictions that account for both fairness and risk aversion and test them in a set of incentive compatible experiments. We find that subjects' actions in the presence of risk cannot be explained by models in which preferences are consistent across roles and risk situations.

#### 2 - Centralized or Decentralized Transfer Prices: A Behavioral Approach for Improving Supply Chain Coordination

Sebastian Villa, University of Los Andes, Cra. Bogota, Colombia, Elena Katok

When a retail channel includes multiple retailers, transshipments can be utilized to better match supply and demand. We study transshipment decisions in a channel with one supplier and two behavioral retailers under both centralized and decentralized transfer-price settings. We find that using the theoretical price does not help to increase neither profits nor coordination. However, by setting a behavioral transfer price, subjects place ordering decisions that lead to high supply chain profits.

#### 3 - Patient Misinformation: The Costs and the Remedy

Arshya Feizi, Boston University, 595 Commonwealth Avenue, Boston, MA, 02215, United States, Anita L. Tucker, Jillian Berry Jaeker

We explore the increased healthcare costs due to patient misinformation with their caregiver and devise a screening policy to mitigate these costs. We focus on occasions when patients misinform their caregivers about their medication compliance and how this may increase their healthcare spending due to an increased risk of hospitalization. We investigate a screening mechanism that informs the caregiver about the true state of medication compliance.

#### 4 - Trying and Failing: Donor Aversion to Rejection

Kaitlin Daniels, Olin Business School, Washington University in St. Louis, Saint Louis, MO, United States, Leon Valdes

The outpouring of concern that follows a disaster often generates excess donations. Nonprofits routinely accept these donations, fearing that turning away donors would discourage them from donating again in the future. We interrogate the extent to which this fear is warranted and study the impact of this behavior on nonprofits' inventory management. We explore some of the behavioral motives for not donating again, as well as possible interventions to mitigate donor aversion to rejection.

### Managing Uncertainties in New Product Development and Business Process Innovations

Emerging Topic: New Product Development

Emerging Topic Session

Chair: Janne Kettunen, The George Washington University, Washington, DC, 20052, United States

#### 1 - Impact of Queue Removing Technology on Competitive Retail

Onesun Steve Yoo, University College London, School of Management, Gower Street, London, WC1E 6BT, United Kingdom, Adam Smith

We analyze the impact of physical retailers removing the consumer's need for queuing during checkout via new technologies such as Amazon Go or Mishipay. We examine value added for the retailers in a competitive retail environment and

consumers, and provide strategic implications for startups such as Mishipay.

## 2 - Multi-period New Product Development and Risk Aversion Paradox

Janne Kettunen, The George Washington University, Department of Decision Sciences, 2201 G. Street NW, Washington, DC, 20052, United States, Shivraj Kanungo

We investigate how the conventional periodic risk-averse project selection approaches perform in multi-period new product development problems, in terms of satisfying the decision makers' risk preferences. Our results show that the conventional project selection approaches can result in that the risk in attainable profit is systematically higher under the risk-averse selection approach than even under the risk-neutral selection approach. We call this phenomenon as the risk aversion paradox. We show how projects' profits can be revised to overcome this paradox.

## 3 - Incentives for Managing Emissions in the Maritime Industry

Leonardo P. Santiago, Copenhagen Business School, Department of Operations Management, Solbjerg Plads 3, Blok B. 5. sal, Frederiksberg, Denmark, Arundhati Srinivasan, Franz Buchmann

This paper explores incentives for managing emissions in the maritime industry. We develop a market-based mechanism for smart carbon reporting. One of the key features of our model is to relax the assumption of information asymmetry by taking into account blockchain technology. We explore our model to discuss current challenges for policy makers and for potential opportunities for principals (ship owners).

## 4 - Familiar or Fresh. The Effect of Typicality on the Value of Product Design

Tian Chan, Emory University's Goizueta Business School, 1300 Clifton Road, Atlanta, GA, 30322, United States

We examine how typicality—the degree to which a design is similar to other designs of the same category—affect the market value of designs. We compiled a dataset combining US design patent data and stock market reactions in the days subsequent to the design patent grant. We show that a focal design's value rises when it is typical with respect to category-members released in the near past, and falls when it is typical with respect to category-members that are concurrently on the market. Finally, we show that designs in high clockspeed industries exhibit no positive effect of typicality on value. Our results show how firms can rethink the 'familiar or fresh' conundrum to develop valuable designs.

### Health Care and Bandits

Sponsored: Health Applications

Sponsored Session

Chair: Lawrence M. Wein, Stanford University, Stanford, CA, 94305-5015, United States

## 1 - Mostly Exploration-free Algorithms for Contextual Bandits

Khashayar Khosravi, Stanford University, Stanford, CA, 94305, United States, Hamsa Sridhar Bastani, Mohsen Bayati

The contextual bandit literature has focused on algorithms that address the exploration-exploitation tradeoff. Exploration-free greedy algorithms are desirable in settings where exploration may be costly or unethical. We prove that, under some assumptions on the distribution of the contexts, the greedy algorithm is rate-optimal for the two-armed bandit. Also, even absent these assumptions, we show that a greedy algorithm is optimal with nonzero probability. Thus, we introduce Greedy-First, an algorithm that uses only observed contexts and rewards to decide whether to follow a greedy algorithm or to explore. Greedy-First is rate-optimal without any additional assumption.

## 2 - Precision Healthcare Using Non-stationary Bandits

Yonatan Mintz, UC Berkeley, Berkeley, CA, United States, Anil Aswani, Philip Kaminsky, Elena Flowers, Yoshimi Fukuoka

Recommendations from fitness tracking devices are often ineffective in motivating users to exercise because the recommendations are not tailored to specific individuals. In this talk, we address this by using the data and infrastructure of fitness tracking devices to personalize exercise programs for users. We develop and analyze a new multi-armed bandit model, which we call the ROGUE multi-armed bandit, to adaptively learn each participant's exercise preferences and personalize their exercise programs to increase adherence. We present both computational and theoretical results that show the efficacy of this modeling approach when compared to existing precision fitness approaches.

## 3 - The Impact of Using an Online Health Platform on Weight Management

Yingfei Wang, University of Washington, Seattle, WA, United States, Lu Yan

Overweight and obesity have raised severe social issue in the world. Many weight-loss communities are designed, aiming to provide individuals with community support and thus help with their weight management process.

However, it has been noticed that such communities suffer from high drop-out rate. Therefore, we are interested in optimizing the online healthcare platforms strategy in suggesting a more manageable and encouraging weight loss goal, in order to facilitate user's continuous participation. In order to take into account heterogeneity in need for treatment across individuals, we formulate our problem in a Bayesian contextual bandit setting.

## 4 - Best Arm Identification in Generalized Linear Bandits

Abbas Kazerouni, 2071 El Camino Real, Palo Alto, CA, 94306, United States

Many real-world problems in personalized medicine and advertisement can be formulated as best arm identification in a structured bandit. In such problems, the goal is to identify the best among a possibly infinite set of actions with the fewest number of trials. While there is a vast literature on best arm identification in Multi-Armed Bandit with independent arms, little is known about efficient exploration schemes for structured bandits with dependent arms. In this talk, we introduce an algorithm for best arm identification in generalized linear bandits and provide a bound on its sample complexity. We further illustrate the applicability of the proposed algorithm by providing simulation results.

### Prevailing Issues in Public Sector OR

Sponsored: Health Applications

Sponsored Session

Chair: Hrayr Y. Aprahamian, Virginia Tech, Blacksburg, VA, 24060, United States

## 1 - The Two-stage Group Testing Problem: The Exact Analytical Solution with an Application to Robust Group Testing

Hrayr Y. Aprahamian, Virginia Tech, 1145 Perry Street, Blacksburg, VA, 24060, United States, Ebru Korular Bish, Douglas R. Bish

Group testing, i.e., testing multiple subjects simultaneously with a single test, is essential for classifying a large population of subjects as positive or negative for a binary characteristic. We develop exact closed-form expressions for the two stage group testing problem, and use these results to gain novel insights on the dynamics of an optimal solution. These results enable us to exactly solve a robust formulation of the group testing problem, which, prior to our findings, was intractable to solve. We demonstrate the value of robust testing schemes with a case study on public health screening.

## 2 - An Inventory Policy Model for Intravenous Fluids

Sasan Khorasani, Texas Tech University, Texas, Lubbock, TX, 79415, United States, Milton Louis Smith, Jennifer Cross

Intravenous fluids (IV) waste is a major source of inpatient pharmacy cost related to medication waste. Moreover, few works have been conducted on inventory policy specifically for IV medications. The optimal inventory policy for IV medications requires considering detailed parameters and variables that significantly impact waste. Thus, this study aims to observe the IV delivery process in an inpatient pharmacy, discover the main roots of IV waste for different types of medications, and establish the optimal replenishment policy for IV delivery systems.

## 3 - Online Health Communities and Health Literacy

Sejun Park, University of Texas at Dallas, 800 W. Campbell Rd, Richardson, TX 75080, Richardson, TX, 75080, United States, Taewoo Roh, Giyeon Kwag

Knowledge sharing via online health communities has been considered as a major method of communication to fortify user health literacy. These connections improve patient access to extensive healthcare information. This research investigates the impact of knowledge sharing on patient health literacy based on the activities of users in the online health community. This study outlines whether users who are not literate in medical terminology benefit from these knowledge communities and expands on the dynamics of these virtual interactions.

## 4 - Optimal Resource Allocation for Surveillance of Emerging Infections

Ngoc Nguyen, Virginia Tech, 1145 Perry Street, 214 Durham Hall, Blacksburg, VA, 24060, United States, Ebru Korular Bish, Douglas R. Bish

Accurate prevalence estimation is essential for planning of healthcare services, especially for emerging infections such as Zika. Therefore, policy-makers need to allocate the scarce resources among the surveillance activities of different infections or regions in the most efficient way. Towards this end, we develop stochastic optimization models and determine structural properties of their optimal solutions. Our case study on surveillance efforts for Zika highlights the benefits of optimization-based approaches to this decision. We also establish guidelines on effective testing strategies for surveillance of emerging infections.

### Modeling and Optimization in Organ Allocation

Sponsored: Health Applications

Sponsored Session

Chair: Murat Kurt, Bristol-Myers Squibb, 3401 Princeton Pike, Lawrence Township, NJ, 08648, United States

#### 1 - Developing an Organ Allocation Design using Distributional Robustness

Sanjay Mehrotra, Northwestern University, Dept of I. E. / M. S. C246 Tech Inst, 2145 Sheridan Road, Evanston, IL, 60208-3119, United States, Vikram Kilamb, UT Dallas, Dallas, TX, Kevin Bui

We will present a distributionally robust model for designing an organ allocation mechanism to achieve equitable sharing of deceased donor organs. The model will be tested using data from liver allocation, using historical supply-demand information as nominal distribution. Parametric sensitivity analysis using the distributional robust modeling will provide information on the stability of the design.

#### 2 - A Sub-distribution Hazard Model to Predict the Likelihood of Deceased Donor Renal Transplant Under New Kidney Allocation System

Yeongin Kim,, Mehmet Ayvaci, Bekir Tanriover

As the rules for kidney allocation have changed recently, it is inevitable to develop a new model to predict time-to-transplant. We study adult waitlisted kidney patients in the USA after the implementation of the new Kidney Allocation Systems (KAS) using the national registry of kidney patients employing for sub-distribution hazard regression. The sub-distribution hazard regression prediction on waitlist outcomes in the KAS era carries clinically relevant information. Preparation of a risk calculator based on this model is feasible and would be a useful online tool for transplant health care providers to counsel kidney transplant candidates.

#### 3 - Head of Line Matching Policies for Allocation of Deceased Donor Kidneys

Yichuan Ding, University of British Columbia, 2053 Main Mall, Vancouver, BC, V6T1Z2, Canada, Baris Ata, Stefanos Zenios

We seek the deceased-donor kidney allocation policy that achieves the best efficiency-equity tradeoff, taking into account patients' strategic choices. We developed an analytical framework based on the fluid model that can analyze a broad class of ranking policies, which provides approximations to the previously and currently used policies in practice. The analysis characterizes the optimal scoring formula for given efficiency-fairness tradeoffs. Our results show that the policies that incorporate characteristics of both the donor and the recipient can improve the quality-adjusted-life-years up to \$3.1\%\$ based on the fluid model predictions, and also eliminates kidney wastage.

#### 4 - Effective Adult Heart Allocation Policies: An Optimization Approach

Fatemeh Karami, University of Louisville, JB Speed Bldg. 211, e, Louisville, KY, United States, Mehdi Nayeypour, Monica Gentili, Naoru Koizumi, Andrew Rivard

Heart failure is a growing health problem affecting nearly 6 million in the United States, with approximately 200,000 patients suffering from a progressed to end-stage or Stage D heart disease. Heart transplantation is the definitive therapy for the end-stage heart disease patients. However, the geographic disparity in access to heart transplant in the United States is substantial. This research analyzes the geographic disparity in the heart allocation system and explores different heart allocation boundaries derived from our mathematical optimization models to decrease disparity.

### Aged Care Analytics: Models, Methods and Applications: Part II

Sponsored: Health Applications

Sponsored Session

Chair: Nan Kong, Purdue University, West Lafayette, IN, 47906-2032, United States

Co-Chair: Mingyang Li, Tampa, FL, 33647, United States

#### 1 - Heterogeneity Modeling of Drug Use Behavior via Semi Markov Mixture Modeling

Zhouyang Lou, Purdue University, West Lafayette, IN, 47906, United States, Nan Kong, Christopher Callahan, Wanzhu Tu, Noll Campbell, Qing Tang

Drug use disorder harms individual health as well as the welfare of others.

Modeling of behavior are essential to early detection of drug abuse and optimization of behavioral interventions from clinicians and pharmacists. A longitudinal drug dispensing dataset is used to study drug use behavior. We develop a semi-Markov mixture modeling approach to model heterogeneous drug use behavior. We identify a weighted combination of canonical semi-Markov models for each individual. We use the frailty term embedded in the semi-Markov models to characterize the heterogeneity among individual behaviors.

#### 2 - A Multi-attribute Optimization Approach for Post Acute Care System Management

Hossein Badri, Wayne State University, Detroit, MI, United States, Ashkan Hassani, Maryam Khatami, Mark Lawley, Kai Yang

In this study, a stochastic multi-attribute decision making approach is developed for the Post Acute Care System (PACS) management. In this problem, besides the cost metrics, there are some service coverage requirements that make the decision making complex. The proposed approach provides the decision making procedure for healthcare providers who are willing to subcontract post-acute care services. The proposed approach is implemented for PACS management problem in the city of Houston, TX.

#### 3 - Using Analytics to Understand and Model the Problems of Seniors Blocking Hospital Beds

Michael Carter, ON, Canada, Pavel Shmatnik

The aging demographic created by the "Baby Boomers" is creating some serious capacity issues for downstream sub-acute facilities like nursing homes, retirement homes, rehab and home and community services. The problem is bound to get worse over the next 10-20 years. Today, over 16% of hospital beds are occupied by someone who is supposed to be somewhere else. This is a fairly common problem internationally and Health Authorities are scrambling for intelligent solutions that do not simply involve more money. In this paper, we will present some of our preliminary analysis on root causes and modelling alternatives.

#### 4 - Midterm Nurse Scheduling with Specialized Constraints and Preference Considerations

Jia Guo, PhD Student, The University of Texas at Austin, Austin, TX, 78731, United States, Jonathan F. Bard

A nurse scheduling IP model is developed to minimize the sum of weighted unsatisfied demand and individual preference violations. Constraints account for vacations, birthdays, maximum number of consecutive working days and days off, and minimum number of rest hours. The problem is solved in two phases using a column generation algorithm. In the first phase, overtime is not allowed. In the second phase, we take the first phase solution and add overtime to cover unsatisfied demand. Results are presented for instances with up to 30 nurses.

#### 1 - Creating a Robust Hospital Pharmacy Delivery System

Anna Svirska, University of Pittsburgh, 4200 Fifth Avenue, Pittsburgh, PA, 15260, United States, Hamdy Salman, Bryan A. Norman

Large hospital systems route medications from the hospital pharmacy to the inpatient units daily. The medication demand on each unit varies based on the patients in the unit and their medical conditions. First, we create a linear program to establish delivery pathways and then formulate the robust counterpart. Using historic data, we consider the deterministic problem where our unit demand is the average medication demand compared to the robust formulation where the demand is given by an uncertainty set based on the medication demand across each day for a year. We compare the deterministic and robust solution to note the difference between the two formulations.

#### 2 - Social Platforms on Healthy Eating Mobile App: Who Participate in What Activities, and Why Not?

Yi-Chin Kato-Lin, PhD, Hofstra University, Hempstead, NY, 11549, United States, Rema Padman, Vibhanshu Abhishek, Julie Downs

A mobile app for healthy eating was designed for our study participants' use. Users' behaviors in interacting with peers on a closed social platform were observed. Matching the app usage data with survey data allows us to understand who participate in what activities, or why they were not participating.

### 3 - A Chance Constrained Model to Locate an Automated Central Fill for a Community Pharmacy Network

Hamdy Salman, 1989, Pittsburgh, PA, 15216, United States, Wei Wang, Bo Zeng, Bryan A. Norman, Bryan A. Norman

Community pharmacies play an important role in providing patient safety by providing Pharmacist To Patient (PTP) interaction. One of the strategies to provide more PTP interactions in a community pharmacy is to use an automated Central Fill. An automated central fill offloads part of the pharmacy's prescription filling process. Our research focuses on locating a central fill that can provide relief for multiple pharmacies under stochastic demands. We provide a chance constrained capacitated facility location model when pharmacy demands are variable. The results include a comparison between using a chance constraint model and using a simpler policy to determine the central fill location.

### 4 - Sequential Modeling and Optimization for Resources in Mail-order Pharmacy Automation Systems

Duaa Serhan, Binghamton University, 4400 VESTAL PKWY E, Binghamton, NY, United States, Sang Won Yoon, Husam Daoud

This research proposes an integrated optimization strategy to improve resource planning and replenishment operations in Central Fill Pharmacies (CFPs). The objective of this research is to develop a resource planning solution that determines the number of required dispensers, canisters, and replenishment operators. An integer programming mathematical model is developed to solve the planogram design and replenishment planning problems simultaneously. Tabu Search and Genetic Algorithm are proposed to solve this NP-hard problem efficiently. This research is expected to help with understanding the factors that influence CFP resource planning.

### Optimization Society Award II

Sponsored: Optimization

Sponsored Session

Chair: David Morton, Northwestern University, IEMS Department, 2145 Sheridan Road, Evanston, IL, 60208, United States

#### 1 - Learning Semidefinite Regularizers from Data

Yong Sheng Soh, California Institute of Technology, Pasadena, CA, United States

Regularization functions are widely used in optimization-based approaches for solving ill-posed inverse problems. These serve to induce desired structure in solutions, and are typically chosen based on domain-specific expertise. We consider the problem of learning regularizers from data in settings in which domain knowledge is not available. The regularizers we obtain are convex functions that can be computed via semidefinite programming. Our approach is based on computing certain structured factorizations of data matrices, and it requires the Operator Sinkhorn iteration as a subroutine.

#### 2 - Pareto Efficiency in Robust Optimization

Nikos Trichakis, MIT, Cambridge, MA, United States, Dan Andrei Iancu

We formalize the concept of Pareto efficiency in the context of robust optimization (RO) for linear optimization. We argue that RO need not produce solutions that are Pareto robustly optimal (PRO), and illustrate how this could lead to suboptimal performance. We provide a theoretical characterization of PRO and show how to verify and generate PRO solutions by solving optimization problems of the same complexity as the underlying RO problems; hence, the potential improvements from PRO come at no extra computational cost. Numerical studies demonstrate PRO solutions to have significant upside.

#### 3 - On the Construction of Converging Hierarchies for Polynomial Optimization Based on Certificates of Global Positivity

Amir Ali Ahmadi, Princeton University, Dept. of Operations Research & Financial Eng., Sherrerd Hall (room 329), Charlton Street, Princeton, NJ, 08544, United States, Georgina Hall

In recent years, techniques that combine semidefinite programming with Positivstellensatz from algebraic geometry to produce a converging hierarchy of lower bounds for polynomial optimization problems have gained much popularity. In this talk, we show that such hierarchies can in fact be designed from much more classical statements in algebra dating back to the 1920s. We also provide a converging hierarchy of lower bounds for polynomial optimization problems which does not require optimization at all, but simply the ability to multiply polynomials together.

### 4 - Optimization Society Award

David Morton, Northwestern University, IEMS Department, 2145 Sheridan Road, Evanston, IL, 60208, United States

### Joint Session DM/Practice Curated: Optimization in Data Mining and Analytics

Sponsored: Data Mining

Sponsored Session

Chair: Young Woong Park, Iowa State University, Ames, IA, 50011, United States

#### 1 - A Mathematical Programming Approach for Imputation of Unknown Journal Ratings in a Combined Journal Quality List

Young Woong Park, Iowa State University, 2167 Union Drive, 2139 Gerding Business Building, Ames, IA, 50011, United States, Jinhak Kim, Alvin Williams

Many journal quality lists rate limited numbers of journals. However, in many academic institutions, fair evaluation procedure is needed to rate journals that are not listed in their trusted journal quality lists. In this research, mathematical programming models are proposed to determine unknown ratings of multiple journal quality lists only using their known rating information. The objective of the models is to minimize the total number of instances where two journals are rated in opposite order by two quality lists. Computational results based on the journal quality list data in <https://harzing.com> show that our method outperforms existing multiple imputation algorithms.

#### 2 - Recent Advances in Mixed-integer Optimization Approaches to Feature Subset Selection

Yuichi Takano, University of Tsukuba, Tsukuba-shi, Japan, Ryuhei Miyashiro

Mixed-integer optimization (MIO) approach to feature subset selection was proposed in the 1970s, and recently it has received renewed attention due to progress in algorithms and hardware. In this talk, I review some recent advances in MIO approaches to feature subset selection and introduce latest research developments of our group.

#### 3 - Optimal Clustering on a Graph

GOKCE Kahvecioglu, Northwestern University, 2145 Sheridan Road, Room C210, Evanston, IL, 60208, United States, David Morton

We study a hierarchical clustering problem on an undirected graph with a weight function assigning nonnegative weights to the edges. We remove a subset of edges to break the graph into a number of smaller pieces, i.e., clusters. We consider a bicriteria graph clustering problem, in which we maximize the number of clusters while minimizing the weight of deleted edges. Solving this bicriteria problem parametrically identifies solutions that lie on the concave envelope of the efficient frontier, and the breakpoints on this envelope are nested, yielding a hierarchical family of clusters. We illustrate our ideas using NCAA football schedules, attempting to identify conferences, divisions, etc.

#### 4 - Mixture-based Multiple Imputation Models for Clinical Data with a Temporal Dimension

Ye Xue, Northwestern University, Evanston, IL, United States, Yuan Luo, Diego Klabjan

Missing values are commonly occurred in many kinds of datasets, especially in time series. We present mixture-based multiple imputation models for multivariate time series. We design mixture models with one component capturing the correlation between variables and others catching the fluctuations of time series. The mixture models are optimized by maximizing their mixture likelihood functions using Estimation and Maximization (EM) algorithm. Then the imputation is performed based on the estimates of parameters of the optimized mixture models. We demonstrate the effectiveness of our imputation models on clinical data with a temporal dimension.

**Joint Session DM/Practice Curated:  
Data Science for Electrical Markets**

Sponsored: Data Mining

Sponsored Session

Chair: Mehrdad Pirnia, University of Waterloo, 200 University Ave West, Waterloo, ON, N2L3G1, Canada

**1 - Internet of Things for Power Consumption**

Rachneet Kaur, Student, University of Illinois-Urbana Champaign, Department of Industrial Engineering, TB 21, Champaign, IL, 61820, United States, Richard Sowers, Kevin Thompson

The objective of our research is to use historical pricing data from a U.S. energy supplier to schedule policies which can be implemented in a smart home which allows for a major appliance to be turned on so as to minimize cost. The policy is back tested, showing significant savings. We design a dishwasher that can be activated via voice command through the use of an app, wireless speaker (Amazon Echo Dot), and an AI voice assistant (Amazon Alexa). More importantly, we want to predict the future price of power in order to activate the dishwasher at an optimal time to save the consumer on the operation cost of the dishwasher.

**2 - Data-driven Strategies for Trading Renewable Energy Production**

Miguel A. Muñoz, PhD. Student, University of Malaga, Edificio I+D Ada Byron, Malaga, Spain, Juan Miguel Morales, Salvador Pineda

In this talk we first introduce the problem of selling renewable energy in day-ahead electricity markets with a dual-price balancing settlement as a newsvendor problem. We then analyze different strategies to include information of auxiliary variables that may have predictive power on the renewable power production. Different data-driven optimization techniques are used to determine the optimal amount of energy to be sold in the market taking into account the information of those variables. The performance of these techniques is evaluated in a realistic case study in which we consider a single renewable power producer trading the whole wind power production of a relatively small country.

**3 - A Bilevel Optimization Model for Estimating Utilities of Price-responsive Electricity Consumers**

Arnab Roy, PhD Candidate, University of Louisville, 3177 South 3rd Street, Louisville, KY, 40214, United States, Lihui Bai, Chaosheng Dong, Bo Zeng

A bilevel optimization model is presented to estimate parameters of the utility function for price-responsive electricity consumers. The lower level minimizes the sum of electricity cost and inconvenience cost, due to consumers' curtailment of load in a demand response event. Real-world data from a field demonstration project is used in a joint predictive and prescriptive model (Bertsimas and Kallus, 2015). The upper level minimizes the difference between the total consumption determined by the lower level problem and the consumption measurements from the collected data.

**4 - Chance Constrained Optimization to Model Micro-grids with Renewables and Storage Capacities**

Mehrdad Pirnia, University of Waterloo, 200 University Ave West, Waterloo, ON, N2L3G1, Canada, Hassan Shavandi, Alberto J. Lamadrid, John David Fuller

In this presentation, we develop a social welfare maximization model with storage capacities (batteries), considering wind uncertainties. The uncertainties associated with wind generation is modeled using chance constraints. Furthermore, an equivalent deterministic mixed integer programming model is used to find the solution of the chance-constrained model. We use these models to analytically investigate the impact of storage capacities on the electricity prices, and the optimal number of charge/discharge for batteries. We also present the electricity price differences between the stochastic and deterministic models.

## ■ TC64

**Data Analytics for Behavioral Operations and Business Decisions**

Sponsored: Data Mining

Sponsored Session

Chair: Mohsen Ahmadian, University of Massachusetts Boston, Malden, MA, 02148, United States

**1 - The Impact of Sellers' Reputation on Customers' Purchasing Intention Toward Remanufactured Products**

Zhaoji Yu, Shenyang University of Technology, Shenyang, China  
Zhaoji Yu, California State University, Stanislaus, Turlock, CA, United States, Yingzi Zhao, Xun Xu

Apart from elevating public awareness of sustainable consumption, remanufacturing offers an opportunity for products to create a "secondary value". Since remanufacturing is a manufacturing process, the ultimate goal is to promote the product sales. Laying emphases on fixed-price trading environment, this paper studies the influence of remanufactured product seller's reputation on the customer's willingness to purchase a remanufactured product. The results of the study confirm that consumers are more willing to buy products from manufacturers than are remanufactured by sellers. Interestingly, we also find that the longer the seller registered, the lower its consumer willingness to buy.

**2 - Forecasting and Inventory Control with Compound Poisson Demand Using Periodic Demand Data**

Dennis Prak, University of Groningen, Nettelbosje 2, Groningen, 9747 AE, Netherlands, Ruud Teunter, Mohamed Z. Babai, Aris Syntetos, John E. Boylan

We propose a consistent, closed-form method-of-moments estimator for compound Poisson demand parameters that dominates in terms of estimation accuracy and achieved service level. It estimates the arrival rate from the fraction of periods without demand, and combines this with the average of period demand to estimate the mean demand size. It outperforms standard method-of-moments for intermittent demand patterns and performs similarly to maximum likelihood. Period forecasting techniques as implemented in software are not suitable for inventory control based on compound Poisson demand, and doing so leads to severe biases and too high inventories.

**3 - Predicting Order Variability in Inventory Decisions: A Model of Forecast Anchoring**

Dayoung Kim, Assistant Professor, California State University Fullerton, 800 N. State College Blvd, SGMH 5373, Fullerton, CA, 92831, United States, Andrew M. Davis, Li Chen

We take a unique perspective to the Newsvendor problem, by developing a simple theoretical model that can accurately predict order variability (of human subjects), in addition to average orders. Indeed, a number of behavioral models which can predict average newsvendor orders (i.e. the pull-to-center effect) have been proposed, but they cannot explain and predict order variability observed in data. Therefore, from a managerial standpoint, our model allows upstream suppliers the ability to form a complete forecast distribution of downstream orders, leading to better inventory decisions, planning, and increased profitability.

**4 - Multi-product Demand Prediction and Price Optimization**

Yasaman Shahi, PhD Student, Georgia Institute of Technology, 755 Ferst Dr, Atlanta, GA, 30318, United States, Kris Johnson Ferreira, Gurhan Kok

Multi-product demand prediction models typically lack either flexibility or interpretability. We propose a neural network architecture that balances these two and show how it can be used in price optimization. We partner with a consumer electronics retailer to estimate our demand model and implement our price optimization approach.

**5 - Rival Chasing Behavior in Simultaneous Competitions**

Mohsen Ahmadian, PhD Student, University of Massachusetts Boston, 100 William T. Morrissey Blvd., College of Management, Boston, MA, 02125, United States, Roger H. Blake, Ehsan Elahi

This research uses the results of laboratory experiments in which subjects playing the role of suppliers competing for the business of a buyer. These results show significant differences with predictions from theory. We find the observed behaviors can be explained by a phenomenon that we name "rival-chasing". Rival-chasing is individuals' tendency to change their decisions toward their competitors' decisions. In symmetric competitions, this tendency leads to a faster convergence of the decisions. However, in asymmetric competitions, rival-chasing behavior results in a closer gap between observed decisions compared with the gap between the equilibrium points predicted by the theory.

### Data Science and Deep Learning II

Sponsored: Data Mining

Sponsored Session

Chair: James Patrick Bailey, Georgia Institute of Technology, Atlanta, GA, 30309, United States

#### 1 - Relaxed Wasserstein and Applications to Generative Adversarial Networks

Tianyi Lin, University of California, Berkeley, 4174 Etcheverry Hall, 2521 Hearst Ave, Berkeley, CA, 94709, United States, Xin Guo, Johnny Hong, Nan Yang

We propose a class of statistical divergences called \textit{Relaxed Wasserstein} (RW) divergence. We establish for RW divergence several properties: 1) RW divergence is dominated by Total Variation and Wasserstein- $L^2$  divergence; 2) RW divergence has continuity, differentiability and duality representation; 3) RW divergence has a non-asymptotic moment estimate and a concentration inequality. Experiments on the image generation demonstrate that RWGANs possess better convergence than the existing WGANs with competitive inception scores. To the best of our knowledge, this is the first to provide both the flexibility to design effective GANs and the possibility to study different losses.

#### 2 - Probabilistic Mixture Models for Predicting Unbalanced Thunderstorm-induced Power Outages

Elnaz Kabir, University of Michigan, 1205 Beal Ave., Ann Arbor, MI, 48109, United States, Seth Guikema, Steven Quiring

Severe storms have substantial impacts on power systems, posing risks and inconveniences due to power outages. Statistical prediction models have promise for supporting utility response, but power outage data are highly zero-inflated. In this study, we propose probabilistic mixture models for predicting the spatial distribution of power outages based on zero-inflated data. The result shows that these models offer strong predictions with zero-inflated data.

#### 3 - Multiplicative Weights Update in Zero-sum Games

James Patrick Bailey, Postdoctoral Researcher, Singapore University of Technology and Design, Singapore

We study the classic setting where two agents compete in a zero-sum game by applying Multiplicative Weights Update (MWU). In a twist of the standard approach of Freund, we show the K-L divergence from an equilibrium increases and that strategies converge to the boundary of the smallest face containing all equilibria. Our results come in stark contrast with the standard interpretation of the behavior of MWU in zero-sum games, which is typically referred to as "converging to equilibrium". If equilibria are indeed predictive even for the benchmark class of zero-sum games, agents in practice deviate robustly from the axiomatic perspective of optimization driven dynamics captured by MWU.

### Joint Session QSR/Practice Curated: Prognostics and Health Management

Sponsored: Quality, Statistics and Reliability

Sponsored Session

Chair: Tongdan Jin, Texas State University, San Marcos, TX, 78666, United States

Co-Chair: Yan-Fu Li, Tsinghua University, Beijing, 100084, China

#### 1 - Joint Optimization of Maintenance Planning and Workforce Routing for Networked Infrastructures

Chi Zhang, Tsinghua University, Department of Industrial Engineering, Tsinghua University, Beijing, 100084, China, Chuanchou Jia

The economic development and social well-being of modern societies are highly dependent on networked infrastructures. Thus, it is necessary to timely and effectively maintain them to ensure the reliability of their continuous operation. However, their components are geographically distributed and the time required to transport between the components needs to be considered in order to make achievable maintenance plans. To address this problem, we transfer the time of each component being maintained into their sequence of being visited by each team of workforce, and propose a new approach to jointly optimize the maintenance planning and workforce routing for a networked infrastructure.

#### 2 - A New Algorithm with Real-time Smoothing for Predicting Blood Glucose Concentrations Based on Wavelet Filters

Lei Li, Beihang University, Beijing, China, Jun Yang

Based on the Continuous Glucose Monitoring (CGM) data, we aim at predicting future blood glucose levels so that appropriate actions can be taken in advance to prevent hyper/hypoglycemia. Due to the small fluctuations of CGM data, an ARMA model with a wavelet filter is proposed in the prediction framework. To verify the performance of the proposed method, we conduct the proposed method with different wavelet function, different decomposition levels and threshold methods of wavelet denoise in a case study based on the CGM data of 5 diabetics. Results show that the proposed methods with db8 wavelet function and minimaxi threshold method has most satisfactory and robust performance.

#### 3 - The Recognition Method of the Equipment State Based on the MTS Modified by FDA

Ning Wang, Chang'an University, Middle-section of Nan'er Huan Road, Xi'an, ShaanXi, 710064, China, Dawei Hu, Yingbin Fu

Mahalanobis-Taguchi System (MTS) is a kind of data classification and reduction method using Mahalanobis distance (MD) as the measurement scale to identify the system state with multidimensional characteristics. In this paper, against the imbalanced classification by the model to identify the sample when the benchmark and abnormal space constructed by the traditional MTS have a serious overlap, a modified MTS amended by Fischer linear discriminant analysis (FDA) is proposed, and to be used to recognize the running state of equipment. The result proves the effectiveness and superiority of the modified model.

#### 4 - Scheduling of Maintenance Teams and Activities for Nuclear Power Plant Subsystems

Meng-Yu Du, Tsinghua University, Beijing, China, Yan-Fu Li

The existing research works on nuclear power plant (NPP) maintenance scheduling normally assume that activities are performed on the exact scheduled times. However, due to budget limit, the shortage of maintenance workers cannot be ignored and thus the plans can be missed. To deal with this problem, we propose an integrated scheduling of maintenance teams and activities. A mixed integer program model is built with the objective of minimizing maintenance cost. The lower bound of system unavailability, limited maintenance workers, etc. are regarded as constraints. The proposed optimization model is applied to an NPP subsystem and solved by a mathematical programming solver.

### Joint Session ISS/AI/Practice Curated: Applications of Deep Learning Methods in Information Systems

Sponsored: Information Systems

Sponsored Session

Chair: Xiao Liu, University of Utah

#### 1 - How Are You Feeling Today? Let Online Cancer Communities Help You Feel Better

Anqi Xu, University of Utah, Salt Lake City, UT, United States, Paul Hu

Cancer is devastating and has profound effects on patients' well-beings, both physical and emotional. Cancer patients need strong social support in different aspects and their emotions can greatly benefit from effective support. Toward that, online communities are crucial because they can provide the needed support to cancer patients. This study analyzes patients' different social support needs, then develops and empirically evaluates a deep learning-based, multi-label classification method to scrutinize their respect effects on a patient's emotion change, with a focus on the fit between the patient's particular need and the specific support by an online cancer community.

#### 2 - Using Crowd Reactions to Detect Social BOT Intent

Victor Benjamin, Arizona State University, Tempe, AZ, United States, Kunal Sahay, Raghu Santanam

Social bots hold immense power, as they are excellent broadcasters of good/bad messages in high velocity. Some bots are useful because they can assist other users in several ways, such as providing news article summaries. However, other bots act maliciously by spreading misinformation or exploiting users. As these bots become more prevalent on social media, platform owners must identify strategies to manage them. One key capability that platforms need is the ability to distinguish between beneficial and harmful social bots that exist within their platform. In this research, crowd reactions to known social bots are scrutinized through a deep learning framework to assess the intent of the bot.

### 3 - Go to YouTube and See Me Tomorrow: The Role of Social Media in Managing Chronic Conditions

Xiao Liu, University of Utah, Salt lake City, UT, United States,  
Bin Zhang, Anjana Susarla, Rema Padman

To assess the medical knowledge in YouTube videos, we propose an interdisciplinary lens that synthesizes deep learning methods with themes emphasized in Information Systems (IS) research and research on healthcare informatics. We extract medical terminology from videos. We annotate videos using inputs from domain experts and build a logistic regression based classifier to categorize videos based on whether they encode a high degree of medical knowledge or not. We find that medical terminology embedded in textual data is more salient to an assessment of medical knowledge encoded in a video, rather than image analytics.

### 4 - Predicting Hepatocellular Carcinoma Recurrences: A Data-Driven Multiclass Classification Method by Incorporating Hidden Risk Factors

Qihua Sheng, University of Utah, Salt Lake City, UT, 84102,  
United States, Da Xu, Paul Hu, Tingshuo Huang, Wen-Chen Lee

Hepatocellular carcinoma (HCC), a malignant disease, is normally treated with surgical resections that however often associated with high cancer recurrence rates. We propose a Bayesian network-based method to infer HCC recurrences by incorporating distinctive pathogenesis that differs between early and late recurrences. The proposed method considers the underlying mechanisms control the clinical endpoint in the learning process and offers interpretability and flexibility to support HCC prognosis predictions.

Sponsored Session

Chair: Arman Sabbaghi, Purdue University, West Lafayette, IN, 47907, United States

#### 1 - An Adaptive Data Augmentation Strategy for Fitting Gaussian Process Models with Application to 3D Printing

Tirthankar Dasgupta, Rutgers University, Minge Xie

Gaussian process (GP) models are useful tools for fitting models that predict in-plane deformation of 3D-printed products. However, products are often produced sequentially (either individually or in batches), making it necessary to develop computational procedures that allow sequential augmentation of data obtained from manufactured products. We propose a novel approach for adaptive estimation of GP model parameters using an inferential tool called confidence distribution (CD) that also helps capture the uncertainty associated with the estimators. The method can also help reduce the computational burden associated with GP modeling using the “divide and conquer strategy.”

#### 2 - Data and Compute Challenges in Enabling 3D Printing for Mass Customization

Jun Zeng, HP Labs, HP Inc., 1501 Page Mill Road, Palo Alto, CA, United States

Industry 4.0 will disrupt the 12 Trillion-dollar manufacturing business by enabling producing customized products with mass manufacturing cost efficiency. 3D printing holds the promise to realize this Industry 4.0 vision however there are multiple technology challenges from design to production covering a broad spectrum of hardware, software and material sciences. This paper will describe generative design thinking (aka. design-for-additive manufacturing), interoperability and file formats (e.g., 3MF), high-fidelity manufacturing including process, sensing, and data-driven compensation and control drawing from our learning from commercializing HP's Multi Jet Fusion technology.

#### 3 - Understanding the Requisite Ecosystem to Qualify Aerospace Additive Manufactured Parts

William Bihlman, Aerolytics LLC, West Lafayette, IN, United States

Additive manufacturing (AM) shows promise to be highly disruptive in many industrial markets. Aerospace, however, lags. This presentation will address the primary challenges that are rather unique to commercial aerospace. It explores questions such as: Why is aerospace slow to adopting this technology? What are the main targets/components? How does this differ between engine vs airframe markets? In short, it will discuss the requisite ecosystem to necessitate adoption of AM for one of society's highest risk-adverse industries. Indeed, AM is a powerful new paradigm. But is aerospace able to engage?

#### 4 - A Data Fusion Framework for Historical and Prototype Experimental Data with Applications to Personalized Heart Surgery Planning and Optimization

Chuck Zhang, Georgia Institute of Technology, Atlanta, GA, United States, Jialei Chen, Kan Wang, Simon Mak, Roshen Vengazhiyl, Ben Wang

This paper presents a study of augmenting historical patient data with experimental data based on 3D printed patient prototypes to develop more reliable predictive models for physicians and surgeons to use to make more informed decisions for surgery planning and optimization. This research work involves innovative materials design for creating tissue-mimicking structures, multi-material 3D printing, machine learning for generating “virtual patients, and data fusion. This method is demonstrated through an application case of outcome prediction of transcatheter aortic valve replacement (TAVR) surgery.

#### 1 - Lithium-ion Battery Pack SOC Estimation Considering Cell-to-Cell Variability

Modjtaba Dahmardeh, Rutgers, The State University of New Jersey, Piscataway, NJ, United States, Zhimin Xi

Accurate estimation of lithium-ion battery pack SOC is technically challenging because of the cell-to-cell variability caused by the manufacturing tolerance. In addition, there is no unanimous definition of the pack SOC since each cell has its own SOC and the pack can be configured in different ways. This study firstly investigates different pack SOC definitions and adopts the one best suitable in our study. Next, uncertainty modeling and propagation analysis are conducted for accurate pack SOC estimations considering the cell-to-cell variability. Both analytical and simulation solutions are reported under different scenarios.

#### 2 - A New Collision Avoidance Algorithm for Autonomous Vehicles Based on the Velocity Obstacle Algorithm

Elnaz Torkamani, Rutgers, The State University of New Jersey, Piscataway, NJ, United States, Zhimin Xi

Vehicle navigation autonomously in a dynamic environment is a challenging task because it should not be pre-programmed under a given handful situations and the vehicle must be able to avoid collisions under numerous unforeseeable but reasonable situations to a human being. From the practical perspective in autonomous cars, the algorithm must be efficient and reliable. This study proposes a new vehicle collision avoidance algorithm for multiple obstacles by eliminating the need of running sampling or optimization approaches, so that the algorithm could be practical useful in real-time collision avoidance under high vehicle speed.

#### 3 - Reliability-Based Optimal Design of a Micro-Grid System under Natural Disasters

Zhetao Chen, Rutgers, The State University of New Jersey, Piscataway, NJ, United States, Zhimin Xi

This study proposes reliability-based optimal design of a micro-grid system under service disruptions due to natural disasters. The objective is to determine the minimum number of generators and their distributions in the micro-grid so that the system's recoverability can be guaranteed under random failure scenarios of the power transmission lines. Power flow analysis combining with the Monte Carlo simulation (MCS) are used for uncertainty propagation analysis to quantify the system's recoverability distribution under random failure scenarios of the transmission lines. The proposed work is demonstrated through a 12-bus power system.

#### 4 - Finite Element Modeling of the Selective Laser Melting Process for Ti-6Al-4V

Alaa Olleak, Rutgers, The State University of New Jersey, Piscataway, NJ, United States, Zhimin Xi

Physics-based modeling of the selective laser melting (SLM) process is critical for better understanding the influence of the parts quality with respect to various process parameters and scanning strategies. The challenge is to balance model validity, domain size, and computational efficiency so that the model can be practically useful for improving reliability and quality of the printed products. In this study, a transient thermal finite element model of a SLM process for Ti-6Al-4V is developed using ANSYS for predicting the melt pool size and its temperature history. The thermal model is then integrated with mechanics-based modeling process for predicting the residual stress of the products.

### 5 - Deep Autoencoder with Regularization on Sensor Signals for Virtual Metrology in Semiconductor Manufacturing

Jeongsub Choi, Rutgers University, 96 Frelinghuysen Road, Core Building, Room 201, Piscataway, NJ, 08854, United States, Harshit Bokadia, Myong K. Jeong

In semiconductor manufacturing, feature extraction from raw sensor signals on process equipment is an essential task to build an accurate predictive model for virtual metrology. Autoencoder is a neural network based feature extraction model that compress inputs into features in a latent space. In this talk, we present a new virtual metrology method with a new regularized deep autoencoder considering the characteristics of sensory data. Experimental results with real-life data show that the proposed method improves the performance of prediction models for virtual metrology.

Co- Chair: Yimin Zhou

#### 1 - Accelerated Degradation Testing Modelling and Analysis with Recovery Capability Considered

Qingpei Hu, Chinese Academy of Sciences, 55 East Zhongguancun, Haidian, Beijing, 100190, China, Chengjie Wang, Dan Yu, Jian Liu

The precision of ADT models heavily relies on the consistency of the testing environments and the corresponding assumptions. Recovery phenomenon is always observed when measurement conducted offline at low stress for some typical degradation failure modes. Statistical model and inference are proposed for this phenomenon, together with simulation results addressed.

#### 2 - WCF-Approach for Complex System Reliability Assessment

Dan Yu, Chinese Academy of Sciences, Beijing, China

System reliability assessment from component failure data is usually approximated by the central limit theory combined with delta method. A novel polynomial adjustment method for high reliability systems is adopted to construct higher-order approximate lower confidence limits, elaborated for log-location-scale family models with numerical studies conducted.

### Geospatial Optimization Problems

Sponsored: Computing

Sponsored Session

Chair: John Gunnar Carlsson, University of Southern California, Los Angeles, CA 90089, United States

#### 1 - Equitable Partitioning of a Delivery Service Region with Orthogonal Blocks

Mehdi Behroozi, Boston, MA, United States

Motivated by the last-mile delivery service operation, we consider the problem of utilizing a fleet of vehicles over a rectilinear polygonal service region with orthogonal blocks and fixed vehicle depot locations so that all demand points are serviced and the workload is evenly distributed among the vehicles. We present an efficient algorithm for partitioning the territory into sub-regions using horizontal and vertical lines such that each sub-region contains exactly one vehicle depot location and the workloads of the vehicles, i.e. total traveled distance of the vehicle with respect to some natural metric, are balanced.

#### 2 - The Covering Path Problem on a Grid

Liwei Zeng, Northwestern University, Evanston, IL, United States, Karen Smilowitz, Sunil Chopra

This paper introduces the covering path problem on a grid (CPPG) which finds the cost-minimizing path connecting a subset of points in a grid such that each point is within a pre-determined distance of a point from the chosen subset. We leverage the geometric properties of the grid graph which captures the road network structure in many transportation problems. We develop a trade-off constraint which quantifies the trade-off between path length and stop count and provides a lower bound for the bi-objective optimization problem. We introduce simple construction techniques to provide feasible paths that match the lower bound within a constant factor.

### 3 - Distributionally Robust Travelling Salesman Problems and Variations

John Gunnar Carlsson, University of Southern California, 3750 McClintock Avenue, Los Angeles, CA, 90089, United States

Recent research on the robust and stochastic travelling salesman problem and the vehicle routing problem has seen many different approaches for describing the region of ambiguity, such as taking convex combinations of observed demand vectors or imposing constraints on the moments of the spatial demand distribution. One approach that has been used outside the transportation sector is the use of statistical metrics that describe a distance function between two probability distributions. Motivated by a districting problem in multi-vehicle routing, we consider a distributionally robust version of the Euclidean travelling salesman problem in which we compute the worst-case spatial distribution of demand against all distributions whose Wasserstein distance to an observed demand distribution is bounded from above.

#### 4 - Fair Division Approaches to Political Districting

Gerdus Benade, Carnegie Mellon University, 5000 Forbes Avenue, Pittsburgh, PA, 15213, United States, Ariel Procaccia

Gerrymandering and the problem of dividing a state into political districts are attracting a lot of attention. One of the difficulties in detecting gerrymandering is that it is hard to determine how many districts a party may expect to win. We approach districting as a fair division problem and propose a target number of districts for every party that is sensitive to the distribution of voters and the geography of the problem. We determine the extent to which this target can simultaneously be guaranteed to every party and propose a computational approach to districting.

#### 5 - Real World VRP Needs a GIS

Heather Moe, Product Engineer, Esri, 380 New York St, Redlands, CA, 92373, United States, Shubhada Kshirsagar

The Vehicle Routing Problem (VRP) becomes much more complex when the solutions need to be deployed in the real world. To produce an operational result, the VRP model must include geographically precise inputs. The best way to integrate this massive amount of information is to use a Geographic Information System (GIS) in the problem-solving methodology. This presentation will discuss requirements from a wide range of commercial and public-sector clients over 30 years?. With the described GIS inputs, the VRP model will produce a route plan that is both cost efficient and realistic.

#### 1 - Benefit Ambiguity and Asymmetric Herding in Privacy Decision: A Mobile Field Experiment

Youngsok Bang, PhD, The Chinese University of Hong Kong, Hong Kong, Jaehyeon Ju, Dong-Joo Lee, Jae-Hyeon Ahn

We conduct a field experiment with a self-developed mobile app to examine how the benefit ambiguity of using the app and others' permission setting affect users' permission on each of sixteen information items requested by the app. We find that participants who received the detailed reward scheme permitted more items than participants who received the abstract scheme. We also find that participants who permitted fewer items than the average were encouraged to permit more by getting the feedback of others' permission status, whereas participants who permitted more than the average were not affected. The asymmetric herding effect was greater for participants who received the detailed reward scheme.

#### 2 - Does Sharing Make My Data More Secure? An Empirical Study on Health Information Exchanges and Data Breaches

Liting Zhang, Temple University, Philadelphia, PA, 19122, United States, Sunil Wattal

This paper examines the IT security implications of hospitals joining a Health Information Exchange (HIE). Using IT governance theory and institutional theory, we propose hypotheses regarding the relation between a hospital joining an HIE and the likelihood that it suffers data breaches. We analyze a panel data for hospitals over a 6 year period empirically. Our preliminary results show joining HIEs mitigates security breach risks for hospitals. We also find that the mitigation effect is higher for hospitals with higher security capabilities and lower for large hospitals. The study contributes to the literature in IT governance, information security, as well as provides practical implications.

### 3 - A Cross Industry Study of Institutional Pressures on Organizational Effort to Raise Information Security Awareness

Hwee-Joo Kam, University of Tampa, Tampa, FL, 33606, United States, Thomas Mattson, Sanjay Goel

In this paper, we conceptually and empirically investigate the relationship between industry and information security awareness (ISA). To examine these potential industry effects, we draw on Neo-Institutional Theory (NIT). We specifically theorize that the pressures from the three institutional pillars (regulative, normative, and cultural-cognitive) will affect employees across all industries but the magnitude of those effects will vary across industries. To evaluate our theorized relationships empirically, we surveyed employees in the banking, healthcare, retail, and higher education industries.

### 4 - Do Data Breaches Impact Healthcare Market Share?

Juhee Kwon, Korea Advanced Institute of Science & Technology (KAIST), Hoe, Seoul, Kosovo, Republic of, M. Eric Johnson

Using propensity score matching combined with a difference-in-differences technique, this study examines whether hospitals observes changes in market share after a data breach. Accounting for geographically based competition in the U.S. healthcare sector, we find that data breaches significantly impact healthcare market share only in moderately concentrated markets where consumers have reasonable alternatives. We also find that the impact is much smaller in geographic regions with large health maintenance organizations plans. This implies that regionally dominant hospitals are able to endure breaches with little loss.

### Artificial Intelligence Based MCDM

Sponsored: Multiple Criteria Decision Making

Sponsored Session

Chair: Noor E. Alam, Northeastern University, Boston, MA, MA 02115, United States

### 1 - Consequence-based Framework for Municipal Infrastructure using Bayesian Belief Network

Golam Kabir, Assistant Professor, University of Windsor, CEI 3013, 401 Sunset Avenue, Windsor, ON, N9B 3P4, Canada, Ngandu B. Balek, Solomon Tesfamariam

The failure of municipal infrastructures like roads, water mains, sewers, bridges may cause crucial consequences to the health, environment, society, and economy. To develop an effective consequence-based framework, the data required from multiple sources and the relationship among the multiple consequence criteria is nonlinear and complex. In this study, a BBN-based sewer

consequence model is developed to handle the cause-effect relationships between multiple criteria and to prioritize the sewers for maintenance, repair, and replacement. The efficacy and the applicability of the proposed concept are demonstrated on the wastewater collection network of the City of Vernon, BC, Canada.

### 2 - Resilient Suppliers Selection: A Pragmatic Decision-Making Approach

Noor E. Alam, Northeastern University, 334 Snell Engineering Center, 360 Huntington Avenue, Boston, MA, MA 02115, United States, MD Mahmudul Hasan, Tasnim Ibn Faiz, Dizuo Jiang

This study aims to select resilient suppliers based on multi-criteria decision making approach, entailing both crisp and perception based information. To handle computing with words and crisp information in an integrated manner, a single valued neutrosophic sets and interval valued fuzzy sets in combination with TOPSIS was proposed, followed by a sensitivity analysis with respect to varying weight of the criteria.

### 3 - Big Data Driven MCDM

Noor E. Alam, Northeastern University, 334 Snell Engineering Center, 360 Huntington Avenue, Boston, MA, MA 02115, United States, Sharif Ullah

In this talk, we will introduce a decision making framework which can use Big data driven graphical information to make multi-criteria decision making.

### 4 - Multiobjective Adaptive Convolutional Neural Network for Medical Image Segmentation

Maria Baldeon, USF, 18322 Bridle Club Dr., Tampa, FL, 33647, United States, Susana Lai-Yuen

In this work we present an adaptive convolutional neural network for medical image segmentation. The AdaResU-Net consists of a fixed architecture and a learning framework that adapts the hyperparameters to the training dataset. The fixed architecture combines the favorable structure of the U-Net with a residual learning framework. The learning framework uses a multiobjective evolutionary algorithm to evolve networks with different hyperparameters subject to segmentation accuracy and model size as objective functions. Experimental results show that the AdaResU-Net is able to find competitive architectures with less than half the number of trainable parameters than competing networks.

### Considering Human Aspects in Military Operations

Sponsored: Military and Security

Sponsored Session

Chair: Richard F. Deckro, Air Force Institute of Technology, AFIT/ENS Bldg 641, 2950 Hobson Way, Wright Patterson AFB, OH, 45433-7765, United States

### 1 - Dynamic-data-Driven Application System (DDAS) Based Multi-scale Simulation for Border Surveillance

Seunghan Lee, PhD Candidate, University of Arizona, Tucson, AZ, 85721, United States, Saurabh Jain, Young-Jun Son

Implementation of a robust border-surveillance system is challenging due to the information diversity and variability. We present an autonomous effective surveillance system based on multi-level simulation by deploying different types of sensors. Integration of agent-based and physics-based simulations will be developed and demonstrated for optimal planning and control of unmanned vehicles with a real-time geographic information system.

### 2 - Intersection of Human Aspects of Military Operations and Quantitative Decision-making

Kevin Kennedy

The JC-HAMO recognizes the centrality of human will, behavior, and decision-making in war and provides a framework that integrates into the Commanders Decision Cycle. The four central imperatives underpinning the concept are: "Identifying the range of relevant actors and their associated social, cultural, political, economic, and organizational networks". "Evaluating relevant actor" Anticipating decision-making. "Influencing the will and decisions of relevant actors" This discussion will show how research from various operations research fields have laid the groundwork to make this concept feasible.

### 3 - Linking Human Behavior to Campaign Planning: A Discussion of Some Modeling Approaches

Richard F. Deckro, Air Force Institute of Technology, Afir/ENS; Bldg 641, Department of Operational Sciences, Wright Patterson AFB, OH, 45433-7765, United States

The JC-HAMO calls for including aspects of a foes human behavior into campaign planning. This presentation reviews some of the modeling approaches available and suggests how they might begin to be included in campaign planning. After setting the stage, a participatory discussion is encouraged.

Sponsored Session

Chair: Shannon Harris, The Ohio State University, Columbus, OH, 43203, United States

#### 1 - Revenue Management with Random Resources

Luis G. Vargas, University of Pittsburgh, Operations, Decision Sciences and AI, 356 Mervis Hall, Pittsburgh, PA, 15260, United States

We consider how to set the protection level in a system with two groups of customers when the resource demands of the customers are random variables. We operate a flat-fee legal clinic that serves both walk-in customers and those covered by employer-sponsored legal insurance. Consultation times are random obtained from historical data for customers of either type. Professional ethics require you to take customers on a first-come-first served basis and to complete a consultation no matter how much time it requires. Customers covered by legal insurance pay less for a consultation than do walk-ins. How much of the fixed opening hours of the clinic should you reserve for walk-in customers?

#### 2 - A Decision Support System for Augmentative and Alternative Communication Device Selection

Eduardo Perez, Assistant Professor, Texas State University, Roy F. Mitte Complex, 749 N. Comanche St., San Marcos, TX, 78666, United States, Mahima Sajan Varghese, Amy L. Schwarz

The goal of this research is to improve services for patients in need of Augmentative and Alternative Communication (AAC). In this talk, a methodology is presented to help selecting the devices to consider for a patient based on a disability profile. Currently, the decision-making process of what device to try on the patient is largely based on the health professional's experience and familiarity with specific devices or companies. The proposed models will limit patient discomfort and reduce device assessment time by helping in selecting the best fit based on the patient's disability profile.

#### 3 - Evaluating a Prediction Driven Targeting Strategy for Reducing Transmission of Multidrug Resistant Organisms

Sean Barnes, Univ of Maryland-College Park, 4352 Van Munching Hall, 20742, United States, Miranda Myers, Clare Rock, Daniel Morgan, Lisa Pineles, Kerri Thom, Anthony Harris

The transmission of multidrug-resistant organisms (MDROs) in the healthcare setting is an ongoing challenge. In this study, we leverage an agent-based model of MDRO transmission focusing on methicillin-resistant *Staphylococcus aureus* to develop and evaluate the effectiveness of a prediction-driven approach for targeting patients for intervention, based on their daily likelihood of becoming colonized by the organism. We show that we can predict these outcomes with moderate-to-high accuracy, and that these predictions can be used to efficiently target patients for intervention and ultimately reduce the overall acquisition rate across the entire unit.

#### 4 - CODAP: An Action Plan for Decision Making and Knowledge Discovery

Lincoln J. Chandler, Chandler Decision Services, 1224 S. Central Park, Floor 2, Chicago, IL, 60623, United States, William A. Massey

Motivated by a desire to support policy development and multidisciplinary collaboration, we propose an adaptable, iterative framework for managers and researchers. We refer to the action steps of the framework as CODAP, where: CODAP = Collect, Organize, Describe, Analyze, Prescribe. Taken in order, these action steps define a path of inquiry from observation (data) to informed response (policy). In a broader context, each individual action of CODAP aligns to a research narrative, with its own goal, motivation, and outcomes. In a literary sense, the narratives can be thought of as parts of a larger narrative, or saga. This talk will introduce the framework and provide some examples of application.

### Evaluating Efficiency in the Public Sector

Sponsored: Public Sector OR

Sponsored Session

Chair: Ronald McGarvey, University of Missouri, IMSE and TSPA, Columbia, MO, 65211, United States

#### 1 - Health Center Efficiency and Quality of Chronic Disease Management: Associations with EHR Implementation

Andreas Holger Thorsen, Montana State University, 11 N. Chouteau Avenue, Bozeman, MT, 59718-6211, United States, Ronald G. McGarvey, Maggie L. Thorsen

Federally-qualified health center (FQHC) providers can receive federal incentives for activities such as participation in "Meaningful Use of electronic health records (EHRs)". While there is evidence of the positive impacts of EHR implementation, other research suggests that a focus on Meaningful Use can cause distractions and negatively impact health outcomes. Using national data, we conduct a data envelopment analysis to examine how quality and efficient care of patients with chronic conditions are associated with EHR implementation at FQHCs.

#### 2 - Woody Biomass use for Biopower and its Impact on Forest Resources

Ashkan Mirzaee, University of Missouri, Columbia, MO, 65201, United States, Ronald McGarvey, Francisco X. Aguilar

Energy derived from woody biomass is a major source of renewable energy in the U.S. Its use in biopower has experienced significant growth in recent decades. In spite of the ample use of wood in biopower, knowledge about its estimated impact on forest resources is limited. In this research, statistical analyses are performed to evaluate changes in forest attributes over time within wood procurement areas. An MILP model is then developed to minimize the total cost of generating the required electricity projected to be demanded by the EIA through 2030, with environmental and spatially-explicit woody biomass availability constraints.

#### 3 - Developing and Applying Predictive Models for Flood Impacts as Part of Advanced Operational Planning for Disaster Response

Kiatikun Louis Luangkesorn, Assistant Professor, University of Pittsburgh, 1028 Benedum Hall, 3700 Ohara St, Pittsburgh, PA, 15261-0001, United States, Sanjeev Goyal, Michael Whitehead

In a major disaster response, outside assistance is often delayed due to the need to determine what resources are required before identifying and mobilizing those resources. We use a predictive model to determine the resources required for mass care (feeding and sheltering) response following a major flood based on the use of real time flood gage and demographic information from the social vulnerability index. These predictions can be used as the basis for initial estimates of resource requirements to begin mobilizing resources in a more timely way, with adjustments being made as better information becomes available. This model has been used to inform the response to flooding in the U.S. in Spring 2018.

### Alternative-Fuel Vehicles Refueling and Routing Problems II

Sponsored: Location Analysis

Sponsored Session

Chair: Ismail Capar, Texas A&M University, College Station, TX, 77843-3367, United States

Co-Chair: Yudai Honma, The University of Tokyo, Tokyo, 153-8505, Japan

#### 1 - Planning for Electric Vehicles: Maryland Case Study

Sevgi Erdogan, University of Maryland, College Park, MD, United States, Ismail Capar, Ibrahim Capar, Mohammad M. Nejad

Many states in the US have been deploying public battery charging stations to accelerate adoption of plug-in electric vehicles (PEVs). This research proposes an optimization-based approach to support EV infrastructure planning efforts. We use the flow-refueling location model to determine the location of public charging stations that would capture the maximum EV flow while preventing over-concentration of locations among other state specific policy constraints such as serving to designated EV corridors. We specifically use demand projections for years 2020 and 2040 for Maryland to create an electric vehicle charging network to facilitate long-distance travel throughout the state.

#### 2 - Promoting the Usage of Electric Vehicles Through the Efficient Design of Charging Station Network

Mohammad Miralinaghi, Purdue University, 550 W. Stadium Ave, West Lafayette, IN, 47907, United States, Gonzalo Correia, Sania E. Seilabi, Samuel Labi

This study proposes a framework to curb vehicular emissions by promoting the electric vehicle (EV) as an alternative to internal combustion engine vehicle on a long-term planning horizon in urbanized regions. In this framework, transportation planners seek to gradually install new electric charging stations by selecting new locations and/or repurposing existing gas stations. A bi-level model is developed to capture the decision-making process of both transportation planners and travelers. This study shows that as the transportation planner constructs EV charging stations, travelers are motivated to shift toward EVs which leads to significantly lesser vehicular emissions in the long run.

### 3 - Flow-capturing Location Problem with Capture Level Based on Detour Distances

Ken-ichi Tanaka, Keio University, Takehiro Furuta

We consider a flow-capturing location problem where capture level of each flow is dependent on the detour distance from a shortest path between origin-destination nodes. Two types of detour distances are considered. The first model assumes that a traveler deviates from the original path at the node nearest to a facility and then returns to the original path. The second model supposes that a traveler chooses a minimum-distance path between origin-destination nodes to visit a facility. We apply the two models to instances created from road networks and analyze optimal solutions.

### 4 - Collaborative Geodesign for Alternative Fuel Station Location using Open-source Collablocation Software

Michael J. Kuby, Arizona State University, School of Geographical Sci & Urban Planning, Tempe, AZ, 85287-5302, United States, Fangwu Wei, Keiron Bailey, Daoqin Tong, John W. Fowler, Qing Zhong, Oscar Lopez

We present an open-source collaborative GIS planning tool for facility location called Collablocation. Built with R, Shiny, MongoDB, and Open Street Maps, the first application is for natural-gas fueling stations for trucking across the Southwest. Results are presented from a pilot workshop with government and industry experts from five states.

### Supply Chain Management II

Contributed Session

Chair: Xun Xu, California State University-Stanislaus, One University Circle, Turlock, CA, 95382, United States

#### 1 - How Offline In-store Service Affects Online Drop-shipping Strategies in a Dual Channel System

Wei Lu, University of Science and Technology of China, Hefei, China, Jie Wu, Xiang Ji, Xiaohang Yue

We use a game-theoretical model to tackle the issue how the offline in-store service level affects online drop-shipping strategies in a dual channel environment. Our results show that when the retailer adopts a sufficiently aggressive in-store service strategy, the manufacturer (or the e-tailer) prefers drop-shipping rather than batch ordering even if it must sign a severe revenue-sharing contract. In addition, we show that when considering the retailer's in-store service strategies, the manufacturer's and e-tailer's preferences for drop-shipping are independent of the status of channel dominance.

#### 2 - The Role of Product Modularity on the Resilience of Multi-echelon Supply Networks

Yaneth Correa, Colorado State University-Pueblo, Pueblo, CO, United States, Roschele Henry

This work presents a simulation-based experimentation where instances of product modularity (represented by the BoM), define the structure of the supply network. The network is subject to random disruptions: node based and region based and a combination of both. The disruptions are represented by independent rare event statistical distributions. Network performance is evaluated using global (structural) and local (node) metrics.

#### 3 - The Effect of Carbon Tariff on Global Carbon Emission Control a Global Supply Chain Model

Yuan Fang, School of Management, University of Science and Technology of China, Hefei, China, Yugang Yu, Ye Shi

Motivated by the strategic production problem in a global manufacturing network, we study the impact of carbon tariff on the choice of production policies. Our paper conducts an analytical model to explore the operation decision by global supply chain managers under carbon tariff regulation. Exporting to domestic sales and invest green technology will be two candidates responses for suppliers without carbon reduction policies. Numerical examples in our paper further test our insights, and the outcome is consistent with our model analysis. We derive the optimal supply chain decisions for each case and find that carbon tariff policy is not always benefit for controlling global carbon emission.

#### 4 - Customer Concentration and Supplier's Corporate Social Performance

Jia Gao, PhD Candidate, Shanghai Jiaotong University, 1954, Huashan Road, Shanghai, 200030, China

Although there are extensive studies about Corporate Social Performance (CSP), our understanding of CSP in supply chain context is limited. In this study, we first identify the correlation between customer concentration and supplier's CSP. Then we investigate several key factors to help to explain this correlation.

### 5 - Examining Factoring Financing Strategies with Credit Insurance for Capital-constrained Supply Chain

Xun Xu, Assistant Professor, California State University, Stanislaus, One University Circle, Turlock, CA, 95382, United States, Nina Yan, Baowen Sun

This study examines and compares two factoring financing strategies: supplier insurance and factor insurance for supply chain using credit insurance. We use game theory models to find the optimal operations and financing decisions of supply chain participants, which include supplier, retailer, insurer, and factor. We find although the optimal decisions are different under the two strategies, both increase the profit of whole supply chain. We conduct empirical studies validating the modeling results. We provide implications of implementing factoring financing strategies to alleviate the SME retailers' financial constraints and enhance the supply chain performance.

### Practice- Supply Chain Management IV

Contributed Session

Chair: Matthew Petering, University of Wisconsin-Milwaukee, Industrial and Manufacturing Engineering Dept, Ems E367, Milwaukee, WI, 53201, United States

#### 1 - Sharing Demand Forecast with Common Retailer under Competition

Aditya Jain, Baruch College, Zicklin School of Business, 55 Lexington Ave, Suite 9-240, New York, NY, 10010, United States

We consider two competing manufacturers' decision to share private demand information with a common retailer. We show that the incentive to share information diminishes with competition intensity, which is contrary to existing results without competition, as well as investigate manufactures' investment in gathering information.

#### 2 - Strategic Management of Humanitarian Supply Chains for Disaster Relief and Readiness

Seong-Hyun Nam, Professor, University of North Dakota, 2517 Sand Hills Ave., Grand Forks, ND, 58201, United States

This research project will also examine the option contract pricing approach to the relief supply chain management and discuss in more detail about how the model presented in this paper can help the humanitarian supply chain managers make strategic decisions on their goal achievement.

#### 3 - Ranking of Key Supply Chain Enablers in Small and Medium Enterprise with Reference to Indian Handloom Sector

Tarunima Mishra, Research Scholar, Indian Institute of Technology, Kharagpur, D 507, Nivedita Hall, Kharagpur, 721302, India, Jitesh J. Thakkar, Kunal Kanti Ghosh

Handloom industry lies in SME which is the second largest sector providing employment to rural people in India but it is battling for its survival. This paper attempts to study and prioritize various enablers responsible for poor performance of small and medium industry while focusing on handloom industry with the help of interpretive structural modelling (ISM) and MICMAC analysis.

#### 4 - The Impact of Supply Chain Disruptions on Organizational Performance: A Literature Review

Mansoor Shekarian, Graduate Student, North Carolina A&T State University, Greensboro, NC, 27408, United States, Mahour Parast

This paper examines the effect of supply chain disruptions on organizational performance. We employ a systematic literature review to identify different conceptualizations and theorizations of supply chain disruptions, and to understand how different types of supply chain disruptions affect organizational performance. We later discuss organizational capabilities (resilience enhancers) that can improve an organizational response to supply chain disruptions. Finally, we outline future research directions in supply chain risk management and supply chain resilience.

#### 5 - Inventory Control with Flexible Demand: Cyclic Case with Multiple Batch Supply and Demand Processes

Matthew Petering, Associate Professor, University of Wisconsin-Milwaukee, Industrial and Manufacturing Engineering Dept, Ems E367, Milwaukee, WI, 53201, United States, Xi Chen, Wen-Huan Hsieh

We introduce, and present methods for solving, the cyclic inventory control problem with multiple flexible batch supply and demand processes. The objective of this new problem is to minimize the average or maximum amount of inventory of a single item that is held during a cycle of given length in a buffer whose stock is replenished by multiple batch supply processes and consumed by multiple batch demand processes. The problem is noteworthy in that the decision maker has control over the timing and lot sizes of all supply and demand processes. Thus, demand is flexible.

### Optimization III

Contributed Session

Chair: Mohsen Mohammadi Dehcheshmeh, University of Louisville, 2301 S. 3rd St., Louisville, KY, 40292, United States

#### 1 - Designing and Optimizing an Integrated Platelet Supply Chain Network Considering Transshipment

Yuan Xu, PhD Candidate, North Dakota State University, 1045 17th Ave N. 161 Unit, Fargo, ND, 58102, United States, Joseph Szmerekovsky

Given the perishable and lifesaving characteristics of blood, unpredictable and unbalanced supply and demand incur a lot of waste due to expiry. Transshipment can help organizations deal with demand variability and stock outs, which will lead to a more balanced supply chain system. In this study, a mixed integer programming model considering blood transshipment for an integrated platelet supply chain is developed to minimize total operational cost under centralized control. The developed model considers multiple sources of supply and stock age information. Effects of demand variation, age composition, and transshipment will be analyzed.

#### 2 - Using Probability Dominance for Experimental Analysis of Algorithms

Hesam Shams, University of Tennessee, 851 Neyland Drive, 525 John D. Tickle Engineering Building, Knoxville, TN, 37996, United States, Oleg Shylo

We describe a framework for comparing optimization algorithms based on the concept of probability dominance. This approach provides a rigorous assessment of algorithms' performance, which is intuitive and statistically sound. It can be widely used as a tool for algorithm design and development in the operations research.

#### 3 - The Outcome Interval Problem

Mohsen Mohammadi Dehcheshmeh, University of Louisville, 132 Eastern Pkwy, J.B. Speed School of Engineering, Louisville, KY, 40292, United States, Monica Gentili

We introduce and study a new problem, namely the outcome interval problem, to quantify externalities in decision making under uncertainty. The outcome interval problem consists of determining the best and worst values of a given linear function (namely, the outcome function) over the optimal solutions of an interval linear optimization problem. We present some theoretical properties of the outcome interval problem and solve it heuristically and exactly. A comprehensive experiment is conducted to evaluate the performance of our methods and a real case study on healthcare access measurement is presented to show the importance of the problem for reliable decision making.

### Health Care III

Contributed Session

Chair: Nooshin Hamidian, University of Tennessee-Knoxville, Knoxville, TN, 37920, United States

#### 1 - Improve the Quality of Care After Discharge by Selecting a Referral Network of Skilled Nursing Facilities

Yunsi Yang, Washington University in St. Louis, St. Louis, MO, 63130, United States, Fuqiang Zhang

Since the implementation of the Affordable Care Act (ACA), hospitals become more incentive to improve the care patient receive after discharge. To improve the efficiency of discharge planning, hospitals are seeking to collaborate with high-quality Skilled Nursing Facilities (SNF) and narrow down referral list. Bed reservation program and Preferred Network are two schemes commonly used to create the referral network. Considering hospital facing with uncertainty from patient choice and availability of SNF beds, we provide an algorithm for hospital to select a portfolio of SNFs for these two schemes.

#### 2 - Codified Knowledge Sharing and Operational Failures in Healthcare: Evidence From NHS Hospitals' Risk Management Documents

Mecit Can Emre Simsekler, Khalifa University of Science & Technology, Dept. of Industrial & Systems Engineering, Abu Dhabi, United Arab Emirates  
Mecit Can Emre Simsekler, UCL School of Management, London, United Kingdom, Bilal Gokpinar

Considering two key components of knowledge sharing among healthcare personnel, (i) codified in the form of written documents and (ii) tacit with behaviors and daily practices, we examine how knowledge sharing capabilities in healthcare settings translate into risk management performance. We employ a

unique dataset from the NHS acute trusts in England to investigate our hypotheses.

#### 3 - A Physicians and Medical Staffs Scheduling Problem in Hospitals with Multi-branches

Wenjuan Fan, Hefei University of Technology, No. 193 Tunxi Road, Hefei, 230009, China

This paper investigates the scheduling problem of physicians and medical staffs in large hospital with multi-branches. Each branch has its own medical staffs, while the physicians need to serve in all the branches affiliated to the hospital. The paper takes into account the demand and the available resources of the hospital, the workload of physicians and medical staffs, etc. as the constraints, and the objective is to minimize the dissatisfaction of physicians, and the cost of physicians. Then, a hybrid meta-heuristic algorithm SCA-VNS combining a Sine Cosine Algorithm (SCA) and variable neighborhood search (VNS) is proposed to solve this problem.

#### 4 - Control of an Infectious Disease in a Metapopulation

Ceyda Yaba, Clemson University, 110A Martin Circle, Central, SC, 29630, United States, Burak Eksioglu, Amin Khademi

An infectious disease for which there is no cure can quickly spread in a metapopulation with devastating consequences. Spreading of such a disease can be represented via a compartmental model. We modeled this problem as a Markov Decision Process, to control the spread of the infection by quarantining the infectious individuals. However, due to the curse of dimensionality, we solve the problem by an approximate dynamic programming (ADP) approach. We also compare the policy obtained from ADP with other benchmark heuristic policies, such as restless bandit, and one-step look-ahead policy. We then simulate our results for the 2014 Ebola epidemic in Sierra Leone.

#### 5 - House Calls and Office Visits: A Primary Care Model for Aging People Using Multi-objective Approach

Jennifer L. Mendoza-Alonzo, University of South Florida, Tampa, FL, 33613, United States, Jos Zayas-Castro

In the US, the elderly population will nearly double in the next 20 years. The primary care delivery system needs to be enhanced to face the new challenges of an aging population. Aligned with the health care reforms, this creates a "perfect storm for the development of house call models. This study analyzes from a strategic level, three perspectives: organization, patient, and care worker, in a mixed model-house calls and office visits- for people 65 years and older, using multi-objective optimization and Nash bargaining solution of an integer-programming model. It is expected to generate evidence about the possible benefits of this sub-model under the emerged model: patient-centered medical home.

#### 6 - Application of Mixture Model to Identify Risk Factors Corresponding to Heart Disease

Nooshin Hamidian, University of Tennessee-Knoxville, 851 Neyland Dr, Knoxville, TN, 37996, United States, Hamparsum Bozdogan, Rapinder Sawhney

This study explores critical features impacting heart disease for males and females. It investigates whether features contributing to heart disease significantly vary for males and females and determines the critical risk factors for both genders. A medical dataset, Cleveland dataset (UCI, 2009) is used. The Mixture model technique such as the kernel mixture model is applied to classify sick males and females. To select the best mixture models, we use information criteria such as ICOMP. The best mixture model identifies different subpopulations of patients. We study whether these subpopulations are associated with gender and determine the critical risk factors corresponding to each gender.

## ■ TC83

Hyatt, Remington

### Practice- Health Care III

Contributed Session

Chair: Haolin Feng, Sun Yat-sen University, Lingnan College, Guangzhou, 510275, China

#### 1 - Optimal Resource Allocation Policies in Nonprofit Organizations

Faisal M.M. Alkhannan Alkaabneh, Cornell University, Ithaca, NY, 14850, United States, Siddhartha Banerjee, H. Oliver Gao

We develop a framework for resource allocation, in the context of food banks operations, to help food banks optimize their share allocation policies by considering the nutrition needs of served population. To this end, we propose a convex programming model, a mathematical model whose solution provides a provable utility optimal policies. Through a novel mathematical model and the utilization of decomposition techniques, we arrive at two simpler sub-problems that can be solved efficiently. We prove that both sub-problems can be solved in polynomial time.

## 2 - New Models and Algorithms for Operating Room Scheduling Problems

Yang Wang, Associate Professor, Northwestern Polytechnical University, 127 West Youyi Road, Xi'an, 710072, China,  
Xue Yang, Haichao Liu, Haibo Wang

We propose new continuous and discrete mathematical programming models and design dedicated algorithms for solving operating room scheduling problems. The throughput of surgical patients, overtime of operating rooms and satisfaction of patients are optimized. Our algorithms incorporate new coding/decoding rules to represent feasible scheduling and dynamic programming guided scheduling strategy to significantly reduce computational time. We perform extensive experiments on both simulated and real-life hospital data to verify the merit of this study.

## 3 - Teaching Healthcare Process Management using Discrete Event Simulation

Chester G. Chambers, Asst. Professor, Johns Hopkins University, 100 International Drive, Baltimore, MD, 21202, United States

In this case study we use Discrete Event Simulation to teach about management of patient flow in an outpatient clinic. Students are provided with simulation models built using actual clinic data. Students explore issues involving patient punctuality, parallel activities, pre-processing, and appointment scheduling. This case has been used successfully with a wide array of students to teach about ways to develop process measures, experiment with process improvements, and evaluate potential results from interventions. The case serves as a course capstone to tie together elements of experimentation, process analysis, and process improvement.

## 4 - Optimal Experimental Design for a Partially Observable Simple Birth Process

Ali Eshragh, Senior Lecturer, The University of Newcastle, Newcastle, 2308, Australia

Our goal is to estimate the rate of growth,  $\lambda$ , of a population governed by a simple birth process. We may choose  $n$  time points at which to count the number of individuals present. But due to detection difficulties, we are able only to observe each individual independently with fixed probability  $p$ . We discuss the optimal times at which to make our  $n$  observations in order to maximise the Fisher Information for the birth rate  $\lambda$ . Finding an analytical form of the Fisher Information appears intractable. Nonetheless, we utilise the concept of generating functions to develop a new algorithm to maximise the Fisher Information. Our numerical results reveal the efficiency of this new algorithm.

## 5 - Clinic Scheduling with Patient Re-entrants

Haolin Feng, Sun Yat-sen University, Lingnan College, Guangzhou, 510275, China, Mark Lawley, Michelle M. Alvarado, Stephen Steidle

We consider a clinic scheduling with same-day patient re-entrants. The motivation is Mohs Micrographic Surgery (MMS), a surgical method for skin cancer excisions. It repetitively removes and examines one skin layer at a time until a cancer free layer is found. Current scheduling practice results in long in-clinic waiting and doctor overtime due to the stochastic nature of excision and pathology. We develop a model for MMS clinic scheduling to improve patient experience and clinic revenues. The model captures the key characteristics of the surgery-pathology and stochastic re-entrants. Theoretical results and numerical study based clinical data are provided to demonstrate the benefit of the method.

## 2 - Design Cost and the Birth of User Entrepreneurs

Ohchan Kwon, Harvard Business School, Wyss House, Soldiers Field, Boston, MA, 02163, United States

This paper examines how a reduction in design cost affects the entrepreneurial entry in the context of the video game industry. I exploit a sudden business model innovation of a major game engine software company, which provides the low-cost licensing option to some user innovators if their existing contents are compatible, but not others. I find that when the licensing cost decreases dramatically, user innovators are more likely to release independent games based on their prior innovation. The effects are stronger if the innovators' idea is of high-quality.

## 3 - Coexistence of Quality and Innovation an Automotive Perspective

Donna L. Bell, Wayne State University (Detroit, MI), Redwood City, CA, 94063, United States, Ratna Babu Chinnam, Julia Gluesing

In a time when the consumer electronics industry is getting new products to market at a rapid rate, automotive manufacturers must identify ways of getting new products and features to customers faster and with high quality to maintain or increase market share. We provide an analysis of the interviews and surveys completed by professionals of a global automotive company in understanding the impact that quality requirements have on innovation and the advanced product design process.

## 4 - Too Much is Not a Good Thing: The Inverted U-shaped Relationships of Average Tie Strength, Structural Holes, Intraorganizational Knowledge Search and Transfer

Wei Wang, PhD Student, Xi'an Jiaotong University, No.28, Xianning West Road, Xi'an, Shaanxi, 71, Xi'an, 710049, China, Xiaoming Sun, Antonio Capaldo, Wentian Cui

In this paper, we predict both average tie strength and structural holes exert inverted U-shaped effects on intraorganizational knowledge search and transfer by inventors and further suggest above relationships are flattener in key inventors compared to normal ones. Analysis of American patent data of 33 largest pharmaceutical firms worldwide from 1975 to 2014 offers support for our conjectures, except for the relationship of average tie strength and intraorganizational knowledge search, which is a gradually diminishing positive curve instead. We thus advance network research on knowledge flow by confirming the existence of curvilinear relationships and adding inventor attributes.

## 5 - Green Entrepreneurial Orientation for Enhancing Firm Performance: A Dynamic Capability Perspective

Wenbo Jiang, PHD, Northwestern Polytechnical University, Chang'an Compus, Xi, 710129, China

Despite much attention has been focused on the importance of green entrepreneurial orientation, its impact on environmental and financial performance remains unclear. Drawing on dynamic capability theory, we hypothesized that green entrepreneurial orientation has positive influences on two dimensions of firm performance, and green technology dynamism and knowledge transfer and integration play moderating roles in the relationship between green entrepreneurial orientation and firm performance. We tested the research hypotheses using data from 264 Chinese firms. This study enhances our understanding of green entrepreneurial orientation, as a dynamic capability applied in the firm.

## 1 - Advancing Digital Transformation: Integrating the Problem Space, the Solution Space, and the Quality Space for Successful Digital Transformation

Munir Majdalawieh, Associate Professor, Zayed University, Mirdif, Dubai, 19282, United Arab Emirates

Many c-suite executives are facing various challenges such as rigid processes, risk avoidance, digital disruption, interdepartmental conflict, disinterest in new ideas and complacency to move forward. These challenges require a vastly different approach to transform companies. The objective of this paper is to propose an integrated framework for problem space (design thinking), solution space (lean startup, Agile, SDLC), quality space (total quality management, six sigma) and change management space methods for successful digital transformation.

## 1 - Training Data Construction for Recommender Systems

Hanisha Vemireddy, Iowa State University, Ames, IA, 50011, United States, Sigurdur Olafsson

Recommendation systems provide predictions of user preferences based on prior ratings by the user. For users with only a few ratings, the quality of the recommendations may be low. Addressing this shortcoming, we develop an approach that uses modified rating for similar users to improve recommendations for the target user.

## 2 - Clustering with Incomplete Proximity Matrices

Samira Karimzadeh, Iowa State University, Ames, IA, 50011,  
United States, Sigurdur Olafsson

In data clustering, we sometimes only have an incomplete proximity matrix available to measure distance. This compromises the quality of the clusters, especially when values are not missing at random. Addressing this, our study proposes an effective graph theory method to complete values that are not missing at random.

## 3 - Sentence Embedding Module Satisfying a Characteristic of Human Language Recognition

Myeongjun Jang, Korea University, Seoul, Korea, Republic of,  
Pilsung Kang

Sentence embedding is an important topic in natural language processing (NLP). It is essential to generate a good embedding vector to enhance performance for many NLP tasks. So far, various models have been proposed and claim their superiorities through the good performance for sentiment analysis and text classification. However, since the performance of those tasks can be enhanced by using a simple sentence representation method, it is not sufficient to claim that they are good embedding methods. In this paper, inspired by human language recognition, we suggest the concept of semantic coherence that a good sentence embedding method should satisfy and propose the model to pursue this property.

## 4 - Prediction of Performance Deterioration for Solid Oxide Fuel Cell System

Jumpei Kawasaki, Tokyo Gas Co Ltd, Minato-ku, Tokyo, 105-8527,  
Japan

Although solid oxide fuel cell is an environmentally friendly system with high power generation efficiency and low carbon dioxide emissions, early fault detection and prediction of performance deterioration of the system components, especially fuel cell stacks, is required for further operation stabilization and maintenance optimization. In this study, the correlation of about 300 system parameters measured for 4000 hours and the power generation performance of the fuel cell stack is examined using machine learning technique, and performance deterioration prediction method is constructed which is expected to contribute for stabilization and cost reduction of operation.

## 5 - ELM-SOM: A Continuous Self-organizing Map for Visualization

Renjie Hu, Research Assistant Professor, University of Iowa,  
Iowa City, IA, 52242, United States

This paper presents a novel dimensionality reduction technique: ELM-SOM. This technique preserves the intrinsic quality of Self-Organizing Maps (SOM): it is nonlinear and suitable for big data. It also brings continuity to the projection using two Extreme Learning Machine (ELM) models, the first one to perform the dimensionality reduction and the second one to perform the reconstruction. ELM-SOM is tested successfully on six diverse datasets. Regarding reconstruction error, ELM-SOM is comparable to SOM while bringing continuity.

## 6 - Deep Convolutional Networks for Forgery Classification and Anomaly Detection

Zohreh Raziei, Southern Methodist University, Dallas, TX, United States, Xinyi Ding, Eric Larson, Michael Hahsler, Paul Krueger, Eli Olinick

We apply Convolutional Neural Networks (CNN) to identify fake photographs. Using medium-to-high-resolution images, we combine an auto-encoder-based neural network with explicit facial modeling to generate swapped faces of celebrities and compare the CNN's performance to approximate pairwise rankings inferred from judgement of human subjects.

## 7 - Optimal Design of Experiments on Riemannian Manifolds

Hang Li, Pennsylvania State University, State College, PA, 16803,  
United States, Enrique Del Castillo, George Runger

In recent years, scientists and engineers often need to deal with large volumes of high-dimensional data. Sometimes these data are available in a high-dimensional ambient space but they truly lie on a lower-dimensional manifold. The objective of this research is to develop theory of optimal experimental design on manifold data. In particular, we prove a new Equivalence Theorem for continuous optimal design on Riemannian manifold, and also provide a converging algorithm to find the optimal design.

## 8 - WeCureX Intelligent Psychiatry Assistant

Salih Tutun, Binghamton University (SUNY), Johnson City, NY, 13790, United States, Sedat Irgil, Ilker Yesilkaya, Ahmet Aykac, Nilay Aras, Begum Basaran Tutun

The aim of this research is to propose a new intelligent system (namely WeCureX) by using artificial intelligence approaches and psychometrics values for detecting major symptoms of social and personal maladjustment, assessing medical patients and design effective treatment strategies with high accuracy rates. Therefore, in this research, we will show how to identify symptoms for the SCL-90 test. We proposed optimized Lasso Logistic Regression and outlier detection. Finally, the results show that it works with 97% accuracy, and this system can be used by experts and patients for better treatment.

## 9 - A Framework for Five Big V's of Big Data and Organizational Culture in Firms

Thuan Nguyen, University of North Texas, Denton, TX, 76203,  
United States

Based on Cameron and Quinn's organizational cultural model, this study proposes a theoretical framework that describes how each type organizational culture - hierarchy, clan, adhocracy, and market - has an impact on each Big V of big data. The framework suggests that firms, influenced by their organizational culture, have different views on how important each Big V's should be. The study argues that organizations should develop, nurture, and maintain an adhocracy organizational culture that has a positive impact on each of the five Big V's of big data to harness the full potential of big data.

## 10 - Two Stage Aggregate Production Planning with Flexible Requirement Profiles

Setareh Torabzadeh, University of North Carolina-Charlotte,  
Charlotte, NC, 28262, United States, storabza@uncc.edu,  
Ertunga Ozelkan

This Research investigates on the aggregate production planning problem, using a flexible optimization approach, called: Flexible Requirement Profile, which enforces flexible bounds on production levels in different planning periods to improve the stability of the production plans. Due to the uncertainty of future periods demand estimation, the stochastic programming approach is incorporated into the optimization framework.

## 11 - Degradation Models of Biopolymers Under Accelerated Weathering Conditions

Elias Arias Nava, New Mexico State University, Las Cruces, NM, 88001, United States, Delia Valles-Rosales

Research in renewable products with the potential to replace fossilized matter as raw materials for energy and materials use is at the forefront of modern science and engineering. This project designs new degradation models that could provide reliable lifetime data of biopolymers. The goal associated with this study is to present a new degradation model(s). Specimens were manufactured under ASTM standards using extrusion and injection molding; followed by 2000 hours of accelerated degradation test. The accelerating variables were: temperature, humidity, UV exposure and time. Multivariate analysis of five responses were analyzed: tensile, flexural, color change, mass loss, and FTIR analysis.

## 12 - Berth Scheduling at Marine Container Terminals: Minimizing Carbon Dioxide Emissions Due to Container Handling

Maxim A. Dulebenets, Florida A&M University-Florida State University, Tallahassee, FL, 32311, United States, Olumide Abioye, Ren Moses, Eren Erman Ozguven, Arda Vanli, Thobias Sando

This study presents a mixed integer programming model for the green berth scheduling problem, which accounts not only the total vessel service costs, but also considers the cost associated with the carbon dioxide emissions produced due to container handling. A set of Hybrid Evolutionary Algorithms are proposed to solve the mathematical model. Numerical experiments demonstrate that introduction of local search heuristics within the developed algorithms improved the quality of the obtained solutions. Furthermore, changes in the carbon dioxide emission cost influence the berth schedule design.

## 13 - Dynamically Scheduling National Football League Games to Reduce Strength of Schedule Variability

Jamie Fravel, Furman University, Greenville, SC, 29613, United States, Elizabeth Bouzarth, Andrew Cromer, Ben Grannan, Kevin Hutson

The NFL schedules games where some matchups are based on the previous year's results. Since team composition changes from year to year, this scheduling policy sometimes benefits teams unfairly, allowing some an easier path to the playoffs than others. Thus, strength of schedules vary between teams and arguments have to be made why some teams make the playoffs and others do not. We propose methods to produce an NFL schedule that combines some of its traditional elements with dynamically-scheduled games aimed at optimizing different objectives, such as reducing the variability of teams' strengths of schedules or minimizing the number of pairwise comparisons needed to differentiate team quality.

## 15 - User-based Rebalancing Approach for Free-floating Bike Sharing Systems

Yan Wang, The University of Hong Kong, Hong Kong, Hong Kong, Junwei Wang

This work studies the rebalancing problem in FFBS, which aims at reconfiguring the spatial and temporal distribution of bikes so that supply matches demand. We propose the first model specially designed for FFBS. Based on our original Radiant Service Theory (RST), the model describes the real-time status of the system. Also, we develop the first user-based rebalancing approach for FFBS. A dynamic incentive mechanism that encourages users to change parking places to problematic locations is presented. Finally, simulation results show the effectiveness of the mechanism and suggest it best fits a system with modest bike amount, high unbalance degree, and users sensitive to incentives.

**16 - Framing in Supplier Selection Problem**

Somaye Ramezanzpour Nargesi, PhD Candidate, University of Texas at Arlington, Arlington, TX, 76015, United States, Kay-Yut Chen

One of the crucial steps of procurement process is supplier selection. Assuming that the supply management of the company is single sourcing, the real problem will be a multi-attribute trade off decision to choose one supplier from several. In this research we tackled this problem from behavioral economy stand point. We administered experimental design to investigate the effect of two types of framing (Content and Information Framing) on this multi-attribute trade-off decision and found out that both types of framing matter in a meaningful way.

**17 - Impacts of Government Subsidies on Cooperative Game Pricing for China Railway Express and Freight Forwarders**

Jingru Ren, Southwest Jiaotong University, Chengdu, China, Yinying Tang, Qinglin Li, Weidong Dai

China's subsidies to China-Europe express can be divided into subsidies for CHINA RAILWAY Express and freight forwarders. To study the impacts of subsidies on cooperative pricing strategy for the Express and forwarders, considering market demand fluctuation, the Stackelberg game model under different subsidy objects and Nash model under non-subsidy situation have been established. The optimal contract pricing strategy, freight volume and market pricing strategy have been obtained. A numerical example has been used to verify the validity of the models and to analyze the impacts of different subsidy policies on both sides' revenue and supply chain revenue when market demand fluctuates.

**18 - Project Team Communication and Understanding Cycles of Mental Model Convergence**

Deanna Kennedy, Associate Professor, University of Washington, Bothell, WA, 98011-8246, United States

Project teams are thought to produce better quality outcomes than individuals working alone. Yet, given the inconsistency of teamwork effectiveness found by researchers for at least the last 35 years, there is still much to be learned about why teams achieve, or fail to achieve, more than the sum of their parts. Herein, I look at team mental models, cognitive repositories containing abstract representations relevant to taskwork and teamwork activities, and model the system to understand the dynamics of shared and accurate team mental models over time. This research uses agent based modelling and particle swarm optimization to study the system and provide preliminary analysis about teams over time.

**19 - The Effects of Manager's Perception on Intellectual Property, Innovation, and Firm Performance**

Giyoon Kwag, Illinois Institute of Technology, Chicago, IL, United States, Sejun Park, Taewoo Roh

Analyzing survey data from CEOs collected by Science and Technology Policy Institute (STEPI) in South Korea, we establish further understandings on the Intellectual Property (IP) and its impacts in the perspective of CEOs. The research investigates how the CEOs' attitude toward IP affects the firm performance through product, process, organization and marketing innovations. This study examines the direct and indirect effects of IP on innovation and financial performance with the structural equation method (SEM) and captures the mediating role of innovation between IP and financial benefits.

**20 - Stochastic Programming-based Bypass Strategy for Acute Stroke Patients and EVT Resource Re-distribution**

Ting-Yu Liu, National Tsing Hua University, Hsinchu, Taiwan, Ming-Ju Hsieh, Chun-Han Wang, Yu-Ching Lee, Wen-Chu Chiang

The prognosis performance of endovascular therapy (EVT) is shown better than thrombolysis in the patients with acute ischemic stroke (AIS) caused by large vessel occlusion in recent clinical medical research. Yet EVT resources are available only in a few number of comprehensive stroke centers. According to stroke symptom severity and geographic information, we develop a bypass strategy for AIS patients using a stochastic programming model to decide a comprehensive stroke center where the patient should be sent. Policy of reduction or expansion of EVT hospitals can further be facilitated.

**21 - An Integrated Approach to Train Timetabling and Rolling Stock Circulation in Urban Rail Transit Lines**

Bum Hwan Park, Korea National University of Transportation, Uiwang, Korea, Republic of

There have been many tries to reduce travel time in rail transit. One of them is to diversify the stop patterns to provide faster trains to the passengers. Diversifying the patterns makes it difficult to find an optimized plan since there are some operational constraints like overtaking, complicated headway to consider. And a rolling stock circulation can not be easily found due to different running times. We present a network model to consider timetabling and rolling stock circulation, simultaneously. We first find a circulation with available stocks, which may be not feasible. And then the model finds an optimal circulation with shifted arrival and departure time by column generation approach.

**22 - Optimizing Green Infrastructure Placement Under Precipitation Uncertainty**

Masoud Barah, University of Tennessee, Knoxville, TN, 37996-2315, United States, Anahita Khojandi, Xueping Li, Jon Hathaway, Olufemi A. Omitaomu

Green Infrastructure (GI) practices are low cost, low regret strategies that can contribute to urban runoff management. However, questions remain as to how to best distribute GI practices through urban watersheds given the precipitation uncertainty and the hydrological responses to them. We develop a stochastic programming model to optimize placement of GI practices in a watershed to minimize the excess runoff under medium-term precipitation uncertainties. The model was calibrated using precipitation projections and the associated watershed hydrologic response. The optimal GI placement is identified for an urban watershed in a mid-sized city in the U.S.

**23 - A Three-level Defender-attacker-operator Problem Against Cyber-attacks in Electric-gas Systems**

Bining Zhao, Lehigh University, Bethlehem, PA, 18015, United States, Alberto Lamadrid, Rick Blum

The interdependence between natural gas and power systems is increasing rapidly. Availability of natural gas for gas-fired units can impact the secure operation of power systems. Fuel supply shortage for gas-fired generators can be caused by uncertain interruptible supply and incorrect supply information. This work proposes a trilevel min-max-min optimization problem to provide the power system operator a practical tool to protect critical fuel supply information from man-in-the-middle cyber-attacks, and also the strategies to sign firm supply contract to reduce gas supply uncertainties. Column and constraint generation (C&CG) algorithm is employed to solve the proposed problem.

**24 - Dandelion Algorithm: A New Meta-heuristic Based on the Wind Markov Chain**

Kihyuk Yoon, UNIST, Ulsan, Korea, Republic of, Jongkyung Shin, Chiehyeon Lim, Chiehyeon Lim

This work proposes a new meta-heuristic algorithm called the dandelion algorithm (DA). The DA is inspired by the dispersal of dandelion seeds by wind. Such dispersal can be considered as a random walk for optimization and may be affected by flower height (i.e., objective value) as well. In the DA, the two essential phases of optimization, exploration and exploitation are achieved during the designed mechanisms of planting, growth and survival, and seed dispersal. Several engineering problems are used for evaluation, and the result is compared with those of several existing algorithms. Results show that the proposed DA is powerful.

**25 - Algorithms for the Mean Steady-state Waiting Time in the GI/GI/1 Extremal Queue**

Yan Chen, Columbia University, New York, NY, 10027, United States, Ward Whitt

The effective algorithms are developed to compute the steady-state mean waiting time of extremal GI/GI/1 queues. We establish two reductions for an extremal queue, reducing it to D/GI/1 and GI/D/1. The idle time simulation algorithms are exploited to estimate first two moments of idle time and then compute E[W] by associated equilibrium excess distribution of idle time. Also, the paper exploits fast numerical algorithms for the extremal queue, one is using the negative binomial recursive formula, and another is considering an equivalent discrete-time Markov chain recursion. The computational results for different cases of c2a, c2s are compared with known approximations and bounds.

**26 - Dynamic Routing in a Many-server System with Costly Information**

Junfei Huang, The Chinese University of Hong Kong, Shatin, N.T., Hong Kong

We study a multiple-station queueing system with a single class of customers and many servers in each several stations. Upon a customer's arrival, the system manager decides which station the customer should be routed to. The station information retrieval is costly. We propose routing policies that are proved to be asymptotically optimal in minimizing the long-run average waiting cost plus the information retrieval cost.

**27 - Revised Adaptive Linear Programming Algorithm**

Lin Guo, The University of Oklahoma, Norman, OK, 73071, United States

We revise the Adaptive Linear Programming (ALP) algorithm. ALP is a linearization algorithm with limitations: its critical parameter Reduced Move Coefficient (RMC) is determined with heuristics and there is no mechanism of updating it to get more desired solution; little knowledge on the association between RMC and model behavior has been explored; no generic criteria for the designer to evaluate the quality of the results. To fill in the gaps, we revise the algorithm by using the insight obtained from post-solution analysis into the critical parameter updating to remove the heuristics. We use a test problem to examine the performance of the revised ALP algorithm and validate its advancement.

**28 - Land-use Optimization of a Watershed for Nutrient Reduction Under Stochastic Weather Conditions**

Gorkem Emirhuseyinoglu, Iowa State University, Ames, IA, United States, Sarah M. Ryan

Agricultural runoff causes nutrient loads in waterways and creates a hypoxia zone downstream, which threatens oceanic life. We build a land-use optimization model to minimize the cost for a watershed to meet target reductions in nitrate and phosphorus levels under stochastic weather conditions. Results are illustrated using an online tool.

**29 - Stochastic Programming Models to Plan for Distributed Generation Under Wind Power Volatility**

Clara Novoa, Associate Professor, Texas State University, Clara Marcos, TX, 78666, United States, Temitope Runsewe, Jordan Givens, Tongdan Jin

We present non-linear stochastic integer programming models to find the optimal wind turbine capacities and locations that minimize costs of adopting renewable energy considering loss-of-load probability, thermal constraints, and volatilities on wind turbine power generation. The models solve exactly and through simulation optimization. The models include scenarios that represent the wind speed across the turbine blades over the different operational phases of the wind turbines. Wind speed data collected for Wellington, New Zealand and Rio Gallegos, Argentina permit to estimate the probabilities associated to the scenarios and illustrate the benefits of the stochastic models.

**30 - Stochastic Dynamic Markov Decision Process on Airport Security Checkpoint Demand Shifting**

Nigel Pugh, PhD Student, North Carolina A&T State University, Greensboro, NC, 27409, United States, Hyoshin Park

Airport Delays known to cost airport operation of U.S. airlines billions of dollars each year. In this paper, we focus on reducing airport congestion from both passenger and airport operations perspectives. This is accomplished through incentivizing the passenger to switch arrival times to encourage a system optimal. The demand is then used as an input for worker assignment problem of switching airline workers based on current demand. A Markov Decision Process is proposed to maximize reward by making best decision of whether to switch airline worker security checkpoint location depending on the current demand of the congestion state.

**31 - Data Analytics in Agricultural Business**

Hieu Pham, Syngenta, Slater, IA, 50244, United States

Advancing analytical techniques in agriculture are vital to satisfying increased food demand. At the forefront of the agricultural data science, revolution is Syngenta with innovative machine learning algorithms (sparse biclustering) and novel optimization models (portfolio selection) to mitigate world hunger.

**32 - A Novel Dynamic Routing Framework for Shared Mobility Services**

Yue Guan, Massachusetts Institute of Technology, Cambridge, MA, 02139, United States

Shared Mobility on Demand (MoD) services like Uber, Lyft, and Didi have shown that a continuum of solutions can be provided between traditional private transport and public mass transit. Here we propose a novel shared MoD framework which generates a dynamic route for multi-passenger transport, using a new concept of space window that introduces a degree of freedom to help reduce system cost in designing the optimal route. An Alternating Minimization based algorithm is developed. Its analytical properties are characterized. Detailed computational experiments are carried out that demonstrate its advantages in computational efficiency and optimality compared to standard optimization solvers.

**33 - An Agent-based Simulation Model for Assessing a Charging Infrastructure Design for a Public Electric Vehicle Charging Network**

Long Zheng, University of Louisville, Louisville, KY, 40217, United States, long.zheng@louisville.edu, Lihui Bai

We present an agent-based simulation model for performance assessment of the infrastructure design of a public EV charging network. The model, comprised of three agents (EV, battery and charging station), is capable of handling heterogeneous trips in an urban traffic network (e.g., commute, shopping). Further, the model considers a mix of charging sources: public, home charging and workplace charging, available to the EV fleet. The model can be used in conjunction with an optimization model for an optimal design of the charging infrastructure at both strategic and operational levels.

**34 - A New Markov Processes Methodology for Identifying Screening Strategies for Breast Cancer in Low- and Middle-income Countries: Application to Peru**

Vijeta Deshpande, University of Massachusetts, Amherst, MA, 01002, United States, Chaitra Gopalappa, Shifali Bansal

Peru is currently in preparation of a national 'investment case' for the prevention of premature mortalities from non-communicable diseases including breast cancer. This is informed by quantitative economic analysis of current and future health interventions. We apply a Markov process method for

parameterization of a natural cancer progression model for conducting an economic analysis of interventions for Peru. We also apply a Markov decision process model for identifying optimal number of mammography screenings and ages to screen, under different willingness to pay per life-year saved to model the trade-offs in costs and impacts.

**35 - Prediction of Inpatient Length of Stay Using Bootstrap Aggregating Machine Learning Algorithm**

Sohong Chakraborty, California State University, Los Angeles, CA, 90032, United States, Shilpa Balan, Divya Pakhale

Hospitals face the daunting task to provide timely patient care. This research aims at improving the inpatient admission rate by predicting the length of stay in an inpatient care facility. A National Inpatient Sample (NIS) data for the year 2013 is considered for this study, which is available through the Healthcare Cost and Utilization Project (HCUP). We predicted the length of stay of patients using the Bagging or Bootstrap aggregating algorithm. The independent variables considered for this study are age, diseases, diagnosis categories, time of admission, hospital charges and emergency department services. The correlation coefficient for the inpatient length of stay is found to be 0.842.

**36 - A Latent Markov Model for Predicting Return to Work for Injured Workers**

Suyanpeng Zhang, University of Michigan, Ann Arbor, MI, 48109, United States, Haozhu Wang, Mukai Wang, Brian T. Denton, Jenna Wiens, Jon Seymour

We present a data-driven approach based on the use of latent Markov models for predicting the probability of returning to work for workers injured in the workplace. We show how models fit to observational longitudinal data on injuries and follow-up procedures and treatment can be used to classify patients based on sequential observations over time. We demonstrate the proposed approach using longitudinal data from a large national data set.

**37 - Stochastic Optimization Algorithms for Robust Medical Decision Making**

Vinayak Ahluwalia, University of Michigan, Ann Arbor, MI, 48109, United States, Charmee Kamdar, Lauren N. Steimle, Brian T. Denton

Healthcare is increasingly reliant on mathematical models, such as Markov Decision Processes, to monitor disease progression and improve patient care. To address the abundance of parameter ambiguity from clinical data, the Multi-Model Markov Decision Process (MMDP) was invented. We designed a custom branch-and-bound algorithm to solve large, practical MMDPs that was orders of magnitude faster than commercial mixed-integer programming software, for a set of test cases. In addition, we implemented various objective functions allowing for different risk preferences towards parameter ambiguity. We present a relevant medical decision-making case study to illustrate our approach.

**38 - An Analytic Approach to Incorporate the Six Aims for Quality in the Analysis of Trauma Care Services**

Lucy Aragon, Wichita State University, Wichita, KS, 67260, United States, Laila Cure, Karen Schieman

The Institute of Medicine proposed six aims to guide healthcare quality improvement efforts. However, most healthcare improvement programs still evaluate quality along one aim at a time, effectiveness. This research proposes an analytic approach to incorporate all six aims in the evaluation of healthcare quality. A trauma care setting is used to investigate data requirements, develop the methodology and evaluate its implications.

**39 - Impact of Referral Strategy on a Medical Network**

Shao-Jen Weng, Associate Professor, Tunghai University, Taichung City, 407, Taiwan, Ping-Wen Huang

Hospital emergency departments have been becoming more congested, and thus one issue of interest is how to better allocate limited medical resources and make more effective medical care referral strategy decisions. This study thus uses the system simulation to design and simulate a medical system for analyzing different kinds of referral strategies to enhance medical bed usage efficiency in each hospital, and promote the quality of service offered by shortening the waiting times of patients with regard to getting a medical bed.

**40 - Multi-method Simulation Modeling of the Hospital Readmission Reduction Program**

Arlen Dean, Arizona State University, Tempe, AZ, 85281, United States, Michelle Alvarado

The Hospital Readmission Reduction Program (HRRP) was enacted to penalize hospitals with poor readmissions. A multi-method simulation model is created to capture the interaction of hospitals and the insurer under the HRRP. The goal is to improve healthcare quality by studying how a payment adjusting policy affects hospital decision making.

**41 - Addressing Parameter Ambiguity in Medical Decision Making**

Charmee Kamdar, University of Michigan, Ann Arbor, MI, United States

Data driven mathematical models are increasingly being used for medical decision making. However, the parameters used in the mathematical models can be imprecise due to scholarly disagreement or small input data sizes. One way to account for this ambiguity in a Markov Decision Process (MDP) is to use a Multiple Model Markov Decision Process (MMDP) that has many different transition probability matrices. Using an MMDP results in a treatment policy that is more robust to changes in the transition probability matrix. This poster discusses how to construct MMDPs from observational data.

**42 - A Clustering Based Decision Tree Approach for Risk Assessment of Information Security in Smart Cities**

Yana Yuan, PhD Candidate, Northwestern Polytechnical University, Xi'an, 710129, China, Huaqi Chai

The emergence of new information technologies poses challenges to information security in smart cities. Risk is the most prominent challenge. In this paper, we analyze the impact factors of information security in smart cities and evaluate the risk that these factors bring to information security. We aim at establishing a new evaluation index system and building a risk assessment model based on Ward's method and decision tree. Then we present an empirical study on risk assessment of information security in 15 smart cities. We provide a data-based and intelligent method to assess the risks of information security, and give solutions to address the challenges for information security in smart cities.

**43 - Estimating and Analyzing Hazardous Material Flows in Oklahoma**

Ronny Pacheco, Oklahoma State University, Stillwater, OK, 74075, United States, Manjunath Kamath, Farzad Yousefian, Scott Frazier, Babak Farmanesh, Goutham Takasi

We present a unique survey-driven hazardous material flow estimation model for the state of Oklahoma. Our approach begins with a database of Oklahoma commercial facilities, which store materials considered as extremely hazardous substances (EHS). A web-based survey targeting these facilities is used to collect shipment data for the EHS materials handled by these facilities. Shipments are then assigned to routes identified using a shortest path algorithm. A GIS application is being developed to analyze and visualize the flow patterns and intensities of the various EHS materials transported. The results will be useful to Local Emergency Planning Commissions in planning for emergencies.

**44 - Efficiency Study in Public Tenders: Analysis of Framework Agreements in Chile.**

Eduardo Lara, Universidad de Chile, Santiago, 8370456, Chile, Marcelo Olivares, Gabriel Weintraub, Daniela Saban

Framework Agreements (FA) is a commonly used procurement mechanism by governments and large organizations. It is based on an auction-type design to select an assortment of products from multiple suppliers with posted prices, allowing some flexibility and variety to purchasing units. The design of FA requires balancing competition to enter the market with the variety offered inside the market. This paper conducts an empirical study of the FAs used by the Chilean government, identifying inefficiencies in the procurement market, providing improvements to design and conducting a field study to measure the actual effectiveness of the new implemented design.

**45 - The Effects of Video Game Players' Emotions and Experiences on Online Review Ratings**

Pei-Hua Chen, National Chiao Tung University, 1001 University Road, Hsinchu, 300, Taiwan, Li-Chien Cheng

Previous literature suggested that consumers prefer to make purchasing decisions based on online user-generated contents. This study investigated the different effects of video game players' emotions and game playing experiences on professional and general consumer reviews ratings for different kinds of video game genres. Text mining techniques was used to investigate the effects of polarity of online reviews, emotions and gaming experiences on video game sales on amazon.com. The results showed that factors affect review ratings for different genre of games are not the same.

**46 - An Intelligent Design Assistant System Development:****A Case of the Korean Shipbuilding Industry**

Jun-Mo Nam, Ulsan National Institute of Science and Technology (UNIST), Ulsan, Korea, Republic of, Dong-Joon Lim, Yeo-Myung Rho, Je-Kyung Kim, Wook-Hyun Cha

This poster presents a development case of an intelligent design assistant system that can give an insight into: 1) optimal scheduling based on workload estimation; 2) response-bot based on past communication records with shipowners; and 3) design verification based on revision log analysis. We adopt various machine learning techniques including the gradient boosting and similarity matching algorithms to replicate experts' decisions recorded in the legacy system. The system has been successfully integrated into the newly developed project management system and is expected to be deployed as a part of the Smart Shipyard Program of Korea by 2019.

**47 - Modeling Human Decision Making Behavior in Simulation**

Farhad Moeeni, Professor, Arkansas State University, Jonesboro, AR, 72467, United States, Karen Yanowitz, John Seydel

The purpose of this study is to acquire insights into the behavior of people when they encounter waiting lines. It is expected that several theories of decision-making to be examined by this study through controlled laboratory experiments. The first objective is to identify and possibly quantify the important factors that influences people's behavior when they encounter waiting lines, for example balking and renegeing. The second objective is, to apply what we learn, as a result of investigating the first objective, to optimize the queueing systems from the perspectives of both service receivers and service providers.

**48 - Gaussian Mixture Model Based Random Search for Continuous Optimization via Simulation**

Wenjie Sun, Tongji University, Shanghai, China

This paper studies integrated random search algorithms for continuous optimization-viasimulation (COvS) problems. We first tailor the Gaussian process-based search (GPS) algorithm to handle COvS problems. We then analyze the potential sampling issue of the GPS algorithm and propose to construct a desirable Gaussian mixture model (GMM) which is amenable for efficient sampling and at the same time also maintains the desirable property of exploitation and exploration trade-off. Then, we propose a Gaussian mixture model-based random search (GMRS) algorithm. We build global convergence of both the tailored GPS algorithm and the GMRS algorithm for COvS problems.

**49 - An Integrated Simulation Optimization Framework For Controlling A Biological Invader**

Sevilay Onal, NJIT, Newark, NJ, 07103, United States, Najmaddin Akhundov, Esra B y ktahtak Jennifer Smith, Gregory R. Houseman

An aggressive invasive plant, *Sericea*, reduces the abundance and diversity of native plants and causes large economic damage in the Great Plains of U.S. We present an integrated simulation-optimization framework to control this invader. Simulation mimics *Sericea* growth over space and 12 years, while a bio-economic optimization model finds an optimal search and treatment path to minimize its economic damage.

**50 - Consolidation of Picked Orders in a Fulfillment Center with Explosive Storage**

Wen Zhu, New Jersey Institute of Technology, Newark, NJ, 07102, United States, Sanchoy Das

Online fulfillment warehouses, similar to those used by Amazon, typically operate an explosive storage policy. That is, each item is stocked in multiple random locations dispersed throughout the warehouse. Orders are then picked and collected in totes which are assigned to one of many packaging stations. Each multi-item order is therefore located in several totes and must be consolidated or rebined at a packaging station. A perfect assignment is not possible. We formulate the problem a MIP and present a fast heuristic solution.

**51 - Multi-attribute Supplier Selection Model**

Mazen Hussein, Assistant Professor, University of Wisconsin-Platteville, Platteville, WI, 53818, United States

The main purpose of this work is to create a fuzzy logic model to select the most appropriate supplier based on the lowest reduction rate with multiple attributes. A mechanism with certain criteria is used to evaluate the suppliers and then select the best alternative among them.

**52 - Multi-level Reverse Supply Chain Redesign Under Unknown Facility Capacity**

Jieyu Lei, Northwestern Polytechnical University, Xi'an, China

Technological innovation motivates consumers, especially the young, to chase after new products constantly. Lots of old products has been put aside or dropped randomly. How to reuse these waste resources has been an urgent issue for many countries. This research aims to solve the problem by designing a multi-echelon reverse supply chain. We modeled a network optimization problem using the mixed integer planning approach and proposed a heuristic algorithm to calculate the optimal designing choice. The results show that through the model, we can not only get the optimal location and transportation scheme, but also the optimal capacity decision for new facilities.

**53 - Estimate the Characteristics of Truck Flow Based on Spatial Scale**

Fadong Zhang, Southwest Jiaotong University, Chengdu, 610031, China, Mi Gan, Xinyuan Li

This paper takes the truck trajectory data as the research object, classifies it by transportation efficiency index, and uses statistical physics method to probe the distribution of travel trajectory, transportation distance and freight volume of the individual truck, and the group trucks. At the same time, through the regression analysis of the relationship between the unload rate of trucks and the transportation distance and transportation capacity, the interaction characteristics of the probability distributions are explored, and the mechanism of the influence of truck mobility characteristics on the no-load rate of road freight is explained.

#### 54 - Research on the Application of Daul-cost Control Standard in Railway Freight Transportation Enterprise

Li Luhui, South West Jiao Tong University, Cheng Du, China,  
Tang Yinying, Zhu Xinglong, Lv Dong

Daul-cost control standard, as one of the latest methods of costing control, has been almost used in manufacturing enterprise. To study the application of Daul-cost control standard in railway freight transportation enterprise, this paper combines the activity-based costing and the benchmark-model dual-cost control standard together, and produces a new cost control model. Then the DEA method is used to evaluate the performance of activity-based costing control with double standards. At last, this paper proposes specific measures of cost control with double standards as well as incentives from the environment of railway freight transportation enterprise.

#### 55 - Intra-hub Transportation Simulation

Mohammad Torkjazi, University of South Carolina, Columbia, SC,  
29208, United States

A complex simulation of a rail hub operations is one of the approaches that has been employed by the BNSF Railway to evaluate different expansion scenarios within a rail hub. This study presents few practices to improve the movements of Hostlers in simulation.

#### 56 - The Transport Route Selection of International Container Intermodal Transport Base on the China Railway Express

Bohao Zhao, Southwest Jiaotong University, Chengdu, 611756,  
China

Nippon Express seeks to capitalize on China's Belt and Road Initiative to offer speedy, low-cost transport of containers between Japan and Europe via CHINA RAILWAY Express. The prosperity of CR Express has led to the construction of an international container line which features intermodal transportation. The research conducts a dynamic analysis of this transportation that connects port between Japan Europe from the three perspectives including transport time, total costs and carbon dioxide emissions. This research used Ant Colony Optimization to solve the shortest path model. Using Python and MySQL software to compile routes selection model for international container intermodal transport.

#### 57 - Research on Modularization Design of China Railway Express Freight Product Based on Fuzzy C-means Clustering Algorithm

lv Dong, Southwest Jiaotong University, ChengDu, China,  
YinYing Tang, LuHui Li, Si Chen

By expounding the status quo of the development of China Railway Express freight product and relying on standardized operation procedures, a modular design method for railway freight products is proposed, and pre-segmentation of product modules and product function decomposition are carried out. Then a quantization model of the module division of freight products business, based on fuzzy C-means clustering algorithm is established.

#### 58 - Research on Optimization of Empty Container Allocation in China Railway Express in Case of Chengdu-Europe Express

Xinglong Zhu, Southwest Jiaotong University, Chengdu, 610031,  
China, Yinying Tang, Jingru Ren

In order to reduce the large amount of empty container allocation cost, rental cost and storage cost which are generated during the transportation process of the China Railway Express. This paper analyzes the current empty container transportation of China Railway Express. Considering the factors such as minimum total cost incurred by empty container transportation and meeting customer needs. Establishing China Railway Express empty container allocation model. And Taking Chengdu-Europe Express as an example, and Solved by Lingo software. The result is satisfactory, which provides a reference for the empty container allocation of China Railway Express.

#### 59 - Large Scale Passenger Train Timetabling Using Combined Primal and Dual Approaches

Xuesong Zhou, Arizona State University, Tempe, AZ, 85281,  
United States, Yongxiang Zhang, Qiyuan Peng, Yu Yao

Train timetabling is important for allocating rail network spatial and temporal capacity resources to trains safely and efficiently. This paper proposes a novel fixed-primal-dual (FPD) framework combining the primal and dual approaches. In the FPD framework, the train timetabling process is divided into several stages from the time dimension and the sequences of trains within each stage are generated dynamically considering the primal and dual costs of trains. For each stage, a dynamic programming approach is developed to find feasible space-time shortest paths for the trains sequentially. The benefits of our approach are demonstrated by comparing with previously proposed approaches.

#### 60 - Study on the Matching Method Between Tidal Flow of Passengers and Transport Capacity of Line Network in Urban Railway

Chen Sixia, Southwest Jiaotong University, Chengdu, 610000,  
China, Ma Si, Kuniaki Sasaki

With the rapid development of urban railway in China, operation plan is becoming complicated, and ridership is increasing simultaneously. A serious problem of urban railway network of Chengdu city is that the distribution of passengers is uneven. It will bring waste of transport capacity. Passenger flow will have a distinct phenomenon at peak hours because of commuting passengers. Finding the regular of passenger flow and then finding the sections where are free

and overloaded in network. Big-small Crossroad Method is useful to balance transport capacity and passenger flow. That method means that instead of running the whole line, some trains only runs a part of line.

#### 61 - Feasibility Analysis of the Implementation of a High Speed Rail Line

Reinaldo Crispiniano Garcia, University of Brasilia, 70237-180,  
Brazil, Rodrigo Vigo Groetaers Vianna, Aline Goulart

This work presents a model for the financial analysis of a High Speed Rail Line. It includes economics and social topics besides the need to update the rail cars due to the increase in the demand. Moreover, a case study is presented showing the feasibility of the proposed model.

#### 62 - Analysis on the Development Quality and Scale of Intercity Railway in Yunnan Province

Siyu Tao, Southwest Jiaotong University, Chengdu, China,  
Anjun Li, Zishuai Pang, Tao Feng, Xinmei Chen, Qiyuan Peng

Appropriate railway network means not only to meet the need of travel and development, but also to avoid duplication of investment and waste of resources. Initially, Comparative Analysis and Canonical Correlation Analysis are utilized to estimate the current situation of Yunnan province's railway network. In order to determine a reasonable intercity railway scale, railway network adaptability indicators are integrated to establish a measure model. Meanwhile, referred to similar regional intercity railway projects, the scale of Yunnan provincial intercity railways could be predicted by Linear-regression Analysis. Finally, the development goal of Yunnan intercity railway is put forward.

#### 63 - Research on the Development Patterns of the Urban Functions of The Passenger Transport Hub

Siyu Tao, Southwest Jiaotong University, Chengdu, 610031,  
China, Xinmei Chen, Liwen Wang, Tao Feng, Anjun Li,  
Qiyuan Peng

With the progress of urbanization, green, humane, intelligent and integrated passenger transport hubs are developing. Nowadays, the integrated passenger transport hub is not only planned for transferring, but also providing various urban services. Up to now, the development concept of the urban functions with the traffic station has developed from traditional layout to the mode integrating city and station. Summarize characteristics and adaptability of different modes through the typical cases. The suitable urban function development mode is chosen to guide the transformation and construction of Shapingba integrated hub.

#### 64 - Addressing Orientation-symmetry in the Time Window Assignment Vehicle Routing Problem

Kevin Dalmeijer, Erasmus University Rotterdam, Rotterdam,  
3000 DR, Netherlands, Guy Desaulniers

The Time Window Assignment Vehicle Routing Problem (TWAVRP) is the problem of assigning time windows for delivery before demand volume becomes known. For TWAVRP instances that are difficult to solve by current methods, we observe many similar solutions in which one or more routes have a different orientation, i.e., the clients are visited in the reverse order. We introduce a new branching method that eliminates this orientation-symmetry from the search tree, and we present enhancements to make this method efficient in practice. Through computational experiments, we show that our algorithm outperforms other solution methods, and we solve 29 previously unsolved benchmark instances to optimality.

#### 65 - Real World VRP Needs a GIS

Shubhada Devidas Kshirsagar, Product Engineer, ESRI, Redlands,  
CA, 92373, United States, Heather Moe

The Vehicle Routing Problem (VRP) becomes much more complex when the solutions need to be deployed in the real world. To produce an operational result, the VRP model must include geographically precise inputs. The best way to integrate this massive amount of information is to use a Geographic Information System (GIS) in the problem-solving methodology. This presentation will discuss requirements from a wide range of commercial and public-sector clients over 30 years. With the described GIS inputs, the VRP model will produce a route plan that is both cost efficient and realistic.

#### 66 - Research on Multi-objective Optimization of Multimodal Transportation Routing Choice: Take Chengdu-Lodz Express as an Example

Yang Ge, Southwest Jiaotong University, Chengdu, China,  
Yinying Tang, Qinglin Li, Li Yu

In order to improve the efficiency of CHINA RAILWAY Express, the four indicators of transportation cost, transportation time, transportation quality and international influence are selected as optimization objectives. Considering time window constraints, a multi-objective optimization model for multimodal transport routes is established for designated OD. An improved genetic algorithm is designed to solve the model, and the validity of the model is verified by real data between Chengdu and Lodz. The results show that: transport costs significantly affect the results of the path selection, and the transportation costs restrict the international influence mutually.

#### 67 - Controlling Freeway Merge Operations Under Conventional and Automated Vehicles Traffic

Aschkan Omidvar, University of Florida, Gainesville, FL, 32603  
United States, Mahmoud Pourmehrab, Lily Eleftheriadou

In this paper, we present an optimization algorithm for freeway operations at merge zones which maximizes the average speed of the segment in the presence of Automated Vehicles (AV) and human-operated (i.e., conventional) vehicles. The necessary algorithms are developed to simulate and carry out the merging operations on a 2-lane freeway (one merge line and one ramp line) which is tested under a variety of scenarios ranging in demand level, demand splits, and AV penetration rate. Results suggest that the proposed algorithm can efficiently manage the traffic at freeway merge zones and reduce average total travel time (increase average speed).

#### 68 - Vulnerability Analysis and Assessment of Urban Rail Transit Network

Meiyi Zhao, Southwest Jiaotong University, Chengdu, China,  
Kuniaki Sasaki, Guofang Li, Jianmei Zhu

It is necessary to study vulnerability, what kind of impact the interruption will cause on urban rail transit network, described by the number of passengers multiply time loss, if emergency occurs. First, topological network is built by stations and lines. Then K paths are being searched by GA and their validity judged by time impedance threshold and train schedule. Next, passenger flow will be assigned to multiple paths. Normal distribution is chosen to describe the passenger behavior based on sensitivity to the shortest path and ratio will be corrected according to transfer times. After interruption, passengers were divided into 3 type. 1. all invalid; 2. partly invalid; 3. all valid.

## Tuesday, 12:30PM - 2:30PM

### ■ Tuesday Poster Competition

North Exhibit Hall E

#### Tuesday Poster Competition

Competition Poster Session

Chair: Junming Yin, University of Arizona, Management Information Systems Department, McClelland Hall, Room 430BB, Tucson, AZ, 85721, United States

Co-Chair: Neng Fan, University of Arizona, Tucson, AZ, 85721, United States

Co-Chair: Burcu B. Keskin, University of Alabama, Tuscaloosa, AL, 35406, United States

#### 1 - Smart Additive Manufacturing Using Data Analytics and Feedback Control

Chenang Liu, Virginia Tech, Blacksburg, VA, 24061, United States,  
Zhenyu Kong

A major challenge in additive manufacturing (AM) is to ensure product quality and consistency. To address this challenge, this research proposes an integrated manifold learning algorithm to achieve online quality monitoring and a bilateral time series modeling approach to implement online quality forecasting. With the application of feedback control system, the monitoring and forecasting results are also utilized to achieve significant quality improvement of AM via online process adjustment. The proposed methods demonstrate effective performance in real-world case studies.

#### 2 - Distribution Network Reconfiguration with Decentralized Autonomous Electric Vehicles

Zhaomiao Guo, University of Central Florida, Orlando, FL, 32816, United States

Autonomous electric vehicles (AEVs) provide unique opportunities to cope with the uncertainties of distributed energy generations in distribution network. We investigate the potential benefits of dynamic distribution network reconfiguration (DDNR) considering AEVs' spatial-temporal availability and their charging demand. A mixed integer programming model is proposed to optimally coordinate the charging/discharging of AEVs with DDNR, while satisfying AEVs' original travel plan. Numerical studies show that DDNR and AEV are complemented to each other to improve distribution system operation.

#### 3 - Fireline Construction in a Heterogeneous Forest Landscape

Xu Yang, Northeastern University, Boston, MA, 02115, United States, Emanuel Melachrinoudis

In this research we develop a methodology to construct the fireline in minimum time by considering the realistic case of heterogeneous forest landscape. We represent the forest landscape as a partition into homogeneous areas and consider multiple line segments crossing each polygon that represent potential paths of the fireline. This discretization reduces the forest landscape to a network whose nodes have as attribute the time of the fire arrival. A methodology is developed that uses a modified Dijkstra's algorithm to find the fastest yet safe paths for two

firefighting crews who work simultaneously in two opposite directions until they meet and thus they encircle and contain the fire.

#### 4 - Cell-based Network Flow Model Under Uncertainty in Evacuees' Behavior by Social Influence

Hyeong Suk Na, PhD Candidate, The Pennsylvania State University, University Park, PA, 16802, United States,  
Necdet Serhat Aybat, Soundar Kumara

We investigate a stochastic network flow model for planning a large-scale hurricane evacuation strategy considering uncertainty on the number of vehicles leaving from the affected areas. We model human evacuation behavior using a time inhomogeneous discrete time Markov chain and this corresponds to using a stochastic S-shaped response curve. The proposed model is developed based on the Cell Transmission Model with joint chance constraints and it is handled by the sample average approximation method and Monte Carlo simulation techniques. A numerical case study examines the applicability of the proposed model and the effect of the evacuation traffic flows on different social network topologies.

#### 5 - An Iterative Combinatorial Auction for Fractional Ownership of Autonomous Vehicles

Aigerim Bogrybayeva, University of South Florida, Tampa, FL, 33613, United States, Mahdi Takaloo, Hadi Charkhgard,  
Changhyun Kwon

This study explores a market design for fractional ownership of autonomous vehicles (AVs), where an AV is co-leased by a group of individuals. We propose an iterative combinatorial auction design for this novel application. The study discusses the unique features of the proposed auction and delivers solution tools.

#### 6 - Long Ties Accelerate Realistic Complex Contagions

Amin Rahimian, Postdoctoral Associate, Massachusetts Institute of Technology, Cambridge, MA, 02142, United States, Dean Eckles,  
Elchanan Mossel, Subhabrata Sen

The spread of behaviors (i.e. social contagion) depends on the structure of the network of contacts between people. For simple contagion models borrowed from epidemic spread, highly clustered networks slow spread compared with more random networks, such that interventions that randomly rewire edges would increase spread. However, for other contagion models that require multiple exposures before adoption (i.e. complex contagions), recent work has argued for the opposite conclusion: highly clustered, rather than random, networks facilitate spread. Here we show that slight modifications of prior analyses, which make them more realistic, reverse this result.

#### 7 - Two Stage Stochastic P-Order Conic Mixed Integer Programs Tight Second Stage Formulations

Yingqiu Zhang, Virginia Tech, Blacksburg, VA, 24060, United States

We study two-stage stochastic p-order conic mixed integer programs (TSS-CMIPs) in which the second-stage problems have p-order conic constraints along with integer variables. We provide sufficient conditions under which the integrality constraints on the second-stage integer variables of the TSS-CMIP can be relaxed, without effecting the integrality of the optimal solution of the problem, by adding parametric (non)-linear inequalities a priori. We perform computational experiments to evaluate the effectiveness of this second-stage convexification approach for solving TSS-CMIPs with second-order conic constraints in the second stage.

#### 8 - Operations Research for Blood Donor Management

Nico M. Van Dijk, University of Twente, Enschede, Ph.D.7522 NB, Netherlands

Blood Management is of general societal interest. Dutch blood donations involve 750,000 yearly voluntary donations. By three projects: on blood inventory, on donor delays at collection sites, and on selective donor recruitment, it will be highlighted how Operations Research can provide quantitative and formal support. The results are real-life based on Dutch Blood Supply.

#### 9 - Political Districting with Fairness Objectives: An Optimization-based Framework

Rahul Swamy, University of Illinois at Urbana-Champaign, Urbana, IL, 61801, United States, Douglas M. King,  
Sheldon H. Jacobson

Political districting (PD) is a problem of national interest. Classical models for PD focus on non-political objectives such as compactness. This paper addresses the question: How can voter information (e.g. polling data) be used to find politically fair districts. Three such criteria are used, based on fundamental fairness principles such as proportionality (efficiency gap), partisan (a)symmetry, and competitiveness. A multilevel algorithm reduces instance sizes by graph contraction and solves an exact nonlinear bi-objective problem. A case study in Wisconsin shows Pareto-frontiers between the objectives, and that solutions that are politically fair are still reasonably compact.

### 10 - Optimal Bidding for Highly Valued IT Service Contracts Theoretical Results and Practical Implications

Xiangyu Zhang, Cornell University, Ithaca, NY, 14850,  
United States

Information technology service providers compete to win highly-valued IT service contracts in a tender process. Prior literature shows that features other than price, including the service provider's relationship with the client, contribute to the client's selection because good relationship increases the provider's chance of winning the deal. Thus, it might be beneficial for the provider to lower their price for improving the client relationship and increasing their potential future contracts profits. In this work, we provide theoretical and numerical results illustrating the optimal price is lower than the myopic price which tries to maximize the expected profit of the current deal.

### 11 - A New Collision Avoidance Algorithm for Autonomous Vehicles Considering Physical Constraints

Elnaz Torkamani, Rutgers University-New Brunswick, Piscataway,  
NJ, United States, Zhimin Xi

Vehicle navigation autonomously in a dynamic environment is a challenging task because it should not be pre-programmed under a given handful situations and the vehicle must be able to avoid collisions under numerous unforeseeable but reasonable situations to a human being. From the practical perspective in autonomous cars, the algorithm must be efficient and reliable. This study proposes a new vehicle collision avoidance algorithm for multiple obstacles by eliminating the need of running sampling or optimization approaches, so that the algorithm could be practical useful in real-time collision avoidance under high vehicle speed.

### 12 - Reliability Based Optimal Design of a Microgrid System under Natural Disasters

Zhetao Chen, Rutgers University-New Brunswick, Piscataway, NJ,  
United States, Zhimin Xi

This study proposes reliability-based optimal design of a micro-grid system under service disruptions due to natural disasters. The objective is to determine the minimum number of generators and their distributions in the micro-grid so that the system's recoverability can be guaranteed under random failure scenarios of the power transmission lines. Power flow analysis combining with the Monte Carlo simulation (MCS) are used for uncertainty propagation analysis to quantify the system's recoverability distribution under random failure scenarios of the transmission lines. The proposed work is demonstrated through a 12-bus power system.

### 13 - Characterization of Battery Model Uncertainty for Effective State of Charge Estimation

Modjtaba Dahmardeh, Rutgers University, Piscataway, NJ, United  
States, Zhimin Xi

SOC estimation accuracy of batteries has been extensively studied through the development of various battery models and online dynamic estimation algorithms. All battery models, however, contain inherent model bias due to the simplifications and assumptions, which cannot be effectively addressed by the already established algorithms like EKF. Consequently, as observed in our study, battery SOC estimation using a typical EKF is not very accurate depending on the battery characteristics. This poster reports great potential for improving SOC estimation accuracy by proposing two bias characterization methods (i.e. polynomial and GP regression) without the complexity of novel algorithms.

### 14 - Optimal Smoothed Variable Sample-size Accelerated Proximal Methods

Afrooz Jalilzadeh, Pennsylvania State University, University Park,  
PA, 16801, United States, Uday Shanbhag

We consider a class of structured nonsmooth stochastic convex programs. Traditional stochastic approximation schemes are generally characterized by far poorer convergence rates compared to the deterministic counterparts. In this study, we consider variable sample-size schemes in which the bias in the sampled gradient is reduced by taking increasingly larger sample-sizes. We prove that the deterministic rates can indeed be attained while maintaining an optimal complexity in the number of sampled gradients. Moreover, optimal rates are obtained by combining an iteratively smoothing framework with this variable sample-size structure.

### 15 - Modeling the Impact of Large-scale Disruptions on Supply Chain Networks

Ni Ni, Rensselaer Polytechnic Institute, Troy, NY, 12180,  
United States, Thomas Sharkey

We provide optimization models to capture the impact of disruptions to different segments of supply chains. For disruptions to the production segment, we build two-stage stochastic programming models to optimize the pre-event and post-event strategies in terms of the impact of unmet demand of customers. The insights include a 'chain reaction' among recovery efforts in the production segment. For disruptions to the distribution segment, we create models to predict the cascading failure on supply chains based on damage to infrastructures and restoration models to provide the importance of coordination between efforts for elements in the distribution segment.

### 16 - Lignocellulosic Biomass to Biofuel Supply Chain Optimization with Mobile Densification and Farmers' Choices

Nibal Albashabsheh, Kansas State University, Manhattan, KS,  
66502, United States, Jessica Heier Stamm

We present an optimization model for lignocellulosic biomass-to-biofuel supply chains that considers mobile densification and farmers' choices, factors not considered in prior studies. Case study results based on Kansas data indicate that omitting mobile densification increases logistics costs, and ignoring farmers' choices results in significantly overestimating available supply.

### 17 - OD Flow Prediction with Vehicle Trajectory Data and Semi-supervised Recurrent Neural Network

Yintai Ma, DiDi Research America, Mountain View, CA, 94043,  
United States, Tao Huang, Zhiwei Qin, Jianfeng Zheng

With the emergence of smartphone usage and ride-sharing economy, a large amount of trajectory data of travelers are produced every day, which can be and should be used to leverage the OD flow estimation and prediction on a complex OD network. In this work, We propose a deep neural network to make the prediction of OD flows of an urban network solely based on the trajectory data of DiDi Drivers in both supervised and semi-supervised setting. Our model reaches median MAPE around 25% for peak hours. Our experiments indicate that the app-recorded trajectory data contains essential information of traffic status, encouraging future exploration to use app-recorded trajectory data for traffic patterns studies.

### 18 - Investigating Autonomous Air Operations Centers for On-demand Mobility Networks

Victoria Chibuogu Nneji, PhD Candidate, Duke Robotics,  
Durham, NC, United States

Several manufacturers are developing new vehicles for high-speed intra-city air taxi on-demand mobility (ODM) services. With diverse vehicle design requirements, how might airline operations centers need to innovate to support these new fleet demands? We used task- and time-based data from a collective case study of dispatchers to develop a discrete event simulation to serve as a predictive model of human-system performance in these air operations centers. With this tool, companies can rapidly prototype future ODM concepts of operations to make better informed strategic, tactical, and operational decisions in staffing and designing centers.

### 19 - Reliable Routing of Road-rail Intermodal Freight under Uncertainty

Majbah Uddin, University of South Carolina, Columbia, SC,  
29210, United States, Nathan Huynh

Transportation infrastructures, particularly those supporting intermodal freight, are vulnerable to natural disasters and man-made disasters that could lead to severe service disruptions. These disruptions can drastically degrade the capacity of a transportation mode and consequently have adverse impacts on intermodal freight transport and freight supply chain. To address service disruption, this paper develops a model to reliably route freight in a road-rail intermodal network. The proposed methodology is demonstrated using a real-world intermodal network in the Gulf Coast, Southeastern, and Mid-Atlantic regions of the United States.

### Decision Making with Noisy Information

Sponsored: Optimization/Optimization Under Uncertainty

Sponsored Session

Chair: Bo Zeng, University of Pittsburgh, Pittsburgh, PA, 15260,  
United States

### 1 - Incorporating Clustering in Decision Making with Noisy Information

Chaosheng Dong, University of Pittsburgh, 4200 Fifth Avenue,  
Pittsburgh, PA, 15260, United States, Bo Zeng

Clustering is the problem of partitioning unlabeled data points into a number of clusters so that data points within one cluster are homogeneous. In this study, we show that clustering will increase the robustness of the decision made with noisy information. Meanwhile, it will dramatically improve the efficacy of the decision-making process. Numerical results on both synthetic data and real-world problem show the merit of our method.

**2 - Sensor Network Localization Under Imperfect Information**

Liang Xu, University of Pittsburgh, 3700 O'Hara Street, 1048  
Benedum Hall, Pittsburgh, PA, 15261, United States, Bo Zeng

The use of wireless sensors has drastically increased, and accurately estimating the location of sensors under imperfect information becomes more important. In this study, we consider sensor network localization problem through game theory and bilevel generalized interdiction framework. Bilevel optimization models with different distance measures are proposed, and numerical results are also demonstrated.

**3 - Security Games with Multiple Adversaries**

Wei Wang, University of Pittsburgh, 1025 Benedum Hall,  
Pittsburgh, PA, 15261, United States, Bo Zeng

We build a defender-attacker-defender (DAD) model with multiple adversaries, in which different cooperative levels of the attackers are considered. We demonstrate our model on RTS-96 24-bus systems with one and two areas. Computational experiments show that different attackers' collaboration levels have very much different influences on these systems. The results can help allocate defense resources against one group or cooperative adversaries.

**4 - A Study on Approximation Methods of Robust Optimization with Integer Recourse**

Bo Zeng, University of Pittsburgh, 3700 O'Hara Street, Benedum  
Hall, Pittsburgh, PA, 15260, United States

A few approximation strategies are investigated. Numerical results will be presented to evaluate their qualities.

**5 - Traveling Salesman Problem with Probabilistic Visiting Chances Between Nodes**

Yiwen Xu, Assistant Professor, North Dakota State University, 1410  
14th Avenue North, Room 202 Civil & Industrial Engineering,  
Fargo, ND, 58102, United States, saeid rasti

In this talk, we will propose a probabilistic visiting TSP including a success visiting probability from node  $i$  to  $j$ . A chance constraint is added to guarantee that the success probability of the whole travel has a lower bound. Note that this TSP is different from (1) the PTSP proposed by Jaillet in which only a subset of potential nodes needs to be visited, and (2) the VRP with stochastic demand by Bertsimas. All nodes must be visited exactly once. The problem is formulated as an MILP. A PTAS is proposed by a DP algorithm.

Sponsored Session

Chair: Ruediger Schultz, University of Duisburg-Essen, Faculty of  
Mathemati, Thea-Leymann-Str. 9, Essen, D-45127, Germany

**1 - Newsvendor in Sobolev Space - Stochastic Shape Optimization**

Ruediger Schultz, University of Duisburg Essen, Department of  
Mathematics, Thea-Leymann-Str. 9, Essen, D-45127, Germany

The talk reports on some developments in handling shape optimization under uncertainty by means of recourse stochastic programming.

**2 - On Stability of a Risk Averse Linear Bilevel Problem under Stochastic Uncertainty**

Johanna Burtscheidt, University of Duisburg-Essen, Germany

Stochastic bilevel problems arise from the interplay between two decision makers on different levels of hierarchy where the lower level problem is entered by a random vector. We present a risk averse formulation for linear bilevel problems under stochastic uncertainty which are based on special risk measures. In particular, structural properties and qualitative stability of the optimal value function of this model under perturbation of the underlying Borel probability measure will be investigated wrt weak convergence of probability measures. Focusing on a finite number of realizations of an underlying random vector, equivalences to single-level problems conclude the talk.

**1 - The Carrot or the Stick: Quality in Engineering Contracts**

Pascale Crama, Singapore Management University, 50 Stamford  
Road, Singapore, 178899, Singapore, Zhenzhen Chen,  
Wanshan Zhu

In large engineering procurement contracts, the main contractor is responsible for the quality of the end product to the consumer. The main contractor uses subcontractors and the final quality is influenced by the efforts of all the contracting parties. Outcomes that do not meet the minimum required standard require rework, the cost of which is shared between the main contractor and the subcontractor. We find that the first-best may not be attained even for a risk-neutral subcontractor because of the shared rework cost; yet for a risk-averse subcontractor, the main contractor may choose to increase its share of the rework cost.

**2 - Personal Fabrication as an Operational Strategy: Value of Delegating Production to Customer**

Nagarajan Sethuraman, Kenan Flagler Business School, UNC  
Chapel Hill, Campus Box 3490, Chapel Hill, NC, 27599, United  
States, Ali Kemal Parlakturk, Jayashankar M. Swaminathan

In this paper, we study an operational strategy enabled by 3D printing— Personal Fabrication (PF)—in which a firm focuses on product's design and delegates its production to customers. We characterize the conditions under which, such a strategy benefits the firm. We study the implications of various roadblocks for such a strategy: high production costs of 3D printing, intellectual property concerns and product liability issues.

**3 - Technology Adoption in Organisations: An Evolutionary Model**

Antoine Feylessoufi, University of Cambridge,  
St Andrews Street, Cambridge, CB2 3BU, United Kingdom

Through social interactions, the behaviour of an individual is affected by the population but also influences the other members within that population. In a new approach to capture this effect on technology and innovative practices adoption in organisations, we incorporate social comparison into an evolutionary model widely used in biological ecosystems. We find that unexpected and extreme levels of innovative behaviour (or lack thereof) can emerge in organisations through this mechanism. We also find that for a same technology and firm reward mechanism, the culture of the organisation can lead to different adoption patterns.

**1 - Submodular Optimization with Contention Resolution Extensions**

Benjamin Moseley, Carnegie Mellon University,  
5000 Forbes Av, Pittsburgh, MO, 15208, United States

This talk considers optimizing a submodular function subject to constraints. Previous work usually (1) discovers a fractional solution to the multi-linear extension and (2) rounds this solution to an integral solution via a contention resolution scheme. Diverging from previous work, we introduce a method called contention resolution extensions. A contention resolution extension combines the contention resolution scheme into a continuous extension of a discrete submodular function. In the case where there is loss in both (1) and (2), by optimizing them together, the losses can be combined resulting in an overall improvement.

**2 - Random Sampling and Contraction for Hedge and Hyperedge Connectivity**

Debmalya Panigrahi, Duke University, Durham, NC, United States

In this talk, I will introduce the problem of hedge connectivity which generalizes the notion of (hyper)-edge connectivity in graphs and hypergraphs to model robustness of a network under dependent edge failures. I will then give new algorithms for finding the hedge and hyperedge connectivity of graphs and hypergraphs using random sampling and contraction of hedges and hyperedges.

### 3 - Submodular Maximization Under Matroid Constraints: A Case for Robustness

Alfredo Torrico, Georgia Institute of Technology, Atlanta, GA,  
United States, Mohit Singh, Sebastian Pokutta

In the robust submodular maximization problem subject to a matroid constraint, we are given a collection of  $k$  monotone submodular functions and a matroid on a ground set of size  $n$ . The goal is to select a feasible set that maximizes the minimum of the submodular functions. This is known to be NP-hard to approximate to any polynomial factor. We design a bi-criteria approximation algorithm that returns a set with (nearly) optimal value and such that it is the union of few feasible sets. This algorithm uses less function evaluations than previous works. Also, we provide a computational study of our algorithm in real-world applications.

### 4 - Stochastic Load Balancing on Unrelated Machines

Xiangkun Shen, University of Michigan, 1205 Beal Ave,  
Ann Arbor, MI, 48109, United States, Viswanath Nagarajan,  
Anupam Gupta, Amit Kumar

We consider the unrelated machine scheduling problem when job processing-times are stochastic. We provide the first constant factor approximation algorithm for the setting where one wants a fixed assignment of jobs to machines so as to minimize the expected makespan. The identical machines special case has been well-understood for several years, but the problem was previously open even in the case of related machines. The main technical contribution is an efficiently computable lower bound via an exponential-sized LP, and its rounding.

### Linear and Conic Optimization in Energy Systems

Sponsored: Optimization/Linear and Conic Optimization

Sponsored Session

Chair: Alberto J. Lamadrid, Lehigh University, 621 Taylor Street, R451,  
Bethlehem, PA, 18015-3120, United States

### 1 - Multistage Expansion Planning of Distribution Networks Considering Reliability

Javier Contreras, Universidad de Castilla-La Mancha, E.T.S. de  
Ingenieros Industriales, Campus Universitario s/n, Ciudad Real,  
13071, Spain, Gregorio Muñoz-Delgado, Jos M. Arroyo

This work presents the multistage expansion planning problem of a distribution network considering reliability. Thus, the best alternative, location, and installation time for the candidate assets are identified while jointly accounting for economic and reliability aspects. Unlike previously-reported works, reliability is implemented through algebraic expressions whereby the effect of the network topology is explicitly represented by decision variables of the optimization process. The resulting optimization problem is cast as an instance of mixed-integer linear programming.

### 2 - Piecewise Linear Approximation for Separable Concave Programming Problem

Amin Nikakhtar, Texas Tech University, 2500 Broadway,  
Lubbock, TX, 79409, United States, Ismael De-Farias,  
Victoria Howle

Quadratic programming (QP) arises in a wide variety of applications, from finance to public policy and electric grids. We report the results of applying an algorithm that uses piecewise linear functions for approximating QP problems with a separable objective function of multiple variables. We compare our results with the results from three other solvers: CPLEX, BARON, and IPOPT. The results show that the new algorithm outperforms the other three solvers both in computational time and objective function value. It also shows that we can reach a near optimal solution faster than the current solvers.

### 3 - Stochastic Operation for Networked Building Clusters Integrated with Glides and Thermal Storage

Yang Chen, Oak Ridge National Laboratory, Oak Ridge, TN, 37830,  
United States, Patrick O'Connor

The Ground-Level Integrated Diverse Energy Storage (GLIDES) technology is a hybrid pumped hydropower-compressed air technology which can use waste-heat as an energy input. A two-stage stochastic model is established with uncertainties from energy loads and solar radiation for community building clusters equipped with GLIDES and thermal storage and an integer L-shaped algorithm is developed to solve the problem efficiently.

### 4 - Optimal Scheduling for Power Systems Under Uncertainty

Alberto J. Lamadrid, Assistant Professor, Lehigh University, 621  
Taylor Street, R451, Bethlehem, PA, 18015-3120, United States,  
Ray Zimmerman, Carlos Murillo-Sanchez, Haeyong (David) Shin,  
Robert Thomas, Daniel Munoz

We present an open source simulation tool for security-constrained unit commitment (SCUC) problem. We discuss our formulation using a Markov Decision Process with a traditional deterministic approach. We focus on the our proposed stochastic approach to explicitly model of the operational characteristics of the technologies available, the changes over time, the network and congestion effects, and the regulatory constraints that assure reliability and adequacy.

### Joint Session OPT/Practice Curated: Recent Advances in Global Optimization and Applications

Sponsored: Optimization/Global Optimization

Sponsored Session

Chair: Erfan Mehmanchi, University of Pittsburgh, Pittsburgh, PA,  
15260, United States

### 1 - Globally Solving Non-convex Quadratic Programs via Linear Integer Programming Techniques

Luis F. Zuluaga, Lehigh University, Harold S. Mohler Laboratory,  
200 West Packer Avenue, Bethlehem, PA, 18015, United States,  
Wei Xia, Juan C. Vera

Quadratic programming (QP) is a well-studied fundamental NP-hard optimization problem which optimizes a quadratic objective over a set of linear constraints. In this paper, we reformulate QPs as a mixed-integer linear problem (MILP). This is done via the reformulation of QP as a linear complementary problem, and the use of binary variables and big-M constraints, to model the complementary constraints. To obtain such reformulation, we show how to impose bounds on the dual variables without eliminating all the (globally) optimal primal solutions; using some fundamental results on the solution of perturbed linear systems.

### 2 - Optimizing a Bundle Pricing Problem

Hamid Nazari, Clemson University, Clemson, SC, 29631,  
United States, Akshay Gupte, Lawrence Joseph McCormick

We are interested in solving a combinatorial matrix assignment problem which appears in literature as a bundle pricing problem in a multi-buyer-single-seller market. The problem has a MIQCQP formulation due to the requirement that a feasible assignment of buyers to bundles have envy-free equilibrium. Literature has many approximation results and polynomial-time algorithms under certain assumptions. We adopt an integer programming approach to solve this problem in general. We test our formulations and polyhedral relaxations on random instances and compare our MIP methodology to the Lagrangian relaxation techniques proposed in literature.

### 3 - Boundedly Rational User Equilibrium Models in Electricity Consumer Market Studies in Smart Grid

Guanxiang Yun, University of Central Florida, 12800 Pegasus  
Drive, P.O. Box 162993, Orlando, FL, 32816, United States,  
Qipeng Zheng

We propose a new boundedly rational user equilibrium (BRUE) model of the residential users' behavior for the consumption of energy schedule with the smart grid. People will accept any option with which utilities just less than a certain level compare to the best option's utility. We also introduce the unit time pricing strategy that can flatten the user's behavior of energy consumption. The problem is solved by using three methods, use BARON directly, penalty method and lagrangian dual method. Even though the BRUE constraints are non-convex constraints, we still find under our conditions, it have the strong duality. From the result, we find by introducing the price, it can decrease the cost of the system.

### 4 - On Robust Fractional 0-1 Programming

Erfan Mehmanchi, University of Pittsburgh, 4200 Fifth Avenue,  
Pittsburgh, PA, 15260, United States, Colin P. Gillen,  
Andres Gomez, Oleg A. Prokopyev

We examine single- and multiple-ratio robust fractional 0-1 programming problems (RFPs) under a broad classes of uncertainty sets. In particular, we demonstrate that under budgeted uncertainty sets single-ratio RFPs are polynomially-solvable if the deterministic counterparts are. We also reformulate the multiple-ratio RFPs as several mixed-integer linear programs (MILPs). Finally, computational experiments are conducted to evaluate the performance of MILP reformulations, as well as to compare the various uncertainty sets.

**Joint Session OPT/Practice Curated:  
Network Optimization Models and Algorithms for  
Evacuation Planning**

Sponsored: Optimization/Network Optimization

Sponsored Session

Chair: Maxim A. Dulebenets, Florida A&amp;M University-Florida State University, Tallahassee, FL, 32311, United States

**1 - Cost-effective Evacuation Network Design Under  
Travel Congestion**

Nadere Mansouri, Southern Methodist University, Dallas, TX, 75231, United States, Halit Uster

We consider an evacuation network design problem under cost considerations and travel congestion. We propose a mathematical model that prescribes evacuee routes through the road network to shelter locations under evacuation time constraints. To solve our model, we devise an efficient Benders Decomposition framework and present an experimental run on its effectiveness using data from Central Texas. We provide computational results illustrating the efficiency of our solution approach and an analysis of evacuation network design strategies.

**2 - Cell-based Network Flow Model Under Uncertainty Considering  
Social Influence for Large-scale Evacuation**

Hyeon Suk Na, PhD Candidate, The Pennsylvania State University, 234 Leonhard Building, University Park, PA, 16802, United States, Necdet Serhat Aybat, Sukran Ilgin Guler, Soundar Kumara

The emergency management agencies are faced with numerous challenges during the evacuation due to several unpredictable traffic conditions. This study addresses uncertainties of the road capacity induced by traffic congestion in a real evacuation situation. An evacuation network flow model based on the Cell Transmission Model with joint chance constraints is proposed to deal with the uncertainties and the model reliability is investigated. In addition, social media is transforming the way of communicating and sharing the evacuation-related information. A numerical case study examines the applicability of the proposed model and the social media influence for the evacuation process.

**3 - Modeling a Latency Based Evacuation Process**

Hamoud S. Bin Obaid, University of Oklahoma, Norman, OK, 73071, United States, Theodore B. Trafalis

A latency-based evacuation model (LBEM) is developed to optimize the evacuation procedure. The model is composed of two phases. In the first phase, the model builds the feasible space of the time path on every route, then the model uses the feasible space to build the constraints in the second phase as a mixed integer linear programming (MILP) model. The model is capable of capturing the latency of each group of evacuees as the travel time in the model is load-dependent. The evacuees are distributed fairly to balance between system optimum (SO) and user equilibrium (UE). Preliminary computational results are reported.

**4 - Emergency Evacuation Planning Optimization in the Areas with  
Vulnerable Populations**

Maxim A. Dulebenets, Florida A&amp;M University-Florida State University, Tallahassee, FL, 32311, United States, Olumide Abioye, Eren Erman Ozguven, Ren Moses, Walter Boot, Thobias Sando

Many U.S. coastal areas, which are characterized with a significant presence of vulnerable populations (e.g., aging adults), often experience natural hazards. In order to facilitate emergency evacuation planning, this study proposes a set of exact and heuristic algorithms for assigning evacuees to the available evacuation routes and emergency shelters, considering socio-demographic characteristics of evacuees, which may further affect their driving ability. Numerical experiments are conducted to evaluate the proposed solution algorithms using real life emergency evacuation scenarios.

**Recent Advances in Optimization Methods for  
Machine Learning**

Sponsored: Optimization/Nonlinear Programming

Sponsored Session

Chair: Lam Minh Nguyen, IBM Thomas J. Watson Research Center, Yorktown Heights, NY, 10598, United States

**1 - Optimal Diminishing Stepsizes in SGD for Strongly Convex  
Objective Functions**

Marten van Dijk, PhD, University of Connecticut, Storrs-Mansfield, CT, 06269, United States

We study the convergence of Stochastic Gradient Descent (SGD) with diminishing stepsize (non-adaptive) in the strong convex case. First, we notice that the Bounded Gradient (BG) assumption is in conflict with strong convexity. Without assuming BG, prior work shows that a diminishing stepsize of  $O(1/t)$  achieves an expected convergence rate of  $O(1/t)$ . Here, we demonstrate a simple example of a strong objective function together with a straightforward proof of a  $O(1/t)$  lower bound on the expected convergence rate (where we do not need a bound on the computed gradients in SGD). The concrete expressions of the upper bound from prior work and this lower bound are about a 32 factor apart for moderate and large  $t$ .

**2 - Catalyst for Gradient-based Nonconvex Optimization**

Courtney Paquette, Lehigh University, 1182 Jaeger St, Columbus, OH, 43206, United States

We introduce a generic scheme to solve nonconvex optimization problems using gradient-based algorithms originally designed for minimizing convex functions. Even though these methods may originally require convexity to operate, the proposed approach allows one to use them without assuming any knowledge about the convexity of the objective. In general, the scheme is guaranteed to produce a stationary point with a worst-case efficiency typical of first-order methods, and when the objective turns out to be convex, it automatically accelerates in the sense of Nesterov and achieves near optimal convergence rate in function values.

**3 - On Linear Convergence for Douglas Rachford Splitting  
and ADMM**

Pontus Giselsson, Lund University, Lund, Sweden

Several local and global linear convergence rate results for ADMM have recently appeared in the literature. Many of these are derived under strong monotonicity and smoothness assumptions. It is well known that ADMM is Douglas-Rachford splitting applied to a Fenchel dual problem formulation. In this talk, we show that the recent linear convergence results for ADMM follow from our results on contraction factors for the Douglas-Rachford operator under similar assumptions. Our analysis improves on previous analyses in three aspects 1) the contraction factors are provably sharp 2) the results hold in more general Hilbert space settings 3) the proofs are more compact as they are based on operator theory.

**4 - Stochastic Quasi Newton Methods – Past, Present, and Future**

Albert Solomon Berahas, Postdoctoral Research Fellow, Northwestern University, 2145 Sheridan Road, C210, Evanston, IL, 60208, United States, Jorge Nocedal, Martin Takac

In this talk, we present a survey of stochastic quasi-Newton (SQN) methods; methods that attempt to judiciously incorporate second-order information using only gradient information and that alleviate some of the problems that plague stochastic first-order methods. We begin with an overview of recent developments of SQN methods, and then describe in detail the multi-batch L-BFGS method and its extensions. We present, in general form, convergence analyses for SQN methods, and illustrate the performance of several SQN methods on a plethora of machine learning tasks. Finally, we discuss open questions and the future of SQN methods.

**1 - Stochastic Methods for Nonsmooth Nonconvex Optimization**

Damek Davis, Cornell University, 218 Rhodes Hall, Hoy Road, Ithaca, NY, 14850, United States, Dmitriy Drusvyatskiy

We prove that the proximal stochastic subgradient method, applied to a weakly convex problem (i.e. difference of convex function and a quadratic), drives the gradient of the Moreau envelope to zero at the rate  $O(k^{-(1/4)})$ . This class of problems captures a variety of nonsmooth nonconvex formulations, now widespread in data science. As a consequence, we obtain the long-sought convergence rate of the standard projected stochastic gradient method for minimizing a smooth nonconvex function on a closed convex set. In the talk, I will also highlight other stochastic methods for which we can establish similar guarantees.

## 2 - A2BCD an Asynchronous Accelerated Block Coordinate Descent Algorithm with Optimal Complexity

Robert Hannah, UCLA, Los Angeles, CA, 90025, United States, Wotao Yin

In this talk we present work on A2BCD, an asynchronous accelerated randomized coordinate descent algorithm. For asynchronous delays that are not too large, we prove that A2BCD has the same complexity as NU\_ACDM, the current state-of-the-art coordinate descent algorithm. We then show that this complexity is essentially optimal: That is, it cannot be improved except by a small constant factor without very different algorithmic assumptions. To motivate and clarify our proof techniques, we also present an ODE which is the continuous-time limit of our algorithm and converges to a solution at the same rate.

## 3 - Conditional Gradient Methods for Stochastic Submodular Maximization

Hamed Hassani, University of Pennsylvania, 3330 Walnut Street, Philadelphia, PA, 19104, United States

In this talk, we study the problem of constrained and stochastic submodular maximization (both discrete and continuous) and develop gradient methods that achieve a tight approximation guarantee. More precisely, for a monotone and continuous DR-submodular function and subject to a general convex body constraint, we provide stochastic and conditional gradient methods that achieve a  $(1-1/e)$ -OPT guarantee (in expectation). By using stochastic continuous optimization as an interface, we also provide the first  $(1-1/e)$ -OPT tight approximation guarantee for maximizing a monotone but stochastic submodular set function subject to a general matroid constraint.

## 4 - Escaping Saddle Points in Constrained Optimization

Aryan Mokhtari, Massachusetts Institute of Technology, 77 Massachusetts Avenue, Room 32-D608, Cambridge, MA, 02139, United States, Asuman Ozdaglar, Ali Jadbabaie

In this talk, we focus on escaping from saddle points in smooth nonconvex optimization problems subject to a convex set. We propose a generic framework that yields convergence to a second-order stationary point of the problem if the convex set is simple for a quadratic objective function. To be more precise, our results hold if one can find a  $\gamma$ -approximate solution of a quadratic program subject to the convex constraint in polynomial time, where  $\gamma < 1$  is a positive constant that depends on the structure of the convex set.

### Joint Session MSOM/RMP/Practice Curated: Online Retailing and Marketplace Analytics

Sponsored: Manufacturing & Service Oper Mgmt  
Sponsored Session

Chair: Yun Fong Lim, Singapore Management University, Singapore, 178899, Singapore

#### 1 - The Impact of Repeat Business and Word of Mouth for an E-Retailer

Opher Baron, University of Toronto, 105 St George Street, Toronto, ON, M5S 1L7, Canada, Simai He, Hongsong Yuan

We use data from the M&SOM data competition to investigate repeat purchase behavior and the impact of word of mouth (WOM) on reference prices at the giant Chinese e-retailer, Taobao. We develop algorithms to study both questions and demonstrate their usage. Our main findings are that improving repeat business is extremely important to Taobao and that it is important to consider WOM affect in the presence of reference price effects.

#### 2 - Urban Consolidation Center or Peer-to-peer Platform? The Solution to Urban Last-mile Delivery

Qiyuan Deng, Singapore Management University, Singapore, Xin Fang, Yun Fong Lim

The growth of last-mile delivery to urban areas creates negative impacts on the environmental, social, and economic well-being of cities. As a potential solution to address this challenge, an urban consolidation center (UCC) bundles shipments from multiple carriers before delivering them to a city center. Despite the potential benefits, the success rate of UCC projects in practice is low. More recently, a notable number of peer-to-peer platforms have been established to share the carriers' truck capacity. These capacity sharing platforms can potentially be more economically sustainable, while making urban last-mile delivery more operationally efficient.

## 3 - Distributionally Robust Inventory Management with Network Flows - An Application to Ecommerce and Omnichannel Retailing

Aravind Govindarajan, Ross School of Business, University of Michigan, Ann Arbor, MI, 48104, United States, Amitabh Sinha, Joline Uichanco

A fundamental assumption in network inventory planning is that the underlying joint distribution of demands across locations is known. However, this may not be the case for ecommerce demand due to high volatility in online customer behavior. We propose a distributionally robust model for network inventory optimization with reactive recourse, where the worst-case expected cost is minimized over the set of demand distributions satisfying known mean and covariance information. We derive closed-form optimal inventory levels and worst-case distribution for two locations and develop tractable upper bounds and heuristic solutions for the multi-location problem.

## 4 - Matching Supply with Demand for Online Retailing

Yun Fong Lim, Singapore Management University, Lee Kong Chian School of Business, Singapore, 178899, Singapore, Song Jiu, Marcus Teck Meng Ang

We consider a joint replenishment, allocation, and fulfillment (JRAF) problem over multiple periods for an online retailer. In each period, the retailer determines the replenishment quantity for each product from each supplier and then allocates the inventory to the FCs. After the demand is realized, the retailer chooses the FCs to satisfy it. The retailer's objective is to minimize the expected total cost. We have developed a two-stage approach based on robust optimization to solve the JRAF problem. A case study with a major apparel online retailer in Asia suggests that the two-stage approach can reduce the retailer's current cost by 36.73%, demonstrating a significant value of joint optimization.

### Stochastic Models for Biomanufacturing Supply Chains

Sponsored: Manufacturing & Service Oper Mgmt  
Sponsored Session

Chair: Ananth Krishnamurthy, University of Wisconsin-Madison, Madison, WI, 53706, United States

Co-Chair: Tugce Martagan, Eindhoven University of Technology, Eindhoven, 5611AZ, Netherlands

#### 1 - Contract Structures for Biomanufacturing Projects with Failure Risks

Yasemin Limon, University of Wisconsin-Madison, Madison, WI, 53705, United States, Tugce Martagan, Ananth Krishnamurthy

Bio-pharmaceutical companies often subcontract projects from their drug development pipeline to smaller biomanufacturers to reduce costs of failure. These projects require multiple sequential steps with significant uncertainty, leading to risks of not meeting client requirements. Currently, contract terms for these projects are negotiated with limited quantification of the risks of failure. We analyze the performance of two contract structures, Fee For Service (FFS) and Price Per Mass (PPM) and assess how these contracts distribute profits and costs of failure. We then propose a new Scout Before Commit (SBC) contract, and study when the SBC contract is likely to yield better performance.

#### 2 - Optimal Harvesting and Replenishment Policies to Reduce Changeovers in Fermentation Processes

Yesim Koca, Eindhoven University of Technology, Eindhoven, Netherlands, Tugce Martagan, Lisa M. Maillart, Ivo Adan

We develop a time-based and a condition-based stochastic model to reduce the number of changeovers in the fermentation processes. We determine the optimal harvesting and replenishment policies that maximize the expected total profit obtained from a batch. We analyze the structural characteristics of optimal policies, and illustrate the industry use of the models through a case study.

#### 3 - Biomanufacturing Companies Accelerate Growth Using Operations Research

Ananth Krishnamurthy, University of Wisconsin-Madison, 1513 University Avenue, Madison, WI, 53706, United States, Tugce Martagan, Yasemin Limon

In the biomanufacturing industry, production and planning decisions are challenging due to batch-to-batch variability and uncertainty in the production yield, quality, cost, and lead times. A multidisciplinary team of researchers developed decision support tools that use a data-driven, operations research-based approach to improve biomanufacturing efficiency. Optimization tools for fermentation and purification operations provide a decision support mechanism that links the underlying biological and chemical processes with business risks and financial trade-offs. Interactive scheduling and capacity planning tools enable efficient use of the expensive and limited resources.

#### 4 - Supply Failure Probability in Pharmaceutical Supply Chains under Input-model Uncertainty

Canan Gunes Corlu, Boston University, Alp Akcay,  
Tugce Martagan

We consider a pharmaceutical manufacturer who sources a customized product with unique attributes from a set of unreliable suppliers. We model the likelihood of a supplier to successfully deliver the product via Bayesian logistic regression and study the impact of input uncertainty; i.e., the uncertainty that is due to the estimation of logistic regression parameters from limited amounts of historical data, on the overall supplier failure probability. We investigate how the input-model uncertainty changes with respect to the characteristics of the historical data and the product attributes.

#### Dynamic Decision Making in OM

Sponsored: Manufacturing & Service Oper Mgmt

Sponsored Session

Chair: Hao Zhang, University of British Columbia, Vancouver, BC, V6T 1Z2, Canada

#### 1 - An ADP Approach to Dynamic Matching with Applications in Kidney Exchange

Fan You, University of Colorado-Boulder, 995 Regent Drive,  
Boulder, CO, 80302, United States, Dan Zhang, Doug Popken

We study dynamic matching problems where the objective is to maximize the total matchings over a finite planning horizon with random arrivals and departures. We start by formulating the problem as an MDP, which suffers from the curse of dimensionality. Subsequently, we apply the approximate linear programming approach. We derive an upper bound as well as a control policy from the solution of the ALP, and test numerically on a set of dynamic kidney exchange instances taken from the literature.

#### 2 - Optimizing Remote Maintenance Decisions under Imperfect Failure Predictions

Guanlian Xiao, Eindhoven University of Technology, Eindhoven,  
Netherlands, Alp Akcay, Lisa M. Maillart, Geert-Jan Van Houtum

We consider a critical component which deteriorates according to a three-state discrete time Markov chain, with two unobservable operational states, and a self-announcing failed state. A remote monitoring center periodically receives imperfect signals and suggests maintenance actions to a local service organization. We build a partially observable Markov decision process that takes the binary signals as input, and minimizes the discounted total corrective and preventive maintenance costs. We characterize the optimal policy by at most one critical threshold, and provide a closed-form critical solution. We also show the impact of imperfectness of signals on the objective values.

#### 3 - Analytical Solution to a Partially Observable Machine-Maintenance Problem

Weihua Zhang, University of British Columbia,  
6335 Thunderbird Crescent, Vancouver, BC, V6T 2G9, Canada,  
Hao Zhang

We study a classic machine maintenance problem in which the state of the machine changes according to a hidden Markov process under regular production. The state can be observed upon inspection and can also be reset through replacement. The objective is to find a production-inspection-replacement policy that minimizes the expected discounted cost over an infinite horizon. In contrast to the standard Bayesian framework, we adopt a recently established dual framework to derive an exact, analytical solution to this problem. The solution carries a cyclic structure and highlights the core behavior, which explains the puzzling non-monotone optimal policy widely acknowledged in the literature.

#### 4 - Managing Queues with Static Delivery Guarantees

Mehdi Hosseinabadi Farahani, PhD, The University of Texas at  
Dallas, Richardson, TX, 75080, United States, Milind Dawande,  
Ganesh Janakiraman

We study the problem of managing queues in online food ordering services where customers, who place the order online and pick up at the store, are promised a common due-date lead time. The objective is to minimize the total earliness and tardiness costs incurred by the customers. Due to the difficulty of implementing sophisticated policies in practice, we investigate the performance of easily-applicable heuristic policies. Our results show that a simple policy, that starts serving a customer as soon as the time remaining to the due date falls below a threshold, yields near-optimal solutions.

#### Data-Driven Models in Healthcare

Sponsored: Manufacturing & Service Oper Mgmt/Healthcare  
Operations

Sponsored Session

Chair: Vishal Ahuja, Southern Methodist University, Southern  
Methodist University, Dallas, TX, 75275, United States

#### 1 - Utilizing Data Driven Decision Support Systems to Reduce Readmission Rates for Patients with Congestive Heart Failure

J K. Srinivasan, Boston University, Boston, MA, United States,  
Kellas Ross Cameron

Physicians currently attempt to identify CHF patients that are likely to be readmitted within 30 days. However, the readmission rate for these patients remains over 20%. Data-driven decision support systems can provide an additional tool to understand which patients are at high-risk of readmission. We create a statistical model to utilize patient-specific information to not only more accurately identify the patients most likely to be readmitted, but also why - whether for condition-related reasons or not. This allows physicians to suggest patient-specific readmission prevention strategies.

#### 2 - Being on the Productivity Frontier: Identifying Triple Aim Performance Hospitals

Sriram Venkataraman, University of South Carolina, Department  
of Management Science, Moore School of Business, Columbia, SC,  
29208, United States, Aleda Roth, Anita L. Tucker,  
Jon A. Chlingerian

Hospital decision-makers may face trade-offs that make it difficult to obtain the trifecta of high performance on clinical quality, patient experience, and technical efficiency. Using datasets from 2010 and 2012 and data envelopment analysis, we identify more than 40 triple aim performance hospitals among U.S. acute care hospitals with 200 beds or more. Further, we find that the percentage of physicians employed by the hospital has a positive and significant relationship with triple aim performance, and that bed utilization rate has a positive relationship with technical efficiency but a negative relationship with clinical quality and patient experience performance.

#### 3 - Reduction of Patient and Surgery Preparation Time in the Operating Room

Yann Ferrand, Clemson University, Clemson, SC, United States,  
Brandon Lee, Dee San, Kevin M. Taaffe, Lawrence Fredendall,  
Amin Khoshkenar, Anjali Joseph, Scott Reeves

This paper used a set of cameras to record all the activities in the operating room during 26 surgical procedures and the room preparation periods. Four of these were selected for intensive analysis of the room turnaround and surgery preparation times. All activities by all staff in the room were coded and placed into a Gantt chart format timeline. The timeline was used to identify potential bottleneck resources and how slack resources could begin activities in parallel with the bottleneck resources to reduce the overall length of the turnaround time.

#### 4 - Quality Improvement Spillovers: Evidence from the Hospital Readmissions Reduction Program

Mohamad Soltani, University of Wisconsin-Madison, 4284A, 975  
University Ave., Madison, WI, 53706, United States, Robert Batt,  
Hessam Bavafa

In this study, we look at the impact of the Hospital Readmissions Reduction Program in the US hospitals to examine (1) the extent to which hospitals were able to achieve 30-day readmission reductions for target patients and (2) the extent to which non-target patients experienced "spillover improvements in 30-day readmissions. We also study 31-60-day readmissions and length of stay as possible mechanisms by which hospitals can achieve improvements in 30-day readmissions. Taken together, our results show that this policy has been effective and has generated significant beneficial spillovers in quality improvement.

Co-Chair: Rouba Ibrahim, University College London, London, WC1E 6BT, United Kingdom

#### 1 - Large Deviations Analysis for Non-Markovian Multi-server Queues with Abandonments in the QED Regime

David Goldberg, Cornell University, 136 Hoy Road, Ithaca, NY, 14850, United States, Debankur Mukherjee, Yuan Li

We consider the FCFS  $M/H_2/n + M$  queue in the QED regime. It is known that the normalized sequence of steady-state queue-lengths converges to a limit  $W$ , with sub-Gaussian tails. However, the exact tail behavior was left open. Dai and He later conjectured an explicit form for this tail exponent, which was insensitive to higher moments. We explicitly compute the true large deviations exponent, the first such result for non-Markovian queues with abandonments, and resolve the conjecture of Dai and He in the negative. Our stochastic comparison approach sheds light on several novel ways to think about multi-server queues with abandonments, and may be helpful in analyzing other related models.

#### 2 - Workload Management in Telemedical Physician Triage and Other Knowledge-based Service Systems

Soroush Saghafian, Harvard University, Kennedy School of Government, 79 John F. Kennedy Street, Cambridge, MA, 02138, United States, Wallace J. Hopp, Seyed Iravani, Yao Cheng, Daniel Diermeier

Telemedical physician triage (TPT) is an example of a hierarchical knowledgebased service system (HKBS) in which a second level of decision agent (telemedical physician) renders a decision on cases referred to him/her by the primary level agents (triage nurses). Managing the speed-versus-quality trade-off in such systems presents a unique challenge because of the interplay between agent knowledge and flow of work between the two levels. We develop a novel model of agent knowledge based on the beta distribution, and deploy it in a partially observable Markov decision process model to describe the optimal policy for deciding which cases (patients) to refer to the second level for further evaluation.

#### 3 - Operational Issues in Large Jail and Judiciary Systems

Russell Charles Hannigan, University of Chicago Booth School of Business, Chicago, IL, 60615, United States, Baris Ata

We perform an analysis of a large jail and judiciary system with the goal of simultaneously reducing Length of Stay (LOS) and improving outcomes for detainees. Two primary issues contribute to high LOS: a large number of outstanding warrants and detainees' trials often lasting longer than their eventual sentences require. We model the jail as a queueing network and consider the benefits of letting low-level warrants expire. We also consider a dynamic discrete choice model of detainees' behavior to estimate detainees sentence location sensitivity and resulting optimal trial termination time.

#### 4 - The Impact of Customer Impatience on Scheduling in a Multi-class Many-server Queue

Amy R. Ward, University of Southern California, Marshall School of Business, Bridge Hall BRI 401H, Los Angeles, CA, 90089-0809, United States, Amber L. Puha

Many classic models used to study scheduling problems do not incorporate customer impatience. Furthermore, many of the ones that do assume the time a customer is willing to wait for service is exponentially distributed, which can lead to poor scheduling decisions. We study the interplay between customer impatience and scheduling decisions in a many server queue with reneging ( $G/G/N+G$ ) and multiple customer classes. On fluid scale, we characterize a closed-form non-linear relationship between the queue-length and server effort allocation that is determined by the reneging distribution. This leads to an optimization problem whose solution provides insight into scheduling decisions.

### Economic Models in OM

Sponsored: Manufacturing & Service Oper Mgmt/Service Operations

Sponsored Session

Chair: Krishnamurthy Iyer, Cornell University, Ithaca, NY, 14850, United States

#### 1 - Diffusion in Random Networks: Impact of Degree Distribution

Scott Rodilitz, Yale University, New Haven, CT, United States, Vahideh Manshadi

Motivated by viral marketing on social networks, we study the diffusion process of a new product on a network where each agent is connected to a random subset of others. The number of contacts (i.e., degree) varies across agents and the firm knows the degree of each agent. Further, the firm can seed a fraction of the population and compensate them on a per-contact basis. Under any bounded degree distribution and for any target adoption proportion, we compute both the cost and the time it takes to reach the target in the limit of network size. Using our limit results, we conduct comparative statics on degree distribution and uncover a trade-off between cost efficiency and fast growth.

#### 2 - Information and Pricing in Unobservable Queues

Guido Martirena, Stanford University, 579 Serra Mall, Stanford, CA, 94305, United States

I consider information and pricing design in unobservable queues with strategic and heterogeneous customers that are privately informed and impatient. I show that 1) if the platform optimizes among all possible pricing and information mechanisms, the optimum is achieved by disclosing all the information about congestion and setting a sequence of posted prices, 2) for any information policy, the steady-state can be replicated by full-information and prices while achieving a higher revenue, 3) I identify conditions under which the platform profits from releasing information strategically and provide a characterization for the optimal rule.

#### 3 - Section 8 Voucher Exchange

Nicholas A. Arnosti, Columbia Business School, 3022 Broadway, Uris Hall, New York, NY, 10027, United States

We consider a dynamic model motivated by the administration of Section 8 vouchers. In the model, family relocation results in inefficient billing between housing authorities. We study the potential for voucher exchange to reduce billing. We show that if the rate at which families become ineligible is identical across cities, then voucher swapping has no long-term effect on the number of voucher recipients living in each city. This implies that either pairwise or multi-way voucher exchange offer a Pareto improvement over current practice. Additionally, we calibrate our model using data from the Twin Cities metropolitan area, and study the magnitude of the benefit of multi-way exchange.

#### 4 - A Truth Serum for Large-scale Evaluations

Vijay Kamble, University of Illinois at Chicago, 405 N. Wabash Ave, Unit 3511, Chicago, IL, 60611, United States, Marn David, Nihar Shah, Abhay Parekh, Kannan Ramchandran

A major challenge in obtaining large-scale evaluations of products or services in online platforms is that of eliciting honest responses from agents in the absence of verifiability. We propose a new reward mechanism with strong incentive properties applicable in a wide variety of such settings. This mechanism has a simple and intuitive output agreement structure: an agent gets a reward only if her response for an evaluation matches that of her peer. But instead of the reward being the same across answers, it is inversely proportional to a popularity index of each answer. Rare agreements earn a higher reward than agreements that are relatively more common.

### Sustainable and Socially Responsible Operations

Sponsored: Manufacturing & Service Oper Mgmt/Sustainable Operations

Sponsored Session

Chair: Xin Wang, Hong Kong University of Science and Technology, Hong Kong

#### 1 - Promoting Innovative Technology in Developing Countries through Solution Based Contract

Guangrui Ma, Tianjin University, 92 Weijin Road, 25A, CoME, Tianjin, 300072, China, Ying-Ju Chen, Hau Leung Lee

We study farmers' production decision and technology adoption incentives in developing countries, and then investigate how technology providing firms can use business innovation to promote the technology adoption. We show that through solution based contract, firms can help farmers overcome potential adoption barriers.

#### 2 - To Bribe or Not to Bribe in a Procurement Auction Under Disparate Corruption Pressure

Xiaoshuai Fan, Hong Kong University of Science and Technology, Kowloon, Hong Kong, Ying-Ju Chen, Christopher S. Tang

This paper examines the effect of "disparate corruption pressure on manufacturers' bribery decisions and bidding strategies in a procurement auction. In our setting, small manufacturers are highly likely to be pressed to bribe in exchange for the right of first refusal. We consider the case when only large manufacturer can choose not to bribe. After analyzing a corrupt auction model, we find that the large manufacturer can benefit from corruption even when it is disadvantaged by refusing to bribe. Consequently the large manufacturer has no incentive to expose the collusion between the auctioneer and the small manufacturer, which provides a novel explanation for the prevalence of corrupt auctions.

#### 3 - Social Responsibility Auditing of Supply Chain Networks

Han Zhang, Indiana University Bloomington, 1309 E. 10th St Ste 4100, Bloomington, IN, 47405, United States, Goker Aydin, Rodney Parker

We study a buyer's problem of auditing a three-tier supply network with general sourcing relations between adjacent tiers for social responsibility compliance. The buyer may suffer economic damages if a violation is exposed at a non-compliant supplier. To avoid damages, the buyer may judiciously audit some suppliers; in the event of a failed audit, the buyer decides to either incur a cost to rectify the supplier or drop the supplier from the supply network, losing the potential profit from production attributable to the now-dropped supplier. We characterize the equilibrium of the production activities in the supply network and the buyer's optimal auditing strategies before the production phase.

#### 4 - Green Technology Development and Adoption: Competition, Regulation, and Uncertainty - A Global Game Approach

Xin Wang, Hong Kong University of Science and Technology, IELM, Hong Kong, Soo-Haeng Cho, Alan Scheller-Wolf

When a government is considering tightening a standard on a pollutant, their decision often is influenced by the number of firms being able to meet the tightened standard, because a higher number indicates a more feasible standard. We study how such regulation may affect a firm's incentive to develop a new technology to reduce a pollutant. To analyze this problem, we use the global game framework recently developed in economics. We find that regulation that considers industry capability, compared with regulation that ignores it, can more effectively motivate development of a new green technology. Surprisingly, uncertainty in the payoff can also help promote development of a new green technology.

### Joint Session MSOM/Practice Curated: Topics on Two-Sided Platforms

Sponsored: Manufacturing & Service Oper Mgmt/Supply Chain

Sponsored Session

Chair: Fernando Bernstein, Duke University, Durham, NC

#### 1 - The Impact of the Gig-economy on Financial Hardship

Kaitlin Daniels, Washington University in St. Louis, Saint Louis, MO, United States, Michal Grinstein-Weiss

We empirically measure the impact of Uber's entrance into a market on the welfare of workers. Measures of worker welfare considered include income and financial hardship (e.g. failure to pay bills on time). Analysis elucidates the role of gigs like Uber within the broader economy.

#### 2 - Competition Between Two-sided Platforms Under Demand and Supply Congestion Effects

Fernando Bernstein, Duke University, Fuqua School of Business, 100 Fuqua Drive, Durham, NC, 27708-0120, United States, Gregory A. DeCroix, N. Bora Keskin

This paper explores the impact of competition between two ride-sharing platforms. Customers' and drivers' utilities are sensitive to the prices set by the platforms and to congestion in the system. We consider two scenarios, one in which each driver works exclusively for a single platform ("single-homing") and another scenario in which drivers may work for both platforms ("multi-homing" or "multi-apping").

#### 3 - Price, Wage and Fixed Commission in On-demand Matching

Yun Zhou, McMaster University, 1280 Main Street West, Hamilton, ON, L8S 4M4, Canada, Ming Hu

We study an on-demand platform's price and wage determining problem under uncertain market conditions. Demand and supply functions have different forms in different conditions. While the platform can jointly optimize price and wage in each condition, our research shows that the simpler fixed commission structure achieves a decent portion of profit.

### Operations/ Marketing Interface II

Contributed Session

Chair: Lifei Sheng, University of Houston-Clear Lake, 2700 Bay Area Boulevard, Houston, TX, 77058, United States

#### 1 - Nonlinear Pricing for Yield Management and Countering Strategic Consumer Behavior

Jing Zhou, Associate Professor, University of North Carolina-Charlotte, 9201 University City Blvd, Belk College of Business, Charlotte, NC, 28223, United States, Moutaz J. Khouja

In this study, we examine the impact of using a nonlinear pricing "buy one at regular price get the second for x% off on the optimal order quantity and the profit of a newsvendor. We also examine the above questions in the presence of strategic consumers. Implementing the nonlinear pricing may increase demand more than by using a straight per-unit discount, and, therefore reduces strategic consumers' chances of obtaining a unit at a discount which decreases their incentive to wait. Thus, this type of discount can be used to counter strategic consumer behavior.

#### 2 - Robust Salesforce Contracts with Inventory Considerations

Xiangyin Kong, Mr, Xi'an Jiaotong University, No. 28, Xian ning Road, Bei ling District, Xi'an City, Shaanxi Province, China, Tat Chee Avenue, Kowloon, Hong Kong SAR, Xi'an, 710049, China Xiangyin Kong, Mr, City University of Hong Kong, Tat Chee Avenue, Kowloon, Hong Kong SAR, Hong Kong, China, Yimin Yu, Gengzhong Feng

We consider the salesforce compensation with limited inventory and model uncertainty where the demand is censored by the lost sales and the parameters of the underlying demand distribution is uncertain. The firm jointly decides the compensation plan and inventory levels by the worst-case criterion subject to the robust incentive compatibility and limited liability condition. We show that a linear contract with commission rates decreasing in inventory is optimal; and that under the optimal robust contract, the firm tends to understock with a multiplicative demand model, contrary to the stock-more effect in the literature; while it can either overstock or understock under a general linear demand.

#### 3 - Free Riding Effect in Sales of a Complex New Product When Multiple Sales People Compete

Vahideh S. Abedi, Assistant Professor, California State University Fullerton, Fullerton, CA, United States, Rahul Bhaskar

Purchase of complex new products (e.g. insurance plans) typically depends on customer word-of-mouth both about the new characteristics of the product and about the quality of service of one or more brokers. We show that this leads to a free-riding effect between the brokers that has not been explored in the literature. We model this sales process, and validate it from membership data for an insurance product. We measure the free-riding effect, and show how the resulting model can facilitate decision making in managing the sales force.

#### 4 - Factors Affecting the Performance of Small And Medium Sized Wholesalers in Korea

Ji Min Park, KyungPook National University, Daegu, Korea, Republic of, Jaewoo Chung

In this study, we analyze the factors affecting repurchase intention in the wholesale industry derived through intensive literature reviews and an exploratory study, which are classified into product, sales competence and service competency. By understanding these factors and their relationships, the authors expect managers in the small and medium wholesale industry will enable more effective management activities.

### 5 - Self Pricing Beating in a Market With Preference Interdependence and Uncertainty

Ting Luo, Assistant Professor, California State University Fullerton,  
Mihaylo College of Business and Economics, Fullerton, CA, 92831,  
United States, Lijia Shi

Self price beating pricing strategy promises the early buyers that if the seller lowers the price in the later period, an ex post price refund that is more than the price difference will be refunded to them. We propose self price beating as a pricing policy under market externality and uncertainty. It combines the advantages of both price commitment and no price commitment. Based on a two-period model, we find that self price beating can sustain the high 1st period demand as price commitment does, while it can also generate high 2nd period profit as in the no price commitment case when there is market uncertainty. The total profit from self price beating surpasses both price commitment and no price commitment.

### 6 - Designing Shipping Policies for Online Retailers: The Role of Topping-up Behavior to Qualify For Free Delivery

Lifei Sheng, Assistant Professor, University of Houston Clear Lake,  
Houston, TX, United States, Guang Li, Dongyuan Zhan

We study a widely used shipping policy for online retailers. Under such a policy, a flat shipping fee can be waived if a customer's total purchase amount in a single order exceeds a certain pre-determined threshold. The threshold may promote some customers to top up their order size to qualify for free shipping. We model this "topping-up" behavior and design the optimal shipping structure under both monopolistic and competitive settings.

### Novel Revenue Management Models

Sponsored: Revenue Management & Pricing

Sponsored Session

Chair: Pratik Mital, Revenue Analytics, Atlanta, GA, 30318,  
United States

#### 1 - A Novel Approach for Multiple-round Bid Pricing

Iman Nekooimehr, Revenue Analytics, Atlanta, GA, United States

In B2B pricing, it's very common for the sellers to propose their prices in multiple rounds of bids. The sellers have multiple chances, therefore they can price their products/services higher and gradually decrease their prices in the next rounds of bids. In this presentation, we would like to present a new framework which assists companies find the optimal price when participating in multiple-round bids.

#### 2 - Mathematical Modelling for Time-of-Use Pricing of Electricity in Monopoly and Oligopoly

Goutam Dutta, Professor, Indian Institute of Management, Wing 3,  
Room No 3H, Production Quantitative Methods Area, Ahmedabad,  
Gujarat, 380015, India, Nidhi Kaicker, Debamanyu Das,  
Subhashree Banerjee

This paper attempts to study the efficiency gains for time-of-use (TOU) pricing over flat-rate pricing in the electricity sector. The electricity market may be characterised by a monopoly in some cases, where a single firm continues to enjoy market power, or an oligopoly, where two or more firms compete against one another by strategic interaction. This study establishes the feasibility condition for efficiency gains to arise from time-of-use pricing in a monopolistic set up using constrained optimization. The strategic behaviour of firms in a duopoly, generalizable to  $n$  firms, is modelled in this study using constrained optimization.

#### 3 - Approaches to Cancellation Forecasting in the Travel Industry

John Harvey, Senior Manager, Carnival UK, Southampton,  
United Kingdom

In the Cruise Industry, understanding Cancellation behaviour is key to maximising revenue, as we can identify mitigation strategies as well as overbooking strategies. But new patterns can take time to emerge so relying on previous cancellation curves is insufficient in a dynamic market.

We propose a statistical approach of modelling Cancellations using a Poisson Process at an appropriate level of aggregation. These will allow us to generate confidence intervals and establish the probabilities of a new cancellation trend emerging, which can then be used to update the Poisson models via Bayesian methods.

### 4 - Applications of Mixed-Integer Programming in Media Industry

Oguzhan Ozlu, Revenue Analytics, Atlanta, GA, 30318,  
United States

In this talk, we'll present the applications of mixed-integer optimization models in scheduling television/radio commercials and a high-level architecture of such scheduling solutions. Advertisers purchase several spots to air their commercials for a specified time period. The goal of an ad-scheduling solution is to optimally place all advertisements to maximize the advertiser and broadcaster revenues while minimizing the violations of advertisers' order requirements and reducing the need for manual ad placements by scheduling teams. The ad-scheduling solution automatically retrieves key data inputs from a variety of enterprise data marts, solves a series of interacting MIP's and publishes resulting schedules to the enterprise scheduling system. We will present the challenges and key learnings that helped us to develop automated cloud-based scheduling systems for large media enterprises.

### 5 - Enterprise Revenue Management System

Pratik Mital, Revenue Analytics, Atlanta, GA, 30318, United States

Developing an enterprise revenue management system is a complex task that requires significant resource investment (IT infrastructure and people), and time investment. The task becomes even more complex where entities from different parts of the world are involved and a common platform is being developed to serve all of them. Systems thinking and developing the right team to work on this task is key to its success. This talk will present a case study from developing an enterprise revenue management system for one of the largest cruise companies in the world.

### Revenue Management in Advertising

Sponsored: Revenue Management & Pricing

Sponsored Session

Chair: John G. Turner, University of California-Irvine, Irvine, CA,  
92697-3125, United States

#### 1 - Managing Digital Advertising Campaigns

Sami Najafi Asadolahi, Santa Clara University, Leavey School of  
Business, 500 El Camino Real, Lucas Hall, Santa Clara, CA, 95053,  
United States, Naren Agrawal, Stephen A. Smith

Advertising agencies, a key intermediary in the digital advertising supply chain, manage numerous ad campaigns for multiple clients in real-time. Because of uncertainties in the demand from campaigns for viewers, and the rate at which the target viewers visit websites, ensuring that campaigns proceed according to plan is a difficult challenge. We describe a methodology to manage such campaigns.

#### 2 - Dynamic Revenue and Project Management with Application to Online Advertising

Hossein Jahandideh, Google, Mountain View, CA, United States

We consider a provider who makes dynamic pricing decisions for deadline-based projects. The provider has the flexibility of processing a project in different time periods as long as all projects are completed by their respective deadlines. Because of the additional flexibility, this amounts to a non-traditional dynamic network revenue management (DNRM) problem. We convert this problem into the format of a traditional DNRM, approximately solve the problem, and provide a real-time pricing strategy. We discuss the application of this model to online advertising, where advertising campaigns correspond to projects.

#### 3 - Effect of Complex Multimedia Advertising Campaigns: A New Automated Method for Big Data

Will Wei Sun, University of Miami Business School, Miami, FL,  
United States, Pengyuan Wang, Guiyang Xiong, Jian Yang

The proliferation of online advertising not only brings new opportunities for advertisers to reach the consumers but also allows them to efficiently track large-scale individual-level data on ad exposures and conversions. Advertisers often question whether multimedia campaigns are actually effective and it remains unclear how to maximize their success. This study introduces a novel tree-structured causal inference model, which is nonparametric, flexible, computationally efficient, and suitable to analyze complicated nonlinear effects. The model enables automatic segmentation of consumers, allowing advertisers to better optimize the allocation of ad resources via accurate targeting.

#### 4 - Competitive Real-time Policies for the Allocation of Online Display Advertising

Ali Hojjat, University of New Hampshire, 10 Garrison Ave.,  
Durham, NH, 03824, United States, John G. Turner

We propose a new bid scaling mechanism for real-time matching of online guaranteed targeted display advertising with a website's users. Using primal-dual analysis, we derive the competitive ratio and show the conditions under which it beats the commonly known best bound of  $1 - 1/e$ .

**Information in Networks**

Sponsored: Revenue Management &amp; Pricing

Sponsored Session

Chair: Ozan Candogan, University of Chicago, Chicago, IL, 27708, United States

**1 - Fake News Propagation and Detection**Yianguos Papanastasiou, University of California Berkeley,  
2220 Piedmont Ave, Berkeley, CA, United States

We consider the problem faced by a social media platform that is observing the sharing actions of a sequence of rational agents and is dynamically choosing whether to conduct an inspection (i.e., a “fact-check”) of an article whose validity is ex ante unknown. We present results pertaining to: (i) the properties of the agents’ sharing behavior; (ii) the structure of the platform’s optimal inspection policy; and (iii) the impact of fake news on the society’s learning environment.

**2 - Fact-checking Policies for Fake Content Detection in Social Networks**Gizem Yilmaz, University of Chicago, 5807 S. Woodlawn Ave,  
Chicago, IL, United States, Ozan Candogan, Varun Gupta

We study the spread of multiple possibly erroneous pieces of content on a network. For a given content the spread rate is time-varying, and the spread process is approximated using an inhomogeneous continuous time branching process. We compute the offspring mean and variance of this branching process and discuss its relationship to the degree distribution of the network. We address the problem of minimizing the total spread of erroneous content, by using simulation techniques together with the moment information of the approximating branching process. We pose the problem as a continuous time optimal control problem and suggest heuristics for an approximate solution.

**3 - An Edge-based Model of Network Formation**Hao Li, Hong Kong University of Science and Technology, Clear  
Water Bay, Academic Building, Room 5551, Kowloon, Hong Kong,  
Ying-Ju Chen, Jin Qi

We present a dynamic model of network formation where new nodes find and connect old nodes based on edges: first, a new node finds an edge purely randomly; second, the new node connects to each endpoint of the selected edges with separated probabilities; third, the new node connects to the out-neighbours of the tail node of the selected edge with a probability. We checked the features of degree distribution and clustering coefficient exhibited by large random networks. Simulations are presented to illustrate the theoretic results of the model. This model could be applied to describe the network where cooperations are formed to produce a masterpiece, e.g. co-authorship network and movie actors network.

**4 - Optimal Signaling of Content Accuracy: Engagement vs. Misinformation**Ozan Candogan, University of Chicago, Booth School of Business,  
Chicago, IL, 27708, United States, Kimon Drakopoulos

We study information design in social networks. We consider a setting, where agents’ actions exhibit positive local network externalities. There is uncertainty about the underlying state of the world, which impacts agents’ payoffs. The platform can choose a signaling mechanism that sends informative signals to agents upon realization of this uncertainty, thereby influencing their actions. We investigate how the platform should design its signaling mechanism to achieve a desired outcome. We discuss our findings in the context of increasing engagement or decreasing misinformation in social networks.

**Computational Methods in RMP**

Sponsored: Revenue Management &amp; Pricing

Sponsored Session

Chair: Gustavo J. Vulcano, Universidad Torcuato di Tella,  
Universidad Torcuato di Tella, Buenos Aires, 1428, Argentina**1 - Demand Model Estimation with Unobserved Stockouts**Hongzhang Shao, Georgia Institute of Technology, Atlanta, GA,  
United States, Anton J. Kleywegt

In many settings one wants to estimate discrete choice models, but customers’ choice sets are not known. In one such setting stock levels are observed periodically, and stockouts occur between successive observations, with stockout times not being observed. Therefore different customers had different unobserved choice sets. We developed a choice model estimation method that works with data with both unobserved customer arrivals and unobserved stock-outs. We

introduced a transformation of the likelihood function that significantly improved the algorithms’ performance. The method was used to develop a tool for managing vending machines, and results based on these data are presented.

**2 - A Constant-factor Approximation Algorithm for Network Revenue Management**Mika Sumida, Cornell Tech, New York, NY, 10128, United States,  
Yuhang Ma, Paat Rusmevichientong, Huseyin Topaloglu

We provide a constant-factor approximation algorithm for network revenue management problems. In our approximation algorithm, we construct a policy using value function approximations that are expressed as linear combinations of basis functions. We use an efficient backward recursion to compute the coefficients of the basis functions. If each product uses at most  $L$  resources, then the total expected revenue obtained by our policy is at least  $1/(1+L)$  of the optimal total expected revenue. In many network revenue management settings, the number of resources used by a product remains bounded. In this case, our policy provides a constant-factor performance guarantee.

**3 - CDLP-based Bid-prices for Network Revenue Management**Juan Jose Miranda Bront, Universidad Torcuato Di Tella /  
CONICET, School of Business, Av Figueroa Alcorta 7350,  
Buenos Aires, C1428BCW, Argentina, Isabel Mendez-Diaz,  
Gustavo J. Vulcano, Paula Zabala

The primal solution of the linear programming formulation for choice-based revenue management (CDLP) is known to be effective from a revenue perspective. However, from a practical perspective, there is a representation issue since airline systems are in principle incompatible with those offer sets. In this work, we consider a variation of the CDLP that naturally generates bid-prices. Based on our numerical experiments, their performance is promising.

**4 - On Reformulations of Approximate Linear Programs for Network Revenue Management**Jiannan Ke, Shanghai Jiao Tong University, 1954 Huashan Road,  
Zhongyuan 111, Shanghai, 200030, China, Dan Zhang,  
Huan Zheng

Approximate linear programming is a popular method to approximately solve dynamic programs that suffer from the curse of dimensionality. However, approximate linear programs (ALPs) still pose computational challenge due to the large number of variables or constraints. Vossen and Zhang (2015) show that ALPs for the network revenue management problem can be dramatically reduced in size for affine and separable piecewise linear approximations under either independent or discrete choice models of demand. In this paper, we give an alternative proof of the results based on reformulations of constraints in the ALPs and duality arguments. The result also applies to the dynamic pricing setting.

**Topics in FinTech and Risk Management**

Sponsored: Finance

Sponsored Session

Chair: Xuedong He, The Chinese University of Hong Kong, Shatin,  
Hong KongCo-Chair: Nan Chen, Chinese University of Hong Kong, Shatin N. T,  
Hong Kong**1 - Risk Adjustment Processes**Sturm Stephan, Worcester Polytechnic Institute (WPI), 100  
Institute Road, Worcester, MA, 01609, United States

In the wake of the financial crisis factors commonly ignored in financial modeling got on the center stage: funding differentials and the absence of the postulated riskfree rate and counter party credit risk. These factors have been taken into account in derivatives pricing in the framework of value adjustments (also known as XVA). However, to the best of our knowledge this has so far not been accounted for in risk management. We are developing a theory of risk-adjustment processes incorporating funding spreads and credit risk to market risk evaluations based on BSDE representations of convex risk measures.

**2 - Evidence from Risk Disclosures: Are Banks Transparent About Their Risks?**Steve Yang, Stevens Institute of Technology, Hoboken, NJ,  
United States, Aparna Gupta, Xiaodi Zhu

We address the risk information transparency of US banks by examining the banks’ risk disclosures in annual reports (10-K) and its relationship with bank risk-taking. We quantify the descriptive using the Sentence-based Dynamic Topic Model and propose an automatic topic labeling algorithm based on a predefined keyword dictionary of 16 risk factors. Comparing the risk factors against the CAMELS risk rating system shows that US banks’ risk disclosures provide useful information pertaining to specific bank risk-taking behavior. Large and small banks differ in emphases, with both lacking disclosing management and liquidity risks.

### 3 - A Confidence Interval-based Learning Algorithm for Stochastic Dynamic Programs and its Applications

Nan Chen, Chinese University of Hong Kong, William M.W. Mong  
Engineering Bldg, Rm 609, Shatin N.T, Hong Kong, Xiang Ma

We employ the information relaxation technique in this paper to develop a method of value iteration to solve stochastic dynamic programs. The advantages of the new method are that we can construct valid confidence interval to assess the performance of a heuristic policy and provide an recursive algorithm to improve the policy quality. Various applications in finance and inventory management are discussed. Our method can also be easily extended to the investigation on reinforcement learning, in which the decision maker has to learn the dynamic of the stochastic system.

### 4 - Bitcoin Transaction Fees

Wei Jiang, National University of Singapore, Singapore, Min Dai,  
Steven Kou, Cong Qin

Although Bitcoin mining activities are widely discussed in the media, as miners attempt to profit from transaction fees, there are few academic papers studying the transaction fees. We proposed a model for Bitcoin transaction fees from the miners' perspective. The model is rich enough to incorporate both inventory and demand levels. The model is calibrated to the empirical data and dynamics of the average transaction fees are discussed. The model is made possible by significantly extending the classical Hotelling model for exhaustible natural resources, via the addition of both feedback supply and an S-shaped stochastic demand function.

### Practice- Blockchain and Innovation

Contributed Session

Chair: Qianyu Hu, Penn State University, State College, PA, 16801, United States

#### 1 - Automation and Ecosystem Level Operations Management via Decentralized Ledger Technology

Michael Zargham, CEO, BlockScience, Oakland, CA, 94609, United States, Matthew Barlin

Incentive functions are engineered to induce independent actors to provide services to decentralized networks. Formal models of the system behavior and careful scoping of models based on design goals is paramount. System models may be derived from game theoretic or behavioral economic models; Operations Research and Swarm Robotics provide existing tools for engineering emergent dynamics. Partitioning the problem improves feasibility and introduces testing requirements and integration challenges for simulation and verification. After deployment, systems require tuning capabilities, monitoring, and maintenance. The safety of public economic infrastructure is a duty of engineers.

#### 2 - Blockchain-based Renewable Energy Certificates Program

Fangyuan Zhao, Tsinghua University, Shenzhen, Chinan,  
Ying Kong, Xin Guo

In the era of green energy revolution, distributed renewable energy generation is emerging, while it is out of the scope of conventional renewable energy certificate programs, which involves only large power plants and utility companies. Blockchain shows an advantage of incorporating a galaxy of distributed prosumers in a transparent and low cost manner. This paper proposes a proof of concept model of blockchain-based renewable energy certificates trading system, in which a cryptocurrency is designed for tracing the footprint and stimulating the popularization of renewable energy. The concept model is implemented on Ethereum blockchain for performance and risks analysis.

#### 3 - Blockchain-enabled Pharmaceutical Supply Chain System: A Hyperledger Fabric Design

Qianyu Hu, Penn State University, State College, PA, 16801, United States

The drug supply chain safety has gained immense attention due to prevalent counterfeit products, widespread fake online pharmacies, drug abuse crisis and so on. Serialization, placing unique identifiers on products, can provide some visibility to the pharma supply chain. However, the identifiers suffer from duplicates and are prone to theft. Our blockchain-enabled system keeps the pharma supply chain data in an immutable and distributed manner to enforce zero counterfeits and allows for transparency and accountability. Data stored on the hyperledger fabric system are accessed based on consented permissions to protect users' privacy.

### Complex Service

Sponsored: Service Science

Sponsored Session

Chair: Fengming Cui, Tsinghua University, Tsinghua, Beijing, China

#### 1 - The Influence of Water, Sanitation and Hygiene Factors on Healthcare Service Utilization During Floods

Nirarcha Tungtisanont, Assistant Professor, University of Maryland, College Park, 3422 Van Munching Hall, LBPP Dept., College Park, MD, 20742, United States, Aleda Roth

We demonstrate that household level factors associated with access to clean water, sanitation and hygiene (WASH) play an integral role on the over- and under-utilization of healthcare resources during a major flood. We apply econometric analyses using field and archival data from 34,000 households in Thailand during the 2011 flood.

#### 2 - The Impact of Dealer Networks on Market Success of Manufacturers

Sina Golara, Postdoctoral Associate, Massachusetts Institute of Technology, 1 Amherst St., E40, 239C, Cambridge, MA, 02142, United States, Kevin Dooley

Most durable goods manufacturers use a network of dealers to distribute their products. While dealers are the consumer-facing stage of the supply chain and can potentially have a make or break effect on manufacturer's business, the extent of their influence is not very well understood and has been subject to controversy. By scraping web, we obtain daily sales and consumer rating information for all dealerships in the US and all new cars in inventory in five car classes. We find that consumers' satisfaction with dealerships influences their purchase of the product. Furthermore, this effect is stronger in markets where the focal brand's dealer network is sparse and the competing dealer networks are dense.

#### 3 - Performance Effects of Diversity in Experience in Fluid Teams

Antti Tenhi l, IE Business School, Calle Maria de Molina 12, piso 5, Madrid, 28006, Spain, Constantin Alba, Fabrizio Salvador

How does team diversity in past work experience influence project productivity and responsiveness? We study this question using work assignment data from a multinational software services firm. We operationalize diversity in experience along the dimensions of variety of specializations, separation of experience profiles, and disparity of expertise, hypothesizing and observing distinct curvilinear effects for each dimension. We further theorize that team familiarity may moderate these effects, receiving partial support for these hypotheses.

#### 4 - Agent-based Modeling in Complex Service Systems and Service Systems Engineering

Fengming Cui, Tsinghua University, Beijing, China, Lefei Li

We introduce agent-based simulation into the design of complex service systems. Each individual in service processes is modeled as a "smart agent" who interacts with each other. By integrating simulation and service science, we obtain insights about service systems dynamics which help us propose better operation strategies.

#### 1 - Advertising Campaign Optimization

Niloy J. Mukherjee, Research Scientist, Amazon.com, Seattle, WA, United States

Creating an advertising campaign requires several decisions. Including the selection of optimal keywords, match-types and bid values. We discuss methods of making these decisions in an optimal manner when creating a campaign as well as updating them based on performance.

**2 - Waterfall Bandits: Learning to Sell Ads Online**

Zheng Wen, Adobe Systems, 345 Park Avenue, E07-415,  
San Jose, CA, 95110-2704, United States, Branislav Kveton,  
Saied Mehdi, S. Muthukrishnan, Yikun Xian

A popular model of pricing in online advertising uses what is known as the waterfall, where the publisher orders ad networks with their offered prices, and then contacts them in that order sequentially. A common approach to revenue maximization in the waterfall model is to estimate the model from past data and then maximize the revenue in the estimated model. This is statistically inefficient because the learning and optimization are separated. We propose an online learning algorithm for solving this problem, which interleaves learning and optimization. We also derive a sub-linear regret bound for the proposed algorithm, and evaluate it on both synthetic and real-world data.

**3 - Data Scientist Professions in Big Data Era**

Marwah Halwani, King Abdulaziz University, Jeddah, 76208,  
Saudi Arabia, Nicholas Evangelopoulos, Victor Prybutok

With the evolution of technology and big data, industry has adopted new job titles that require a new set of technical skills. This research examines the differences and commonalities among company-posted job requirements for five overlapping job titles, which include statistical analysts, big data analytics professionals, data scientists, data analysts, and business analytics professionals, by obtaining and analyzing online job descriptions through latent semantic analysis. The results are used to clarify skill requirements for big data professionals for the joint benefit of the job market where they will be employed, and academia that prepares such professionals.

**1 - Predictive Switch Health Using Switch Amperage**

Casey Jen, CSX Corporation, Jacksonville, FL, United States

Among all the Communication and Signal (C&S) components, switches cause biggest number of train delays on line of road. In this study, we leveraged switch amperage and developed a set of classification models to identify switch health. Taking information from multiple data sources, such as switch amperage, switch inspection records, switch incidents records, and many others, these classification models will enable CSX to proactively maintain our vital assets and better plan C&S workforce.

**2 - Predicting Rail Defects with Massive Foot-by-foot Track Geometry Data**

Reza Mohammadi, University at Buffalo, Amherst, NY, United States, Faeze Ghofrani, Qing He

Using foot-by-foot track geometry data, this study examines the relationship between rail defects and track geometry measurements. Fast Fourier Transformation is applied to extract the frequency-domain feature from track geometry data. To identify the significant variables in terms of variation, Singular Vector Decomposition (SVD) is implemented. In fact, SVD is applied to explain the source of variation in the dataset. Studying the behavior of rail defects based on this well-prepared track geometry measurements data set results in time- and cost-effective track predictive maintenance.

**3 - Using Predictive Analytics for Railway Track Maintenance Planning**

Clark Cheng, Sr. Director Operations Res & Chief Data Scientist, Norfolk Southern Corporation, 1200 Peachtree Street NE, Atlanta, GA, 30309, United States, Mabby Amouie, Gongli Duan

Railway track maintenance is critical to safety and efficient operations. It's capital and labor-intensive. The planning process is manual and largely relies on the readings from the most recent single run of track geometry car. In this presentation, we will describe a machine-learning approach to predicting rail wear over five years based on historical track geometry car readings. The rail wear prediction model has significantly improved the track maintenance planning at Norfolk Southern.

**4 - Integrated Optimization of Timetable and Rolling Stock Rescheduling Due to Temporary Maintenance Tasks**

Jianrui Miao, Beijing Jiaotong University, Beijing, China

In daily railway operations, some inevitably unexpected disruptions often occur, resulting in some temporary maintenance tasks arranged, which will perturb normal operations. This paper builds up a space-time-state network based mixed-integer linear programming model to reschedule timetable and rolling stock, i.e. retiming, reordering, re-servicing and re-circulation of rolling stocks, simultaneously. The objective function minimizes total cost of timetable and rolling stock utilization. Finally, comprehensive experiments based on Beijing - Shanghai High-speed Railway Line are conducted to examine the applicability and validity of the proposed method.

**Modeling and Analysis of Emerging Mobility Services and Systems II**

Sponsored: TSL/Urban Transportation

Sponsored Session

Chair: Hai Wang, Singapore Management University, Singapore Management University, Singapore, 178902, Singapore

**1 - Refuse or Accept? Analysis of Taxi Driver Operating Strategies in e-Hailing Platforms**

Debjit Roy, Indian Institute of Management Ahmedabad, Ahmedabad, India, Arulanantha Prabu PM, Prahalad Venkateshan

In e-hailing platforms, a taxi driver adopts one of the three reactive strategies to a customer pick-up request: no refusal, refusal based on proximity, and refusal based on profitability index (based on dry and live-run distance). We develop driver operating policies for profit maximization with different service region topologies.

**2 - On the Range Anxiety for Electric Vehicles: An Empirical Investigation**

Sang Won Kim, CUHK Business School, Hong Kong, China, Ho-Yin Mak, Marcelo Olivares, Ying Rong

One of the most well-cited reasons of slow adoption of electric vehicles is the range anxiety. However, it has not been adequately quantified, quite possibly due to the lack of quality data. We propose a novel way to do so by use of a dataset from a car sharing platform.

**3 - Can Multiple On-demand Service Platforms Coexist?**

Jiaru Bai, Binghamton University, SUNY, Binghamton, NY, 13902, United States, Christopher S. Tang

As venture capital firms are financing many startups that are essentially on-demand service platforms, we wonder how many startups of this kind can survive in a competitive market. To examine this question, we present a model in which two on-demand service platforms compete in both the provider and customer markets with earning-sensitive service providers and price- and delay-sensitive customers.

#### 4 - Public Transit Scheduling Under Ride-hailing Competition and Congestion

Keji Wei, Dartmouth College, Thayer School of Engineering at Dartmouth, 14 Engineering Dr, Hanover, NH, 03755, United States, Vikrant Vaze, Alexandre Jacquillat

Ride-hailing services are becoming increasingly popular in major urban and suburban areas across the world, raising many important questions about their overall impact on the quality of urban transportation and the potential shifting of passengers from public transit to ride-hailing. The objective of this study is to optimize urban public transit schedules while incorporating the impacts of ride-hailing. We present and solve a mixed-integer linear programming model that captures the dynamics between transit schedules, passenger choice, congestion and environmental impacts.

#### 5 - The Logic of Matching in Ride Sharing Markets: Revenues, Service Ratings or Pick-up Times?

Hai Wang, Singapore Management University, Room 5023, School of Information Systems, Singapore Management University, Singapore, 178902, Singapore, Wang Chi Cheung, Guodong Lyu, Chung-Piaw Teo

We study a class of multi-period multi-objective online optimization problems, where a decision maker takes actions over time in an online fashion without being informed of future scenarios. To balance the trade-offs between different objectives, we develop an efficient online policy to derive the “compromise” solution, which minimizes the lp-distance from the attained KPIs to the utopia target. We apply the online policy in ride sharing market settings, and observe that all parties in the ride-sharing eco-system, from drivers, passengers, to the platform, are better off under our proposed online matching policy.

#### Communities Towards a Smart City

Emerging Topic: Smart Cities

Emerging Topic Session

Chair: Michael P. Johnson, University of Massachusetts-Boston, 100 Morrissey Blvd., Boston, MA, 02125-3393, United States

#### 1 - Modeling the Role of Human Mobility on Dengue Outbreak Evolution in Sri Lanka

Ying Zhang, Johns Hopkins University, Baltimore, MD, United States, Jefferson Riera, Kayla Ostrow, Sauleh Ahmad Siddiqui, Lauren Gardner

Dengue is a prevalent mosquito-borne disease that infects approximately 390 million people every year globally, particularly in tropical and subtropical countries. There is a need to better understand and predict dengue outbreaks and transmission risk within a region so that vector control and surveillance resources can be optimally targeted. To address this issue, we model the spatial-temporal dynamics of dengue transmission as a function of human mobility patterns, in combination with land use and climate data for the Negombo region in Sri Lanka. We quantify the impact of mobility on disease-spread, and compare it to other standard predictors in the literature.

#### 2 - Community-engaged Planning Support for Shrinking Cities and Blighted Communities

Michael P. Johnson, University of Massachusetts Boston, Department of Public Policy & Public Aff, 100 Morrissey Boulevard, Boston, MA, 02125-3393, United States

In the conversation about smart cities and big data, users have been presumed to be growing, progressive cities seeking to better-manage and better-plan innovative services, as well as tech-savvy residents who want to perform routine tasks more efficiently. Using a review of data and technology applications, research on decision modeling in shrinking cities and novel applications of spatial decision support for neighborhood redesign, I demonstrate how residents of under-developed communities use technology, digital data and decision modeling to make creative and data-informed decisions about the future of their neighborhoods.

#### 3 - A Dynamic Policing Simulation Framework

Khan Md Ariful Haque, The University of Texas at Arlington, Industrial, Manufacturing, & Systems Engr., Campus Box 19017, Arlington, TX, 76019-0017, United States, Victoria C.P. Chen

Predictive policing seeks to predict crime, criminals, and victims. The focus is on prediction itself, as opposed to actions that might mitigate crime. Unfortunately, these predictions are only valid under the same conditions of data collection. Prediction-led policing is a concept that connects police actions to the reduction of criminal activity. This concept recognizes that the policing system is dynamic. For example, criminal behavior will be altered in response to specific actions. The presented framework proposes a structure to study dynamic policing strategies. A case study for the Arlington, TX Police Department is used to illustrate the framework.

#### 4 - Implementing Smart Cities Programs: Towards a New Agenda

Tayo Fabusuyi, PhD, University of Michigan, Ann Arbor, MI, United States

Despite the proliferation of analytics and technological deployments in the urban space, only incremental improvements in performance have been documented. I examine why this is the case and make the argument that the ill-structured nature of the issues at stake; obscure goals from multiple stakeholders and a myriad of poorly understood factors are contributing reasons. Drawing from the policy and community operations research literature, I make the case for a framework that broadens and enriches conventional approaches to capture the subtleties inherent in urban systems. I demonstrate the approach using as a case study the design and implementation of a smart parking program in a mid-size US city.

#### Vehicle Routing I

Sponsored: TSL/Freight Transportation & Logistics

Sponsored Session

Chair: Camilo Ortiz-Astorquiza, Université de Montréal, Montreal, QC, H3E 1C6, Canada

#### 1 - Robust Optimization of Heterogeneous Vehicle Routing Problems Under Demand Uncertainty

Anirudh Subramanyam, Carnegie Mellon University, DH3122, 5000 Forbes Ave., Pittsburgh, PA, 15213, United States, Panagiotis Petros Repoussis, Chrysanthos Gounaris

The Heterogeneous Vehicle Routing Problem (HVRP) generalizes the classical VRP to allow multiple vehicle types, with different capacities, fixed and variable costs. In this work, we study a generic HVRP under demand uncertainty. First, we develop robust versions of classical local search moves. Specifically, we augment local search so that the generated vehicle routes remain capacity-feasible for demand realizations from any of five broad classes of uncertainty sets. The robustified local search is shown to be modular via two metaheuristic implementations. Second, we develop a new integer programming formulation to obtain lower bounds and quantify the quality of the metaheuristic solutions.

#### 2 - The Inventory Routing Problem with Time Windows

Gizem Ozbaygin, Sabanci University, Faculty of Engineering and Natural Sciences, Istanbul, 34956, Turkey, Esra Koca, Hande Yaman

In this study, we consider the inventory routing problem with time windows (IRPTW), which is a variant of the vehicle routing problem with time windows involving inventory management decisions over a discrete planning horizon. More precisely, the inventory level at each retailer is managed by the vendor, who plans the distribution routes in a way that the retailers never run out of stock and are served within their specified time windows. We propose an exact solution approach for the IRPTW and report the results of our preliminary experiments.

### 3 - The Locomotive Assignment Problem with Distributed Power

Camilo Ortiz-Astorquiza, Université de Montréal, Montreal, QC, Canada, Emma Frejinger, Jean-François Cordeau

The Locomotive Assignment Problem consists of determining the optimal assignment of locomotive types to scheduled trains while ensuring power requirements and flow balance. We introduce a variant of the LAP where the operation mode of the train is also part of the decision process. Two modes of operation are considered: Distributed Power and Conventional. We also include additional constraints and preferences to capture the requirements of the partner railway company for this project, Canadian National Railway (CN). We model the problem as a network design problem, present an IP formulation and discuss a solution method with some preliminary computational results.

### Design and Modeling of Advanced Manufacturing

Emerging Topic: OR and Advanced Manufacturing

Emerging Topic Session

Chair: Linkan Bian, Mississippi State University, MS, 39762, United States

#### 1 - Life Cycle Cost Trade-off Model: Comparison of Life Expectancy and Quality on Overall Cost

Janis Terpenney, Penn State University, Industrial & Manufacturing Engineering, 310 Leonard Building, University Park, PA, 16802, United States, Connor Jennings

The classic problem in business is the trade-off between quality and cost. Models have been created to predict the life expectancy of products based on usage and manufacturing specifications and other models have been created to estimate the total life cycle cost of the model. However, few models look at both life cycle length and life cycle cost together. This paper presents a framework that combines these two types of models to determine an optimal decision. A Genetic optimization algorithm is applied to find the minimal cost, given a desired life cycle. An alternative model is also presented, that determines the maximum life cycle, given a set cost.

#### 2 - A Design and Process Improvement Framework for Additive Manufacturing

Gul Kremer, Iowa State University, 2529 Union Drive, 3004 Black, Ames, IA, 50011, United States

Although additive manufacturing (AM) offers unprecedented opportunities to design and manufacturing professionals to improve product designs and benchmark manufacturing processes for capability comparisons, the cost of training and technology for AM adoption is high. Specifically, AM adoption as a viable alternative requires part designs that take into account technology capabilities and limitations. Moreover, what is possible with a specific technology using one material may not be possible with another material. Finally, reproducibility is a significant concern across many AM technologies that requires attention. This talk will summarize our group's work responding to these challenges. The design and process improvement framework synergistically uses Axiomatic Design, TRIZ, Design of Experiments and Process Capability Analysis. Several case studies will be summarized that show tangible benefits of using the developed framework.

#### 3 - A Spare Parts Sourcing Policy with Additive Manufacturing

Taner Cokyasar, University of Tennessee-Knoxville, Knoxville, TN, United States, Mingzhou Jin, Sean Willems

Spare part demand is usually met through two suppliers: fast and slow. The trade-off in between these channels was extensively studied in the literature. In recent studies, additive manufacturing (AM), was proposed as an alternative option to minimize spare parts acquisition cost. Yet, these studies did not quantitatively measure the effectiveness of the technology. In this study, an optimization model was developed to assess the viability of acquiring AM technology and determine the sourcing policy of the parts. M/G/k queueing theory and (S-1, S) inventory policy were used to calculate the average long-term cost of using AM and inventory options, respectively.

#### 4 - Layer-wise Quality Modeling of Laser-Based Additive Manufacturing Using High-Dimensional Thermal Images

Linkan Bian, Mississippi State University, Industrial and Systems Engineering Department, MS, 39762, United States, Wenmeng Tian, Seyyed Hadi Seifi Shishavan, Hongyue Sun

One of the main challenges in Additive Manufacturing (AM) process is concerned with functional quality of fabricated parts. A novel layer-based approach is introduced to evaluate the quality of the deposited layer based on analyzing the process properties (e.g. thermal history). High dimensional process data is mapped to a lower dimensional domain that is correlated to the porosity distribution of a layer. A real-world case study shows that the accuracy of the proposed methodology in predicting defected layers is close to 98%.

### Traffic Flow Management Concepts

Sponsored: Aviation Applications

Sponsored Session

Chair: James Calvin Jones, University of Maryland-College Park, Cambridge, MA, 02140, United States

#### 1 - Autonomous Air Traffic Control for Sequencing and Separation with Nested Deep Reinforcement Learning

Marc Brittain, Iowa State University, Ames, IA, United States, Peng Wei

With the increasing air traffic density and complexity in the traditionally controlled airspace, an autonomous air traffic control system is needed as the ultimate solution to handle dense, complex air traffic. In this work, we design and build an artificial intelligence agent to perform air traffic control sequencing and separation. The approach is to formulate this problem as a reinforcement learning model and solve it using deep reinforcement learning. For demonstration, the NASA Sector 33 app has been used as our learning environment for the agent. Results show that this agent can guide aircraft safely and efficiently through Sector 33 and achieve required separation at the metering fix.

#### 2 - Saturation Technique for Optimizing Planned Acceptance Rates in Traffic Management Initiatives

Peng Wei, Assistant Professor, Iowa State University, Aerospace Engineering Department, Iowa State University, Ames, IA, 50011, United States

In this paper, we have addressed a fundamental question in TMI PAR planning: do there exist optimal PARs which only depend on the physical airport or airspace capacity but not the demand? We show that this conjecture holds true in the deterministic capacity case but not in the general stochastic case. We propose a new heuristic saturation technique. We demonstrate that this technique can not only reveal the properties and limiting behaviors of GDP models but also could potentially be used as a robust PAR policy when facing demand uncertainty. The findings of this paper provide valuable insights in understanding the TMI rate planning problem and a robust algorithm for GDP optimization.

#### 3 - Reinforcement Learning Methods for AFP selection

James Calvin Jones, University of Maryland-College Park, Cambridge, MA, 02140, United States

In this talk we discuss the use of a set of reinforcement learning algorithms for setting the planned flow rates on a set of airspace flow programs. The work is validated through the use of an agent-based air traffic management simulation.

North Bldg 224B

### Robotics, Drones, and AVs in Logistics

Emerging Topic: Robotics, Drones and Autonomous Vehicles in Logistics

Emerging Topic Session

Chair: Michael Levin

#### 1 - Unmanned Aerial Vehicle Path Planning for Network State Estimation

Cesar N. Yahia, The University of Texas at Austin, Austin, TX, 78705, United States, Stephen D. Boyles, Christian G. Claudel

We investigate the problem of planning a trajectory for an unmanned aerial vehicle with the objective of estimating network state parameters. The optimal trajectory would maximize the information on the network state over a finite time horizon. In this case, planning and estimation are coupled since different paths chosen by the mobile sensor generate distinct observations, which in turn directly influences the quality of the estimates. To address this problem, we propose an online control algorithm based on forward propagation of traffic flow.

#### 2 - Traffic Optimization for a Mixture of Self-interested and Compliant Agents

Michael Albert, University of Virginia, Charlottesville, VA, United States, Guni Sharon, Peter Stone, Stephen D. Boyles, Tarun Rambha

This paper focuses on two commonly used path assignment policies for agents traversing a congested network: self-interested routing, and system-optimum routing. A computationally tractable method is presented that computes the minimal amount of agents that the system manager needs to influence (compliant agents) in order to achieve system optimal performance. Moreover, this methodology can also determine whether a given set of compliant agents is sufficient to achieve system optimum and compute the optimal route assignment for the compliant agents to do so. Experimental results are presented also presented.

#### 3 - Who Should Drive? Optimal Switching Policy Between Driving Entities in Semi-Autonomous Vehicles

Franco van Wyk, University of Tennessee, Knoxville, TN, United States, Anahita Khojandi, Neda Masoud

Autonomous vehicles are expected to increase safety on the road. However, currently automated entities do not necessarily outperform human drivers under all circumstances. Therefore, in certain conditions it is safer for the human driver to take over the control of the vehicle. However, switching control back and forth between the driver and the automated driving-entity may itself pose a short-term, elevated risk. We develop a Markov decision process model to determine the optimal driving-entity switching policy that minimizes the expected safety risk of a trip, considering the dynamic changes of the road/environment during the trip. We conduct numerical analyses and provide insights.

#### 4 - Leveraging Shared Autonomous Electric Vehicles for First/last Mile Mobility

T. Donna Chen, Assistant Professor, University of Virginia, P.O. Box 400742, Charlottesville, VA, 22904, United States, Farhan Javed

A simulation framework is proposed to evaluate shared autonomous electric vehicle (SAEV) operations that center around Tukwila light rail station to provide first/last-mile mobility in Seattle. Results show great potential for leveraging SAEVs to increasing the station's catchment area, resulting in reduced parking demand. The proposed SAEV fleet reduce system-wide VMT by 36.65% through ridesharing. Fast charging technology decreases the fleet size and wait time by 56% and 72.97%, respectively. Decision makers can apply this framework to evaluate the service by comparing scenarios with varying vehicle configuration, capacity, and charging infrastructure.

### Large-Scale Games

Sponsored: Applied Probability

Sponsored Session

Chair: Gabriel Weintraub, Stanford Graduate School of Business, Stanford, CA, 94304, United States

#### 1 - Mean Field Equilibria for Resource Competition in Spatial Settings

Krishnamurthy Iyer, Cornell University, Ithaca, NY, 14850, United States, Pu Yang, Peter Frazier

Inspired by crowd-sourced transportation services and other location-based activities, we consider a model of competition among nomadic agents for time-varying and location-specific resources. Each agent derives a periodic reward based on the overall resource level at her location, and the number of other

agents there. Each agent is free to move between locations, and at each time decides whether to stay at the same location or switch to another one. We study the equilibrium behavior of the agents as a function of dynamics of the stochastic resource process and the nature of resource sharing in the limit where the number of agents and locations increase proportionally.

#### 2 - Mean Field Equilibrium: Uniqueness, Existence, Comparative Statics, and Applications

Bar Light, Stanford GSB, Stanford, CA, United States, Gabriel Weintraub

The standard solution concept for stochastic games is Markov perfect equilibria (MPE), but the computation of MPE becomes intractable as the number of players increases. We instead consider mean field equilibria (MFE) that have been popularized in the recent literature. We make three main contributions. First, our main result in the paper provides conditions that ensure the uniqueness of an MFE. Second, we generalize previous existence results of an MFE. Third, we provide general comparative statics results. We apply our results to dynamic oligopoly models commonly used in previous work. We believe our uniqueness result is the first of its nature in the class of models we study.

#### 3 - The Cutoff Structure of Top Trading Cycles in School Choice

Irene Yuan Lo, Columbia University, New York, NY, United States

The prominent Top Trading Cycles (TTC) mechanism has attractive properties for school choice, as it is strategy-proof and Pareto efficient. However, these properties are obfuscated by the common combinatorial description of TTC. We show that the TTC assignment can be described by admission cutoffs for each pair of schools. In a large-scale continuum model these cutoffs can be computed directly from the distribution of preferences and priorities, providing a framework for evaluating policy choices. As an application of the model we solve for optimal investment in school quality under choice and find that an egalitarian distribution can be more efficient as it promotes better sorting by students.

#### 4 - The Ubiquity of Aggregate Uncertainty in Mean Field Equilibria

Daniel Lacker, Columbia University, 500 W. 120th St, Mudd 306, NY, United States

A game with a continuum of agents is typically justified by showing that, if the mean field (continuum) game has a unique equilibrium, then any sequence of equilibria in the corresponding N-player games converges as N goes to infinity to this mean field equilibrium (MFE). For static games, even when the MFE is not unique, limit points of N-player games can still be characterized as mixtures (randomizations) over the set of MFE. However, in dynamic games with nonunique MFE, there are other randomized limit points which cannot be described as mixtures of MFE; the relevant aggregate quantities evolve stochastically. The goal of this talk is to explain this phenomenon and provide examples.

### Design Innovations in Matching Markets and Systems

Sponsored: Applied Probability

Sponsored Session

Chair: Vahideh Manshadi, Yale University, New Haven, CT, 06511, United States

#### 1 - Carta: A Data-driven Course Planning Platform

Ramesh Johari, Stanford University, Huang Engineering Center Rm 311, 475 Via Ortega, Stanford, CA, 94305-4121, United States, Sorathan Chaturapruek, Thomas Dee, Rene Kizilcec, Mitchell Stevens

College students rely on increasingly data-rich environments when making learning-relevant decisions about the courses they take and their expected time commitments. In this talk we discuss recent research involving Carta, a course exploration platform for undergraduates. In particular, we discuss two field experiments that investigate the consequences of such a platform on college students' GPA.

#### 2 - On the Optimal Design of a Bipartite Matching System

Rene A. Caldentey, The University of Chicago, Booth School of Business, 5807 S. Woodlawn Ave, Chicago, IL, 60637, United States, Philipp Afeche, Varun Gupta

In this talk, we explore the optimal design of matching topologies for a multi-class multi-server queueing system in which each customer class has a specific preference over server types. We investigate the performance of the system from the perspective of a central planner who must decide the set of feasible customer-server pairs that can be matched together under fairness constraints for both customers and servers.

### 3 - Joint Pricing and Matching in Ridesharing Systems

Erhun Ozkan, Koç University, Istanbul, Turkey

Two key questions common to all ridesharing firms concern pricing and matching. The pricing decisions determine both customer demand and driver supply. The decision of which driver to match to an arriving customer determines how long that customer must wait for driver pick-up. We study the interplay between the pricing and the matching decisions of a ridesharing firm. We show that optimizing only in the pricing (matching) dimension while using same area matchings (constant prices) has no benefit to the firm. Therefore, pricing and matching decisions should be optimized jointly.

### 4 - On Matching and Thickness in Heterogeneous Dynamic Markets

Vahideh Manshadi, Yale University, New Haven, CT, 06511, United States, Itai Ashlagi, Maximilien Burq, Patrick Jaillet

We study dynamic matching in an infinite-horizon stochastic market. While all agents are potentially compatible with each other, some are hard-to-match and others are easy-to-match. Agents prefer to be matched as soon as possible and matches are formed either bilaterally or indirectly through chains. We adopt an asymptotic approach and compute tight bounds on the limit of waiting time of agents under myopic policies that differ in matching technology and prioritization.

## ■ TD39

North Bldg 226A

### Queueing and Inventory Models

Sponsored: Applied Probability

Sponsored Session

Chair: John Hasenbein, University of Texas-Austin, Austin, TX, 78712-0292, United States

#### 1 - Stochastic Analysis of Queues with Information Updates

Jamol Pender, Cornell University, 228 Rhodes Hall, Ithaca, NY, 14850, United States

Many service systems provide real-time information to their customers with the goal of reducing the customers' anxiety of the unknown. However, the information might be unreliable and is often not given in real-time. In this talk, we will show how to prove fluid limit theorems for a state dependent infinite server queueing model where customers choose which queue to join by a generalized customer choice model. In the choice model, the information about the queue length is updated in discrete intervals unlike a constant delay model. We show that the fluid limit is given by a system of functional differential equations with a non-stationary time delay.

#### 2 - Queue Length Asymptotics for the G/G/D Queue with Heavy-tailed Service Times

Chang-Han Rhee, Centrum Wiskunde and Informatica, Jakoba Mulderplein 164, Amsterdam, 1018 MZ, Netherlands, Mihail Bazhba, Jose Blanchet, Bert Zwart

In this talk, we answer the long-standing open question posed by Sergey Foss and Ward Whitt regarding the queue length asymptotics of the multiple-server queues with heavy-tailed service times. It is well documented that queueing systems typically experience congestions because of a small number of exceptionally large jobs in heavy-tailed environments. However, the rigorous characterization of such phenomenon has been limited to power-law type service times. In this talk, we show that when the service time distribution has a Weibull tail, a number of unexpected and interesting features—such as the asymmetry in job sizes and the trade-off between the number of big jobs and their sizes—arise.

#### 3 - Optimal Stock Allocation for Production-inventory Systems with Multiple Impatient Customer Classes

Yasar Levent Kocaga, Sy Syms School of Business, Belfer Hall Room # 403/A, 2495 Amsterdam Ave, New York, NY, 10033, United States, Yen-Ming Lee

We address the production and inventory control of a make-to-stock system with multiple impatient customer classes. We assume Poisson demand and exponential production times. Demand not satisfied immediately is backordered; but waits only up to an exponentially distributed amount of time and is cancelled if not satisfied within this time. We show that the threshold inventory rationing policy, which is optimal under backordering and lost sales, is still optimal under certain conditions including a requirement on the order of order cancellation rates.

#### 4 - A Unified Fluid Model for Service Systems with Exogenous and Endogenous Dependencies

Chenguang (Allen) Wu, Hong Kong University of Science and Technology, Clear Water Bay, Hong Kong, Achal Bassamboo, Ohad Perry

A prevalent assumption in the queueing literature is that the service times of customers are independent of the system's state, and of all other primitives comprising the system. However, in many practical settings, the service requirements of arriving customers may depend on their individual patience times, or on the delay they experienced while waiting to be served. We thus

consider two models, corresponding to the two dependence structures, to which we refer as exogenous and endogenous dependence. To approximate the intractable queueing processes, we propose a unified fluid approximation which captures two models simultaneously while exposes fundamental differences between the two models.

North Bldg 226B

### Spatial Decision Analysis

Sponsored: Decision Analysis

Sponsored Session

Chair: Valentina Ferretti

#### 1 - Persistent Patterns of Discriminatory Housing Policy and Inequity: A Spatial Statistical Analysis

Anna White, University of Michigan, Ann Arbor, MI, United States, Seth Guikema

Racial discrimination by housing and lending institutions was legal and widely practiced well into the 1960s in the United States. Although such discrimination is now illegal, the footprint of the system can be visualized through discriminatory "redlining maps created by the Home Owner's Loan Corporation (HOLC). We use Bayesian Belief Networks and statistical methods to analyze the relationships between maps created by the HOLC and current day quality-of-life indicators like health, income, employment, and education in cities across the United States. Through this analysis, we reveal the patterns that endure across the country as a result of this system.

#### 2 - Weight Elicitation for Spatial Decision Problems

Jay Simon, American University, 4400 Massachusetts Avenue, NW, Washington, DC, 20016, United States

Decisions with spatial outcomes present several preference assessment challenges. Some can be addressed via preference conditions that make the functional forms of value and utility functions simpler. Others, however, are unavoidable; if an outcome will occur across a large geographic space, then it is necessary to elicit a large number of weights from stakeholders. We present a fast and cognitively simple weight approximation technique for a large number of regions, and show that it performs well relative to commonly used approaches.

#### 3 - Cognitive Biases in Spatial Decision Analysis

Valentina Ferretti, London School of Economics and Political Science, Houghton Street London WC2A 2AE, London, United Kingdom

The need and interest to consider cognitive and motivational biases has been recognized in different disciplines (e.g. economics, decision theory, finance, risk analysis) and has recently reached environmental decision making. Within this domain, Spatial Decision Analysis represents a particularly interesting domain to explore new dimensions and implications of behavioral aspects. This talk will present insights from a first behavioral experiment on the spatial dimension of biases. The aim of the experiment is to understand whether or not and to which extent the use of spatial information (maps) can bias the weights' elicitation phase of a Multicriteria Decision Aiding process.

### Cyber Risk and Public Policy

Sponsored: Decision Analysis

Sponsored Session

Chair: Jonathan W Welburn, RAND Corporation, Pittsburgh, PA, 15213, United States

#### 1 - Text Mining and Public Policy

Seifu John Chonde, Penn State University, Alexandria, VA, 22314-2299, United States

RAND is devoted to helping the public and clients understand the impact of policies. Over the past few years, RAND has developed a suite of text analysis tools known as RAND-Lex that have been applied to a variety of different types of texts. This talk will overview a subset of research projects that RAND has completed to demonstrate the ongoing issues faced in text mining. For example, recent work has shown the utility of embedding models in natural language tasks such as sentiment analysis and document classification; however, the bias of these models is largely unknown and is an ongoing area of research complicating the use of these models for certain applications.

## 2 - The Cyber Threat and Options For Deterrence

Jonathan W. Welburn, RAND Corporation, 4570 Fifth Ave #600,  
Mailstop 3, Pittsburgh, PA, 15213, United States

The risk of cyberattacks on critical infrastructure has materialized beyond science fiction. The realistic threat of attacks on the power grid underscores the need for novel policy actions that deter adversaries and enhance resilience. We model the potential impact of cyberattacks on the grid, highlighting economic consequences and strategies for deterrence.

## 3 - Frameworks for Cybersecurity are Failing

Igor Mikolic-Torreira, PhD, RAND Corporation, Arlington, VA,  
United States

Effective cybersecurity can be attained by creating financial incentives for manufacturers to produce secure technologies, or from legal frameworks that protect users and set standards for vendors. Based on four role-playing exercises we conducted in the U.S. and Australia during the past two years with over 200 participants, we find that both models are failing: existing financial incentives for security are insufficient at best, and society has not implemented a regulatory model for cybersecurity. Our approach also served to illuminate the cybersecurity interests and priorities of governments, the business community, private organizations, and individuals; helped us understand the roles of these various groups in cybersecurity; and set the stage for us to explore how legal, economic, and societal mechanisms might be harnessed to advance cybersecurity.

## 4 - Targets and Attackers: Cybersecurity and Commercial UAVs

Katharina Ley Best, The RAND Corporation, 5836 Ferree Street,  
Pittsburgh, PA, 15217-1452, United States

RAND will discuss a framework for assessing cybersecurity risks related to increased adoption of commercial UAVs by government/law enforcement, adversaries, and civilians. The framework helps policymakers identify and think about risk related to cybersecurity and UAVs, covering cases where UAVs are cybersecurity targets as well as cases where UAVs are serving as cybersecurity weapons. In building the framework, we use a variety of methods, including the STRIDE threat model and the cyber kill chain, to understand and inventory the UAS/cybersecurity threat space. We include a review of attacks, introduce key industry trends that affect the complexity of the UAV and cybersecurity landscape, and highlight implications for policymakers.

### Mining Data for Business Intelligence

Sponsored: Analytics

Sponsored Session

Chair: Davit Khachatryan, Babson College, 231 Forest St, Babson Park,  
MA, 02457, United States

## 1 - Uncovering Insight from Patent Data using Text Mining

Davit Khachatryan, Babson College, Babson Park, MA, 02021,  
United States, Brigitte Muehlmann

In 1790 President George Washington signed a bill launching a framework which over decades evolved into the modern patent system in the United States. Today the United States Patent and Trademark Office receives more than half a million patent applications annually. In this talk, I will provide a background on patenting and discuss a recent project that involves text mining of patents related to cybersecurity. I will discuss how topic modeling and in particular Latent Dirichlet Allocation (LDA) can be used to define a measure for assessing the alignment between patent claims and specification. I will then illustrate how the newly defined measure can be of value to entrepreneurs and patent examiners.

## 2 - Relieving Emergency Room Overcrowding through Data Modeling

Courtney Paulson, Assistant Professor, University of Maryland,  
College Park, MD, 20742, United States

Maryland has the longest ER wait times in the nation primarily due to ER overcrowding. In partnership with the University of MD Medical Center, we explore several interventions to alleviate hospital patient pressures. One (Mobile Integrated Healthcare) is designed to provide effective, efficient care outside the hospital. Paramedics and nurses with advanced training assist identified patients off-site. We also consider in-house practices like stationing physical therapists in the ER to reduce wait times for consultations. We show this can result in significant decreases in ER length of stay.

## 3 - Realizing the Commercial Value of Healthcare Innovation

Dessislava Pachamanova, Babson College, Math/Science Dept,  
319 Babson Hall, Babson Park, MA, 02457, United States,  
Sinan Erzurumlu

We develop a framework for identifying factors that contribute to the commercial value of innovations. We illustrate the approach on data from a large healthcare provider, and discuss strategic implications of the findings.

## 4 - Are Major Airlines Losing the Battle? Investigation of Contrasting Market Domination Strategies

Farbod Farhadi, Roger Williams University, 1 Old Ferry Road,  
Bristol, RI, 02809, United States, Amirhossein Alamdar Yazdi

There has been substantial research on competition between legacy and low cost airlines in the US domestic passenger market. This competition mainly takes place in the medium haul and short haul flights. However, the nature of competition in these markets are substantially different. In this study we demonstrate the contrasting strategies of legacy airlines in these two market types, and investigate the domination rules in a 10-year panel of US domestic air transport data.

## 5 - Health Care Process Mining for Hospital Workflow Improvements

Ranjith Tellis, Philips Research North America, Cambridge, MA,  
United States, Michael Prokle, Jevita Poer, Ushanandini Raghavan,  
Christopher Hall, Sandeep Dalal, Prabhakar Dixit

The switch to value-based reimbursement drives health care leaders to further explore innovative ways to reduce costs while keeping patient and staff satisfaction at the highest possible level. New and available data sources are combined to propel innovative solutions for clinical decision-making. Taking an operational view in hospital workflow, we highlight key insights and learning from mining health care data for modeling, simulating, and optimizing of a Boston area interventional radiology department. We discuss how process mining, simulation, and optimization can be integrated for quick decision-making and present multiple practical use cases with actionable case study results.

## ■ TD43

North Bldg 227B

### Informing Energy Technology Commercialization through Systems Analysis

Emerging Topic: Energy and Climate

Emerging Topic Session

Chair: Daniel Sanchez, American Association for the Advancement of  
Science, Washington, DC, United States

## 1 - Near-term Deployment of Carbon Capture and Sequestration from Biorefineries in the United States

Daniel Sanchez, University of California-Berkeley, Berkeley, CA,  
United States

Capture and permanent geologic sequestration of biogenic CO<sub>2</sub> emissions may provide critical flexibility in ambitious climate change mitigation. However, most bioenergy with carbon capture and sequestration (BECCS) technologies are technically immature or commercially unavailable. Here, we evaluate low-cost, commercially ready CO<sub>2</sub> capture opportunities for existing ethanol biorefineries in the United States. The analysis combines process engineering, spatial optimization, and lifecycle assessment to consider the technical, economic, and institutional feasibility of near-term carbon capture and sequestration (CCS).

## 2 - City-Integrated Renewable Energy for Sustainable and Resilient Power Systems

Deborah Sunter, UC Berkeley, Berkeley, CA, United States

To prepare for an urban influx of 2.5 billion people by 2050, it is critical to create cities that are low carbon, resilient, and livable. We explore options for establishing sustainable urban energy systems by reducing and shifting energy consumption, particularly in the buildings and transportation sectors, and providing robust, decentralized, and renewable energy sources. Through technical advancements in power density, city-integrated renewable energy will be better suited to satisfy the high-energy demands of growing urban areas.

## 3 - The Role of Technology Innovation in Methane Emissions Mitigation Policy

Arvind P. Ravikumar, Stanford University, Stanford, CA, United  
States

Rapid development in unconventional oil and gas resources have raised concerns regarding associated methane emissions. Methane, a highly potent greenhouse gas, contributes about 25% to anthropogenic global warming. Because of low gas prices, solutions to detect and repair methane emissions needs to be cost-effective. In this talk, I will discuss new technological approaches such as truck-, drone-, and plane-based systems to rapidly detect methane emissions at oil and gas facilities. Using techno-economic modeling, I describe how such innovative approaches can be incorporated within a policy framework to achieve cost-effective emissions mitigation.

#### 4 - Geospatial Analysis of the Near-term Potential for Carbon Negative Bioenergy in the United States and Pathways of Meeting the Potential

Ejeong Baik, Stanford University, Stanford, CA, United States,  
Daniel Sanchez, Peter A. Turner, Katharine J. Mach,  
Christopher B. Field, Sally M. Benson

Bioenergy with carbon capture and storage (BECCS) is a negative emissions technology that may play a crucial role in climate change mitigation. However, the near-term deployment potential of BECCS is limited by the ability to transport biomass and CO<sub>2</sub>. A high resolution geospatial analysis is conducted to determine the near-term potential of BECCS in the U.S. by considering the colocation of biomass production and suitable storage sites. The analysis shows that 30% of the available biomass in the U.S. in 2020 is collocated with a storage site, and the resulting near-term potential is 100 Mt CO<sub>2</sub>/yr. The study helps define opportunities that minimize the social and economic barriers to BECCS deployment.

### Panel Discussion on Grand Challenges for Energy Systems

Sponsored: Energy, Natural Res & the Environment/Electricity

Sponsored Session

Chair: Kory Hedman

Co-Chair: Javad Lavaei, University of California-Berkeley, Berkeley, CA, 94720, United States

#### 1 - The Need for Better Software to Solve Power Systems Optimization Problems

Richard O'Neill, Federal Energy Regulatory Commission,  
Silver Spring, MD, USA.

For over a century, power system optimization has suffered from approximations due to the need for a good, but not optimal solution in a specific time frame. We will review the approximations in current use and what needs to be done to improve both the formulation and solutions. We will discuss the potential payoffs for improvements.

#### 2- Computational Challenges For Power Grid Resiliency

Jean-Paul Watson, Sandia National Laboratories, 7305 Blue  
Cypress Avenue NE, Albuquerque, NM, 87113-2065, United States

Solving power grid resiliency problems pose computational challenges that are distinct from those traditionally associated with traditional reliability-focused operations paradigms. We will survey work and open challenges in this key emerging area, emphasizing data science issues that must be solved prior to deployment of any computational resiliency approaches.

#### 3 - The Evolution of Power Systems Needs

Jessica Harrison, MISO, Carmel, IN, USA.

The power industry is undergoing significant changes, with an increase in digitalization, decentralization and de-marginalization. This presentation will briefly review these trends and then identify what challenges and opportunities they present for the power sector. Particular attention will be given to wholesale markets and the choices and needs wholesale markets and their members face in light of these changes.

#### 4 - Energy Systems Challenges and Overview of Arpa-E

Kory W. Hedman, Program Director, Advanced Research Projects  
Agency-Energy U.S. Dept. of Energy, Washington, DC,  
United States

#### Panelists

Richard O'Neill

### Joint Session ENRE/Practice Curated: One and Two-level Equilibrium Modeling with Applications in Energy II

Sponsored: Energy, Natural Res & the Environment/Electricity

Sponsored Session

Chair: Steven A. Gabriel, University of Maryland, College Park, MD, 20742-3021, United States

Co-Chair: Benjamin Field Hobbs, Johns Hopkins University, Baltimore, MD, 21218, United States

#### 1 - Multi-objective Infrastructure Investment Under Uncertainty

Verena Hagspiel, PhD, NTNU, Norway, Maria Lavrutich

We study optimal infrastructure investment decisions of a social planner (SP) that has to anticipate capacity investment of a private company (PC) in a market characterized by uncertain demand. The proposed model captures the investment decisions of the SP and PC and accounts for the conflicting objectives and game-theoretic interactions of the distinct agents. Taking an option-based approach allows us to study the effect of uncertainty on the investment decisions, and to take the agents' discretion over investment timing as well as size into account. We show, if and how the SP can align the decision of the PC with the social optimum using the fact that the PC is dependent on the infrastructure provided.

#### 2 - Bi-level Transmission Planning with Imperfect Transmission and Distribution Charges

Pengcheng Ding, Johns Hopkins University,  
3400 North Charles Street, Baltimore, MD, 21218, United States,  
Benjamin Field Hobbs

Transmission network cost recovery is an important issue in part since network charges affect incentives concerning bulk generation investment mix. Investment decisions can be further affected by distributed energy resources' participation in the market, either in front of or behind the meter, which is also affected by network cost recovery. These interactions are usually neglected in proactive transmission planning. We assume perfect coordination between transmission and distribution network planners, and investigate: how generation and DER decisions would be affected by alternative network cost recovery methods, and how a proactive transmission planner can consider those reactions.

#### 3 - Discretely Constrained Mixed Complementary Problems - Application and Analysis of a Stylized Electricity Market

Richard Johannes Weinhold, TU Berlin, Berlin, Germany

This paper provides insight into different areas of DC-MCPs. First, we look at three different solution-methods for DC-MCPs from the literature and compare them in terms of solutions and usability. The methods discussed in this paper use disjunctive constraints, special ordered sets of type 1 (SOS1) and an implementation of a certain median function. The different methods are applied to a stylized electricity market including a minimum-generation constraint. The minimum-generation constraint includes binary variables, making the problem a DC-MCP.

### Integration of Electric Vehicles in Power Grid

Sponsored: Energy, Natural Res & the Environment/Energy

Sponsored Session

Chair: Vignesh Subramanian, Tampa, FL, 33617, United States

Co-Chair: Tapas K. Das, University of South Florida, Tampa, FL, 33620-5350, United States

#### 1 - Siting Charging Stations for a Growing Electric Vehicle Fleet

Mustafa Lokhandwala, Purdue University, West Lafayette, IN, 47906, United States, Hua Cai

While more cities are setting goals for electric vehicle (EV) penetration, the growing EV fleet will require the support of additional charging infrastructures. The charging infrastructure development is a path dependent process in which the city can choose from upgrading the existing charging stations or investing in new ones. The locations and the type of the charging stations can influence the EV system's electricity demand load profile. This study uses an agent-based model to analyze the optimal charging infrastructure expansion strategies. The emerging travel pattern changes (e.g., ride sharing) and their impacts on the charging station siting are also evaluated.

#### 2 - Solar Powered Bidirectional Smart Charging of EVs with V2G and Regulation Services

Mahdi Kefayati, Electric Power Engineers, Inc., 13001 Highway  
71, Suite G100, Austin, TX, 78738, United States,  
Gautham Ram Chandra Mouli, Ross Baldick, Pavol Bauer

We present an Integrated PV Inverter and EV Charger module that exploits the time and space synergies between the PV generation and demand for EV charging as well as market prices for energy and reserves to offer an economic, efficient and scalable solution for transportation electrification. The optimal operation of the module, formulated as a MILP is also presented. Finally, simulation results are demonstrated and discussed.

### 3 - On The Fairness and Stability of Aggregator-guided Demand Response Programs

Kevin Melendez, University of South Florida, Tampa, FL, 33613, United States, Tapas K. Das

The cooperation among demand side players in the electricity market is a recent subject of interest. In this paper, cooperation among the load consuming entities (LCEs) managed by a demand response aggregator (DRA) is studied. A decision making model for the DRA is proposed with three alternative objectives: (1) overall community cost minimization solution, (2) the Nash bargaining solution and (3) the solution with minimum distance from the ideal point. The modeling approaches were tested using ERCOT (recent) historical data and the three objectives were compared and contrasted under different problem scenarios.

### 4 - A Two-layer Robust Optimization Model for Dynamic Pricing of Electricity and Demand Response by Electric Vehicle Aggregators

Vignesh Subramanian, University of South Florida, Tampa, FL, 33617, United States, Tapas K. Das

This paper develops a robust two-layer bilevel optimization model for obtaining hourly nodal dynamic prices (DP) and corresponding demand response (DR) by electric vehicle (EV) aggregators. The top layer determines the day-ahead quantities and prices. The bottom layer models the real-time (RT) operations and formulates it as a bilevel program; at the upper-level system operator determines dynamic prices and in the lower level aggregators optimize EV consumption. Results demonstrate the feasibility of DP & DR actions even under RT price uncertainties.

North Bldg 229A

### Stochastic Gradient Descent: Recent Trends

Emerging Topic Session

Chair: John Shortle, George Mason University, Dept of Systems Engineering & OR, 4400 University Drive MS 4A6, Fairfax, VA, 22030-4444, United States

#### 1 - Stochastic Gradient Descent: Recent Trends

Raghu Pasupathy, Purdue University, Department of Statistics, 150 N. University Street, West Lafayette, IN, 47907, United States, Farzad Yousefian, David Newton

Stochastic Gradient Descent (SGD), also known as stochastic approximation, refers to certain iterative structures used for solving stochastic optimization and root finding problems. Owing to several factors, SGD has become the leading method to solve optimization problems arising within large-scale machine learning and "big data contexts such as classification and regression. This tutorial will cover the basics of SGD with an emphasis on modern developments. The tutorial starts with examples and problem variations where SGD is applicable, and then details important flavors of SGD that are currently in use. The presentation of this tutorial will include numerical examples.

## ■ TD48

North Bldg 229B

### Sustainability and Social Responsibility

Sponsored: Energy, Natural Res & the Environment Environment & Sustainability

Sponsored Session

Chair: Chengzhang Li, Purdue University, West Lafayette, IN, United States

#### 1 - Choosing the Contract Terms in Carbon Offset Markets

Gokce Esenduran, Purdue University, 403 W. State Street, West Lafayette, IN, 47907, United States

Purchasing voluntary carbon offsets is becoming an increasingly popular way of counteracting carbon emissions. One of the main issues with carbon markets is additionality, i.e., whether the offset project would have happened even if it were not funded through this market. Offset providers can prove additionality through contract terms, i.e., by forward crediting of ex-ante offsets. Or, providers can choose prompt delivery of existing offsets and ensure risk-free deliveries. We analyze the competition between providers and find the equilibrium choice of contract terms. We identify under what conditions prompt delivery achieves higher expected emission reduction than forward crediting.

### 2 - Mitigating Poverty through Solar Panel Adoption in Developing Economies

Zhuo Feng, Assistant Professor, Dalian University of Technology, No. 2 Linggong Road, Dalian, 116024, China, Qiaochu He, Guangrui Ma

In this paper, we investigate a national strategy initiated by the Chinese governments, to combine the growth of solar energy sector with poverty mitigation. By considering households' strategic behavior in buying/selling electricity, we show that only a subset of households will adopt solar panels in equilibrium. We have also examined the government's optimal subsidy design to achieve socially optimal adoption number. Since many Chinese local governments have introduced Public Private Partnership (PPP) scheme to encourage solar panel adoption, we have further examined the outcomes of PPP scheme.

### 3 - Can Voluntary Time-of-use Tariffs be Successfully Diffused in the Residential Electricity Sector?

Karthik Murali, University of Alabama, Tuscaloosa, 351 Alston Hall, Tuscaloosa, AL, 35487, United States, Dong Gu Choi, Michael Lim, Valerie Thomas

Time-of-use pricing is increasingly deployed with some success in the industrial sector, but uptake among residential consumers remains sluggish. In this paper, we investigate how heterogeneity in consumer use-preferences complicates the problem of designing an optimal voluntary time-of-use pricing scheme, and suggest alternative mechanisms to improve residential consumer participation.

### 4 - The Value of Competition in Remanufacturing

Narendra Singh, Indian School of Business, Knowledge City, Sector 81, SAS Nagar, Mohali, 140 306, India, Karthik Ramachandran, Ravi Subramanian

We study an OEM's product strategy when the OEM offers a new product that depreciates over time and consumers are strategic. The OEM competes with a third-party remanufacturer for acquisition and remanufacturing of the depreciated products. We study how competition from the third-party remanufacturer affects the OEM.

### 5 - Ensuring Corporate Social Responsibility in Supply Chain Networks through Multi-unit Bargaining

Chengzhang Li, Purdue University, West Lafayette, IN, 47906, United States, Qi Feng, Mengshi Lu, J. George Shanthikumar

We study ensuring corporate social responsibility (CSR) in general supply chain networks through multi-unit bargaining. We derive the equilibrium negotiation outcome, which captures the imbalance of the bargaining power in the supply chain, and demonstrate its advantages over existing approaches. We also investigate the initiator's preferred implementation structure, and various extensions including multiple investment levels, multiple CSR programs, and decentralized implementation structure decisions that recover the initiator's preferred one.

## ■ TD49

North Bldg 230

### Renewables, PHEVs, and Electricity Markets

Emerging Topic: Energy and Climate

Emerging Topic Session

Chair: Yongpei Guan, University of Florida, Gainesville, FL, 32611, United States

#### 1 - Capacity vs Energy Subsidies for Renewables: Simulation of the 2030 EU Power Market

Benjamin Field Hobbs, Johns Hopkins University, Ames Hall 3rd Fl Geography & Enviro, 3400 N. Charles St, Baltimore, MD, 21218, United States, Ozge Ozdemir, Marit van Hout, Paul Koutstaal

We compare the impact of energy-focused (feed-in premium) and capacity-focused (investment subsidies) renewable policies upon the EU-wide electric power market in 2030 using a market equilibrium model COMPETES. Specifically, do capacity-based policies result in significantly more investment and possibly learning? We also evaluate the efficiency of national policy targets for renewable electricity production (as a whole or per technology) and compare these with a cost-effective allocation of renewable energy production, given resource quality, network constraints and the structure of the electricity system in the various EU countries.

## 2 - How Sampling and Averaging Historical Solar and Wind Data Distorts Generation Expansion Planning

Cynthia D. Bothwell, Johns Hopkins University, Baltimore, MD, 21286, United States, Benjamin Field Hobbs

Industry practice includes developing typical load shapes to forecast future system requirements. As weather-dependent wind and solar generation increase, the prediction of their contribution to the system has also relied on averaging techniques that disregard correlations of load and renewable output. Using long-term optimized expansion planning including hourly dispatch, this work shows the pitfalls of data averaging ignoring dependencies and inadequate sample lengths, as quantified by cost increases and system reliability distortions. Methods to minimize distortions are introduced.

## 3 - Robust Optimal Control of Wind Farm with PHEVs Participating in Energy Market

Xiaojie Wang, University of Florida, Gainesville, FL, United States, Yongpei Guan

Previous studies suggest that plug-in hybrid electric vehicles (PHEVs), serving as electricity storage units, offer a perfect supplement to intermittent renewable energy. In this study, we manage a profit driven wind station with PHEVs as storage devices, where we can either sell the wind energy directly to the market or use it to charge the PHEV batteries and storage the electricity for future sales. We consider an innovative model and provide a robust solution considering price and renewable generation uncertainties. Our numerical results show the advantages of our proposed model.

## ■ TD50

North Bldg 231A

## Mixed-Integer Nonlinear Programming in Power Systems

Sponsored: Optimization/Integer and Discrete Optimization

Sponsored Session

Chair: Burak Kocuk, Sabanci University, Turkey

### 1 - Lazy Cut Generation for Semidefinite Programming

Hassan Lionel Hijazi, Los Alamos National Laboratory, P.O. Box 1663, MS B284, Los Alamos, NM, 87545, United States

In this talk, we will present the theory and the implementation of efficient cut generation algorithms that capture the strength of semidefinite programming relaxations and their application in ACOPE.

### 2 - The Value of Optimization Based Bound Tightening for Power Network Optimization

Carleton Coffrin, Los Alamos National Laboratory, Los Alamos National Laboratory, Los Alamos, NM, United States

Convexification is a fundamental technique in (mixed-integer) nonlinear optimization and many convex relaxations are parametrized by variable bounds, i.e., the tighter the bounds, the stronger the relaxations. This work investigates how optimization based bound tightening can improve convex relaxations for power network optimization. In particular, this work shows that the Quadratic Convex relaxation of AC power flow, enhanced by bound tightening, results in very small variable domains in the seminal Optimal Power Flow problem. Leveraging these improved bounds, experimental results demonstrate root-node optimality gaps that are less than one percent in the majority of test cases.

### 3 - Strengthening Optimal Power Flow Relaxations with Reference Bus Constraints and Bounds Tightening

Michael Lee Bynum, Sandia National Laboratories, Albuquerque, NM, 87123, United States, Anya Castillo, Jean-Paul Watson, Carl Laird

Math programming is a powerful tool frequently used to achieve reliable and efficient operation of the electric grid. We present recent advances toward including high fidelity, nonconvex transmission models in these optimization formulations. In particular, we show that existing relaxations of the alternating current optimal power flow (ACOPF) problem can be further tightened when we combine the McCormick relaxation with reference bus constraints and an appropriate bounds tightening procedure. With these strategies, we are able to reduce the optimality gap to less than 0.1% on all but 5 NESTA test cases with up to 300 buses by performing optimality based bounds tightening alone.

## ■ TD51

North Bldg 231B

## Scheduling

Contributed Session

Chair: William Ellegood, Sam Houston State University, Huntsville, TX, United States

### 1 - On Submodular Search and Machine Scheduling

Thomas Lidbetter, Assistant Professor, Rutgers Business School, 1 Washington Park, Newark, NJ, 07102, United States, Robbert Fokkink, László Vogh

We explore the connections between search theory and machine scheduling by studying an ordering problem proposed by Pisaruk (1992). A target is hidden in one of many locations, which must be searched in some order. The cost of searching an initial segment  $A$  of a given ordering is  $f(A)$  and the probability the target is hidden in  $A$  is  $g(A)$ , where  $f$  is a non-decreasing submodular function and  $g$  is a non-decreasing supermodular function. We want the ordering that finds the target in minimal expected cost. The problem is NP-hard and we present a new 2-approximation algorithm that generalizes well-known results in scheduling theory and establishes new ones. We also consider a game theoretic version of the problem.

### 2 - Simultaneous Scheduling of Machines and Vehicles with Alternative Machines in Flexible Manufacturing Systems

Dalila B. M. M. Fontes, INESC TEC, Rua Dr Roberto Frias, Porto, 4200-465, Portugal, Mahdi Homayouni

This work proposes a mathematical programming model for jointly scheduling production and transport in Flexible Manufacturing Systems considering alternative processing routes. Although production scheduling and transport scheduling have been vastly researched, most of the works address them independently. In addition, the few that consider their simultaneous scheduling assume job routes as an input, i.e., machine-job allocation is previously determined; however, in FMSs this is an important source of flexibility that should not be ignored. Results are reported for small-sized instances.

### 3 - Multi-period Lot-sizing with Supplier Selection: Complexity and Algorithms

Guohua Wan, Professor, Shanghai Jiao Tong University, 1954 Huashan Road, Antai College of Economics & Management, Shanghai, 200030, China, Meichun Lin, Woonghee Tim Huh

We consider a multi-period lot-sizing problem with multiple products and multiple suppliers. The objective is to determine the order quantities for each product from each supplier in each period to minimize the total cost over the planning horizon, including supplier-dependent fixed costs, variable purchase costs and product-dependent holding costs. We show the intractability of the problem in general and study three polynomial-time solvable cases of the problem. For these three cases, we analyze the structural properties, and propose dynamic program solution algorithms. We also develop a heuristic algorithm for the general case and computationally show that it works well.

### 4 - Utility Based Priority Scheduling Rules in Dynamic Job Shops with Customer Balking

William Ellegood, Sam Houston State University, Huntsville, TX, 77341, United States, Kevin D. Sweeney, Stanislaus Solomon, Mitch Millstein

This research examines a particular class of job shops where individual jobs have the option to forgo using the job shop (known as balking) due to expected poor levels of service as a result of system congestion. Using a dynamic job shop with heterogeneous jobs, we use the expected utility of a job to predict the balking behavior of potential job shop users. We further use the metric of expected utility to derive and test new priority dispatching rules for job shops that face the possibility of customer balking. These new rules are then compared to other priority scheduling rules based on processing time.

### 5 - Scheduling And Sequencing To A Two-stage Stochastic Service System With Multiple Servers

Yang Zhan, Shanghai Jiao Tong University, 1954 Huashan Road, Antai College of Economics and Management, Shanghai, 200030, China, Siqian Shen, Guohua Wan

In this paper, motivated by the application in the surgical suite, we consider the scheduling and sequencing problem in a two-stage stochastic service system with multiple servers on each stage. The processing times of jobs on both stages are stochastic and there is no buffer between stages. Our goal to optimize the usage of servers, the assignment of jobs-to-server and the sequence of jobs with the objective of minimizing the total of opening cost and overtime cost. We investigate a stochastic optimization framework and a decomposition algorithm to address the problem. Finally, we apply the model and algorithm to surgical scheduling.

## 6 - Improving Patient Flow Metrics at Outpatient Clinics through Effective Scheduling by Modeling Two Stage Mean Risk Stochastic Programming

Samira Fazel Anvaryazdi, Louisiana Tech University, Ruston, LA, United States, Saravanan Venkatachalam, Ratna Babu Chinnam

We discuss methods for improving patient flow metrics at outpatient clinics through effective appointment scheduling policies by applying risk-averse two-stage stochastic mixed-integer linear programming. We improve patient flow metrics: direct and indirect wait time, provider's overtime and idle time considering patient's no-show behavior, stochastic server, follow-up surgery appointments, and overbooking. The aim is to increase throughput per session while providing timely care, continuity of care, and overall patient satisfaction as well as equity of resource utilization.

### Flash Session II

General Session

Chair: INFORMS, 5521 Research Park Drive, Suite 200, Catonsville, MD, 21228, United States

## 1 - Developing a Model to Select the Best Multiple Sites to Install Wind Farms

Nazanin Naderi, Youngstown State University, Youngstown, OH, 32606, United States, Shabnam Rezapour

Renewable energy production has gained popularity worldwide due to the rapid depletion of fossil fuels and a global effort to reduce carbon emissions to mitigate climate change. Because of the formidable costs associated with wind energy development, the locations for new wind turbines need to be carefully selected to provide the greatest benefit for a given investment. This paper primarily focus on developing a model to find the best sites among alternative sites, could help find the efficient wind resources and lands that are well suited for wind turbines. The model developed in this paper compares combined sites based on nine different criteria and prioritizes them.

## 2 - Robust Service Network Design for Disaster Relief

Syed Tariq, Lahore University of Management Sciences (LUMS), Shah House, A-10, Block 2, Chapal Sun City, Lahore, 75280, Pakistan,, Muhammad Naiman Jalil

The service network design problem we discuss is concerned with facility location and prepositioning of relief goods in the preparedness stage and the reliability of network performance during response. We argue that the location of facilities determines the possible damage to facility capacities, access to vulnerable populations in their time of need, and timeliness of resupplying the facility in the response phase. In addition to facility and network related uncertainties, we evaluate the service network design in terms of both deprivation and logistics cost when some locations are more prone to disaster-related damage than others.

## 3 - Optimizing the Redundancy of IoT Networks

Mohammad Askar Saoud, Kuwait University, P.O. Box 54, Shamiya, 71661, Kuwait, Hamid Al-Hamadi

In this paper, we aim to maximize the lifetime of IoT networks using a redundancy management approach. As such networks are set up, paths must be determined for the IoT devices. While increasing the number of paths (which reflects redundancy level) increases reliability, energy consumption also increases. Thus, one needs to choose paths such that proper reliability level is maintained and simultaneously energy consumption is minimized. So, we propose an INLP model to represent the problem, and our objective is to maximize the Mean Time to Failure (MTTF).

## 4 - Parking Reservation Disturbances

Su Xiu Xu, Department Head, Jinan University, 206 Qianshan Road, Zhuhai, 519070, China

This paper considers an auction-based parking reservation problem where a platform is the auctioneer and drivers are bidders. The platform manages multiple homogenous parking spaces. A winner may leave earlier or occupy the parking space longer than the time he has reserved. The phenomena are called (ex post) demand disturbances, which can only occur after the last auction terminates. The platform may punish or compensate a driver who causes demand disturbance. We investigate three types of driver behaviors: gain/loss neutrality, loss aversion, and gain seeking, and examine the reference effects. We propose an effective multi-stage Vickrey-Clarke-Groves auction mechanism.

## 5 - Inventory-routing Problem with Pick-up and Deliveries: Formulation, Solving Approach, and Sustainability Perspectives

Claudio Sterle, University "Federico II" of Naples, Via Claudio 21, Naples, 80125, Italy, Grazia Speranza, Claudia Archetti, Maurizio Boccia, Sforza Antonio, Maria Elena Nenni

The Inventory Routing Problem (IRP) consists in the distribution of one or more products from a supplier to a set of customers over a discrete planning horizon. In this work we address the IRP with Pickups and deliveries where a single commodity has to be picked up from pickup customers and delivered to delivery customers. A fleet of vehicles is available, starting and ending their routes at the supplier's depot. The objective is to determine a distribution and collection plan minimizing routing and inventory costs. We propose a flow formulation and a branch-and-cut algorithm. Computational results on benchmark instances show that the algorithm outperforms state-of-the-art methods.

## 6 - Agent Scheduling for Call Center Operation

Ayush Patnaik, IIT Kharagpur, A-318, VS Hall, IIT Kharagpur, Kharagpur, 721302, India, Swapnil Waghmare, Samik Raychaudhuri

Agent scheduling, including scheduling breaks, is an important problem for call center operations. In this presentation, we present an optimization model that aims to provide us with the best possible schedule while satisfying numerous constraints such as operational hours, breaks, no transportation etc. It gives us the optimal allocation of agents in each shift so as to minimize agent under-allocation for the forecasted chats. We use the result of this model in a follow-up model, which allocates breaks of different types e.g., training breaks, lunch breaks etc, to individual agents.

## 7 - A Drift-variance Diffusion Control Model for New Venture Creation

Zhengli Wang, Stanford University, 655 Knight Management Way, 655, Stanford, CA, 94305, United States, Stefanos Zenios

We model new venture creation as a stochastic control process in which the value of the venture evolves as a diffusion process, and the drift and variance is controlled by the entrepreneur. The venture goes bankrupt when the diffusion process hits a lower boundary and is successful with a substantial monetary reward when the process hits an upper boundary. The entrepreneur incurs cost for the controls she selects and her objective is to maximize her total cumulative infinite horizon reward. We analyze the situation where the entrepreneur has two control options and we demonstrate that the optimal policy is at most a two-interval policy.

## 8 - Addressing Orientation-symmetry in the Time Window Assignment Vehicle Routing Problem

Kevin Dalmeijer, Erasmus University Rotterdam, P.O. Box 1738, Tilbergen Building H8, Rotterdam, 3000 DR, Netherlands, Guy Desaulniers

The Time Window Assignment Vehicle Routing Problem (TWA VRP) is the problem of assigning time windows for delivery before demand volume becomes known. For TWA VRP instances that are difficult to solve by current methods, we observe many similar solutions in which one or more routes have a different orientation, i.e., the clients are visited in the reverse order. We introduce a new branching method that eliminates this orientation-symmetry from the search tree, and we present enhancements to make this method efficient in practice. Through computational experiments, we show that our algorithm outperforms other solution methods, and we solve 29 previously unsolved benchmark instances to optimality.

## 9 - Patrolling Security Games with Mobile Adversaries and Entrance Nodes

Zhifan Xu, Rutgers University, 18M Reading Road, Edison, NJ, 08817, United States

Patrolling is an important operational decision when safeguarding a public area against adversarial attack. In this paper, we proposed an infinite horizon Stackelberg security game on a graph where the defender commits to a patrolling strategy first. The attacker decides his intruding route by solving a Markov decision process given patroller's movement probabilities and location in each turn. We also introduced the concept of detection probability for each nodes in the graph to model the difficulties of searching different area. To find the Stackelberg equilibrium, we proposed a bi-level programming model that can be solved using bilinear programming and global optimization techniques.

## 10 - Deep Learning Applications in Financial Services

Trevor Kennedy, Ally Financial, Philadelphia, PA, United States

Deep learning, newest incarnation of machine learning is just beginning to be applied in industry. We present a case study of several applications of deep neural networks in the financial services industry including best practices and limitations of this approach.

**Mechanism Design**

Sponsored: Auction and Marketing Design

Sponsored Session

Chair: Brian Baisa, Amherst, MA, 01002, United States

**1 - Dominant Strategy Implementation without Quasilinearity**Brian Baisa, Amherst College, Converse Hall, Office 211,  
Amherst, MA, 01002, United States

I study dominant strategy implementation in a private value setting where agents have non-quasilinear preferences. I show that a mechanism is dominant strategy implementable if and only if the mechanism is ex post implementable in a particular endogenously determined interdependent value quasilinear setting. A corollary of this result is that there is no efficient and dominant strategy implementable mechanism for auction settings where bidders have multi-unit demands and multi-dimensional types.

**2 - Auctions versus Negotiations and Information Revelation**Justin Burkett, Wake Forest University, 1834 Wake Forest Road,  
Department of Economics, Winston-Salem, NC, 27106,  
United States, Kyle Woodward

We consider a seller deciding whether to implement an auction or engage in sequential negotiations with potential buyers. We show that sellers generally prefer auctions to negotiations. In equilibrium, as in reality, bidders in either mechanism use jump bids to signal strength to their competitors. The seller's preference is robust to different assumptions about bidder entry, as well as to the introduction of entry costs. Compared to prior work, we argue that the equilibrium of our model aligns better with observed behavior (e.g., bidders use jump bids in both auctions and negotiations) and gives a clearer and more robust justification for why a seller might prefer to run an auction.

**3 - Contingent Payment Mechanisms for Resource Utilization**Hongyao Ma, Harvard University, 33 Oxford Street, MD 242,  
Cambridge, MA, 02138, United States, Reshef Meir,  
David C. Parkes, James Zou

We consider a multi-period assignment problem, where agents are uncertain whether or not they will have positive value for the future use of a resource, and where it is in the interest of the planner that resources be used and not wasted. We introduce the contingent payment mechanisms (CP), and show that when instantiated for a max penalty equal to the societal value for use of the resource, the CP mechanism is welfare optimal under a set of axiomatic properties. A special case of the CP mechanism maximizes utilization—the probability that the resource is used. We extend the results to assign multiple resources, and present simulation results to demonstrate the effectiveness of the CP mechanisms.

**4 - Non-exploitable Protocols for Repeated Cake Cutting**Shai Vardi, Assistant Professor, Purdue University, 403 W. State  
Street, West Lafayette, IN, 47907, United States, Omer Tamuz,  
Juba Ziani

We introduce the notion of exploitability in cut-and-choose protocols for repeated cake cutting. If a cut-and-choose protocol is repeated, the cutter can possibly gain information about the chooser from her previous actions, and exploit this information for her own gain, at the expense of the chooser. We show that there exist non-exploitable protocols that use a small number of cuts per day. Among our results are a non-adaptive non-exploitable protocol that uses 3 cuts per day on 2-dimensional cakes, and a separation between adaptive and non-adaptive protocols for 1-dimensional cakes.

**Incentive and Process Design with Behavioral Considerations**

Sponsored: Behavioral Operations Management

Sponsored Session

Chair: Xiaoyang Long, University of Wisconsin-Madison, Madison, WI,  
53706, United States**1 - Judgmental Selection of Forecasting Models**Enno Siemsen, University of Wisconsin-Madison, Wisconsin  
School of Business, 975 University Avenue, Madison, WI, 53706,  
United States, Fotios Petropoulos, Nikolaos Kourentzes,  
Konstantinos Nikolopoulos

In this paper, we explored how judgment can be used to improve the selection of a forecasting model. We compared the performance of judgmental model selection against a standard algorithm based on information criteria. We also examined the efficacy of a judgmental model-build approach, in which experts were asked to decide on the existence of the structural components (trend and

seasonality) of the time series instead of directly selecting a model from a choice set.

**2 - The Behavioral Promise and Pitfalls in Compensating Store Managers**Shan Li, City University of New York, Baruch College,  
55 Lexington Avenue, New York, NY, 10010, United States,  
Kay-Yut Chen, Ying Rong

We theoretically and behaviorally studied profit-sharing and target-with-bonus compensation schemes in an inventory management context. Our experimental data reveals behavioral promise and pitfalls of the two widely used incentive compensation schemes, and it further suggests systematic deviations from the theoretical benchmarks. Based on the experimental findings, we manipulate the behaviors and engineer the design of the compensation scheme through two additional treatments, to explore potential improvement of the mechanism. Our results have implications for the design of incentive schemes in practice.

**3 - How Supply Chain Risks Influence Supplier Selection and Ordering Decisions: A Behavioral Investigation**Vincent (Junhao) Yu, University of Minnesota, Minneapolis, MN,  
United States, Karen L. Donohue

Various types of risks occur in business supply chains. When choosing suppliers, buyers need to carefully evaluate the risk and cost profiles of the candidates in order to make appropriate ordering decisions. In this study, we combine modeling and experimental methods to investigate buyer ordering behavior when facing suppliers with different types and levels of risks. Potential risks include reliability-related issues that disrupt the flow of supply and responsibility-related issues that influence the flow of customer demand. Our findings provide insights for supply chain professionals looking to better understand the behavioral biases that enter into their sourcing decisions.

**4 - Wage Transparency in Sales Agents' Compensation Schemes**Xiaoyang Long, University of Wisconsin-Madison, Wisconsin  
School of Business, 975 University Avenue, Madison, WI, 53706,  
United States, Javad Nasiry

Sales agents with social preferences evaluate their pay in comparison with their peers' and experience a positive or negative utility. We characterize the optimal salesforce compensation schemes in this context and identify the conditions under which wage transparency benefits the firm.

**Decentralized Innovation**

Emerging Topic: New Product Development

Emerging Topic Session

Chair: Sreekumar Bhaskaran, SMU

**1 - Strategic Investment in a Budget Constrained Firm's R&D**Junghee Lee, Assistant Professor, Tulane University,  
7 McAlister Dr, New Orleans, LA, 70118, United States

We model a bilateral monopolistic supply chain in which a supplier's sales are linked with a manufacturer's costly R&D. The manufacturer has a limited budget for R&D. The supplier can influence the manufacturer's R&D spending by setting the wholesale price and/or investing in R&D. We find that if the budget is common information, the manufacturer's profit can decrease in its budget, leading the manufacturer to hide the R&D budget. To overcome this information distortion, we develop a simple and implementable threshold policy based on mechanism design. The separating equilibrium can be obtained with fewer structural assumptions about the suppliers prior belief about the budget.

**2 - Outsourcing and Offshoring in Complex Product Development Projects**Jurgen Mihm, INSEAD, Boulevard de Constance, 77305, France,  
Ole Frauen, Arnd H. Huchzermeier

Large organizations that develop complex products are faced with the question of how to decompose and allocate product development work across geographic, or organizational boundaries. Distributing work may offer immense time and cost savings. However, finding a good allocation of work packages to development entities continues to be a challenge for many companies in practice. Based on an extensive data set involving all development projects of one of the largest car manufacturers worldwide, we provide insight into how to best offshore and outsource product development.

**3 - Firm Clockspeed: Toward a Theory of Relativity**Sina Moghadas Khorasani, Student, University of Utah,  
Salt Lake City, UT, United States, Glen M. Schmidt

Intel runs perceptively fast compared to Pfizer (its revenues stem from new products, product lifespans are short, and cost reduction is rapid), yet profit growth is no higher. In this paper, we explore how perceived clockspeed contributes to profit growth (we call this relative clockspeed) and economic progress (we call this absolute clockspeed).

#### 4 - Innovation Positioning Under Disruptive Threats

Xiaochen Gao, University of California-San Diego, La Jolla, CA, 92093, United States, Viswanathan Krishnan, Sreekumar R. Bhaskaran

Typically, while developing a new technology or product, a firm would also have a set of products which it currently makes available to consumers. As a result, one of the key decisions of a firm after developing a new product is its product positioning strategy. After having invested in and developed a new product, a firm has to decide whether this product should replace the existing line of products or whether both the new and old products be sold simultaneously to consumers. In this paper, we develop a framework for studying such an integrated product development and portfolio design problem. Specifically, we examine the value of retaining an existing lower quality product after developing a new higher quality version of the same product family. The economic and game-theoretic analysis used to model this problem brings forth several interesting insights. One of the key results of this research is that a product-line based approach to NPD can provide significant strategic advantages to a firm. In contrast to existing literature on development intensive products, we show that this strategy allows a firm to cover multiple market segments and price discriminate between consumers. Interestingly, the value of pursuing a product line based approach assumes greater significance under competition. Having multiple products in its product-portfolio enables a firm to extract higher margins from its high-end markets without forgoing its presence in low-end markets. Moreover, when the level of competition is high, cannibalization tensions in maintaining a larger portfolio could also serve to deter mutually destructive price competition.

#### Screening and Treatment Models

Sponsored: Health Applications

Sponsored Session

Chair: Steven Shechter, University of British Columbia, Vancouver, BC, V6T 1Z2, Canada

#### 1 - Screening for Breast Cancer: The Role of Supplemental Tests and Breast Density Information

Burhaneddin Sandikci, University of Chicago, Booth School of Business, 5807 South Woodlawn Avenue, Chicago, IL, 60637, United States, Mucabit Cevik, David Schacht

The imperfect nature of mammography led to increased consideration of supplemental ultrasound and Magnetic Resonance Imaging (MRI) screening for timely detection of breast cancer, particularly for high-risk women including those with dense breasts. Breast density not only impairs screening accuracy, but also significantly increases risk of developing breast cancer, resulting in disproportionate risk of death from breast cancer for millions of women with dense breasts. We formulate the optimal breast cancer screening problem using a partially observable Markov decision process model. We compare its results to mass screening guidelines and quantify the value of supplemental screening.

#### 2 - Partially Observable Collaborative Model for Optimizing Personalized Treatment Selection

Jue Gong, University of Washington, Seattle, WA, 98115, United States, Shan Liu

Personalized treatment selection has become an increasingly important topic in health care research. The main challenges include the modeling of individual disease progression dynamics and designing the adaptive treatment selection strategy. We developed the Partially Observable Collaborative Model (POCM), to learn the individual disease progression model under various treatment options when the true health state is hidden to the decision maker. Next, utilizing the learned individual models, a personalized treatment plan can be derived by solving a POMDP. This research helps to advance the development of artificial intelligent decision support tools for chronic disease care.

#### 3 - Analytics in Blood Pressure Management and Control: From Data to Decisions

Anthony Bonifante, Denison University, Granville, OH, 30106, United States, Turgay Ayer, Ben A. Haaland, Peter Wilson

Antihypertensive drug treatment can control elevated blood pressure and reduce the risk of cardiovascular disease. We propose data-driven models that combine stochastic optimization and statistics to identify the optimal thresholds for initiating treatment and for increasing the treatment dosage. We analytically characterize the expected value and variance of the hazard ratio, which enables us to easily compute the optimal treatment initiation and intensification decisions, and capture different attitudes towards risk (e.g. risk neutral or risk averse). Our findings have policy suggestions and may help guide future RCT design.

#### 4 - A High-fidelity Model to Predict Length-of-stay in the NICU

Kanix Wang, Research Professional, University of Chicago, Booth School of Business, Chicago, IL, United States, Walid Hussain, Arnab Sur, John R. Birge, Michael Schreiber, Daniel Adelman

Effective use of medical staff and clinical resources depends on the accuracy of length-of-stay forecasting to match required resources with patient load. Current forecasts are based on an initial severity ranking and are not updated as patients progress. This problem is particularly acute in the Neonatal Intensive Care Unit (NICU) setting because patient lengths of stay tend to be quite long and highly variable, extending from several days to many months. We develop a dynamic forecasting model, and apply machine learning, to predict remaining length-of-stay depending on a patient's severity scores history, clinical progression and demographic and environmental covariates.

#### 1 - Simulating the Outcome of Make-ahead Drug Policies at an Outpatient Chemotherapy Infusion Center

Donald B. Richardson, University of Michigan, 2753 IOE Building, 1205 Beal, Ann Arbor, MI, 48109-2117, United States, Amy Cohn

We have developed a discrete-event simulation tool to evaluate a variety of policies for selecting which drugs to pre-mix for outpatient chemotherapy patients. By making patient-specific drugs ahead of appointment time, patient waiting time can be reduced but this comes at the risk of waste cost if the patient must defer treatment once arriving for their appointment and the drug must be discarded. We utilize data from the University of Michigan Rogel Cancer Center to validate our methods.

#### 2 - Evaluating Veteran Access to Eye Care Services Using Facility Location Models

Adam VanDeusen, University of Michigan, 1205 Beal Ave, Ann Arbor, MI, 48109, United States, April Maa, Amy Cohn

Many patients, including United States veterans, face barriers to accessing appropriate, affordable healthcare. These barriers can be addressed by optimizing clinic locations while delivering care that effectively utilizes providers' practice responsibilities. We present a model to evaluate veterans' eye care facility location options with consideration for overall system access. We further present a case study in which trained technicians perform visual disease screenings typically conducted by ophthalmologists. Our work may guide decision-makers in locating and staffing clinics to improve patient access.

#### 3 - A Comparative Analysis of Resident Block Scheduling Models

William Pozehl, Ann Arbor, MI, 48104, United States, Amy Cohn

Operations research approaches to block scheduling for medical residencies have emerged over the last several years. In particular, mathematical programming models have proven popular and generally successful. Still, though, computational complexity can make solving these models excessively time-consuming. We present a comparison of different modeling approaches and evaluate their performance in relation to a case study for an internal medicine residency program at a large academic hospital.

#### 4 - Stochastic Optimization Models for Childhood Vaccine Distribution Network: A Case Study in Niger

Zahra Azadi, Assistant Professor, University of Miami, Miami, FL, United States, Sandra D. Eksioglu

The main objective of this research is to increase vaccine coverage in low income countries by improving the performance of the corresponding supply chain. We propose a chance constraint programming model which identifies optimal supply chain designs and management strategies. The model considers the limited shelf life of vaccines, facility and transportation storage capacities, as well as variations in patient arrivals at health clinics. The proposed model is an extension of the supply chain network design model. A sample average approximation (SAA) method is used to solve the problem. We develop a case study for Niger by utilizing GeoNames Geographical Database and Demographic Health Survey.

**Joint Session HAS/Practice Curated: Decision Analytics and Models for Medical Diagnostics**

Sponsored: Health Applications

Sponsored Session

Chair: Chun-An Chou, Northeastern University, Boston, MA, 02115, United States

**1 - SD-CNN: A Shallow-Deep CNN for Improved Breast Cancer Diagnosis**

Fei Gao, Arizona State University, 886 N. Cofco Center Court, Unit 1017, Phoenix, AZ, 85008, United States, Teresa Wu, Bhavika Patel, Yanzhe Xu

Deep learning has been widely implemented in practices for imaging based diagnosis. In this research, we first develop a shallow CNN to learn the mapping between low energy digital mammography (LE) and a more advanced breast imaging (recombined image) to tackle the less accessible issue of Contrast Enhanced Digital Mammography for broader clinical uses. A pre-trained deep CNN then takes both LE and "virtual recombined image" to generate novel features for improved breast cancer diagnosis. Experimental results indicate significant improvement from this proposed Shallow-Deep CNN approach.

**2 - Using Logical Analysis of Data as a Tool in Medical Decision Making**

Ruilin Ouyang, Northeastern University, Boston, MA, United States, Chun-An Chou

Transparent results (e.g., if symptom A and symptom B, then outcome C) in addition to achieving high accuracy are desirable as a priority goal in building decision tools for medical diagnosis or health care. In our study, we present a logical analysis approach to build a rule-based decision model for Unplanned ICU transfer. We formulate and solve a mixed-Integer programming model to generate effective logical rules with maximum margins iteratively, and in turn form a compact rule-based decision model. We also compare our computational results with other state-of-the-art supervised learning methods (logistic regression and decision tree).

**3 - Autism Risk Genes Prediction Using Spatiotemporal Gene Expression Data**

Ying Lin, University of Houston, Houston, TX, 77204, United States

Autism Spectrum Disorder is a constellation of neurodevelopmental presentations characterized by impairments in social and communication behavior. Finding causal autism genes is challenged by small effect of single gene and the lack of common risk loci. Although recent large exome sequencing studies of autism families have identified 65 autism risk genes, they represent only a fraction of the estimated genes involved in autism susceptibility. In this study, a gene ranking model is developed based on the identified genes and their brain specific spatiotemporal gene expression and applied to rank more than 25,000 unknown genes. The top ranked genes are potential to enrich the autism risk genes.

**4 - The Effect of Indeterminate Findings on the Cost-effectiveness of Lung Cancer Screening**

Iakovos Tournazis, Stanford University, Department of Radiology, James H. Clark Center, Room S255, Stanford, CA, 94305-5446, United States, Tsai B. Emily, Ayca Erdogan, Summer Han, Ann Leung, Sylvia Plevritis

The US Preventive Services Task Force recommends lung cancer (LC) screening for high risk individuals, yet the effect of indeterminate findings on the cost-effectiveness of LC screening is not established. We use a microsimulation model to estimate the cost-effectiveness of alternative LC screening strategies for the US general population under alternative levels of disutility associated with indeterminate findings. We find that as the effect of the disutility of indeterminate findings increases, the eligibility criteria for LC screening become more stringent and if large enough then biennial screening is cost-effective whereas, annual screening is cost-ineffective.

**5 - Improving Community Paramedicine via Data Science and Optimization: Selective, Proactive Management of ED Patients**

Andrew C. Trapp, Worcester Polytechnic Institute, School of Business, 100 Institute Rd., Worcester, MA, 01609, United States, Shima Azizi, Renata Konrad, Sharon A. Johnson, Brenton Faber

Community paramedicine is a recent healthcare innovation that empowers proactive visitation for chronically ill patients, often as follow-up visitations shortly after ED discharge. However, we are unaware of any studies that have considered it from the viewpoint of analytics. To that end, we purpose to reduce ED costs and increase patient welfare via our data-driven optimization approach. We use real hospital and community data to inform key decisions concerning provision of service, including vehicle and personnel scheduling and routing. We conclude by discussing computational findings.

**1 - A Generalized Latent Disease Detection Problem with Application to Active Surveillance of Prostate Cancers**

Zheng Zhang, University of Michigan, Ann Arbor, MI, United States, Brian T. Denton

We describe a generalized latent disease detection problem with patient-specific risk factors, a customized number of detection strategies for patients, and a general reward function. We formulate an integer programming model that considers patient-to-strategy assignment decisions and the test planning decision for each strategy. We develop a decomposition-based algorithm as a solution method for the model. We also provide insights based on the application of this model to optimize strategies for active surveillance of low-risk prostate cancers.

**2 - A Markov Decision Process Model to Define the Role of Active Surveillance for Small Renal Masses**

Jennifer Mason Lobo, University of Virginia, Charlottesville, VA, United States, Tracey L. Krupski

While the majority of small renal masses (SRMs) are indeed kidney cancer, a considerable proportion are either benign or demonstrate indolent behavior. Recent guidelines recommend active surveillance (AS) over definitive treatment for patients with limited life expectancy. In order to determine precisely which patients should be considered for AS, we developed a Markov decision process model to maximize life years or quality-adjusted life years for SRM patients over a ten year horizon, comparing AS, ablation, and surgical treatments. We present personalized treatment recommendations for patients based on demographics, comorbidities, and mass characteristics.

**3 - Evaluating the Effectiveness of Supplemental Breast Cancer Screening in Women with High Bi-rads Density**

Mahboubah Madadi, Louisiana Tech University, Ruston, LA, 712720029, United States, Sevda Molani

Since the enactment of the breast density notification law, there have been controversial debates over the necessity of this law. The law requires physicians to inform women with heterogeneously or extremely dense breasts of their breast density results, and the potential effect of high breast density on the sensitivity of mammography. In some states, the physicians are required to notify their patients of the possibility of using more sensitive supplemental screening tests. We develop a partially observable Markov model to evaluate the effectiveness of supplemental screening in term of the expected quality-adjusted life years (QALYs), number of false positives, and biopsies.

**4 - Personalized Lung Cancer Screening Strategies Using a Partially Observable Markov Decision Process**

Iakovos Tournazis, Stanford University, Department of Radiology, James H. Clark Center, Room S255, Stanford, CA, 94305-5446, United States, Oguzhan Alagoz, Ann Leung, Sylvia Plevritis

The US Preventive Services Task Force recommends lung cancer (LC) screening for high risk individuals aged 55-80 with at least 30 pack-years, and no more than 15 years since smoking cessation. Many other risk factors are associated with LC incidence, yet screening eligibility is solely based on age and smoking history, leading to sub-optimal screening strategies. We propose a partially observable Markov decision process (POMDP) that provides individualized optimal screening strategies for current and former smokers. Decisions are made based on the risk of the individuals accounting for previous screening results and changes in individuals' smoking behavior.

### HAS Session #II

Sponsored: Health Applications

Sponsored Session

Chair: Bryan A. Norman, Texas Tech University, Lubbock, TX, 79409-3061, United States

#### 1 - Multi-appointment Patient Scheduling for Chemotherapy Scheduling

Maryam Keshtzari, Texas Tech University, Texas, Lubbock, TX, United States, Bryan A. Norman

Cancer clinics are often overwhelmed with a large number of patients requesting chemotherapy treatments. Many patients prefer to have their chemotherapy session on the same day they visit the oncologist. In this study a simulation-based optimization model is presented to create a more balanced schedule to improve patient wait time and reduce nurse workload stress. Different scenarios based on patient's acuity level and length of the infusion appointment are designed and evaluated considering uncertainties related to cancellations and no-shows.

#### 2 - Moving on Up: Appointment Rescheduling to Improve Outpatient Clinic Appointment Slot Utilization

Shannon Harris, The Ohio State University, 1262 Eastwood Ave, Columbus, OH, 43203, United States, Bjorn Berg, Jerrold H. May, Luis G. Vargas, Nathan C. Craig

It is a common assumption that outpatient clinics are passive participants in the appointment booking process. If a patient cancels an appointment during the lead time, and another patient does not book an appointment in the cancelled time slot, the slot will remain empty. However, if the clinic can actively manage the appointment bookings, it may be able to increase the expected utilization of its appointment slots by potentially rescheduling appointments during a scheduling horizon. We prescribe general rules for when and how such appointment movements should occur in order to maximize expected utilization.

#### 3 - Managing Interruptions in Appointment Schedules in Physician Clinics

Ali Dogru, University of Southern Mississippi, Hattiesburg, MS, 35406, United States, Sharif Melouk

Physician clinics often encounter interruptions that affect their operations and impact the patient experience. Thus, in this research, we develop an interruption management procedure employing real-time patient notification. We use stochastic optimization to determine optimal appointment intervals and simulation optimization to establish a notification policy. Experimentation provides managerial insights.

#### 4 - Outpatient Clinic Appointment Scheduling using a Multi-objective Table-input Simulation-optimization Approach

Mohammad Dehghanimohammadabadi, Northeastern University, 170 Brookline Avenue, Unit 1025, Boston, MA, 02115, United States, Mandana Rezaeiahari

Appointment scheduling (AS) is one of the key factors to enhance the patient satisfaction in healthcare services. A practical and robust appointment scheduling pattern allows clinics to utilize medical assets, equipment, and resources in an efficient manner. In this study, a multi-objective simulation-optimization (MSO) approach is applied to determine the most preferred appointment scheduling pattern for an outpatient clinic system with stochastic parameters. The developed MSO model is using the concept of table-experiment (appointments table) in a simulation environment (Simio) which is improved with an iterative metaheuristic algorithm (in MATLAB).

### The Number of Undocumented Immigrants in the United States

Emerging Topic: INFORMS Special Sessions

Emerging Topic Session

Chair: Mohammad Fazel-Zarandi, Massachusetts Institute of Technology, MIT, Cambridge, MA, United States

#### 1 - The Number of Undocumented Immigrants in the United States

Mohammad Fazel-Zarandi, Massachusetts Institute of Technology, MIT, Cambridge, MA, United States, Jonathan S. Feinstein, Edward H. Kaplan

We apply standard operational principles of inflows and outflows to estimate the number of undocumented immigrants in the United States, using the best available data, including some that have only recently become available. We develop an estimate of the number of undocumented immigrants based on parameter values that tend to underestimate undocumented immigrant inflows

and overstate outflows; we also show the probability distribution for the number of undocumented immigrants based on simulating our model over parameter value ranges. Our conservative estimate is 16.7 million for 2016, nearly fifty percent higher than the most prominent current estimate of 11.3 million, which is based on survey data and thus different sources and methods. The mean estimate based on our simulation analysis is 22.1 million, essentially double the current widely accepted estimate.

#### 1 - Multistakeholder Recommendation with Provider Constraints

Edward Carl Malthouse, PhD, Northwestern, 1845 Sheridan Road, Evanston, IL, 60208, United States, Ozge Surur, Robin Burke

Recommender systems optimize the utility of the user, but often there are other stakeholders. One setting is multisided platforms, which match buyers and sellers and it is necessary to jointly optimize the value for both. We propose an integer programming model, where constraints reflect the goals of the different stakeholders. Our model is a post-processing step, so it can easily be added to an existing recsys to make it multistakeholder aware. For computational tractability, we reformulate the IP using the Lagrangian dual and subgradient optimization. We use two data sets to evaluate the utilities of buyers and sellers and show that our approximation can achieve good upper and lower bounds.

#### 2 - Frequently Bought Together: Market Basket Analysis with Shortened Web Link Click Data

Christopher M. Smith, Air Force Institute of Technology, 2795 Ridge View Ct, Xenia, OH, 45385, United States, James Gallagher

Social Media use has grown tremendously since the advent of "Web 2.0". To facilitate the sharing of information, link shortening has become a common method for fitting long web links into space-constrained social media posts. Additionally, most link shortening services provide analytic feedback to users such as how many clicks the link generated or a breakdown by location of those clicks. Market basket analysis using graph mining techniques was applied to this web link data to provide insight into an area's information dissemination patterns. Patterns of access, including by hardware platform and referral sources, within clusters of web domains provide feedback to market research analysts.

#### 3 - Pick-up, Delivery, or Both? An Online Grocer's Optimal Fulfillment Models

Chloe Kim Glaeser, Assistant Professor, UNC Kenan-Flagler Business School, 300 Kenan Center Drive, Chapel Hill, NC 27599, Chapel Hill, NC, United States, Xuanming Su, Ken Moon

We partner with an online grocery retailer to answer the practice-based question of the optimal mix of delivery zones and fulfillment models using data-driven analytics. We investigate (A) how consumers respond to the locally tailored fulfillment options made available to them by the online grocer, and (B) how to leverage data to customize locally available fulfillment options while scaling the retailer's operations. We employ a regression discontinuity design to find the effect of delivery introduction. Based on this empirical evidence, we build and estimate a structural model and perform a counter-factual analysis to estimate the revenue increase from additionally offering delivery.

#### 4 - Machine Learning Approaches to Modeling Category Sales: Implications for Optimal Store-Level Pricing and Promotions

Durai Sundaramoorthi, Washington University in Saint Louis, 10352 Conway Road, Saint Louis, MO, 63131, United States

We propose machine learning approaches - Regression Trees (RT), Bagging (Bag), Random Forests (RF), and Boosted Trees (BT) - with modified loss functions as candidate predictive models of product category profit as functions of marketing variables (price, display, feature, price promotion), both within and across categories at the same retail store. Using store-level weekly scanner data from 24 product categories in each of 9 stores of a supermarket chain over a period of 5 years, we estimate these machine learning models and compare their predictive performance on a validation set. We find that these models with modified loss functions are meaningful in the optimization context.

**Joint Session DM/Practice Curated:  
Data Science for Engineering and Facilities Design**

Sponsored: Data Mining

Sponsored Session

Chair: Reza Alizadeh, University of Oklahoma, Norman, OK, United States

**1 - Parameter Design Optimization of Products with an Ordinal Categorical Response Using Random Forests**

Gulser Koksall, Professor, Middle East Technical University, Industrial Engineering Department, Ankara, 06800, Turkey, Secil Gulbudak Dil

We propose an alternative method for finding optimal settings of product and process design parameters for the case of an ordinal categorical product/process response. The method utilizes Random Forests for modelling mean and variance of the response at a given set of parameter settings. The method uses different weighting strategies of Random Forest, and it is applied on three case problems. Results obtained are compared with those of previous studies that used the same data sets.

**2 - Minimization of Cycle Time Variance in Smart Warehousing**

Mohamed El Tonbary, Georgia Institute of Technology, 755 Ferst Dr, Atlanta, GA, 30318, United States, Leon McGinnis

We are interested in the operational decision in central fill pharmacies of assigning drugs to dispensers to be collected by vials traveling on conveyors. More specifically, we are concerned with finding the drug assignment which minimizes the cycle time variance. We show that the organ pipe arrangement attains the minimum under the assumption of constant travel times between adjacent dispensers. In the case of varying travel times between dispensers, we propose a heuristic which performs well empirically, achieving an optimality gap in the order of 0.1%. Our results can be generalized to other applications as well.

**3 - Queueing Analysis of an MIAPP-AS/RS Order Picking Operation**

Jingming Liu, Research Assistant, University of Arkansas, Fayetteville, AR, 72701, United States, John A. White, Haitao Liao

An M/G/1 queue is used to analyze an MIAPP-AS/RS system, in which case-level order picking occurs at multiple in-the-aisle picking positions (MIAPP) located on the floor and mezzanine levels. The S/R machine is treated as a server, and picking positions are treated as customers. Picking positions generate demands for replenishment performed by the S/R machine. Performance measures are obtained analytically for dedicated and random storage policies, as well as for finite and infinite populations. The results yield insights into the impact of the storage policies on the performance measures and the conditions where an infinite population approximation is reasonable.

**4 - Using Multiple Surrogates for Metamodeling in Complex Engineering Systems**

Reza Alizadeh, Graduate Research Assistant, The University of Oklahoma, 202 W. Boyd Street, Room 219, Norman, OK, 73019-1022, United States, Liagye Jia, Guoxin Wang, Janet K. Allen, Farrokh Mistree

Surrogate models are commonly used to replace expensive simulations of engineering problems. Frequently, a single surrogate is chosen based on past experience. However, we may use all or a subset of the accurate surrogates. We aim at achieving the least accuracy loss using all or the combination of surrogates using multiple surrogates, cross-validation, covariance matrix approximation, and random forest methods.

Chair: Ning Ning, University of Washington, Seattle, WA, United States

**1 - The Effect of Emotional Cues on Making Economic Decisions under Uncertainty**

Pieter Geelen, Maastricht University, Maastricht, Netherlands, Business Intelligence and Smart Service Institute, Heerlen, Netherlands, Stefano Bromuri, Stefano Bromuri, Mahdi Ebrahim, Mahdi Ebrahim, Deniz Iren, Deniz Iren

We investigate the understudied role of emotions on investors' decision. Specifically, we identify six basic human emotions (i.e. happiness, sadness, surprise, fear, anger, and disgust) expressed by S&P 500 CEOs during their earning conference calls and examine their effects on financial analysts' decisions

(i.e. retain, buy or sell shares). To identify CEOs' emotions in more than 500 calls we developed a deep learning algorithm trained by experts annotating vocal data in a subset of calls. Our findings shed light on underlying emotional mechanisms of financial decision-making under uncertainty, thereby contributing to behavioral economic theory.

**2 - Modeling Multivariate Time Series of Counts via Common Factors**

Fangfang Wang, University of Wisconsin, Madison, WI, United States

We develop a new parameter-driven model for multivariate time series of counts. The mean process is modeled as the product of modulating factors and unobserved stationary processes. The former characterizes the long-run movement in the data, while the latter is responsible for rapid fluctuations and other unknown or unavailable covariates. The latent processes are governed by possibly low-dimensional factors. This model is applied to analyze the intraday trading activity of U.S. stocks from ten sectors in the first quarter of 2012. Dynamic relationship between common factors adjusted by their associated loading and intraday volatility is also investigated.

**3 - In-sample Tangency Portfolio Based Portfolio Forecasting**

Kyungchan Park, PhD Candidate, The University of Iowa, 21 E. Market St, PBB S221, Iowa City, IA, 52242-1994, United States, Hongseon Kim, Seongmoon Kim

Representative portfolio selection model consists of two stages: 1) estimating input values, and 2) constructing portfolio by inputting the estimates. Though estimation errors on inputs are inevitable, optimizations construct portfolios sensitively to the fluctuation of inputs. To date, portfolio models have been designed to minimize the influence of estimation errors while maintaining the two-stage mechanism of optimization based on estimated. Portfolio forecasting method of this study was begun to find a method to utilize the most efficient in-sample portfolio outside of the two-stage mechanism by constructing portfolios using historical in-sample tangency portfolios as input values.

**4 - Multivariate Bayesian Structural Time Series Model**

Ning Ning, University of Washington, Seattle, Seattle, WA, United States

This paper deals with inference and prediction for multiple correlated time series, where one has also the choice of using a candidate pool of contemporaneous predictors for each target series. Starting with a structural model for the time series, Bayesian tools are used for model fitting, prediction, and feature selection, thus extending some recent work along these lines for the univariate case. We run an empirical study with one-step-ahead prediction on the max log return of a portfolio of stocks that involve four leading financial institutions. The extensive empirical study confirm that this multivariate model outperforms three other benchmark models.

**1 - Network Intrusion Detection Using Partially Labeled Cybersecurity Data**

Sandjai Bhulai, Vrije Universiteit Amsterdam, Faculty of Science, De Boelelaan 1081a, Amsterdam, 1081 HV, Netherlands, Jan Klein, Mark Hoogendoorn, Robert van der Mei, Raymond Hinfelaar

Network intrusion detection systems (NIDS) have been used to defend computer networks against malicious cyber activities. The lack of training data hinders discovery of new, previously unknown, intrusions. We use recent cybersecurity partially labeled data based on the 2017 Locked Shields exercise. We show how autoencoder and gradient boosting algorithms deal with missing labels on partially labeled data. The results were analyzed by a cybersecurity expert and confirmed that the models were able to classify the known intrusions as malicious and that they were also able to discover new intrusions. This shows how well an unlabeled dataset can be used to construct and evaluate a NIDS.

## 2 - A Comparison Between Different Machine Learning Algorithms for Better Accuracy in Trauma Outcomes Prediction

Fatima Almaghrabi, PhD Student, The University of Manchester, Booth street, Manchester, United Kingdom, Dong-Ling Xu, Jian-Bo Yang

Outcome prediction models are useful in identifying the extent of patient injuries and prioritising immediate life threats. This research aims to identify the most accurate tools for building a prediction model and to increase model accuracy to enhance the care services provided to trauma patients. Thus, the research attempts to identify which algorithms have the highest classification accuracy in predicting trauma outcome. The results of some machine learning (ML) algorithms, such as decision tree, logistic regression, random forest and neural network results were compared to the evidential reasoning rule.

## 3 - Flexible Job Shop Scheduling with Multi Agent Advantage Actor Critic

Jinkyoo Park, Korea Advanced Institute of Science and Technology, 291 Daehak-ro, Yuseong-gu, Daejeon, 34141, Korea, Republic of, Jaehyeong Chun, Jongwoo Ko, Jun Young Park

In this research, we propose a multi-agent reinforcement learning approach to schedule a semiconductor manufacturing process. A semiconductor manufacturing process is composed of a large number of sequential jobs conducted by different types of machines. The optimal scheduling policy seeks to minimize the makespan while satisfying various constraints. We formulate the scheduling problem as a multi-agent team game, and then derive the independent policy for each machine by using the multi-agent advantage actor-critic. Experiment results show that our decentralized multi-agent RL approach is effective compared to centralized scheduling approach or heuristic scheduling approach.

## 4 - Data Driven Sparse System Identification

Salar Fattahi, PhD, UC Berkeley, Berkeley, CA, 94702, United States, Somayeh Sojoudi

In this work, we study the system identification problem for sparse linear time-invariant systems. We propose a sparsity promoting estimator to identify the dynamics of the system with only a limited number of input-state data samples. Using contemporary results on high-dimensional statistics, we prove that logarithmic number of data samples is enough to reliably estimate the system dynamics. The developed estimator offers a small estimation error entry-wise and is capable of "exact recovery" of the underlying sparsity structure of the system with small number of data samples. We demonstrate the effectiveness of our approach through different case studies.

## 5 - Deep Learning in Finance - Estimation of Factor Models

Muye Wang, Columbia Business School, 3022 Broadway, Uris Hall, 4H, New York, NY, 10027, United States

Factor analysis is a statistical method used to describe variability among observed, correlated variables in terms of a potentially lower number of unobserved variables called factors. By using a variational autoencoder framework, we are able to incorporate outside relevant information to improve linear factor model's predictive performance. In addition, we also consider extending the traditional linear factor model to a non-linear framework. Finally, we conduct numerical experiments using SP500 daily return data and trading volume data to illustrate the superior performance.

## 1 - A New Fuzzy Set and Quadratic Surface SVM Approach for Misclassified Classification with Applications

Jian Luo, Associate Professor, Dongbei University of Finance and Economics, No. 217 Jianshan Street, Shahekou District, Dalian, 116025, China, Ye Tian, Zhibin Deng

To handle misclassified classification problem, this paper proposes a totally new method which first adopts the intuitionistic fuzzy set method to detect those misclassified points, then deletes their labels, and utilizes their full position information to build a semi-supervised kernel-free quadratic surface SVM model. Besides, a branch-and-bound algorithm is designed to improve the efficiency and accuracy. Some numerical tests on artificial and real datasets verify the superior performance of proposed method among several benchmark methods. Furthermore, the proposed method is applied to brain-computer interface and credit risk assessment, which strongly demonstrates its effectiveness.

## 2 - As Good as it Gets? Upper Bounds on Prediction Performance

David Anderson, Villanova University, Philadelphia, PA, United States, Margret V. Bjarnadottir

Taking only an assumption that "very similar" observations should have similar predictions to each other, we formulate a linear program to generate upper bounds on the possible predictive accuracy of a given outcome, using data contained in a dataset. We show results on multiple real-world and simulated datasets.

## 3 - Building Interpretable and Highly Accurate Supervised Learning Models

Abdelaziz Berrado, Mohammed V. University, BP 765, Avenue Ibn Sina, Agdal, Rabat, 10080, Morocco

Rule based classification algorithms such as CART are very attractive in several applications. They owe their popularity to the simplicity of the tree-building algorithm and the actionability of the resulting models. These algorithms suffer, however, from instability due to the tree building process: they perform greedy searches for rules, which could lead to missing important rules. Ensemble methods can mitigate this weakness of individual tree learners. They result, however, in blackbox models and are unable to provide insights into the structure of the predictive model. We discuss in this work ongoing research aimed at building accurate and highly actionable classification models.

## 4 - Data Analytics as a Tool for Problem Structuring

Patrick Hester, UNC Asheville, 28 Gibson Rd., Asheville, NC, 28804, United States

Data analytics is everywhere, from healthcare to business to higher education. Analysts use it to understand, predict, and improve an organization's performance, as a fundamental tool in one's Hard OR toolbox. This perspective misses out on an equally valid, yet overlooked, application of analytics to help us frame our problem; in this arena, data analytics can be very powerful. I will argue for the use of data analytics in the problem structuring (or Soft OR) phase, as a natural complement to its continued use during the solution phase of a problem engagement.

## 5 - Coefficient Tree Regression for Discovering Hidden Structure

Zge S rer, Northwestern University, 1310 Chicago Avenue 3H, Evanston, IL, 60201, United States, Daniel Apley, Edward C. Malthouse

The proliferation of technologies allows us to collect datasets of immense size with a large number of variables. In practice, many groups of predictors often share a common regression coefficient, but the groups are unknown. We propose an algorithm called coefficient tree regression to discover the unknown group structure by utilizing the properties of linear regression in an efficient way. We avoid matrix operations and speed up the computation to obtain an efficient algorithm. Our method achieves high accuracy competitive with existing methods. Finally, we test our algorithm with real datasets and demonstrate that it yields interpretable models by exploring the relations between predictors.

## 1 - Are Gaming Apps and Social Media Apps Adversaries or Partners to Education Apps? An Empirical Analysis

Sangpil Han, Arizona State University, Tempe, AZ, United States., Sungho Park, Sanghak Lee, Wonseok Oh

This paper examines an empirical question of whether spending time on hedonic apps such as Facebook and Angry Birds promote or impede users' usage of educational apps. We investigate this question using an individual-level app usage time data set.

## 2 - Personalized Targeting to Tackle the Challenge of Low Engagement in Mobile Apps: Combining Structural Hidden Markov Model and Field Experiment

Yingjie Zhang, Carnegie Mellon University, Pittsburgh, PA, United States

Low engagement rates and high attrition rates have been formidable challenges for mobile apps and their long-term success, especially for those whose revenues derive mainly from in-app purchases. This paper proposes a new structural forward-looking Hidden Markov Model (FHMM) and combines it with a randomized field experiment on app notification promotions. Overall, the novel feature of our paper is to propose a new approach of personalized targeting to tackle the challenge of low engagement in mobile apps by combining structural model and field experiment.

### 3 - Human Behavior in Physical Space and Virtual Space

Lei Dong, MIT, Cambridge, MA, United States

With the widespread of smart phone and location-based services, human 'movements' in the physical space and virtual space are recorded simultaneously. As far as we know, many human mobility patterns in physical space have been studied before, while there are a lot of open questions not be reached combing two spaces together: Does the virtual world have similar patterns of movement with physical space? Are there any interplay patterns between online and offline behavior? How do demographic properties matter in these two spaces? With a mobile phone dataset documenting detailed online and offline behaviors, we are seeking a deep understanding of humans behaviors in online and offline spaces.

Co-Chair: Xiao Liu, University of Arkansas, University of Arkansas, Fayetteville, AR, 5, United States

#### 1 - Spatial Variable Selection and an Application to Virginia Lyme Disease Emergence

Yili Hong, Virginia Polytechnic Institute, 213 Hutcheson Hall, Department of Statistics, Blacksburg, VA, 24061, United States

Lyme disease is an infectious disease that is caused by a bacterium called *Borrelia burgdorferi sensu stricto*. One of the research objectives for the infectious disease community is to identify environmental and economic variables that are associated with the emergence of Lyme disease. In this paper, we use a spatial Poisson regression model to link the spatial disease counts and environmental and economic variables, and develop a spatial variable selection procedure to effectively identify important factors by using an adaptive elastic net penalty. The proposed methods can automatically select important covariates, while adjusting for possible spatial correlations of disease counts.

#### 2 - Penalized Spatio-temporal Regression for Video Monitoring of Additive Manufacturing Process

Hao Yan, 699 S. Mill Ave, Tempe, AZ, 85281, United States

In this work, we focused on detecting the local occurrence of the "hot-spot event" in the metal additive manufacturing (AM) process. Here we propose to model the temporal behavior of the hot-spot event by the autoregressive model and propose a spatial-temporal decomposition approach to isolate the hot-spot event from the background. We also propose a control chart scheme to tell when the event actually happens. The proposed methodology is validated using both simulation and case study in metal AM.

#### 3 - Spatio-temporal Modeling of Topic Flows with an Information Diffusion Monitoring Application on Social Networks

Shyam Ranganathan, Virginia Polytechnic Institute and State University, VT, Blacksburg, VA, United States, Scotland Leman, Peter Hauck, James Hawdon

Spatio-temporal topic flow modeling can be used to understand how information diffusion takes place on networks. We present an extension of the popular Latent Dirichlet Allocation (LDA) model to include spatial and temporal diffusion using ideas from the Gaussian process (GP) and the timeseries literature. We show an application where such a model can be used to monitor how information diffuses on social networks such as Twitter. We build a 'polarization barometer' based on the spatio-temporal model and use it to evaluate the amount of polarization generated by the information diffusion.

#### 4 - A Generic Framework for Multisensor Degradation Modeling Based on Supervised Classification and Failure Surface

Changyue Song, University of Wisconsin, Rm 3221, Mechanical Engineering Building, 1513 University Ave, Madison, WI, 53715, United States

We propose a generic framework for multisensor degradation modeling. Specifically, we model each sensor signal based on random-effect models and characterize failure events by a multi-dimensional failure surface. To overcome the challenges in estimating the failure surface, we transform the degradation modeling problem into a supervised classification problem, where classifiers can be incorporated to estimate the degradation status of the unit based on the underlying signal paths, i.e., the collected sensor signals after removing the noises. The proposed framework is also capable for sensor selection, able to handle asynchronous sensor signals, and easy to implement in practice.

Sponsored Session

Chair: Kangwon Seo, University of Missouri, Columbia, MO, 65211, United States

#### 1 - Comparing Two Kaplan-meier Curves with the Probability of Agreement

Lu Lu, Assistant Professor, University of South Florida, 4202 E. Fowler Ave., Tampa, FL, 33544-8861, United States, Nathaniel Stevens

The probability of agreement has been used as an effective strategy for quantifying the similarity between the reliability of two populations by accounting for a practically important difference. This talk discusses two approaches for assessing the probability of agreement and its associated uncertainty for comparing the Kaplan-Meier curves for estimating the reliability of two populations. The first approach provides an easy assessment based on large sample approximations. The second approach offers more precise estimation by using the fractional random-weight bootstrap approach. The methods are illustrated with examples for comparing the reliability curves of related populations.

#### 2 - Nonparametric Bayesian Network Approach System Reliability Analysis

Rong Pan, Arizona State University, School of Computing Informatics & Decision Sys, P.O. Box 878809, Tempe, AZ, 85287-8809, United States, Dongjin Lee

In this talk we present the a nonparametric Bayesian network method for evaluating a complex system's reliability while considering the uncertainty in system reliability structure and in component reliability assessment.

#### 3 - Realtime Flight Anomaly Detection and Health Management

Ashwin Rai, Arizona State University, Tempe, AZ, United States

A statistical model for in-flight aircraft health management has been developed, with the capability of automated feature extraction, dimension reduction, and anomaly detection. To efficiently handle the high-dimensional flight data, information is de-noised, fused, and encoded following which a multivariate Gaussian mixture model is developed to train the flight data with limited amount of fault cases and form a global probability distribution of the aircraft performance. A robust cross-validation method is then implemented to obtain the optimal safety threshold of the aircraft performance. Results indicate that the developed model can detect faulty operations with short time-lags.

#### 4 - Time-to-failure Analysis of Hollow Shafts in High Speed Trains with Fatigue Crack

Ruochong Liu, Tsinghua University, Yanfu Li

Reliability of the hollow shaft, the critical component in high speed trains, has been a significant issue concerned by the researchers and administrators in the railway domain. Fatigue crack is one of the main failure modes in hollow shafts. Therefore, a stochastic model combining the physics-of-failure mechanism has been established to describe the randomness of fatigue crack growth, which is partially incurred by the uncertainty of the axle force during the operation of the train. A Monte Carlo method has been conducted to simulate the degradation path of crack growth and estimate the distribution of time-to-failure of hollow shafts.

#### 5 - A Hybrid Network Model for Information Fusion in National Airspace System

Yuhao Wang, Arizona State University, Tempe, AZ, United States, Yongming Liu, Yongming Liu

This paper present a hybrid network model combining the classical Bayesian method and the Maximum Entropy method called the Bayesian-Entropy Network (BEN). With the proposed method, the information fusion from various sources can be achieved. The BEN method can take in information other than point data/observation as constraints. It is demonstrated in Air Traffic Control (ATC) system to model human knowledge and empirical information to help the risk assessment and accident prediction in the National Airspace System.

Emerging Topic: Productivity, Efficiency and Data Envelopment Analysis

Emerging Topic Session

Chair: Umit Saglam, East Tennessee State University, Department of Management and Marketing, P.O. Box 70625, Johnson City, TN, 37614, United States

#### 1 - A Dea-based Empirical Analysis for Dynamic Performance of China's Regional Coke Production Chain

Panpan Xia, University of Science and Technology of China, Hefei, China, Jie Wu, Xiang Ji

Coke plays a critical role in China's national economic activities in the past several decades. However, because of the twofold pressures from the sustainability-concerned public and the international steel market downturn, China's coke industry steps into a dilemma. To help the industry solve its current problems, an empirical analysis for dynamic performance of China's regional coke production chain is demonstrated. Through adopting the slacks-based measure (SBM) in Data Envelopment Analysis (DEA) and a famous dynamic network DEA framework, this paper simplifies the coke production chain into a three-stage process, and captures the interactions between intermediates inside each stage.

#### 2 - Axiomatic Modeling of Fixed Proportion Technologies

Xun Zhou, Doctoral candidate, Aalto University School of Business, Runeberginkatu 22-24, Helsinki, 00100, Finlandi, Timo Kuosmanen

Understanding substitution possibilities of inputs/outputs is critical for efficient resource allocation and firm strategy. There are several important examples of fixed proportion technologies where some inputs and/or outputs are not substitutable. However, there is widespread confusion about appropriate modeling of fixed proportion technologies in DEA. We point out and rectify some misconceptions in the published literature, and show how the fixed proportion technologies can be correctly incorporated into the axiomatic framework.

#### 3 - Technical Efficiency in the Chilean Higher Education System: A Comparison with Traditional Measurements of Efficiency

Gianfranco Cossani, Universidad Catolica del Norte, Avenida Angamos 0610, Antofagasta, 1270709, Chile, Hernan Caceres, Loreto Codoceo, Jorge Tabilo

Data Envelopment Analysis (DEA) has often been used to evaluate the efficiency of higher education institutions in many countries. In Chile, few studies using this technique are available. In this work, we propose a network and dynamic DEA model where each university has a structure with resources shared by teaching and research. For our study case, we examined data from 2013 to 2017 of the Chilean System, and we compared our findings with efficiency scores obtained with four different DEA methods, in addition to rankings commonly used by the government and media outlets.

#### 4 - A Two-stage Performance Assessment of Utility Scale Wind Farms in Texas

Umit Saglam, Assistant Professor, East Tennessee State University, Department of Management and Marketing, P.O. Box 70625, Johnson City, TN, 37614, United States

A two-stage Data Envelopment Analysis (DEA) models are applied to evaluate productive efficiencies of the 95 large utility-scale wind farms' electricity generation in Texas, by using pre-determined three input and two output variables. The slack analysis and projection data are obtained for inefficient wind farms to find out benchmarking input-output variables. The sensitivity analysis is provided for the robustness of the DEA models with different combinations of input and output variables of the original model. Tobit regression models are conducted to investigate the reasons for inefficiency.

#### 5 - An Approach for Autonomous Target Selection for an Agent Swarm

Barin N. Nag, Professor, Towson University, Department of E-Business & Tech Management, College of Business & Economics, Towson, MD, 21252, United States, Sungchul Hong, Xiaoyin Wang

Decision making in target selection for a swarm of drones in military use is a complex process that requires the simultaneous consideration of a number of parameters, some of which may not be known with certainty. An approach is presented here for autonomous targeting decisions. The method uses a combination of Bayesian estimation to overcome problems of uncertainty, and Analogical Reasoning to aggregate a large number of observations to achieve a high level of confidence.

Sponsored: Computing

Sponsored Session

Chair: Hamidreza Validi, Oklahoma State University, Stillwater, OK, 74075, United States

#### 1 - The Most Betweenness Central Clique Problem

Foad Mahdavi Pajouh, University of Massachusetts Boston, Boston, MA, 02125, United States, Maciej Rysz, Eduardo Pasillao

This talk addresses the most betweenness-central clique problem, which is to find a clique of maximum betweenness centrality in a connected network. Central cliques have applications in corporate, social, communication, power grid, and biological network analysis. Complexity results, bounds, and a combinatorial branch-and-bound algorithm for solving this problem are presented.

Computational performance of the proposed algorithm is compared with that of a mixed integer programming technique on a test-bed of randomly generated graphs and real-life networks.

#### 2 - Sparse Model Estimation and its Applications to the Insurance Industry

Jessica Wai Yin Leung, University of Sydney, Sydney, Australia, Dmytro Masypura

We study the problem of sparse model estimation in the context of binary classification. We formulate the problem by extending the discrete Dantzig selector to accommodate a hinge loss function. To increase the efficiency in solving the problem, we reformulate the problem as a mixed integer linear optimisation problem (MILP) and propose to add additional bounds and warm-start algorithm to obtain near optimal solutions. Preliminary results show that our method is capable of recovering all the true features with high predictive accuracy within a reasonable time frame when the sample size is less than the number of features.

#### 3 - Interdicting Interdependent Smuggling, Money, and Laundering Networks

Thomas Sharkey, Rensselaer Polytechnic Institute, CII 5015, RPI, 110 8th St, Troy, NY, 12180, United States, Yeming Shen

We consider the problem of disrupting a transnational criminal organization (TCO) operating interdependent smuggling, money, and money laundering networks. The TCO will smuggle contraband across an international border, generate revenue from illegal sales, and then need to send the money back across the border via the laundering network. We examine a bi-level program that seeks to allocate law enforcement resources as to optimally disrupt these interdependent networks. Effective reformulation techniques are discussed as well as examining the impact of disrupting laundering networks across multiple TCOs.

#### 4 - Novel Group Centrality Metrics for Studying Essentiality in Protein Protein Interaction Networks

Saeid Rasti, North Dakota State University, Fargo, ND, United States

We propose a set of novel group centrality metrics and show their performance in estimating protein importance in protein-protein interaction networks. These centrality metrics are extensions of well-known nodal centrality metrics, such as degree, betweenness, and closeness, for a set of nodes which is required to induce a specific pattern. The structures investigated here range from the stricter induced stars and cliques, to a looser definition of an induced representative structure. We then propose mixed integer programming formulations to solve the problem exactly. Finally, the performance of the proposed metrics in identifying essential proteins in a series of organisms is indicated.

### Information Security Risk Management

Emerging Topic: Cyber Security

Emerging Topic Session

Chair: Jingguo Wang, University of Texas-Arlington, Arlington, TX, 76019, United States

#### 1 - To Pay or Not to Pay? A Ransomware Conundrum: A Experimental Study

Yan Lang, University of Texas at Arlington, 701 S. Nedderman Dr, Arlington, TX, 76019, United States, Kay-Yut Chen, Jingguo Wang

Ransomware has become one of the widespread form of malware used in cyber-attacks. We develop a game theoretic treatment of a ransomware scenario with an attacker and multiple defenders. We show, by the use of human subject experiments, that whether a defender is willing to pay ransom can be affected by the ability for the defenders to coordinate, and in terms of implications of how the defender should invest in lowering the risk of an attack.

#### 2 - Accuracy, Confidence, Calibration, and Resolution: A Comparison of Measures of Individuals' Phishing Email Detection Ability

Yuan Li, University of Illinois at Springfield, Springfield, IL, United State, Jingguo Wang, H. Raghav Rao

This study compares four alternative measures of individuals' phishing email detection ability, including accuracy, confidence, calibration, and resolution. These measures reflect different qualities of a person in detecting phishing emails. An online survey experiment was conducted to empirically test these measures and their different antecedents. The study offers new insights into a person's phishing email detection ability. Theoretical and practical implications are discussed.

#### 3 - Defense Strategies under Cyber-Secure Market Interactions in Power Systems

Yihe Zhuo, Lawrence Snyder, Rick S. Blum, Shalinee Kishore, Parv Venkitasubramaniam

We present a tri-level model for cybersecurity in a smart grid. Our model optimizes the defense strategy that an independent system operator (ISO) should take against possible cyber-attacks. An attacker best-responds to this defense strategy to disrupt the system, and then the ISO dispatches energy consumption decisions. Our tri-level model cannot be solved exactly for reasonable instances, so we propose two heuristics, one based on a greedy approach and one that uses an analogy to facility location problems. We test the approaches on benchmark IEEE instances.

#### 4 - Closer for Connection, Closer to Risks? The Impact of Joining IXPs on Cybersecurity Threats

Qihong Wang, Singapore Management University, Singapore, Singapore

The internet exchange point (IXP) is the physical infrastructure through which Internet service providers (ISPs) and content delivery networks (CDNs) exchange Internet traffic between their networks (autonomous systems). According to the latest data published by Packet Clearing House, as of May 2018, 410 IXPs are running across 224 cities in 106 countries with ISPs and CDNs from 9077 autonomous systems. The emergence of IXPs, motivated for faster and cheaper internet peering, has created new challenge and opportunity to secure the internet infrastructure. In particular, for ISPs and CDNs originated from countries with heterogeneity in cybersecurity commitment, would linking to the same IXP increase each member's cybersecurity risk due to free rider and weakest link? Alternatively, would joining IXP reduce each member's cybersecurity risk as a result of the intensified competition for internet peering? This study investigates this issue using a panel data integrating the internet infrastructure migration and malicious internet traffic at autonomous system level. Given the flattening internet infrastructure contributed by the distribution of hundreds of IXPs all over the world, its business and policy implications on cybersecurity are discussed.

### Joint Session MCDM/Practice Curated: MCDM Methodology in Emerging Applications

Sponsored: Multiple Criteria Decision Making

Sponsored Session

Chair: Serpil Sayin, Koc University, Istanbul, 34450, Turkey

#### 1 - Optimal Planning of a Multimodal Mobility System with Rideshare

Xi Chen, University of Michigan - Dearborn, 2290 Engineering Complex, 4901 Evergreen Rd, Dearborn, MI, 48128, United States, Armagan Bayram, Meigui Yu, Xiao Yu

Public transit aims at providing affordable and energy efficient transportation service to residents on their daily commutes. However, the high setup and operating cost of public transit greatly limits its accessibility and utilization. On the other hand, rideshare services have more route flexibility but bear higher cost and energy consumption per trip served. In this paper, we investigate the value of combining these two transportation modes in satisfying customer travel demand and improving system performance. We formulate an integer program for the multimodal transportation planning problem. We also propose an efficient heuristic to solve this optimization problem.

#### 2 - A Filtering-enabled Interactive Algorithm to Find Preferred Solutions of the Decision Maker

Gulsah Karakaya, Middle East Technical University, Business Administration Dept, METU, Universiteler Mahallesi, Ankara, 06800, Turkey, Ceren Tuncer Sakar

In the presence of multiple conflicting objectives, it is not straightforward to find the best solution. We develop an interactive approach to converge to preferred solutions of the decision maker. Iteratively, we present the decision maker small sets of alternatives and obtain preference information. We apply filtering to the data set to obtain more useful information. We use a weighted La distance function as the preference function. Using rankings data of Times Higher Education, we make tests with universities evaluated with five criteria and demonstrate that our method performs well.

#### 3 - Multiple-criteria Decision Making and Smart Systems: A Literature Review

Tung Cu, Bloomsburg University of Pennsylvania, 932 Country Club Dr., Bloomsburg, PA, 17815, United States

Although MCDM is an old school among OR domains, new breakthrough developments in smart systems have extended research in MCDM to new areas that were not possible before. The aims of the study are twofold. This paper first conducts a rigorous review of literature in both theoretical and empirical issues that address smart systems and MCDM methods, decision support tools and platforms in different contexts such as business, healthcare, education, politics, security and privacy. It then focuses on reviewing typical characteristics of smart system users in making their decisions. Findings on behaviors of traditional and nontraditional decision makers are presented in the paper.

#### 4 - Multi-dimensional Sensitivity Analysis in Operations Research, and its Importance for Preventive Healthcare Services

M Gabriela Sava, Assistant Professor, Clemson University, College of Business, 145 Sirrine Hall, Clemson, SC, 29634, United States, Luis Vargas, Jerrold H. May

We propose a method for analyzing the n-dimensional sensitivity and stability of an n-criterion AHP/ANP model, so as to more fully assess the impact of perturbations, such as those that are caused by additional information, on preferred alternatives. We illustrate our methodology by applying it to a preventative healthcare choice problem.

## ■ TD75

### Joint Session MAS/DAS

Joint Session

Chair: Gregory S. Parnell, University of Arkansas, Fayetteville, AR, 72701, United States

#### 1 - Improving Analysis of Alternatives

Gregory S. Parnell, University of Arkansas, 4207 Bell Engineering Center, Fayetteville, AR, 72701, United States, Edward A. Pohl, Simon Goerger

The DoD is required to perform an Analysis of Alternatives (AoAs) to support major program milestone decisions early in the system life cycle. This paper reviews the statutory, defense department, and service guidance for AoAs. One of the major results of the AoA is a trade-off analysis that informs senior decision makers about the technical, cost, schedule risks of the potential new program. We report on a book project to document best practices for trade-off analyses and our research in the Engineering Resilient Systems program to improve the effectiveness and efficiency of AoAs.

#### 2 - Sensor Modeling for Military Applications

Randy K. Buchanan, USACE - ERDC, 3909 Halls Ferry Road, Vicksburg, MS, 39180, United States

Sensor models capabilities within the DoD were investigated for supporting tradespace exploration and analysis of unmanned aerial systems (UAS) integrated sensor systems and sensor payloads. The research was conducted to support examining the performance trades of various modalities including size, weight, and power to a rotary-wing and fixed wing aircraft. Sensor modeling and simulation supports the development and verification of optimized sensor systems and is required when knowledge of sensor system tradeoffs are deemed necessary, or the development of cutting-edge deployed systems are required.

#### 3 - Integrating the Cost Model with Set-Based Design

Randy K. Buchanan, USACE - ERDC, 3909 Halls Ferry Road, Vicksburg, MS, 39180, United States

Integrating cost models with set-based design concepts improves decision making capabilities for analysis of alternatives when implementing model-based engineering early in the design process. These principals were applied to a conceptual Army ground vehicle while integrating an engineering model with a cost model. Stakeholder requirements were used to incorporate value into the design tradespace and sensitivity analysis was applied to input parameters to determine effect on cost. The process of integrating SBD into the cost, engineering, and value models generated analytical insights of the design alternatives within the tradespace that provide guidance for future integration efforts.

#### 4 - Improving Personnel Selection through Multi Objective Decision Analysis

Christopher Smith, PhD, Air Force Institute of Technology, OH, United States, Joshua Deehr

Personnel selection has always and will continue to be a challenging task for the military special operations. They want to select the best out of a number of qualified applicants. What makes a successful candidate and how to compare candidates against each other are some of the difficulties that top tier organizations like the special operations face. Value Focused Thinking places criteria in a hierarchal structure and quantifies the values with criteria measurements, known as a decision model. The selection process can be similar to a college selecting their students. This research used college student entry data and strategic goals as a proxy for special operations applicants and standards.

### Joint Session MIF/HAS: Models and Methods for Improving Patient Outcomes

Sponsored: Minority Issues

Sponsored Session

Chair: Gabriel Zayas-Caban, Madison, WI, 53706-1691, United States

#### 1 - Optimal Biomarker Testing and Subject Classification Under Limited Information

Seyedehsaloumeh Sadeghzadeh, Virginia Institute of Technology, Blacksburg, VA, 24060, United States, Douglas R. Bish, Ebru Korular Bish

Bio-marker testing is essential in public health screening. For many diseases, related bio-markers may have a wide range of concentrations among subjects, particularly among the disease-positive subjects. Furthermore, bio-marker levels may fluctuate based on external and subject-specific factors. These sources of variability can increase the chance of subject misclassification based on a bio-marker test. We study the minimization of the misclassification cost considering

regret and expectation-based objectives, and derive various key structural properties of their optimal solutions. Our case study establishes the benefits of the proposed models over current policies.

#### 2 - Precise: Pancreatic Cancer Prioritization and Screening Evaluation Tool

Lena Abu-El-Haija, NC, United States, Julie Simmons Ivy, Osman Ozaltin, Walter G. Park

Pancreatic cancer (PC) is the fourth cause of cancer death in the US and is projected to be second by 2030. Incidence of PC is low, but the mortality risk is high with 8% five-year survival. Early stage PC can be asymptomatic leading to late diagnosis after it may have metastasized. The key to improving survival is screening. SEER and secondary data were used to develop a model-based framework for evaluating screening policies. The model provides quantitative clarity to identify areas for future data collection to understand the behavior of PC and whom it targets. The model enables the development of personalized screening policies to include race, sex, and age that influence incidence and progression.

#### 3 - Improving Access of Low Back Pain Patients Through Prioritization at a Neurosurgery Clinic

Esma S. Gel, Associate Professor, Arizona State University, 699 S. Mill Ave., Tempe, AZ, 85287-8809, United States, Derya Kilinc

Low back pain (LBP) is often cited to cause significant health impairments for a large fraction of the population. Studies point to the high variability in treatment approaches and frequent mismatch between patient needs and services offered by providers from different specialties. This mismatch results in critical access problems for patients that truly need critical interventions such as surgery within a reasonable timeframe. We present findings from a number of ongoing projects to improve access of LBP patients at a neurological surgery clinic. Our analysis points to the importance of prioritizing surgical patients and demonstrates the potential improvements in patient access.

#### 4 - A Latent-Variable Approach to Potential Outcomes for Emergency Department Admission Decisions

Gabriel Zayas-Caban, University of Wisconsin, Mechanical Engineering Building, 1513 University Avenue, Madison, WI, 53706-1691, United States, Amy Cochran, Paul Rathouz, Keith Kocher

In emergency departments, providers weigh admissions against continued monitoring and treatment often without knowing their health state. We describe a framework to estimate the causal effect of admission decisions on patient outcomes from observational data. Admission decisions are modeled as a decision-making process in which the patient's health needs is a latent variable. We estimate latent health needs with limited knowledge of the decision process using the potential outcomes framework and assuming potential outcomes are independent from admission decisions within a latent health state. We apply our approach to patient encounters with the University of Michigan Health System.

#### 5 - A Data-driven Partially Observable Markov Decision Process for Optimizing Individualized Surveillance Strategies for Prostate Cancer

Weiyu Li, IOE department, University of Michigan, Ann Arbor, MI, United States, Brian T. Denton

Active surveillance (AS) is a strategy that involves regular clinical examinations, biomarker tests, and biopsies to monitor patients diagnosed with low-risk prostate cancer. The ideal strategy must strike a balance between the burden of testing and the benefit of early detection of progression to high-risk prostate cancer. We propose a hidden Markov model (HMM) to estimate the progression rate of cancer, and the sensitivity and specificity of the biomarker tests using longitudinal data from a large surveillance study. We use the HMM as the basis for a partially observable Markov decision process (POMDP) and present results for optimal strategies.

### Health and Humanitarian Supply Chain Management

Sponsored: Public Sector OR

Sponsored Session

Chair: Pinar Keskinocak, Georgia Institute of Technology, Atlanta, GA, 30332, United States

Co-Chair: Seyma Guven-Kocak, Georgia Institute of Technology, Atlanta, GA, 30340, United States

Co-Chair: Pelin Pekgun, University of South Carolina, Columbia, SC, 29205, United States

#### 1 - The Roadside Healthcare Facility Location Problem

Harwin de Vries, INSEAD, Boulevard de Constance, Fontainebleau, 77210, France, Albert P. M. Wagelmans, Joris Van de Klundert

African truck drivers carry a high burden of HIV and are believed to significantly fuel its spread. We consider the problem to select locations for roadside healthcare facilities, so as to maximize their impact in terms of patient volume and continuity of access. We describe how we relate decisions to objectives and discuss how our model and its implementation in a decision support tool enable better location decisions.

## 2 - A Decision Support Tool for Strategic National Stockpile Inventory Policies

Erica L. Gralla, George Washington University, Washington, DC, 20052, United States, Kiren Ajrawat, Alyson Fintzy, Jillian Miles, Chris Shaffer

A decision support tool was developed to assist the Division of Strategic National Stockpile (DSNS) at the Centers for Disease Control and Prevention (CDC). The SNS is the nation's largest inventory of medical supplies to utilize during a disaster. In the case of a large scale public health emergency, there is a need to both serve emergency demand and to minimize the time to recovery and degree of degradation for the commercial supply chain. The simple decision support tool shows how different policies, such as SNS inventory levels and commercial production capacities, affect the response.

## 3 - A Framework for Re-designing Access-to-medicine Supply Chains

Nico Vandaele, KU Leuven, Naamsestraat 69, 0419.052.173, Leuven, 3000, Belgium, Catherine Jenny Decouttere, Stef Lemmens, Kim De Boeck, Mauro Bernuzzi, Stany Banzimana, Sherif Hassane

We present a five-step approach to (re-)design a supply chain. It encompasses stakeholder analysis and system definition, key performance indicator derivation, detailed modelling, scenario generation and ranking up to final scenario choice and implementation. We apply this to the (re-)design of a vaccine supply chain in humanitarian setting where development and disaster relief are connected. We provide examples and insights from the Sub-Saharan region.

## 4 - The Role of Food Banks in Determining the Effectiveness of the Snap Program

Luv Sharma, University of South Carolina, Columbia, SC, 29206, United States, Pelin Pekgun, Sanjay L. Ahire

The Supplemental Nutrition Assistance Program (SNAP) is the largest domestic hunger program in the United States, providing assistance to 47 million individuals. In this study we look at the role of food banks in increasing the reach of the SNAP program. Specifically we look at the interactions between resources dedicated to the SNAP program and characteristics of the food bank service area in influencing SNAP reach.

## 5 - Modeling for the Equitable and Effective Distribution of Food Donations Under Stochastic Capacities

Irem Sengul Orgut, Lenovo, 8209 Pritchett Farm Lane, Raleigh, NC, 27606, United States, Julie Simmons Ivy, Reha Uzsoy

Food insecurity is an increasing threat to people's health status and quality of life. In partnership with the Food Bank of Central and Eastern North Carolina, which distributes donated food to a 34-county service area, our objective is to achieve equitable and effective food distribution among the population at risk for hunger. Counties' capacities are the main source of uncertainty in this system as they constrain the total food distribution due to the need to distribute food equitably. We develop stochastic models for optimal food distribution and prove structural results. We illustrate our results and perform an extensive numerical study using historical data from our collaborating food bank.

West Bldg 213B

## Joint session SOLA/TSL: Alternative-Fuel Location Decisions with Service Constraints

Sponsored: Location Analysis

Sponsored Session

Chair: Ismail Capar, Texas A&M University, College Station, TX, 77843-3367, United States

Co-Chair: Yudai Honma, The University of Tokyo, Tokyo, 153-8505, Japan

## 1 - Designing an Electric Vehicle Charging Infrastructure under Customer Service Constraints

Ismail Capar, Texas A&M University, Industrial Distribution Program, Tamu 3367, College Station, TX, 77843-3367, United States, Ozgur M. Araz, Ibrahim Capar

While there is an interest in applying the flow-refueling location model (FRLM) to capacitated refueling stations including electric vehicle charging stations, the existing research primarily focuses on capacity as the only additional constraint for the FRLM. In this research, we introduce another aspect of the capacity decisions, namely drivers' perspective of minimizing mean sojourn time into FRLM and show results from extensive numerical experiments.

## 2 - Investigating the Alternative Fuel Vehicle Drivers' Deviation Tolerances for Refueling at Stations Off Their Paths

Okan Arslan, HEC Montreal, 5308 Ave Decelles, Montreal, QC, H3T1V8, Canada, Oya Ekin Karasan, Ali R. Mahjoub, Hande Yaman

Due to the limited range of alternative fuel vehicles (AFV) and the sparsity of the available alternative refueling stations, the AFV drivers cooperatively deviate from their paths to refuel. The deviation is generally bounded by the drivers' tolerance. Taking this behavior into account, we develop a natural model for the 'refueling station location problem with routing' based on the notion of length-bounded cuts. We quantify the impacts of the deviation tolerance of the drivers and the range of vehicles on the AFV use. We present insights on deviation characteristics of drivers and discuss the policy implications of our findings.

## 3 - New Node-based and Path-based Location Models for Urban Alternative-fuel Stations: Comparing Their Convenience and Coverage Abilities

Yudai Honma, The University of Tokyo, Ce405, Komaba 4-6-1, Meguro-ku, Tokyo, 153-8505, Japan, Michael J. Kuby

Researchers have proposed many different models for optimizing the locations of alternative-fuel stations to serve new vehicle adopters conveniently. This paper aims to compare the path-based vs. node-based modeling choice as fairly as possible from the perspective of minimizing total additional travel time and feasibly covering all demands with the same number of stations. For this comparison, we introduce two new station location models that extend the Flow Capturing Location Model (FCLM) and the p-Median Problem (PMP) by including consistently defined upper limits on vehicle driving range and degree of inconvenience on refueling trips.

## 4 - Locating Alternative-fuel Stations for Maximizing AADT Coverage and Ensuring Sufficient Spacing: A Case Study of CNG Truck Fueling

Qing Zhong, The University of Arizona, Tucson, AZ, United States, Daoqin Tong, Michael J. Kuby, Fangwu Wei, John W. Fowler, Keiron Bailey

This paper introduces two new arc-based coverage models for locating alternative fuel stations. The new models use arc traffic volumes in the form of AADT data to represent the demand. We incorporate a service area radius and a fractional correction factor to discount for the need to detour to the station and to avoid double-counting of AADT. Station spacing parameters allow the user flexibility in not locating new stations too close to each other or to existing stations. Redundant coverage due to the proximity of multiple stations is also addressed. We apply the models to planning a network of CNG fueling stations for heavy-duty CNG-powered trucking in the Southwest United States.

## ■ TD79

Hyatt, Curtis A

## Supply Chain Management IV

Contributed Session

Chair: Weimar Ardila, University of South Florida, 4207 Winding Moss Trail, # 208, Tampa, FL, 33613, United States

## 1 - Optimal Inventory and Price Competition in a Dual-Omnichannel Market

Bai Yang, PhD Student, Ajou University, San 5 Woncheon-dong, Yeongtong-gu, Suwon, 443 749, Korea, Republic of, Byeong-Yun Chang

With the fast development of science and technology, many retailers nowadays are increasingly adopting an omnichannel SCM to sell their products. In this paper, we model the competitive dual-omnichannel supply chains and the optimal inventory and price decisions are obtained.

## 2 - Coordinating Efforts for New Product Development: A Bilevel Programming Approach

Ece Zeliha Demirci, Postdoc Researcher, Eindhoven University of Technology, P. O. Box 513 5600 MB, Eindhoven, 5600MB, Netherlands, Nesim K. Erkip

Integration of marketing and sales functions with research and development are seen as key success factors for new product development. Our study deals with a problem faced by a manufacturer produces and/or distributes a new product to the market. The aim of the manufacturer is to increase the sales of the product while influencing the retailer to stay in the market. We model this setting as bilevel programming and provide characterization of the optimal solution.

### 3 - Writing to Bridge the Divide: Does Article Readability Affect Cross-citations in Operations and Supply Chain Management?

Seth Washispack, Arizona State University, Tempe, AZ, 85281,  
United States, Seongkyoon Jeong

There is a well-known divide between analytical and empirical researchers in the Operations and Supply Chain Management (OSCM) discipline. Although increasing the dissemination of knowledge across the two methodological camps can advance the development of the field, few solutions to this dichotomy have been suggested. Using 9,405 articles collected from the top four analytical and top four empirical OSCM journals, we tested how readability affects forward citations. Our results suggest that lowering the cognitive barrier in academic writing has the potential to advance the discipline within and between the analytical and empirical camps.

### 4 - Application of Statistical Learning in Demand Forecasting and Supply Chain Resilience

Weimar Ardila, University of South Florida, 4207 Winding Moss  
Trail, # 208, Tampa, FL, 33613, United States, Daniel Romero,  
Alex Savachkin

The inventory redundancy is basically a supply chain resilience strategy that allows a system to increase the safety stock levels to respond in the best way to sudden increases in demand. However, increases in the whole system's inventory levels also imply increases in costs related to the inventory management. A better forecast of the demand, from a statistical learning approach, could generate a better performance in the inventory policy, which would allow the system to react adequately to demand disruptions, without unnecessary increases in inventory levels.

Hyatt, Curtis B

### Practice- Supply Chain Management III

Contributed Session

Chair: Rajiv Saxena, APL Logistics, 11458 N. 128th Place, Scottsdale, AZ, 85259-3528, United States

#### 1 - Exploring the Role of Supplier and Product Characteristics in Vendor-managed Inventory

Roelof Post, University of Groningen, Akkerstraat 77, Groningen, 9717KG, Netherlands, Paul Buijs, Jaap Wieringa, Hans Wortmann

Research shows that transferring stocking decisions and ownership of inventories to suppliers can improve the performance of supply chains, but for which suppliers does this hold? Using both transaction data and empirical observations, we show how supplier and product characteristics affect the gains of a vendor managed inventory (VMI) implementation.

#### 2 - Random Capacity Disruptions in a Make-to-Stock Company with Stochastic Demand and Capacity

Antonio Arreola-Risa, Associate Professor, Texas A&M University, Mays Business School, INFO Department, 4217 TAMU, College Station, TX, 77843-4217, United States, Philip J. Mizzi, Barry Keys

A single-product, make-to-stock firm is considered. Demand and capacity are stochastic, with capacity experiencing random disruptions. Inventory is managed using a base-stock policy and demand stock-outs are back-ordered. The base-stock minimizing the economic cost of inventory holding and demand back-ordering is determined, as is the disruptions' impact on the optimal base-stock and cost.

#### 3 - Supply Chain Optimization in Action – Experiences of a Practitioner

Rajiv Saxena, Vice President, Supply Chain Solutions, APL Logistics, 11458 N. 128th Place, Scottsdale, AZ, 85259-3528, United States

An efficient and effective supply chain could be a competitive differentiator for a company. There is a major potential to cut logistics costs in the supply chain of a company through application of data analytics and optimization techniques. This presentation will include real-life data analytics and optimization case studies covering areas of network design, transportation optimization and facilities design and showcase how a 3PL provider can help a company significantly improve the efficiency and effectiveness of its supply chain.

## ■ TD81

Hyatt, Phoenix East

### Optimization IV

Contributed Session

Chair: Mehmet Unal, CoreLogic, 40 Pacifica, Suite 900, San Francisco, CA, 92618, United States

#### 1 - Cooperation Online and Brick and Mortar Retailers Returns and Induced Customer Traffic Implication

Maryam Mahdikhani, PhD Candidate, Rutgers University, 1 Washington Park, Room 442, Newark & New Brunswick, NJ, 07102, United States, Tolga Aydinliyim, Monire Jalili

Motivated by partnerships between online and Brick&Mortar (B&M) retailers where the online retailer operates a micro store within the B&M store (e.g., Amazon within Kohl's), we study consumers' returns channel choice and induced B&M store customer traffic implications as well as when such partnerships are profitable for the involved parties.

#### 2 - Scheduling Energy Consumption for Residential Stand-alone PV Systems

Dongjin Cho, Auburn University, 1324 Tulip Court, Auburn, AL, 36830, United States

Among various renewable energy sources, solar energy is considered an effective solution to the shortage of energy in the future. A stand-alone photovoltaic (PV) system is particularly significant in an isolated area where access to the grid is limited. Because solar energy generation primarily depends on the availability of solar irradiance, energy management becomes crucial while satisfying user comfort and system efficiency. In this paper, we propose an energy consumption scheduling model for a residential house with a stand-alone PV system and a battery. We develop a mixed-integer optimization model that uses consumption patterns and appliance priority to schedule the use of the appliances.

#### 3 - Optimizing Total Earliness and Tardiness Costs with Maximum Allowable Tardiness Limit Through Unrelated Parallel Machine Scheduling in Job Shops

Parsa Kianpour, Graduate Research Assistant, Wichita State University, Wichita, KS, 67206, United States, Deepak Gupta, Krishna krishnan, Bhaskaran Gopalakrishnan

Motivated by the practical scheduling problem of job shops, this study evaluates unrelated parallel machine scheduling models and proposes a new model considering effects of maximum allowable tardiness. It compares the total cost provided by the proposed model with the case in which there is no limitation on tardiness. In addition, the existing model in the literature is simplified to reduce computational time and enable corporate scheduling staff to use the model efficiently. The model is validated using data collected from a local job shop that manufactures aerospace parts.

#### 4 - Optimization of Solid Waste Management in a Metropolitan City: A Case Study in Chennai, a Major Metropolitan City in India

Sumit Saxena, IIT Madras, Chennai, India, Chandrasekharan Rajendran

The aim of this research is to optimize the total cost (collection and transportation cost) of solid waste management for Corporation of Chennai (CoC), the civic body that governs the city of Chennai, the capital of the Indian state of Tamil Nadu. CoC handles about 7 million people's waste disposal, and the waste accounts for 4,841 tonnes per day. We present a mathematical model, followed by a heuristic approach for the deterministic waste-generation scenario, and a simulation-optimization model for the stochastic waste-generation scenario. The models serve to address the issue of allocation and routing of trucks for waste pickup, and delivery to transfer stations, and thereafter to dumping yards.

## ■ TD82

Hyatt, Phoenix West

**Health Care IV**

Contributed Session

Chair: Xu Zhang, University of Maryland, 4176 Campus Drive, William E. Kirwan Hall, College Park, MD, 20742, United States

### 1 - Multi-appointment Outpatient Scheduling for Cardiology Programs

Lida Aperi, University of Maryland, 8223 Paint Branch Drive, 2243 AV Williams, ISR, College Park, MD, 20742, United States, John Baras, Bruce L. Golden, Kenneth Wood

This research tackles the problem of multi-appointment scheduling of outpatients going through elective programs in cardiology. The patients have to visit the hospital multiple times in order to complete the required tests and treatments before the final procedure. A model is developed towards optimizing the allocation of the available resources to the patients. The objective is to minimize the number of visits that the patients have to make to the hospital. A stochastic integer programming formulation is developed to optimize the scheduling decisions over time.

### 2 - Resilience as a Measure of Preparedness for Pandemic Influenza Outbreaks

Walter Alejandro Silva-Sotillo, University of South Florida, 4202 E. Fowler Ave, Tampa, FL, 33620, United States

Since spring 2013, periodic emergence of avian influenza A(H7N9) virus in China has heightened concerns for a possible pandemic outbreak, though it is believed that the virus is not yet human-to-human transmittable. From a public health preparedness standpoint, it is essential to assess the possible impact of an Influenza pandemic and to measure resilience: the ability to recover after such potential pandemic. The aim of this research is to measure the level of resilience that a given population could face in case of a potential Influenza Outbreak happens.

### 3 - Partition-based Simulation Optimization Algorithms for Primary Care Panel Management

David Desmond Linz, Graduate Student Researcher, University of Washington, Seattle, WA, 98105, United States, Zeld B. Zabinsky, Paul Fishman

When designing primary care panel composition, decision-makers need to balance a number of concerns including patient load, travel times for patients, and accommodating the demand for virtual care. To model primary care systems, a discrete event simulation is developed. To best determine paneling policy, we explore the application of several new partition based algorithms that are designed to explore a high-dimensional problem domain to locate good policy solutions. We compare solutions generated by the optimizers in terms of policy impacts and comment on the relative effectiveness of the optimizers in higher dimensions.

### 4 - A Reliability-based Approach for Performance Optimization of Service Industries: An Application to Healthcare Systems

Hossein Badri, Wayne State University, 4815 4th Street, Manufacturing Building, Detroit, MI, 48202, United States, Taha-Hossein Hejazi, Kai Yang

This study aims to apply the Multi-Response Optimization (MRO) method for reliability-based performance optimization of healthcare systems. In this study, we consider all types of response variables so that strength features of the system are optimized against external stresses. The proposed approach in this research is based on the stress-strength model, and stresses are assumed to be normally distributed. Also, we present the implementation results of the proposed approach to a hospital in Iran for reliability-based optimization of the bed capacity planning. The results indicate that the proposed approach is very powerful in tackling the inherent complexity of healthcare systems.

### 5 - Evaluating Appointment Postponement in Scheduling Patients at a Diagnostic Clinic

Mahsa Kiani, Clemson University, Clemson, SC, 29631, United States, Burak Eksioglu, Tugce Isik

In today's healthcare system, the increase in requests for doctors combined with a shortage of physicians has led to challenges for clinics to give timely appointments to patients. In this study, we propose a postponable acceptance model for scheduling different priorities patients to decrease indirect waiting time of higher priority patients (the time between the day the patient requests an appointment and the appointment day). Higher priority patients receive appointment upon arrival. However, the decision regarding accepting and assigning an appointment to lower priority patients is postponed. By postponing these requests and waiting for more urgent patients the profit is increased.

### 6 - A Continuous-time Markov Model for Estimating Readmission Risk for Hospital Inpatients

Xu Zhang, University of Maryland, College Park, MD, United States, Sean Barnes, Bruce Golden, Paul Smith

Research concerning hospital readmissions has mostly focused on regression models that include various factors that influence the likelihood of this unfortunate outcome. These models are useful in certain settings, but their performance in many cases is lacking, and the dynamics of how readmission risk changes over time is often ignored. Our goal is to develop a model for readmission risk over time—using a continuous-time Markov chain—beginning at the point of discharge. We derive point and interval estimators for readmission risk. Finally, we validate our derived estimators using simulation, and apply our methods to estimate readmission risk over time using discharge and readmission data.

### 1 - Analyzing Alternative Doctor to Room Ratio in an Outpatient Clinic as a Means of Improving Overall Patient Access

Qing Wen, University of Pittsburgh Department of Engineering, Pittsburgh, PA, United States, Louis Luangkesorn, Anna Svirsko, Jay Rajgopal

Children's Hospital of Pittsburgh hosts a number of specialty outpatient pediatrics clinics. Currently, the space available is believed to be a constraint in the overall capacity for outpatient appointments. One way to increase capacity is to reduce the ratio of rooms to doctors. However, that creates a risk that the doctor's time will not be as productive due to waiting for patients and rooms to be prepped and cleaned. We develop a simulation to compare the effect of different room to doctor assignment patterns in doctor productivity and throughput. We also use this as part of a larger simulation that models the effect of increased capacity on the patient backlog for the clinic.

### 2 - A Discrete-event Simulation Model to Optimize Emergency Department Wait Times and Inpatient Unit Flow at an Academic Medical Center

Gokhan Kirlik, University of Maryland Medical System, 920 Elkridge Landing Rd, Linthicum Heights, MD, 21090, United States, Bill Bame, Kenneth Wood, Warren D'Souza

A discrete-event simulation model is developed to improve the flow of patients from the emergency department (ED) through the inpatient setting at a tertiary/quaternary academic medical center. After comprehensive analysis of electronic medical records (EMR), the main inputs of the model, which include ED arrivals, patient flow in ED, direct admissions, hospital inpatient unit flows, length of stay, discharges and bed/room cleaning are obtained. Validation and verification of the simulation model against EMR confirmed that the model mimics the real-world observations accurately. This model will serve as a reliable test bed for hospital operations improvement initiatives.

### 3 - Accelerating Kidney Allocation: Simultaneous and Expiring Offers

Michal Mankowski, King Abdullah University of Science and Technology, Thuwal, Saudi Arabia, Sommer Gentry

After the new Kidney Allocation System (KAS) began, the kidney discard rate increases, especially for marginal quality kidneys. Placing non-ideal organs quickly might increase utilization by decreasing discards. We simulated making simultaneously expiring offers to multiple centers, where every center must accept or decline within the same 1 hour. Simultaneously expiring offers would burden centers to evaluate offers that might otherwise never have come to their center. We also estimated additional workload caused by one new allocation scheme.

### 4 - Prioritization Between Boarding Patients and Patients Currently Waiting or Under Treatment in the Emergency Department

Kim De Boeck, KU Leuven, Leuven, Belgium, Ra sa Carmen, Nico Vandaele

The extra workload introduced by boarding patients is a major concern in emergency departments. Not in the least because this confronts the physicians with a challenging task; making a prioritization decision between boarding patients and patients currently under treatment in the emergency department. The main contribution of this paper is the examination of different control policies for the physicians when needy boarding patients are added to the analysis. Using discrete-event simulation, three static priority policies and one dynamic priority policy are evaluated on various performance measures.

### 5 - A Discrete-event Simulation Approach for Modeling Human Body Glucose Metabolism

Buket Aydas, University of Wisconsin-Milwaukee, 3200 N. Crammer St., Milwaukee, WI, 53211, United States, Mukul Goyal

This study describes CarbMetSim, a discrete-event simulator that tracks the blood glucose level of a person in response to a timed sequence of diet and exercise activities. CarbMetSim implements broader aspects of carbohydrate metabolism in human beings with the objective of capturing the average impact of various diet/exercise activities on the blood glucose level. Key organs are implemented to the extent necessary to capture their impact on the production and consumption of glucose. Key metabolic pathways are accounted for by using the published values of the average flux along these pathways in the operation of different organs. CarbMetSim has the ability to model different levels of diabetes.

### 6 - Verify an Anesthesia Approach for the Target Blood Volume Control

Ting Wu, Nanjing University, Department of Mathematics, No 22 Hankou Road, Nanjing, 210093, China, Cheng Zhu

Anesthesia is an inevitable and critical procedure during an operation, resulting in the amount of blood loss directly. This study verifies a typical anesthesia approach for liver surgeries, which can reach the target blood volume control, through simulation models. We provide clinical guidelines for training anesthetists and evaluating their performance.

Chair: Ping Deng, University of Science and Technology of China, No.96, Hefei, 230026, China

#### 1 - Rights of First Negotiation and Rights of First Refusal in New Product Development Partnerships

Guangyu Wan, Assistant Professor, Hunan University, #724, Admin Building, North Campus, Changsha, 410006, China, Bhattacharya Shantanu, Sameer Hasija, Niyazi Taneri

Strategic control rights such as the right of first negotiation (ROFN) and the right of first refusal (ROFR) are commonly used in the pharmaceutical industry for creating partnerships between biotech and pharmaceutical firms. We build a stylized principal-agent model to study the contract design problem with the ROFN and ROFR. We investigate the efficacy of different control rights being offered from the innovator's (biotech firm) perspective. We also investigate the role of strategic control rights in resolving the adverse selection problem for the innovator. Our results address an important issue, viz., which control right to offer under which circumstances.

#### 2 - Economies Before Scale: Learning, Survival, and Productivity of Young Plants in the Age of Cloud Computing

Wang Jin, Research Associate, MIT, Cambridge, MA, United States, Kristina Steffenson McElheran

Young firms are central to productivity and growth, yet they fail at high rates. Recent advances in how firms access information technology (IT) - in particular, cloud computing - have dramatically lowered the costs of learning about productivity-enhancing IT. Using Census Bureau data from 2006 to 2014, we find that young-plant failure rates fell 5% due to new IT services, while traditional IT proved risky. Conditional on survival, young plants enjoy much higher cloud-related productivity gains compared to older ones. We provide the first large-scale evidence concerning both the magnitude of and mechanisms behind cloud-driven productivity growth in the U.S.

#### 3 - New Knowledge Availability, Intellectual Property Right Regimes and Technology-based Entrepreneurship in China

Ping Deng, PhD Candidate, University of Science and Technology of China, Hefei, China, Jin Hong

This study empirically investigates the contextual influence of intellectual property protection (IPR) on the use of new available knowledge by entrepreneurs in China's high-tech industry. Using a unique database of China's high-tech new formations from 2000 to 2008, we show that higher level investment in new knowledge is critical in encouraging creating high-tech ventures. However, stronger enforcement of IPRs negatively affects new knowledge availability. Industry heterogeneity analyses show that the need of IPR protection varies by industries. These findings contribute to understanding the influence of IPR protection on the technology-based entrepreneurial behavior in China.

#### 1 - FCC Edelman Reprise

Karla L. Hoffman, George Mason University, Fairfax, VA, 22030, United States, khoffman@gmu.edu

The Federal Communications Commission (FCC) recently completed the world's first two-sided spectrum auction, reclaiming spectrum from TV broadcasters to meet exploding demand for wireless services. Operations research tools- including optimization, simulation, and SAT-solvers - were essential to both the design and implementation of the auction. The auction was one of the most successful in the FCC's history, repurposing 84 MHz of spectrum and generating revenue of nearly \$20 billion, including more than \$10 billion in new capital for the broadcast TV industry and over \$7 billion to pay down the U.S. deficit.

North Bldg 121A

### **Distributionally Robust Optimization**

Sponsored: Optimization/Optimization Under Uncertainty

Sponsored Session

Chair: Grani Adiwena Hanasusanto, The University of Texas at Austin, Austin, TX, 78712, United States

#### **1 - A Data-driven Distributionally Robust Optimization Approach for Appointment Scheduling with Random Service Durations and No-shows**

Guanglin Xu, University of Minnesota, Minneapolis, MN, 55108, United States, Ruiwei Jiang

We study a single-server appointment-scheduling problem where the number of appointees and the sequence of their arrivals are fixed. The service durations and appointees' show-ups are stochastic, but the true probability distribution is unknown. With a collection of historical data, we propose a data-driven distributionally robust optimization model, which minimizes the worst-case total expected cost, by optimizing the scheduled arrival times of the appointees. We reformulate the resulting problem into a copositive program and discuss tractabilities under mild conditions. We then develop a tight semidefinite-programming-based approximation and validate it on benchmark instances.

#### **2 - Distributionally Robust Optimization with Infinitely Constrained Ambiguity Sets**

Melvyn Sim, National University of Singapore, 15 Kent Ridge Building, Biz1 8-76, Singapore, 119245, Singapore, Huan Xu, Zhi Chen

We propose a new class of infinitely constrained ambiguity sets for which the number of expectation constraints could be infinite. The description of such ambiguity sets can incorporate the stochastic dominance, the dispersion, the fourth moment, and our newly proposed "entropic dominance information about the uncertainty."

#### **3 - A Copositive Approach for Multi-stage Robust Optimization Problems**

Grani A. Hanasusanto, The University of Texas at Austin, Austin, TX, 78712, United States, Guanglin Xu

In this talk, we study generic multi-stage linear robust optimization problems. We employ affine decision rules for problems with both uncertain objective coefficients and recourse matrices, and utilize quadratic decision rules for problems with only uncertain right-hand sides. The emerging optimization problems are NP-hard but amenable to copositive programming reformulations that give rise to tight conservative approximations. We provide both theoretical and numerical results to demonstrate the effectiveness of the copositive programming approach.

#### **4 - On the Heavy-tail Behavior of the Distributionally Robust Newsvendor Model**

Karthik Natarajan, Singapore University of Technology and Design, Singapore University of Technology and Design, 20 Dover Drive, Singapore, 138682, Singapore, Bikramjit Das, Anulekha Dhara

Since the seminal work of Scarf (1958) on the newsvendor problem with ambiguity in the demand distribution, there has been a growing interest in the study of the distributionally robust newsvendor problem. A simple observation indicates that the optimal order quantity in Scarf's model for any possible value of the critical ratio is also optimal for a censored student-t distribution with degrees of freedom parameter 2 that has infinite variance. In this paper, we generalize this heavy-tail optimality property to the case when information on the first and the  $n$ th moment is known for any real number  $n > 1$ .

## ■ TE02

North Bldg 121B

### **Two-Stage Stochastic Mixed-Integer Programming**

Sponsored: Optimization/Optimization Under Uncertainty

Sponsored Session

Chair: Yingqiu Zhang, Virginia Tech, Blacksburg, VA, 24060, United States

#### **1 - Markov Decision Processes Under Parameter Uncertainty with a Chance-constrained Programming Approach**

Merve Merakli, University of Washington, Simge Kucukyavuz

In classical Markov Decision Processes (MDPs), action costs and transition probabilities are assumed to be known, although an accurate estimation of these

parameters is often not possible in practice. This study addresses MDPs under cost and transition probability uncertainty with the aim of obtaining policies which optimize the Value-at-Risk associated with the expected performance of an MDP model in terms of parameter uncertainty. Considering a sampling approach, we provide a mixed-integer programming formulation and a branch-and-cut algorithm. Our proposed methods are demonstrated on an inventory management problem for humanitarian relief operations during a slow onset disaster.

#### **2 - Two-stage Distributionally Robust P-order Conic Mixed Integer Programs**

Yingqiu Zhang, Virginia Tech, 305 Loudon Rd #631, Blacksburg, VA, 24060, United States

We present two-stage distributionally robust p-order conic integer programs (TSDR-CMIPs) in which the second-stage problems have p-order conic constraints along with integer variables. We provide sufficient conditions under which the integrality constraints on the second-stage integer variables can be relaxed, without affecting the integrality of the optimal solution, by adding parametric (non)-linear inequalities. We introduce structured CMIPs in the second stage of TSDR-CMIPs, derive inequalities which satisfy the foregoing conditions, and present results of our extensive computational experiments for  $p=2$ .

#### **3 - SIPLIB 2.0: Stochastic Integer Programming Library 2.0**

Yongkyu Cho, Pohang University of Science and Technology, Pohang, Korea, Republic of, Kibaek Kim, James Luedtke, Jeff T. Linderoth

SIPLIB was constructed in 2002 by Shabbir Ahmed and his colleagues. The library has been providing a collection of test instances to facilitate computational and algorithmic research in SIP. State-of-the-art in SIP combined with the speedup in computing machinery, however, has made many SIPLIB instances trivial. By SIPLIB 2.0, we provide 1) richer collection of test instances with benchmarking computational results, 2) not only SMPs files but also utilities for generating/analyzing instances. SIPLIB 2.0 is implemented in Julia programming language with modeling package StructJuMP (block-structured optimization framework for JuMP).

#### **4 - Generalized Alpha-approximations for Mixed-integer Recourse Models**

Ward Romeijnnders, University of Groningen, Groningen, Netherlands, Niels van der Laan

We consider generalized alpha-approximations for two-stage mixed-integer recourse models. They are a generalization of a class of convex approximations developed for simple integer recourse models and totally unimodular integer recourse models. We derive an error bound for these generalized alpha-approximations that converges to zero if the total variations of the probability density functions of the random variables in the model converge to zero.

### **Innovative Business Models and Bottom of the Pyramid**

Sponsored: Manufacturing & Service Oper Mgmt

Sponsored Session

Chair: Serguei Netessine, The Wharton School, Philadelphia, PA, 19104, United States

Co-Chair: Bhavani Shanker Uppari, INSEAD, Singapore, 138676, Singapore

#### **1 - Disruptions, Resilience and Performance of Emerging Market Entrepreneurs: Evidence from Uganda**

Amrita Kundu, PhD Candidate, London Business School, London, United Kingdom, Stephen J. Anderson, Kamalini Ramdas

We examine the effect of firm-specific business disruptions (both managerial and operational) on the performance of small firms in emerging markets and the effectiveness of appropriate resilience strategies in buffering against these disruptions. Using a hand-built panel dataset on 646 small firms over four time periods in Kampala, Uganda, we find that disruptions are highly prevalent and have a statistically and economically significant effect on the performance of these firms. Importantly, we find that both relational and resource resilience significantly help buffer against the negative impact of managerial and operational disruptions, respectively.

## 2 - Impact of Inconvenience and Liquidity Constraints on the Usage of Off-grid Solutions: Evidence from Rwanda

Bhavani Shanker Uppari, INSEAD, 1 Ayer Rajah Avenue, Singapore, 138676, Singapore, Serguei Netessine, Ioana Popescu, Rowan Clarke, Manuel Barron, Martine Visser

One-fifth of the world's population does not have access to electricity. Solar-based solutions are unaffordable in these markets due to consumers' poverty. There are alternative business models relying on rechargeable light bulbs (sold at a subsidized price) which require regular payments for recharges. We investigate the viability of these recharge-based models under poverty. In collaboration with a firm in Rwanda, we collected the bulb usage data from randomized experiments wherein the price and the bulb capacity were varied. We also build a structural model that incorporates the light consumption dynamics, and use it to evaluate theoretically-preferred changes to the existing model.

## 3 - Monitoring in Public Sector Supply Chains and the Role of Technology

Maya Ganesh, Indian School of Business, Hyderabad, India, Sarang Deo, Sripad K. Devalkar

We examine the impact of installation of point-of-sale (POS) devices at fair-price-shops (FPS) on leakages. Using a quasi-experimental difference-in-difference approach along with the technique of propensity score matching, we estimate an average monthly reduction of 44 kgs in leakage of rice per FPS. Our results suggest that investing in technology-based monitoring mechanisms can improve performance of public sector supply chains and create economic value even without changing the contracting between channel players. We further conduct a simulation study to estimate the potential value of information of using the real time information provided by POS devices for better decision making.

## 4 - Rent-to-Own Business Models in Developing Economies: An Empirical Analysis

Jose A. Guajardo, University of California-Berkeley, Haas School of Business, 545 Student Services Bldg, Berkeley, CA, 94720-1900, United States

Rent-to-Own business models have become popular for the diffusion of energy products in developing economies, as they provide the flexibility to make incremental payments that eventually lead to product ownership by low-income consumers. I empirically analyze consumer behavior in rent-to-own environments in the context of distribution of solar lamps in Sub-Saharan Africa, characterizing different factors that influence operational performance.

## TE04

North Bldg 122A

## Advances in Theory and Practice of Location Science

Sponsored: Optimization/Integer and Discrete Optimization

Sponsored Session

Chair: Manish Bansal, Virginia Tech., Blacksburg, VA, 24060, United States

## 1 - Locating Drone Platforms for Delivering Medical Supplies with Time Costs

Pitu B. Mirchandani, Arizona State University, School of Computing, Informatics and Decision System, Tempe, AZ, 85287, United States, Monica Gentili, Alessandro Agnetis

In this paper, we consider a drone delivery problem that could potentially create a significant improvement in terms of cost and time required for providing essential medical supplies. In particular, we consider first the case when we study the problem of sending perishable items in a single day to demand points where cost of delivery depends not only on the time of delivery but also on a soft delivery due date. Other cases are studied where delivery may take place over several days and when platforms can be moved from day to day.

## 2 - Planar Maximum Coverage Location Problem with Partial Coverage and General Spatial Representation of Demand and Service Zones

Manish Bansal, Virginia Tech., 227 Durham Hall, 1145 Perry Street, Blacksburg, VA, 24060, United States

We present a new generalization of the planar maximum coverage location problem in which demand and service zones are represented by spatial objects such as circles, polygons, etc., and are allowed to be located anywhere in a continuous plane. We allow partial coverage in its true sense, i.e., covering only part of a demand zone is allowed and the coverage accrued in the objective function as a result of this is proportional to the demand of the covered area only. We present a greedy algorithm and a pseudo-greedy algorithm for it, and showcase that the solution value corresponding to the greedy solution is within a factor of  $1 - 1/e$  of the optimal solution value where  $e$  is the base of natural logarithm.

## 3 - Design and Operation of Renewable Hybrid Energy Systems

Alexandra M. Newman, Colorado School of Mines, 1500 Illinois St, Golden, CO, 80401, United States, Alex Zolan, Michael S. Scioletti, Mark Husted, Gavin Goodall

Renewable energy technologies, specifically, solar photovoltaic cells, combined with battery storage and diesel generators, form a hybrid system capable of independently powering remote locations, i.e., those isolated from larger grids. If sized correctly, hybrid systems reduce fuel consumption compared to diesel generator-only alternatives. We present an optimization model for establishing a hybrid power design and dispatch strategy, solution techniques for this mixed-integer, nonlinear model, and insights and extensions.

## Joint Session OPT/Practice Curated: Recent Developments and Applications using Julia for Optimization

Sponsored: Optimization/Computational Optimization and Software  
Sponsored Session

Chair: Joey Huchette, MIT, Cambridge, MA, 02139, United States

## 1 - Infrastructure Optimization in Julia

Carleton Coffrin, Los Alamos National Laboratory, Los Alamos National Laboratory, Los Alamos, NM, United States

The significant penetration of distributed renewable energy resources and increasingly dynamic fuel prices present significant challenges for the design and operation of critical infrastructure systems. To help explore how optimization algorithms can address these emerging challenges this work presents a collection of Julia packages for infrastructure optimization. These packages provide a variety of tools for, reproducing state-of-the-art results, developing new problem formulations, and benchmarking novel algorithms using standardized data formats and test cases.

## 2 - Mixed-integer Programming in Julia: From Formulations to Modeling to Algorithms

Joey Huchette, MIT, 77 Massachusetts Avenue, Cambridge, MA, 02139, United States

In this talk we show how a variety of tools in the Julia programming language can be used throughout the optimization pipeline. First, we present how computational tools can be used to build MIP formulations: by guiding intuition, but also in a completely automated fashion. Next, we present modeling tools for piecewise linear functions that showcase how a high-level interface can help make advanced techniques more accessible to researchers and practitioners. Finally, we show how to use Julia to customize modern MIP solvers to implement advanced and experimental MIP algorithms.

## 3 - POD.jl: A Global, Mixed-integer Nonlinear Programming Solver in Julia

Kaarthik Sundar, Bryan, TX, 77801, United States

Non-convex, mixed-integer nonlinear programs (MINLPs) are hard optimization problems to solve to global optimality. State-of-the-art global solvers, such as BARON, Couenne, and SCIP, often handle MINLPs using the spatial branch-and-bound approach in combination with various other tools. However, there has recently been a great deal of interest in MILP-based approaches for solving MINLPs that are based on piecewise convex relaxations. In this work, we present a MILP-based global solver for MINLPs, named POD, where the name represents the three key solution techniques to solve MINLPs: Piecewise convex relaxations (P), Outer-approximation (O), and Dynamic partitioning (D).

## 4 - Modeling and Solving Mixed-integer Nonlinear Optimization Problems in Julia

Christopher D. Coey, Massachusetts Institute of Technology, Cambridge, MA, 02139, United States, Juan Pablo Vielma

We use real-world decision problems to illustrate the convenient modeling power of JuMP ([github.com/JuliaOpt/JuMP.jl](https://github.com/JuliaOpt/JuMP.jl)) for mixed-integer nonlinear optimization. We demonstrate how to access a variety of solvers, including our next-generation mixed-integer conic solver Pajarito ([github.com/JuliaOpt/Pajarito.jl](https://github.com/JuliaOpt/Pajarito.jl)). Pajarito is written in Julia and uses a primal-dual continuous conic solver (such as Mosek) and a mixed-integer linear solver (such as CPLEX) to perform conic-certificate-based outer approximation.

## 5 - Mixed-integer Convex Representability

Juan Pablo Vielma, Massachusetts Institute of Technology, 77 Massachusetts Avenue, E62-561, Cambridge, MA, 02139, United States, Miles Lubin, Ilias Zadic

We consider the question of which nonconvex sets can be represented exactly as the feasible sets of mixed-integer convex optimization problems (MICP). We first show a complete characterization for the case when the number of possible integer assignments is finite. We then further study the characterization for the more general case of unbounded integer variables and introduce a simple necessary condition for representability. We illustrate these characterizations through various examples of sets that can or cannot be modeled as MICP.

## ■ TE06

North Bldg 122C

**Joint Session OPT/Practice Curated: Network Optimization in Applications**

Sponsored Session

Chair: Golshan Madraki, PhD, Clarkson University, Potsdam, NY, 13699, United States

**1 - Most Closeness Central Clique Problem**Farzaneh Nasirian, University of Massachusetts-Boston,  
100 William T. Morrissey Blvd, Boston, MA, 02125, United States,  
Foad Mahdavi Pajouh

This talk addresses the most closeness-central clique problem in which we are interested in detecting a most accessible clique in a graph. We use two metrics of maximum and total distance to a clique for measuring its accessibility resulting in two variants of the most closeness-central clique problem. For each of these two problems, we address the computational complexity, develop a new mixed 0-1 integer programming formulation, and propose the first combinatorial branch-and-bound algorithm. The computational performance of these exact algorithms is studied on a test-bed of real-life instances.

**2 - Information Based Drone Assisted Parcel Delivery in Urban Environments**Cesar N. Yahia, The University of Texas at Austin, Austin, TX,  
78705, United States, Can Gokalp, Prashanth Venkatraman,  
Stephen D. Boyles

We investigate the problem of using unmanned aerial vehicles alongside a truck for last-mile parcel delivery in an urban environment. The objective is to determine the route that the truck should traverse as well as the locations where the drone should be deployed to minimize total truck travel time. We propose real-time algorithms that exploit the travel time estimation capabilities of the drone.

**3 - On the Structure of Potential Driven Networks**Gerrit Slevogt, Universit t Duisburg-Essen, Ruediger Schultz,  
Sabrina Nitsche

Potential driven networks such as water, gas and power are core utilities of today's world. They are governed by specific (non-linear) constraints such as derivatives of the Euler equations in gas and water and Kirchhoff's circuit laws in power networks. Especially in power networks the rise of renewable energies is driving the expansion and meshing of networks. Thus, the problem of finding operational bounds on the supported input-output nominations is getting more complex. Finding optimal controls or flows on a case by case basis is operationally feasible but unsatisfying. An analysis of the structure of such networks and arising properties can lead to a more comprehensive view of such networks.

**4 - Accelerating the Scheduling Improvement Heuristics by Finding the Longest Path in the Perturbed Graph**

Golshan Madraki, Clarkson University, Potsdam, NY, USA

Scheduling improvement heuristics iterate over trial schedules to determine a satisfactory schedule. During each iteration, a performance measure (e.g., makespan) is calculated. This research presents an efficient algorithm, Structural Perturbation Algorithm (SPA), that accelerates the calculation of makespan. This means all scheduling improvement heuristics using SPA to calculate makespan for each trial schedule will run faster. We model the manufacturing by a Directed Acyclic Graph (DAG). Schedule trials are represented by perturbed DAGs where multiple edges are added and deleted. SPA can handle multiple edge deletions/additions through a single pass which improves the time complexity in comparison with current approaches.

**1 - Midas Proactive Traffic Control; Autonomous Intersection & Diamond Interchange**Viswanath Potluri, Research Associate, Arizona State University,  
Tempe, AZ, 85281, United States

MIDAS proactive traffic control uses forward recursion Dynamic Programming (DP) approach with efficient data structures, over a finite-time horizon that rolls forward and, then uses a backward recursion to retrieve the optimal decision sequence. MIDAS architecture uses vehicle GPS data, queue estimation models

along with DP framework to optimally manage traffic along diamond interchange corridor. MIDAS proactive control is extended to autonomous vehicular traffic, which optimally schedules vehicle movements and manages platoons (by controlling leader and followers).

**3 - Comprehensive and Quantitative Analysis of the Coordination Between Urban Railway and City**Yong Yin, Southwest Jiaotong University, Chengdu, China  
National United Engineering Laboratory of Integrated and  
Intelligent Transportation, Chengdu, China, Jie Liu, Qiyuan Peng,  
Xu Yan, Anjun Li

Evaluating the coordination between urban railway and the city correctly and comprehensively is of great significance for urban railway construction and city development. Based on the fractal theory, the coordination index of urban railway network and urban road network and the coordination index of urban railway station and urban traffic demand were constructed from aspects of multi radius and multi direction. Then, the comprehensive coordination index of urban railway and city was established based on fractal dimension consistency and vector similarity. The research has a certain significance in guiding urban railway planning and improving the coordination between urban railway and city.

**4 - Evolvement of Public Charging Infrastructure in a Competitive and Stochastic Market**Zhaoimiao Guo, University of Central Florida, 6566 Tealwood  
Drive, Orlando, FL, United States, Julio Deride, Yueyue Fan,  
Yueyue Fan

This paper presents a network-based multi-agent optimization model for strategic planning of charging facilities in a competitive and stochastic market. We provide a solution method based on alternating direction method of multipliers (ADMM).

**5 - Transit Network Design with Congested Common Lines**David Z.W. Wang, Associate Professor, Nanyang Technological  
University, 50 Nanyang Avenue, Singapore, 639798, Singapore

This study focuses on a continuous transit network design problem with explicit consideration of congested common-lines. A tri-level programming model is presented to formulate the problem. Basically, the upper-level program optimizes the transit service frequencies to achieve the objective of both operators and transit users; the middle-level problem describes the passengers' routing choices, which is indeed an equilibrium transit assignment problem; the lower-level program formulates the congested common-line problem. The tri-level model is reduced into an equivalent single level program to be solved. The global optimal solution of the problem is to be obtained.

**6 - Inspection Based Predictive Maintenance for Railways**Ayca Altay, Rutgers University, 640 Bartholomew Rd, Piscataway,  
NJ, 08854, United States, Pedro Cesar Lopes Gerum, Melike  
Baykal-Gursoy

Maintenance activities are essential to preserve safety and cost-effectiveness in railways. The related literature evaluates preventive and corrective maintenance conditions. However, the maintenance activities involve a structured policy of inspections, whose outcomes shape the replacement decisions. This study provides a holistic approach by integrating the prediction of rail and geometric defects, together with the scheduling of inspection-driven maintenance activities. Results indicate a high accuracy rate in prediction and an efficient scheduling structure.

## ■ TE08

**Stochastic First-order Methods**

Sponsored: Optimization/Nonlinear Programming

Sponsored Session

Chair: Farzad Yousefian, Oklahoma State Univeristy, Stillwater, OK,  
74074, United States**1 - Distributed Algorithms for Stochastic Nash Games**Jinlong Lei, Pennsylvania State University, 310 Leonhard Building,  
University Park, PA, 16803, United States, Uday Shanbhag

We consider the development of distributed variable sample-size gradient-response and best-response schemes for structured nonsmooth stochastic Nash games. In each instance, we show that when batch-sizes grow at suitable rates and with sufficient number of consensus rounds, the schemes display linear rates of convergence. Additionally, we quantify the iteration complexity of each scheme.

## 2 - A First Order Method for Stochastic Variational Inequalities on Semidefinite Matrix Spaces

Nahidsadat Majlesinasab, Oklahoma State University, Stillwater, OK, United States, Farzad Yousefian, Mohammad Javad Feizollahi

Motivated by multiuser noncooperative Nash games in stochastic regimes, we consider stochastic variational inequality problems (SVI). While the literature of variational inequality (VI) has focused on vector spaces, there is not enough guidance on solution methods for addressing SVIs on semidefinite matrix spaces. Motivated by this gap, we develop a stochastic mirror descent method. Our contribution is three-fold: (i) employing averaging techniques, we show the generated iterate converges to a weak solution of the SVI; (ii) we derive a convergence rate in terms of the expected value of a gap function; (iii) we implement the method for solving a MIMO throughput maximization problem.

## 3 - An Iterative Regularized Mirror Descent Method for Illposed Nondifferentiable Stochastic Optimization

Mostafa Amini, Oklahoma State University, Stillwater, OK, United States, Farzad Yousefian

A wide range of big data applications result in optimization problems that are often illposed. To address such problems, we consider a model, where the goal is to find an optimal solution that attains the minimum value of a regularizer. We assume the objective function of the main problem and the regularizer are nondifferentiable convex functions, and the main objective is stochastic. We develop an iterative regularized stochastic mirror descent method. We establish the convergence of the iterate generated by the algorithm to the desired optimal solution in both an almost sure and a mean sense, and derive a convergence rate of optimality with respect to the main objective.

## 4 - A First Order Method for High Dimensional Illposed Problems

Harshal Kaushik, Oklahoma State University, 322 Engineering North, Ind, Stillwater, OK, 74078, United States, Farzad Yousefian

We consider high dimensional ill-posed convex optimization problems. To address ill-posedness, we consider minimizing a regularizer over the optimal solution set of a convex optimization problem. We develop a randomized block coordinate iterative regularized gradient method where at each iteration, the stepsize and regularization parameter are updated. We show that the generated sequence converges to the solution of the bilevel problem, and we derive a convergence rate of the order  $d/k^{0.5}$  on the feasibility gap where  $k$  and  $d$  denote the iteration number and number of blocks, respectively. The performance of the algorithm for solving linear inverse problems in image deblurring is presented.

### Managing Technology Products across Generations

Sponsored: Manufacturing & Service Oper Mgmt

Sponsored Session

Chair: Charles X. Wang, State University of New York-Buffalo, Buffalo, NY, 14260, United States

Co-Chair: Aditya Vedantam, SUNY Buffalo, Williamsville, NY, 14221, United States

#### 1 - Remanufacturing Competition

Dongmei Xue, Zhejiang University, Hangzhou, China

The competition between firms is growing fierce, especially for the low-end firms. As the profit margin of low-end market decreasing, we provide remanufacturing as a new competition strategy for low-end firms to enter the high-end market. The goal of this paper is to find out how the optimal competition strategy is influenced by the cost structure and customers' valuation. If high-end firm's strategy is given, we show the optimal strategy space is divided into four pieces. Remanufacturing can be a profitable strategy when the cost is lower. Moreover, when high-end firm react to low-end firms' strategy, the optimal strategy space shrink.

#### 2 - Framework for Reducing Technical Debt

Vera Tilson, University of Rochester, 3-343 Carol Simon Hall, W. E. Simon Graduate School of Business, Rochester, NY, 14627, United States, David Tilson

We discuss a framework for reducing technical debt: retiring, outsourcing applications and starting to work on integrated data model to reduce coupling and moving toward "to-be" vision for the long-term architecture.

#### 3 - Supplier Contracting for Reuse at a Third Party Remanufacturer

Aditya Vedantam, State University of New York at Buffalo, 13 Via Pinto Drive, Buffalo, NY, 14221, United States, Ananth V. Iyer

Business users of electronic products often contract with third parties (3PRs) in the secondary market to dispose their equipment at end-of-use. 3PRs provide services such as data security, value recovery and environmental reports to generators. Motivated by an extensive dataset provided by a 3PR, we generate

insights on contracts and drivers of disposition activity for IT equipment in the secondary market. We show how supplier contracts and reuse rates depend on planned replacement activities. Business users can encourage reuse by early planned replacement and modifying contracts. We discuss the environmental impact of planned vs. unplanned equipment replacement.

## 4 - Manufacturer's Mental Accounting and Payment Schemes in Returns Policy

Jun Ru, College of Business Administration, Cal Poly-Pomona, Pomona, CA, United States

Returns policies have been used between the manufacturer and retailer in the distribution of short life-cycle products with uncertain demand. Previous research has shown that returns policies can mitigate the retailer's risk of excess inventory and improve channel performance. This research extends our understanding of returns policies by adopting the concept of mental accounting to describe the manufacturer's behavioral decisions under returns policies. We also investigate two alternative payment schemes (i.e., manufacturer financing and retailer financing) that help mitigate the manufacturer's mental accounting effect in returns policies and improve channel performance.

## 5 - Selling A Technology Product with the Trade-in Program and Used Product Market

Charles X. Wang, State University of New York-Buffalo, Jacobs Management Center, Room 326M, Buffalo, NY, 14260, United States, Imsu Park, Mingcheng Wei

We investigate the manufacturer's optimal strategy for selling a technology product with the trade-in program and used product market. We characterize the interaction between the equilibrium price of the used product market and the trade-in program offered by the manufacturer in the primary market.

North Bldg 125A

### Innovative Retail Operations

Sponsored: Manufacturing & Service Oper Mgmt

Sponsored Session

Chair: Hao-Wei Chen, University of Toledo, Toledo, OH, 43615, United States

#### 1 - Cost Auditing in Profit Sharing Contracts

Xiaomin Du, Tsinghua University, Beijing, China, Wanshan Zhu, Zhengping Wu

This study is motivated by profit sharing contracts observed in a supplier-retailer channel, where knowledge of the supplier's true production cost is the key to successful contract implementation. However, production cost is often the supplier's private information, unknown to the retailer. We investigate the role of cost auditing mechanisms in such a setting. While cost auditing enables the retailer to protect his interests, interestingly, we find that the supplier may also benefit from it. We also examine supply chain performance under such mechanisms.

#### 2 - Optimal Information Provision for Undifferentiated Products

Huaqing Wang, Emporia State University, 18923 SW 7th Street, Pembroke Pines, FL, 33029, United States, Haresh B. Gurnani, Raphael Boleslavsky

In this paper, we examine the joint interaction of information provision and pricing decisions by two competitive firms when a buyer is uncertain about product valuations. Firms generate product differentiation by allowing consumers to learn about valuations or prevent them from doing so. In this research, we characterize equilibrium prices and its interaction with information policies.

## 3 - Modeling Retail Store and Online Channel Allocation Decisions for Multiple Items

Roshanak Mohammadivojdan, University of Florida, 303 Weil Hall, P.O. Box 116595, Gainesville, FL, 32611, United States, Joseph Geunes

We consider a multi-product retailer who sells items via both a retail store and an online channel. Retail store shelf space limitations require judicious selection of items that will occupy this valuable space. Moreover, the high relative cost of this space, combined with the availability of a lower cost (in terms of storage-related costs) online channel, force a retailer to determine which items to offer in the store, online, or not at all. The goal of this work is to propose a stylized mathematical program to simultaneously model product assortment and channel allocation decisions, in order to gain insights on key decision drivers and characteristics of optimal decisions.

#### 4 - The Tradeoff Between Landed Price and Return Policy Generosity: Seller versus Buyer Perspectives

Guangzhi Shang, Florida State University, Department of Marketing, College of Business, Tallahassee, FL, 32306, United States, Alan Pritchard, Robert Windle, Philip Evers

Using detailed information on the transaction, product, and seller involved in fixed price (buy-it-now) listings of consumer electronics products from eBay, we estimate the trade-off between landed price and return policy generosity in the online setting. First, the value that online sellers place on a generous return policy is estimated through an evaluation of the prices they charge. Then, buyers' reactions to return policy and price combinations are identified from the time to sale for each listing.

### Emerging Topics on Retail Operations

Sponsored: Manufacturing & Service Oper Mgmt

Sponsored Session

Chair: Mehmet Sekip Altug, George Washington University, Washington, DC, 20052, United States

#### 1 - Cause Marketing: Product Pricing, Design, and Distribution

Fei Gao, Indiana University Bloomington, 1309 E. 10th Street, Suite 4100, Bloomington, IN, 47405, United States

Cause marketing (CM) is the practice of donating proceeds from product sales to designated charitable causes. We study the product pricing and design decisions in a CM campaign. We also look at the impact of a decentralized supply chain on the effectiveness of a CM campaign.

#### 2 - Pricing and Assortment Strategies with Product Exchanges

Laura Wagner, NIF 501082522, Lisbon, 1200/830, Portugal  
Laura Wagner, Católica Lisbon School of Business & Economics,  
Católica Lisbon School of Business & Economics, 501082522,  
Lisbon, 1200-830, Portugal, Victor Mart nez de Alb niz

Return policies enable consumers to return /exchange products they are unsatisfied with. We develop a search framework where consumers sequentially learn about products' true value and decide whether to keep, exchange or return them. We show that when pricing is not a decision, the assortment problem does not have a simple structure, but we provide a pseudo-polynomial algorithm to solve it. When pricing is endogenous, the optimization becomes tractable and it is not necessarily optimal to set all products at equal margins. Finally, we find that retailers prefer to pass all return costs on to the consumers, and that this decision can also be beneficial to consumers.

#### 3 - Value of Promotions with Delayed Incentives:

##### An Empirical Investigation of Gift Card Promotions

Bharadwaj Kadiyala, HKUST Business School, Hong Kong,  
Ozalp Ozer, Serdar Simsek

Gift card promotions provide customers an incentive to spend more than an expenditure threshold on regularly priced products, by rewarding customers with a gift card. This type of promotion has become popular among luxury fashion, department, and consumer electronic stores. Using a proprietary data set from a large fashion retailer, we investigate how customers' purchase and expenditure decisions are impacted these promotions as well as the underlying mechanism driving customer response.

#### 4 - Optimal Dynamic Allocation of Sales and Rental Inventory at a Retailer

Mehmet Sekip Altug, George Washington University, 2201 G. Street NW, Funger 415, Washington, DC, 20052, United States, Oben Ceyan

We consider a retailer that simultaneously sells and rents its product over a given horizon. In every period, the retailer faces uncertain demand that splits between renters and buyers based on their utility. We characterize the optimal dynamic rental allocation policy and study its properties. We propose various implementable heuristics. We then extend our results to the duopoly case and characterize the equilibrium. We derive the conditions that lead to "pure sales", "pure rental" or "mixed strategy equilibrium" and discuss their implications.

### Emerging Topics in Healthcare Operations

Sponsored: Manufacturing & Service Oper Mgmt/Healthcare Operations

Sponsored Session

Chair: Yuqian Xu, University of Illinois at Urbana-Champaign, Champaign, IL, 61820, United States

#### 1 - The Interplay Between Online Reviews and Physician Demand: An Empirical Investigation

Yuqian Xu, University of Illinois at Urbana-Champaign, Wohlers Hall 487, 1206 S. 6th St, Champaign, IL, 61820, United States, Mor Armony, Anindya Ghose

Social media platforms for healthcare services are changing how patients choose physicians. In this paper, we derive various service-quality proxies from online reviews and study the relationship between these quality proxies and physician demand. To do so, we study a unique data set from one of the leading appointment booking websites in the United States, that contains online physicians' appointments made over a five-month period, along with other online information. We propose a random coefficient choice model to characterize patient heterogeneity in physician choices, taking into account both numeric and textual user-generated content with text mining techniques.

#### 2 - Reducing Hospital Readmissions through Regulation

Tolga Tezcan, London Business School, Regent's Park, London, NW14SA, United Kingdom, Kenan Arifoglu, Hang Ren

We study the effectiveness of Hospital Readmission Reduction Program (HRRP), which was recently introduced by Medicare. Using a game-theoretical stylized model, we find that HRRP may induce excess healthcare cost. We propose a new compensation scheme that results in socially optimal efforts in reducing readmissions.

#### 3 - How Does Multichannel Delivery Impact Access to a Care Network? Evidence from Telemedicine in South India

Kraig Delana, London Business School, Sarang Deo, Kamalini Ramdas

We use data from the Aravind Eye Care System in India to examine how the introduction of rural vision centers equipped with telemedicine impacts patient visit volumes, patient mix, revenues, and outcomes. Using a difference-in-differences model, we find that the introduction of vision centers substantially increases network volumes, largely through new patients. We also find that patients substitute telemedicine visits for hospital visits when appropriate. However, we do not find strong evidence of an increase in treatments (e.g., glasses/cataract surgeries). Our findings highlight the multifaceted impact of the introduction of telemedicine on a multi-channel healthcare delivery network.

#### 4 - Maximizing Intervention Effectiveness

Brian Rongqing Han, University of Southern California, Los Angeles, CA, United States, Vishal Gupta, Song-Hee Kim, Hyung Paek

Without access to the raw data, policymakers often face challenges when deciding whom to receive an intervention previously proven effective. We propose a novel robust optimization framework that uses only causal inference summary data from a published paper to target a subset of the candidate population to maximize intervention effectiveness.

### Queues in Services II

Sponsored: Manufacturing & Service Oper Mgmt/Service Operations

Sponsored Session

Chair: Amy R. Ward, University of Southern California, Los Angeles, CA, 90089-0809, United States

Co-Chair: Rouba Ibrahim, University College London, London, WC1E 6BT, United Kingdom

#### 1 - Off-placing Patients in Hospital Wards: The Value of Flexibility in Healthcare

Vahid Sarhangian, University of Toronto, Toronto, ON, Canada, Carri Chan, Yuan Zhong

A common practice in many hospitals is the off-placement of admitted emergency department (ED) patients to a non-primary inpatient ward (IW) when the primary ward is at full capacity. We evaluate and compare the performance of practical flexible designs for routing patients from the ED to IW. We consider a multiclass queueing system with multiple server pools (wards) and allow the

customers to be served by servers from a non-primary pool (determined through the flexible design) with a reduced service rate to capture the effect of off-placement.

## 2 - Design and Pricing of Discretionary Service Lines

Laurens G. Debo, Dartmouth College, 100 Tuck Hall, Hanover, NH, 03755, United States, Cuihong Li

We discuss the optimal offering of a menu of discretionary services, for which longer processing times yield higher quality, but also create more system congestion. We show that prioritizing short services increases the breadth of the menu and that prices may be non-monotone in duration.

## 3 - Queueing and Learning

Costis Maglaras, Columbia University, Graduate School of Business, 3022 Broadway Avenue, New York, NY, 10027, United States, John J. Yao, Assaf Zeevi

Demand systems used in service operations often assume that system parameters that affect user decisions, e.g., to join a system or purchase a service, are known or communicated to the market. In practical settings this need not be the case, but users may still form estimates of these parameters through their own observations. We study the effect of observational learning on user behavior and equilibrium performance in a congested queueing model where delay-sensitive customers with no a priori knowledge of the service rate, join the system and observe their progress through the queue in order to learn the system's service rate, estimate remaining waiting times, and make abandonment decisions.

## 4 - On Personalized Scheduling Disciplines in Queueing Systems: Does Knowing your Customer Matter?

Seyedmorteza Emadi, University of North Carolina-Chapel Hill, 221 Tremont Circle, Chapel Hill, NC, 27516, United States, Rouba Ibrahim, Saravanan Kesavan

The paradigm of personalized queues is becoming increasingly relevant with the availability of customer-specific data in practice. In this work, we focus on the implementation of scheduling policies exploiting individual customer service-time information. By analyzing data from a call center, we quantify the improvement in predictive accuracy resulting from exploiting individual customer history to predict future service times. We quantify the operational impact of using those improved predictions in the scheduling of customers through both direct analysis and a numerical study.

### Strategic Queueing in Service Operations

Sponsored: Manufacturing & Service Oper Mgmt/Service Operations

Sponsored Session

Chair: Jianfu Wang, Nanyang Business School, Nanyang Technological University, Singapore, 639798, Singapore

Co-Chair: Shrutivandana Sharma, Singapore University of Technology and Design, 20 Dover Drive, Singapore, 138682, Singapore

## 1 - Evaluating the First-mover's Advantage in Announcing Real-time Delay Information

Siddharth Prakash Singh, Carnegie Mellon University, Tepper School of Business, 5000 Forbes Avenue, Pittsburgh, PA, 15213, United States, Mohammad Delasay, Alan Scheller-Wolf

Advances in internet-based technology have enabled service providers to disseminate real-time delay estimates to customers who are strategic and delay-sensitive. In a market with two service providers who compete for market share, we investigate whether one of the service providers (the technology leader L) should begin to announce her real-time delay information, knowing her competitor (the follower F) could opt to respond. We cast this leader-follower setting as a sequential queueing game. We find that L's delay announcements improve, in equilibrium, her market share when she is not the higher-capacity service provider; otherwise, initiating delay announcements erodes her market share.

## 2 - Queueing Design when Customers Can Balk: Pooled or Dedicated?

Nur Sunar, UNC, 1604 Village Crossing Drive, Chapel Hill, NC, 27517, United States, Yichen Tu, Serhan Ziya

It is generally accepted that operating with a combined (i.e., pooled) queue rather than separate (i.e., dedicated) queues is beneficial mainly because pooling reduces average throughput time in a system. We consider a multi-server queueing system that can be run as a pooled or a dedicated system. Unlike the pooling literature, in our paper, customers are rational, i.e., they decide to join or balk based on queue length information upon arrival. We prove that, in contrast to the general understanding, the dedicated system can result in strictly smaller average throughput time, and strictly larger social welfare than the pooled system; performance degradation due to pooling can be significant.

## 3 - A Model of Queue Scalping

Luyi Yang, Johns Hopkins University, 100 International Drive, Baltimore, MD, 21202, United States, Shiliang Cui

This paper studies a setting in which a queue scalper enters a waiting line only to sell his position later to future arriving customers. The problem is motivated by the business model of a tech company CallEnQ, which applies the idea of queue scalping to helping professionals spend less time waiting on hold to talk to IRS. We find that a higher demand for the underlying queueing system does not translate to a higher revenue for the queue scalper, which implies that when deciding which queue to enter, a queue scalper should not always target high-demand ones. This result extends to a firm operating any finite number of queue scalpers.

### Sustainable and Transparent Supply Chains

Sponsored: Manufacturing & Service Oper Mgmt/Sustainable Operations

Sponsored Session

Chair: Christian Blanco, Ohio State University, Columbus, OH, 43210, United States

## 1 - Companies' Contributions to Sustainability through Global Supply Chains

Joann de Zegher, Assistant Professor, MIT Sloan, Cambridge, MA, 02142, United States, Tannis Thorlakson, Eric Lambin

Companies use a variety of Sustainable Sourcing Practices (SSPs) to address social and environmental challenges in their supply chains. Our current understanding of such SSPs is largely based on theoretical models, literature reviews and case studies. We use a random sample of 450 public companies to study the range of SSPs that companies pursue, addressing the following questions. What SSPs do companies adopt? How many tiers in the supply chain do SSPs cover and to what extent are these SSPs audited? What factors explain the type of SSP a company adopts and are these factors in line with theoretical predictions? This research helps direct the research agenda in sustainable supply chain management.

## 2 - Motivating Supplier Social Responsibility under Incomplete Visibility

Leon Valdes, University of Pittsburgh, Joseph M. Katz Graduate School of Business, 119B Mervis Hall, Pittsburgh, PA, 15260, United States, Tim Kraft, Yanchong Zheng

We study a manufacturer's decisions when the social responsibility (SR) performance of her supplier cannot be perfectly observed. Only the supplier can directly impact SR; the manufacturer can: (i) invest in the supplier's capabilities to improve SR; and (ii) disclose SR information to consumers. A third party may disclose the true level of SR, which can lead to a penalty for the manufacturer. Our results show that greater visibility helps the manufacturer to better tailor her investment. In addition, disclosing SR leads to an improvement in supplier SR practices, but this disclosure is least likely when the supplier has average (not too low and not too high) SR practices.

## 3 - Can Brands Claim Ignorance? Unauthorized Subcontracting in Apparel Supply Chains

Anna Saez de Tejada Cuenca, UCLA Anderson School of Management, 110 Westwood Plaza, B-501, Los Angeles, CA, 90095, United States, Felipe Caro, Leonard Lane

The collapse of the Rana Plaza building in Bangladesh brought into focus the poor safety conditions faced by many workers in the apparel industry. A common way in which safety and environmental standards are violated is through unauthorized subcontracting. We analyze empirically some factors that can lead suppliers to outsource their production to third parties without their retailers' knowledge. We use data provided by a supply chain manager that consists of over 30,000 orders, including 36% of subcontracted ones. Our results provide managerial insights to retailers on what factory and order characteristics increase the probability of unauthorized subcontracting, and how it can be prevented.

North Bldg 127C

**Joint Session MSOM/Practice Curated: New Frontiers in Operations Management**

Sponsored: Manufacturing &amp; Service Oper Mgmt/Supply Chain

Sponsored Session

Chair: Nitin Bakshi, University of Utah, Salt Lake City, UT, 84112-8939, United States

**1 - Mitigating Disruption Cascades in Decentralized Supply Networks**

Nitin Bakshi, University of Utah, 1655 East Campus Center Drive, Salt Lake City, UT, 84112-8939, United States, Shyam Mohan

Using a game-theoretic analysis, we study how firms in a decentralized supply network invest in mitigating the risk from disruption cascades. Specifically, we highlight the informational implications of the equilibrium investments

**2 - The Emergence of Superstar Firms: Endogenous Multi-market Competition**

Kostas Bimpikis, Stanford University, 655 Knight Way, Stanford, CA, 94305, United States, Sergio Camelo, Michael Koenig

We analyze competitive markets with multi-product firms competing in Cournot. We provide an equilibrium characterization in which both production levels and the market structure are endogenously determined. For homogeneous firms and convex production costs we show that the equilibrium market structure is such that each firm participates in only one market. In contrast, in the presence of economies of scale the resulting market structure takes the form of a nested graph. We recapitulate nestedness as a novel empirical fact in a unique panel dataset of firms. The policy implications are discussed with examples of deregulation affecting market entry, firm exit and mergers and acquisitions.

**3 - Designing Rewards-based Crowdfunding Campaigns for Strategic Backers**

Souptika Chakraborty, Duke University, Durham, NC, United States, Robert Swinney

We study a model of rewards-based crowdfunding with the all or nothing funding mechanism. The creator of a campaign solicits pledges from backers, and if total pledges exceed a pre-determined threshold, the campaign is successful, the creator receives all pledges and each backer receives a reward. Otherwise, the campaign fails and backers are refunded their pledges. We determine how a creator should design her campaign when the uncertainty of receiving the reward makes backers behave strategically.

## ■ TE18

North Bldg 128A

**Operations/ Marketing Interface III**

Contributed Session

Chair: Philippe Chevalier, UCL, Louvain School of Management - CORE, L1.03.01, Louvain La Neuve, B1348, Belgium

**1 - Service Investment for Online Retailers with Social Media**

Ruiqi Hou, University of Science and Technology of China, No.96 Jinzhai Street, Room 706, School of Management, USTC East Campus, Hefei, 230026, China

We investigate the impact of investments in customer service experience in a market with one or two major competing online retailers. The firms decide on investments aimed at improving the customer service experience. We distinguish two variants: one Nash case and a leader-follower (Stackelberg game) case. For both cases, the optimal investment cost, optimal profit per unit time, and the effect on market share are calculated. We show that the presence of a social network leads to faster convergence of the market, while it also impacts the profits and market share. Numerical analysis shows that both the leader and the follower invest more when a social network exists and higher profits are gained.

**2 - Creating Value from False-failure Returns**

Eylem Koca, Ozyegin University, Nisantasi Mah. Orman Sk. 34-36, Cekmekoy, Istanbul, 34794, Turkey

We study the problem of creating the most value out of false-failure returns (consumer returns with little to no verifiable defect). In a comprehensive two-period model incorporating product information, return policies, product generations and trade-in upgrades, we identify the optimal conditions for the seller to choose remanufacturing, open-box sales or salvaging, when faced with false-failure returns from strategic consumers. We also investigate the implications of consumer moral hazard and the implications on sustainability performance.

**3 - Channel Coordination Between Manufacturers and Competing Retailers with Fairness Concerns**

Rikuo Yoshihara, Keio University, Yokohama, Japan, Nobuo Matsubayashi

We consider a two-tier supply chain where a single manufacturer sells its product to consumers through two competing retailers, and investigate how fairness concerns, where all channel members have inequity aversion, may affect channel coordination. We show that when the retailers are moderately differentiated, all channel members' fairness concerns can achieve the profit distribution among the channel members that satisfies the maximum channel profitability, the maximum channel utility, and that increases their individual profits compared with the case without fairness concerns.

**4 - Encroachment and Process Investment with Spillovers**

Houcai SHEN, Nanjing University, Department of Management Science, and Engineering, Nanjing, 210093, China, Xia Jing

In this paper, we reveal that a retailer may benefit from supplier encroachment. We develop game theoretic models under different cases and then make two-party comparisons of the equilibrium outcomes. The results show that the supplier prefers encroachment, despite of whether he makes investment. Nevertheless, his investment policy depends critically on a threshold of investment efficiency. The retailer is better off when the two products are sufficiently differentiated and investment externality is strong enough.

**5 - Retail Competition at the E-commerce Age**

Qiang Li, Rutgers Business School-Newark and New Brunswick, New Brunswick, NJ, United States, Xiaowei Xu

We study retail markets, in which a brick-and-mortar retailer competes against an e-retailer. Many department stores announced to close more stores. On the other side of the competition, e-retailers have been growing their business at a double-digit annual rate. The brick-and-mortar retailer needs economies of scale to cover indirect costs, but the e-retailer is free from the scale constraint. We build a mathematical model and try to answer some questions such that: will online retailers win the final trophy and eliminate more local stores in the next decade? What's the suitable trade zone of a local store on certain population density?

**6 - Joint Optimization of Variable Pricing and Supply**

Philippe Chevalier, Professor, UCLouvain, Louvain School of Management - CORE, L1.03.01, Louvain La Neuve, B1348, Belgium, Alejandro Lamas

In most of the lot-sizing models, demand is considered as a parameter and in most pricing models the supply of goods is considered as a parameter. We develop new models and algorithms to jointly optimize supply and demand management combining lot sizing and variable pricing with strategic customers. In particular, we study the optimal scheduling of promotions to maximize profits taking into account revenues but also operations costs.

North Bldg 128B

**Inventory Ordering and Dynamic Assortment Decisions in Revenue Management**

Sponsored: Revenue Management &amp; Pricing

Sponsored Session

Chair: David Simchi-Levi

Co-Chair: Will Ma, Massachusetts Institute of Technology, Cambridge, MA, 02139, United States

**1 - Online Assortment Optimization with Reusable Resources**

Vineet Goyal, Columbia University, 304 S.W. Mudd Building, 500w 120th Street, New York, NY, 10027, United States, Garud N. Iyengar, Shuangyu Wang

We consider an online assortment optimization problem with  $n$  substitutable products with reusable capacities. In each period, a user with a preference model (potentially adversarially chosen) arrives to the platform, and is offered an assortment of products that have available capacity. The goal here is to compute a policy that maximizes the expected revenue of the platform over a finite horizon. We show that a simple myopic policy, that does not require any information about future arrivals or the distributions of usage time, is  $1/2$  optimal with respect to a clairvoyant optimal that has full information about the sequence of user types (or choice models) and the usage time distributions.

## 2 - Dynamic Assortment Optimization With Inventory Cost

Venus Lo, Cornell University, 206 Rhodes Hall, Cornell University, Ithaca, NY, 14853, United States, Huseyin Topaloglu

We consider a dynamic assortment optimization problem of selecting an assortment of products and their inventory level to offer to a stream of customers. Unlike traditional revenue management problem where the seller controls the products available to each arriving customer, the seller only makes initial inventory decisions. There is a cost of stocking the inventory, with no salvage value. The assortment available to each customer depends on the initial stock and the purchases of preceding customers, who are willing to substitute. We present a dynamic program for deterministic customer arrivals with nested preferences and develop related heuristics for the case of stochastic customer arrivals.

## 3 - Inventory Balancing With Online Learning

Xinshang Wang, Columbia University, New York, NY, United States, Wang Chi Cheung, Will Ma, David Simchi-Levi

We study an online resource allocation problem. A manager needs to allocate limited resources to a heterogeneous pool of customers arriving in real time, while maximizing a certain notion of cumulative reward. The manager can observe a list of feature values of each arriving customer, which allow the manager to learn personalized customer behavior and customize allocation decisions. The challenge is to allocate resources effectively, in the absence of any demand forecast model and under uncertain customer behavior. We propose online allocation algorithms with provably tight performance guarantee. Our technique combines online learning theories with competitive analysis.

### Using Pricing to Manage On-line Marketplaces

Sponsored: Revenue Management & Pricing

Sponsored Session

Chair: Robert L. Phillips, Uber, San Francisco, CA, 94101, United States

#### 1 - Surge Moves Drivers: Evidence From a Natural Experiment at Uber

Alice Lu, Uber, San Francisco, CA, United States, Peter Frazier, Oren Kislev

Ridesharing platforms use dynamic pricing (so-called “surge pricing”) to raise prices when demand from riders outstrips drivers’ availability. This is intended to reduce rider demand and attract drivers. While short-run price increases clearly influence riders, anecdotal evidence on whether they move drivers is mixed, with experienced drivers counselling against “chasing surge”. Using a natural experiment created by a surge pricing service outage affecting a portion of Uber’s driver-partners, we show that visibility of the surge heatmap increases drivers’ earnings, attracts drivers toward areas with higher surge prices, and explains 10%-60% of drivers’ self-positioning decisions.

#### 2 - An Empirical Analysis of Price Formation, Utilization, and Value Generation in Ride Sharing Services

Tunay Tunca, University of Maryland, 4361 Van Munching Hall, Robert H. Smith School of Business, College Park, MD, 20742, United States, Weiming Zhu, Liu Ming, Yi Xu

Using data obtained from a leading ride-sharing company, we construct and estimate a discrete choice based model of price, demand and supply formation in ride-sharing services based on operational characteristics such as driver utilization and demand intensity. Further, we conduct counterfactual analysis to examine efficiency and welfare implications of regulation and pricing strategies such as surge pricing.

#### 1 - Believing in Analytics: Managers’ Adherence to Price Recommendations From a Decision Support System

Anna Saez de Tejada Cuenca, PhD Student, UCLA Anderson School of Management, Los Angeles, CA, United States, Felipe Caro

We analyze empirically the drivers of adherence to the prices recommended by a decision support system during the sales season of a fast fashion retailer. We study the effect of two interventions aimed to increase adherence, as well as the drivers

of the evolution of adherence over time. One of the firm’s interventions, a change in the way revenue was displayed in the DSS’s interface, increased adherence to its price recommendations. Moreover, managers’ systematic deviations from the DSS’s recommendations are compatible with well-known behavioral biases such as loss aversion and salience of the inventory. Our results provide insights on how to design better DSSs to entice practitioners to use them.

#### 2 - Assortment Rotation and the Value of Concealment

Kris Johnson Ferreira, Harvard Business School, Morgan Hall 492, Boston, MA, 02163, United States, Joel Goh

We study one reason why frequent assortment rotations can be valuable. Namely, by distributing its seasonal catalog of products over many assortments, the retailer conceals a portion of its product catalog from consumers, injecting uncertainty into the consumer’s relative product valuations. Rationally acting consumers may respond to this uncertainty by purchasing more products, generating additional sales for the retailer. We refer to this phenomenon as the value of concealment. We develop a consumer choice model and stochastic dynamic program to study the value of concealment.

#### 3 - Non-stationary Stochastic Optimization with Applications to Dynamic Pricing

Yining Wang, Carnegie Mellon University, 5000 Forbes Avenue, 8203 Gates-Hillman Center, Pittsburgh, PA, 15213, United States, Xi Chen, Yuxiang Wang

We consider a non-stationary sequential stochastic optimization problem, in which the underlying cost functions change over time under a variation budget constraint. We propose an  $\$L_{[p,q]}$ -variation functional to quantify the change, which yields less variation for dynamic function sequences whose changes are constrained to short time periods or small subsets of input domain. Under the  $\$L_{[p,q]}$ -variation constraint, we derive both upper and matching lower regret bounds for smooth and strongly convex function sequences, which generalize previous results in Besbes et. al. (15). Our results reveal some surprising phenomena such as the curse of dimensionality of the function domain.

#### 4 - Price Optimization under The Finite-mixture Logit Model

Arnoud V. den Boer, University of Amsterdam, Science Park 107, Amsterdam, Netherlands, Ruben van de Geer

We present a price optimization algorithm under the finite-mixture logit model, a choice model that can capture customer heterogeneity. Our algorithm has theoretical performance guarantees and desirable computational properties.

### Application of Revenue Management and Pricing: Interaction of Supply and Demand

Sponsored: Revenue Management & Pricing

Sponsored Session

Chair: Shadi Sharif Azadeh

#### 1 - Robust Demand Estimation under the Multinomial Logit Model Using Sales Transaction Data

Sanghoon Cho, University of South Carolina, Columbia, SC, United States, Jongho Im, Pelin Pekgun, Mark Ferguson

We propose a statistical procedure that can estimate the effect of product attributes and unobservable lost sales under a choice-based demand model using only historical sales transactions, product availability data, and market share information. Our proposed approach does not require time-homogeneous arrival rates, and allows for varying product attributes and choice sets over time. A set of simulation studies and an application to a real hotel dataset are conducted in comparison to several existing methods.

#### 2 - A Revenue Management Model for on Demand Systems

Yousef Maknoon, Delft University of Technology, Delft, Netherlands, Bilge Atasoy, Moshe E. Ben-Akiva, Michel Bierlaire, Shadi Sharif Azadeh

This paper presents a revenue management model for mobility on-demand systems. When a customer arrives to the system, the model decides about the mixture of products offered to the customer to maximize the expected revenue. The expected revenue from an offer set is defined by the price and the demand of each offered product. We formulate the problem as a mixed-integer linear model and present a branch and bound algorithm to solve it. Computational results depict the performance of our approach.

### 3 - Choosing Fairly with Unknown Metric Preferences

Anilesh Krishnaswamy, Stanford University, Stanford, CA, 94305, United States, Ashish Goel, Kamesh Munagala

We consider the problem of choosing a single alternative based on the ordinal preferences of agents on a set of alternatives, under the assumption that the preferences of agents are derived from an underlying unknown metric space. This model is motivated in part by specific settings such as facility location (e.g. choosing locations for schools/hospitals) and in general by preference aggregation in large feature spaces. We identify algorithms that provably choose alternatives that are close to optimal simultaneously for a wide class of convex objective functions which includes various fairness measures such as social welfare (SUM), Nash welfare (PRODUCT) and Rawlsian welfare (MAX).

#### 1 - Risk-sharing Agreements for New Medical Treatments

Ozge Yapar, University of Pennsylvania, Wharton School of Business, 3730 Walnut Street, Philadelphia, PA, 19103, United States, Stephen E. Chick, Noah Gans

Any estimate of a new medical treatment's value that relies on clinical-trial data can have significant residual uncertainty. So-called post-marketing data, captured after the treatment has entered the market and is used by the general population, can augment clinical-trial data to better validate its safety, efficacy, and economic value. To better manage the risks associated with this post-trial residual uncertainty, new price updating mechanisms are under consideration around the world. We analyze these new risk-sharing arrangements.

#### 2 - Supply Disruptions in Sterile Injectable Drug Supply Chain

Parshuram Sambhajirao Hotkar, UT Austin, Austin, TX, 78751, United States, Diwakar Gupta

Injectable drug shortages are a serious problem in the US. Reasons for such shortages vary including contamination and facility updates. We consider a setting in which two firms sell a perfectly a substitutable drug in the same market. Firms make capacity decisions first, followed by production decisions. Firm 1 is subject to production shut downs, but Firm 2 is not. Both firms choose capacities before observing supply disruption, based on the likelihood and intensity of the supply shock. Our analysis focuses on how a central planner should distribute incentives to improve disruptions - either to the safer firm, or to the riskier firm, or to both, and if both, then in what combination.

#### 3 - A New Value Proposition for Reducing Readmissions: Dynamic Staffing for Post-discharge Follow-ups

Alex Mills, Indiana University Bloomington, 1309 E. Tenth St, Bloomington, IN, 47405, United States, Jonathan Helm, Shanshan Hu, Xiaoyang Yu, Jivan Romain Deglise-Hawkinson, Julian Pan

Under a simple staffing policy, the cost of providing follow-ups for discharged patients may outweigh the benefit of reduced hospital readmissions. Motivated by the current state of practice, we formulate a capacity planning problem with a rolling horizon that balances the time-nonhomogeneous benefit of readmission reduction against the cost of providing capacity and the potential cost of wasted capacity, since hospital discharges are stochastic. Unlike when using a simple Newsvendor heuristic, following up with a larger population of patients is cost-effective when capacity is planned using our method.

#### 4 - Managing Outpatient Care Services Under Strategic Walk-in Patients

Nan Liu, Boston College, 140 Commonwealth Avenue, Fulton Hall, Room 340, Chestnut Hill, MA, 02467, United States, Shan Wang, Willem van Jaarsveld, Guanlian Xiao

Outpatient care providers often accept both scheduled patients and walk-in patients without appointments. Patients may choose to book an appointment or to walk in directly, depending on their health condition and the utility of each option. In this talk, we discuss how an outpatient care provider should manage her capacity taking into account such strategic behavior of patients.

### E-Business/Commerce & Accounting

Contributed Session

Chair: Shaoqin Ye, Xiamen University, 422 Siming South Road, Xiamen, 361005, China

#### 1 - How Much to Share. A Study to Understand the Interplay Between Firms and Their Affiliates

Siddharth Bhattacharya, PhD Student, Fox School of Business, Temple University, Alter Hall, 1801 Liacouras Walk, Philadelphia, PA, 19122, United States, Subodha Kumar, Sunil Wattal

Firms increasingly utilize third party affiliates to advertise on their behalf. The focus of our research is to find what optimal pricing and advertising strategies between firms and affiliates maximize profits and how does product quality, customer heterogeneity, affiliate type and type of ad contract (with Google) affect those strategies.

#### 2 - Optimal Pricing Decisions for an Omni-channel Retailer

Nevin Mutlu, Eindhoven University of Technology, P.O. Box 513, Eindhoven, 5600 MB, Netherlands

In this research, we develop an analytical model to study a dual-channel retailer's pricing policy across store and online channels, considering that different channels exhibit different cost structures, yet an inconsistent pricing scheme across channels may lead to lower sales due to consumer confusion.

#### 3 - Optimizing NFL Player's Contracts

Wei Chen, Assistant Professor, York College of Pennsylvania, 211 Willman Business Center, 441 Country Club Road, York, PA, 17403, United States, Benjamin V. Neve

National Football League (NFL) implements restrict salary cap for all professional teams, therefore successfully investing in players' contracts is a key factor to keep a team maintaining competitive. By referring past 30 years NFL players' statistics, this research develops a weighted optimization model to offer recommendations on any free agent player's contract based the player previous performance as well as other similar players' historical performance. A real NFL case has been used to test the model, it shows the developed model offers a better solution than current management system.

#### 4 - Influence of Controlling Shareholders' Pledge on the Quality of Earnings: A Research Based on A-share Listed Companies in China

Shaoqin Ye, Professor, Xiamen University, 422 Siming South Road, Xiamen, 361005, China, Danxia Guo

This study explores the impact of equity pledges by controlling shareholders of listed companies on the quality of earnings using Chinese A-share listed companies during 2007-2016 as a sample. The empirical findings indicate that, other things being equal, the companies whose controlling shareholders have pledged their stocks have a higher quality of earnings than those whose controlling shareholders have no equity pledge. In addition, such an effect is negatively moderated by the degree of marketization.

### Joint Session Service Science/Practice Curated: Analytics in Higher Education and Science Workforce

Sponsored: Service Science

Sponsored Session

Chair: Maryam Alsadat Andalib, Virginia Institute of Technology, Blacksburg, VA, 24060, United States

#### 1 - Happy With a Baby and a Declined Tenure: Effects of Tenure-clock Extension Policies on Career Outcomes of New Parent Faculty Members

Maryam Alsadat Andalib, Data Scientist, Ford Motor Company, Dearborn, MI, United States, Navid Ghaffarzadegan

In this paper, we look at the support mechanisms for new-parent, tenure-track faculty in universities with a specific focus on tenure-clock extension policies. We construct a unique data set to answer questions around the effectiveness of removing the stigma connected with automatic tenure-clock policies. Our results show that such policies are successful in removing the stigma and that, overall, faculty members that have newborns and are employed by universities that adopt auto-TCE policies stay one year longer in their positions than other faculty members. In addition, we investigate the effect of auto-TCE policies on other career outcomes (e.g., getting tenure and job satisfaction).

## 2 - Using Simulation Modeling to Examine Policy Effects on the Workforce Outcomes of Women in Academic Science

Julie A. Maurer, Lead Research Manager, The Ohio State University, Columbus, OH, 43210, United States

Despite gains made over the past 20 years toward gender pay equity for female scientists working in academic research in the U.S., a persistent gap suggests that existing policies have not gone far enough. Insights into how the workforce structure, institutional policies and employer preferences interact to impact the career development of female scientists using ABM and SD modeling will be shared.

North Bldg 132A

### Information in Queueing Systems

Sponsored: Service Science

Sponsored Session

Chair: Ricky Roet-Green, Simon Business School, University of Rochester, Rochester, NY, 14627, United States

#### 1 - The Benefit and Cost of Skipping the Line

Yang Li, Chinese University of Hong Kong, 12 Chak Cheung Street, Cheng Yu Tung Building, Hong Kong, Opher Baron, Xiaole Chen

If you do not have time to wait in a long line to get your morning caffeine fix or to grab your lunch, now you can skip the line and order online. Thanks to the advancing IT technology, more and more restaurants, e.g., Starbucks and McDonald's, are offering online ordering without customer physical presence in the service line. We study the impacts of this novel business model with both online and in-store customers waiting to be served. We find that although the provider enjoys a revenue increase, both online and in-store customers endure longer delays and the social welfare may suffer.

#### 2 - Efficient Inaccuracy: User-generated Information Sharing in a Queue

Jianfu Wang, Nanyang Business School, Nanyang Technological University, Block S3-B2C-85, 50 Nanyang Avenue, Singapore, 639798, Singapore, Ming Hu

We study a service system which does not have the capability of monitoring and disclosing its real-time congestion level. However, the customers can observe and post their observations online, and future arrivals can take into account such shared information when deciding whether to go to the facility. We compare the user-generated information structure, which requires no costly investment, with full and no information structures. Perhaps surprisingly, we show that shared information always generates higher social welfare than no information and than full information when the offered load is high or the service is very popular.

#### 3 - The Armchair Decision: To Travel to a Queue or Not

Ricky Roet-Green, Simon Business School, University of Rochester, C3-345 Carol Simon Hall, Rochester, NY, 14627, United States, Refael Hassin

The availability of queue-length online information affects the way we model service systems. Models which assume customers have full information about the queue length (i.e., observable queues), also assume that if the customer decides to join the queue, joining is instantaneous. But in real-life settings, it is more natural to assume that customers who learn about the service current queue length have to travel to the service, and while they are on their way, the queue length may change: customers may complete their service and leave, others may arrive and join the queue. Our paper investigates the question how does information affects customers' decision to travel to the queue.

### Mass Customization and Applications

Sponsored: Manufacturing & Service Oper Mgmt/Supply Chain

Sponsored Session

Chair: Ali Fattahi, University of California-Los Angeles, Los Angeles, CA, 90095, United States

Co-Chair: Reza Ahmadi

#### 1 - Supply Chain Geography and Product Quality

Robert Louis Bray, Kellogg School of Management, Northwestern University, 830 Hinman Ave., 2s, Evanston, IL, 60202, United States

We study the effect of supply chain proximity on product quality by merging four independent data sources from the automotive industry. We estimate that increasing the distance between an upstream component factory and a downstream plant by an order of magnitude increases the component's expected

defect rate by 3.9%.

#### 2 - Procurement Contracting Under Product Recall Risk

Lauren Xiaoyuan Lu, University of North Carolina at Chapel Hill - Kenan Flagler, Kenan-Flagler Business School, CB #3490, McColl Building 4701, Chapel Hill, NC, 27599, United States, Jayashankar M. Swaminathan, Yue Zhang, Gang Wang

We consider a model in which a manufacturer outsources to a supplier the production of a component, which is subject to potential quality failure leading to a product recall. The manufacturer acts as the Stackelberg leader offering a recall cost sharing contract to the supplier. We analyze two settings: a pull system in which the supplier makes the quantity decision and a push system in which the manufacturer makes the quantity decision. We find that the manufacturer achieves a higher production quantity and induces a higher quality effort of the supplier in the push system than in the pull system.

#### 3 - Mass Customization and the Parts Capacity Planning Problem

Ali Fattahi, University of California-Los Angeles, Anderson School of Management, B501, Los Angeles, CA, 90095, United States, Sriram Dasu, Reza Ahmadi

We study a new parts capacity planning problem motivated by a global auto manufacturer that offers 100-500 car options. The set of end-products (producible configurations) is in the order of 1025-1040. Since it is impossible to forecast the demand for producible configurations, firms forecast demand for options. Parts' requirement cannot be directly determined based on options' forecast since a large number of parts' requirements (up to 60%) is based on the combinations of options selected. The problem of determining parts' requirement is a large-scale NP-Hard problem. We develop an effective approach for solving large industrial instances and compare our approach to that of the current practice.

### Logistics

Contributed Session

Chair: Yulan Bai, SMU, Dallas TX, 75205, United States

#### 1 - A New Methodology Combining JIT with Group Technology to Optimize Order Fulfillment Process for Online Supermarket

Minfang Huang, North China Electric Power University, 2 Beinong Road, Beijing, 102206, China, Yanxin Wang, Xiangpei Hu

Aiming at the difficulty of order processing in multi-variety, small-batch, cross-warehousing and consolidation of online supermarkets, a pull order processing model combining JIT and group technology was proposed. We use the similarity principle of the group technology to establish the flow process path and refer to the free type assembly line to set the takt time for batch orders, in which the order item is pulled to the right position at right time. The model achieves the goal of the shortest time for order processing by reducing the idle time of picking, sorting, and packaging and the waiting time of the order items in buffers.

#### 2 - Sequencing Triple-spreader Crane Operations: Mathematical Formulation and Heuristic Algorithm

Shabnam Lashkari, PhD Candidate, University of Wisconsin-Milwaukee, Milwaukee, WI, 53202, United States, Matthew Petering, Yong Wu

This paper investigates the problem of scheduling a triple-spreader (i.e. tandem lift) crane when lifts are subject to a weight limit. We formulate the problem as an integer linear program and develop a fast method for computing a lower bound on the optimal objective value. In addition, we devise a genetic algorithm that produces high quality solutions for small, medium, large, and very large problem instances.

#### 3 - An Exact Algorithm for an Assembly Routing Problem

Masoud Chitsaz, CIRRELT, Pavillon Andre-Aisenstadt, 2920 chemin de la Tour, Montreal, QC, H3T 1J4, Canada, Jean-François Cordeau, Raf Jans

We consider an integrated planning problem that combines production, inventory and inbound transportation decisions. We provide a mixed integer programming formulation of the problem and propose several types of valid inequalities to strengthen the linear programming relaxation. We propose new algorithms to separate the subtour elimination constraints with fractional node visits. The inequalities and separation procedures are used in a branch-and-cut algorithm. Computational experiments on a large test bed show the performance of the valid inequalities as well as the separation procedures.

#### 4 - The Facility Location Problem with Joint Disruptions

Vishwakant Malladi, Graduate Student, University of Texas-Austin, McCombs School of Business, CBA 5.202, IROM, Austin, TX, 78712, United States, Kumar Muthuraman

Classical facility location problems do not incorporate the possibility of correlated disruptions among facilities. Existent Literature focuses on simplistic disruption probabilities. We propose using Subordinated Markov chains to model the probability of the correlated risk of disruptions. Parameterizing the disruption probabilities offers more realistic and easy-to-simulate disruption distributions while using fewer parameters. We also propose algorithms that calibrate the Subordinated Markov Chain model and optimize for the facility location choices under correlated disruptions.

#### 5 - Backhaul Profit Maximization

Yulan Bai, Doctoral Student, Southern Methodist University, Dallas, TX, United States, Eli Olinick

We present a MIP for the backhaul profit maximization problem in which a freight carrier seeks to generate revenue from an empty delivery vehicle's backhaul trip from its last scheduled delivery to its depot by allowing it to deviate from the least expensive (or fastest) route to accept delivery requests between intermediate points as allowed by its capacity and required return time. The MIP is inspired by a novel representation of multicommodity flow that significantly reduces the size of the constraint matrix, LP upper bound on optimal profit, and solution time compared to a formulation based on the classical node-arc representation.

#### Modeling Dynamic Transportation Networks in the Era of Connectivity, Automation, and Sharing

Sponsored: TSL/Urban Transportation

Sponsored Session

Chair: Rui Ma, University of California, Davis, CA, 95618, United States

Co-Chair: Xuegang Ban, University of Washington, Seattle, WA, United States

#### 1 - Modeling Dynamic User Equilibrium Using Dynamic Complementarity Systems

Rui Ma, University of California, Davis, Davis, CA, United States, Xuegang Ban

We present a mathematical framework, called differential complementarity systems (DCS), to model and solve link-node continuous-time dynamic user equilibrium. We also discuss possible ways to extend the DCS formulations to model emerging mobility services in transportation.

#### 2 - Ridesharing on a Many-to-one Network with Multiple Corridors and a Common Destination

Rui Ma, University of California, Davis, Davis, CA, 95616, United States, Michael Zhang

We study the ridesharing morning commute traffic in a many-to-one network with a common parking area. The morning commute equilibrium problem of both ridesharing role and departure time choices in a many-to-one network is formulated and analyzed. The common parking area and its common parking disutility are shared by travelers on multiple corridors, each of which is represented by a single bottleneck link. It is found that the common parking disutility connects choice behavior and traffic flow patterns on all corridors, so that the problem is significantly different from the morning commute problems with only a single bottleneck link regardless the presence of ridesharing travel modes.

#### 3 - A Data-driven Car-truck Dynamic Traffic Assignment Model

Zhen Qian, Carnegie Mellon University, 5000 Forbes Avenue, Pittsburgh, PA, 15213, United States, Xidong Pi, Wei Ma

Traffic simulation with heterogeneous traffic flow is central to traffic management, for example when examining the impact of new demand/restriction of emerging vehicles. In real-world traffic flow, cars and trucks have different attributes, hence evolve in different behaviors. In this research, we built and implemented a realistic and applicable mesoscopic car-truck traffic simulation model that are data friendly for dynamic traffic assignment, with separate demand estimation and route choices for cars and trucks. It performs well in traffic impact analysis of development projects in case studies.

Chair: William Knudson, Clemson University, Clemson, SC, 29634, United States

#### 1 - Spatio-temporal Flexible Parking System

Xin Wang, University of Wisconsin-Madison, Madison, WI, United States, Xiaotian Wang

In a reservation-based parking system, customers departing late cause service failure for subsequent customers. To guarantee the service level, the parking system needs to run at a low utilization, which is a huge waste of parking resources, especially in congested urban area. From the perspective of the public regulator, we propose a flexible reservation system with spatial-temporal flexibility to address above issues and manage social surplus. A game-theoretical model is used to capture the customers' utility over the flexibility.

#### 2 - Site Characterization by Dem And Satellite Images to Estimate Subsurface Site Conditions

Young-Ji Byon, Associate Professor, Khalifa University, Al Saada Street and Airport Road, P.O. Box 127788, Abu Dhabi, 127788, United Arab Emirates, Tadahiro Kishida, Rita Sousa

Site information need to be obtained for civil infrastructure construction before actual field survey is performed. Digital elevation models (DEM) have been successfully applied for this purpose to estimate the subsurface site conditions. Satellite images are also sometimes used to characterize site conditions visually based on the practitioners' experience. However, the combination of the data from DEM and satellite images have not been explored to estimate the subsurface site conditions. This study investigates the methodology to estimate the averaged subsurface site conditions for Japan from DEM and satellite images which are public available for the entire world.

#### 3 - Quality of Service Constrained Microgrid Optimal Scheduling

Yiwei Wu, University of Houston, 4800 Calhoun Road, Houston, TX, 77004, United States, Gino J. Lim, Masoud Barati

The microgrid (MG) optimal scheduling ensures the economic operation subject to secure performance. To maintain the MG stability, MG should have enough reserve capacity. We define a Quality of Service (QoS) index to evaluate the effects of managing the scheduling uncertainties. Under particular QoS, the MG uses estimated reserve quantity to schedule its operation. A two-stage mixed-integer stochastic programming model is proposed to solve microgrid scheduling problem, in which the first stage is to schedule a microgrid under a normal operating condition, and the second stage is to adjust the first stage decision by finding the optimal provided reserve of microgrid under operation uncertainties.

#### 4 - Urban Climate and Air Quality Services for Climate Change Planning – Europe Case Studies

Roberto San Jose, Professor, Tech. University Madrid, UPM Campus Montegancedo, Boadilla del Monte, Madrid, Spain, Juan Luis Perez-Camano, Libia Perez, Rosa Maria Gonzalez-Barras

UPM has developed integrated urban climate and air quality services to cover the special needs of city planners to develop climate change mitigation strategies. The results are based on high resolution numerical simulations run on high performance computers platforms. The methodology includes health impact assessments to know how climate change may affect the health of citizens.

#### 5 - Using Bike Route Data Visualization to Inform Bicycle Share System Design and Redesign

William Knudson, Clemson University, Clemson, SC, United States, Mary Beth Kurz, Paul Glenn, Jack Henderson, Ciara Hill, Anderson Kemp, Isabella Kazmier

Small entities, such as small universities or towns, may want, for reasons such as sustainability or livability, want to invest in a bicycle sharing system with a limited budget, and not be able to follow best-practices in designing their systems. Using crowd-sourced data, such as that collected by Strava users, planners may be able to determine reasonable station location and potential bike routes. In this study, we utilize longitude, latitude and elevation data collected from bicyclists traveling through and on Clemson University's campus, as well as pilot bike share system usage data, to provide updates to the system design.

Chair: Debdatta Sinha Roy, Robert H. Smith School of Business, University of Maryland, College Park, MD, 20742, United States

#### 1 - Evaluating Profitability of Remanufacturing Operations

Akshay Mutha, University of Vermont, Grossman School of Business, 55 Colchester Avenue, Burlington, VT, 05405, United States, Saurabh Bansal, V. Daniel R. Guide

We compare different methods for evaluating profitability of remanufacturing operations. We show the application of our model to current industry practices.

#### 2 - Modelling Price Dynamics for New and Remanufactured Smartphones

Supanan Phantratanamongkol, University of Birmingham, Birmingham, United Kingdom, Gu Pang

In this presentation, we model price dynamics of new and remanufactured smartphones listed on eBay by using functional data analysis. More specifically, we explore how price velocity and acceleration evolve over product life cycles. We further investigate how the impact of different factors on the price dynamics may vary. Our results shed light on the price dynamics of buy-it-now live listings and their price determinants guiding both eBay sellers and buyers in making informed decisions.

#### 3 - Optimization Models to Enable Job Rotation Schemes for Worker Safety

Amir Mehdizadeh, Auburn University, Auburn, AL, United States, Alexander Vinel, Mark Schall, Richard Seseek, Sean Gallagher

We consider the problem of employing job rotation schemes to improve worker safety in a manufacturing setting by combining optimization methods with novel modeling techniques developed in the occupational safety community. The work is based on a recently proposed fatigue-failure model for musculoskeletal disorders (MSD) risk evaluation. This leads to nontrivial nonlinear and nonconvex optimization problems which we solve through a combination of analytical and numeric tools. We conduct a realistic case study and conclude that while in some cases job rotation can lead to improvements, its effect is highly dependent on the composition of the job pool.

#### 4 - A Stochastic Multi-echelon Multi-channel Network Problem

Yuan Wang, National University of Singapore, Singapore, 119260, Singapore, 119260, Singapore, Loo Hay Lee, Ek Peng Chew

To effectively plan supply chain operations, it is meaningful to integrate strategic decisions on manufacturing capacity with short-term production and distribution decisions considering both demand and supply uncertainties. However, research on integrated supply chain network planning is rather limited in the literature. In this research, a stochastic multi-echelon multi-channel network model is proposed to solve the real supply chain network planning problem with consideration of uncertain demand forecast, production yield and raw material procurement simultaneously. The objective is to minimize overall operating cost through an extended planning horizon.

#### 5 - Voting Mechanism Design in Randomized Strategic Social Choice

Debdatta Sinha Roy, Robert H. Smith School of Business, University of Maryland, College Park, MD, 20742, United States, Debasis Mishra

Consider a voting setup where each agent has an ordering over a set of alternatives. A randomized social choice function (RSCF) assigns probability distributions over the set of alternatives based on the orderings. A voting

mechanism should satisfy some socially acceptable properties, for example, unanimity and strategy-proofness. It is well known that an RSCF is unanimous and strategy-proof if and only if it is a random dictatorship. This leads to a roadblock for designing socially acceptable and truthful voting mechanisms. We construct a normalized scoring-based rule that is unanimous and weakly strategy-proof and, therefore, it is not dictatorial. It is fast to compute and easy to implement.

### 4:35 - 5:20 Responsive Learning Technologies/ 5:20 - 6:05 Lumina Decision Systems

Emerging Topic: Technology Tutorials

Emerging Topic Session

#### 1 - Online Games to Teach Operations and Supply Chain Management

Samuel C. Wood, Responsive Learning Technologies, 4546 El Camino Real, #243, Los Altos, CA, 94022, United States

Littlefield Technologies, the Supply Chain Game, and the Sourcing Game are online competitive assignments used to teach topics including process analysis, inventory control, supply chain management, and sourcing and purchasing. We will describe the games' learning objectives, typical assignments, and actual game results.

#### 2 - How to Engage with Your Clients for More Effective Analytics

Max Henrion, Lumina Decision Systems, Inc, Campbell, CA, United States

In this workshop, Max Henrion will show how you can use Analytica as a key aid for more effective conversations with your clients, including how to: Draw influence diagrams to help clients articulate their real objectives and decisions, and to work with them to frame and scope problems. Use sensitivity analysis to help your clients understand what data and assumptions really matter and why. Employ agile modeling methods to build decision tools that end users find usable and useful. Design compelling visualizations to provide your clients a basis for informed and confident decisions. Practicing analysts and modelers will find these methods effective for improving client engagement in conjunction with almost any analytics software, but Analytica is unique in offering features designed specifically to support this approach to interactive modeling. Active participants will receive a free 12-month Analytica license. If you already have Analytica, you can give it to a colleague.

### Airline Competition and Coordination

Sponsored: Aviation Applications

Sponsored Session

Chair: Reed Harder, Dartmouth, Hanover, NH, 03755, United States

#### 1 - Machine Learning, Discrete Games, and Predictive Models of Entry in the Airline Industry

Kang Hua Cao, Hong Kong Baptist University, WLB 517, 34 Renfrew Road, Kowloon Tong, Hong Kong, Lei Kang, Chia-Mei Liu, Vikrant Vaze

In this paper, we intend to widen connections, and develop further relationships, between machine learning and economic theory. Existing forecasting methods use the reduced-form approach and maintain the so-called fixed network assumption. Ignoring the strategic effects in forecasting can lead to biased results. We implement supervised machine learning methods to infer the general form of the best response functions and the conditional choice probabilities of the game. Then, we apply the model and methods developed to the U.S. airline industry, to predict the probabilities involved in an airline company entering or exiting a market.

#### 2 - Game-theoretic Analysis of Reallocation Mechanisms of Airport Landing Slots

Jackie W. Baek, MIT, 77 Massachusetts Ave, Bldg E40-103, Cambridge, MA, 02139, United States, Hamsa Balakrishnan

We study reallocation mechanisms in which airlines can exchange landing slots amongst each other in the context of ground delay programs. Such mechanisms should not only be able to increase system efficiency, but they should also satisfy other desirable properties such as incentive compatibility and fairness. We analyze two reallocation mechanisms using a game-theoretic framework, and we develop simple, non-truthful strategies that airlines may use in these mechanisms. We show that the overall performance of the mechanisms can vary widely when gaming is introduced, and that enforcing fairness can have a large impact on the airlines' best strategies.

### 3 - Airline Passenger Route Share Forecast

Xufang Zheng, Iowa State University, 537 Bissell Road #2362,  
Ames, IA, 50010, United States, Chia-Mei Liu, Peng Wei

Airline passenger route share(directShare) is the ratio of direct passengers to total passengers on O&D level. It is an important feature of passenger flow distribution. DirectShare is an O&D specific feature, which is highly correlated with quarterly lag. Various supervised learning methods are carefully explored. The best model is gradient boosting machine(GBM), which has better prediction performance than FAA TAF-M directShare forecast model. Category based learning is newly proposed, which provides better prediction performance than GBM. The C-basedapTC model is the best category based learning model, which can provide a long term directShare forecast with less fluctuations.

### 4 - Game Theoretic Modeling for Airline Frequency Competition in Large Networks

Reed Harder, Dartmouth, 14 Engineering Drive, Hanover, NH,  
03755, United States, Vikrant Vaze

Airlines set daily flight frequencies on origin-destination segments across their networks. These decisions are made in competition with other airlines and in coordination with potential connecting flights on other segments, and have significant implications for the efficient functioning of the air transportation system. Game theoretic models have been used to analyze incentives in airline resource allocation, but often suffer from limited computational tractability and predictive accuracy in large networks with many connections. We present approaches for tractable game theoretic modeling in these large networks using approximate methods.

### 5 - Strategic Behaviors in Airport Capacity Allocation Mechanisms

Weilong Wang, Purdue University, West Lafayette, IN,  
United States, Alexandre Jacquillat, Vikrant Vaze

We develop an original bi-level game-theoretic approach to identify opportunities for strategic behaviors by non-atomistic users (e.g. airlines) in non-monetary mechanisms for infrastructure (e.g. airport) capacity allocation. We show that gaming opportunities are limited under a primary mechanism, where capacity is allocated to individual flights. In contrast, airlines may have strong gaming opportunities in a secondary mechanism, where capacity is allocated to airlines who may then swap their own flights. We present computational results comparing the overall performance of both mechanisms.

### Route Optimization for Drones

Emerging Topic: Robotics, Drones and Autonomous Vehicles in Logistics

Emerging Topic Session

Chair: Andrea Leticia Arias, Texas Tech University, Lubbock, TX, 79424, United States

#### 1 - A Heuristic Approach to Path-planning for Delivery Drones in Anisotropic Medium

Abhishake Kundu, Texas Tech University, 201 Indiana Avenue,  
# D210, Lubbock, TX, 79415, United States, Timothy Matis

The purpose of this research is to consider an efficient heuristic to navigate parcel delivery drones (in conjunction with trucks) in direction dependent uniform wind-fields. Constraints on specific relative velocities and available battery power for the drones makes this an excellent utilitarian extension on developing literature.

#### 2 - Route Optimization of Unmanned Area Vehicle with Radio Frequency Identification Interrogator

Victoria Carson, California State Polytechnic University, Dept of  
Industrial & Manufacturing Eng, San Luis Obispo, CA, 93407,  
United States, Tali Freed, Neil Wolfe, Jonathon Scott

The Close Enough Traveling Salesman model is used to optimize the route of an unmanned aerial vehicle (UAV) equipped with a radio frequency identification (RFID) interrogator. The UAV's mission is to identify assets located in a given area within the flight time of a single battery charge. Reported use cases include cattle in grazing pastures and oil drilling equipment.

#### 3 - A Deterministic Two-level Integrated Inventory Approach for Inventory Management at a Drone Battery Swap Station

Olivier Kwizera, University of Arkansas, Fayetteville, AR,  
United States, Sarah G. Nurre

We consider the problem of optimizing the management of batteries at a drone battery swap station which allows for instantaneous swapping of depleted batteries for fully-charged ones. Since drones are powered by batteries with limited flight range, the decisions made with regards to battery charging and replacement actions determine which geographically diverse locations are able to be serviced and when. We use a deterministic two-level integrated inventory model where the first and second inventory levels are battery charge and capacity, respectively. We develop a heuristic that minimizes average weighted delivery time and perform tests to deduce policy insights.

### Joint Session APS/Opt-Uncert: Interfaces between Applied Probability and Robust Dynamic Optimization

Sponsored: Applied Probability

Sponsored Session

Chair: Chaithanya Bandi, 1987, Evanston, IL, 60208, United States

#### 1 - Optimal Approximations for Two-stage Adjustable Robust Optimization Under Budgeted Uncertainty

Omar El Housni, Columbia University, New York, NY, 10027,  
United States, Vineet Goyal

We study the performance of affine policies for two-stage adjustable robust optimization problem under a budget of uncertainty set. The two-stage adjustable robust optimization problem is hard to approximate within a factor better than  $\Omega(\frac{\log n}{\log \log n})$  for budget of uncertainty sets where  $n$  is the number of decision variables. We show that surprisingly affine policies provide the optimal approximation for this class of uncertainty sets that matches the hardness of approximation; thereby, further confirming the power of affine policies. We also provide a faster algorithm to compute near-optimal affine policies.

#### 2 - Robust Queueing Approach to Optimal Control of Fork-join and Replication Systems

Chaithanya Bandi, Kellogg School of Management, Northwestern  
University, 2211 Campus Dr, room 4169, Evanston, IL, 60208,  
United States

We consider the problem of control and analysis of fork-join queues.

#### 3 - A Robust Queueing Network Analyzer Based on Indices of Dispersion

Wei You, Columbia University, New York, NY, 10032,  
United States, Ward Whitt

We present a robust queueing network analyzer (RQNA) algorithm to approximate the steady-state performance of a single-class open queueing network of single-server queues with Markovian routing, allowing general interarrival and service distributions. The RQNA algorithm includes subroutines to (1) approximate system performance measures using the index of dispersion for counts (IDC) of the arrival process at each station, (2) calculate or estimate the IDC's for external flows, (3) solve systems of linear equations to approximate the IDC's for internal flows and (4) eliminate customer feedback. Effectiveness of the RQNA algorithm is supported by heavy-traffic limits and simulations.

#### 4 - Robust Maximum Likelihood Estimation

Omid Nohadani, Northwestern University, 2145 Sheridan Road,  
Technological Institute M233, Evanston, IL, 60208-3119,  
United States, Dimitris Bertsimas

In many applications, statistical estimators serve to derive conclusions from data. However, the conclusions are dependent on uncertainties in the data. We use robust optimization principles to provide robust maximum likelihood estimators that are protected against data errors. We provide efficient local and global search algorithms to compute the robust estimators. The performance is demonstrated on simulated data and on a large set of clinical radiation therapy data, where robust estimators offer more reliable decisions. This approach is general and applicable to a broad range of problems.

### Joint Session APS/Practice Curated: Discrete Convexity and its Application

Sponsored: Applied Probability

Sponsored Session

Chair: Linwei Xin, University of Chicago, Chicago, IL, 60637, United States

Co-Chair: Xin Chen, UIUC, Urbana, IL, 61801, United States

#### 1 - Optimal Inventory Management of a Blood Center

Yixuan Liu, University of Texas, 2110 Speedway, B6000, IROM,  
Austin, TX, 78705, United States, Youyi Feng, Guoming Lai

We study inventory management for a blood center that periodically collects whole blood and processes it into multiple blood products including red blood cell and platelet. With limited lifetimes, blood products are stored to satisfy random demands or sold in clearance sales before becoming outdated. The blood center also has an option to replenish red blood cells from an alternative source. Applying the concept of multimodularity, we characterize the structural properties of the value function and the optimal strategies. We demonstrate that the replenishment and salvage decisions can be coordinated to optimize the inventory system and discuss the value of implementing the alternative.

**2 - Substitutability, M-natural-convexity and Their Applications**

Menglong Li, UIUC, Urbana, IL, United States, Xin Chen

Substitutability, an important concept in economics and operations research, poses significant technical challenges. In this paper, we build fundamental properties of M-natural-convexity and its variant SSQM-natural-convexity, and apply them to analyze operations models with substitution: a multi-product multi-period stochastic inventory model and a portfolio contract model where a buyer reserves capacities in blocks from multiple competing suppliers.

**3 - Stochastic Optimization with Decisions Truncated by Random Variables and its Applications in Operations**

Xiangyu Gao, The Chinese University of Hong Kong, Hong Kong, Xin Chen, Zhan Pang

We study a class of stochastic optimization problems with decisions truncated by random variables. We develop a transformation technique to convert the original non-convex problems to equivalent convex ones. Our transformation allows us to prove the preservation of some desired structural properties, such as convexity, submodularity, and L-natural-convexity, under optimization operations, which are critical for identifying the structures of optimal policies and developing efficient algorithms. We demonstrate the applications of our approach to several important models in operations management.

Sponsored: Manufacturing &amp; Service Oper Mgmt/Service Operations

Sponsored Session

Chair: Song-Hee Kim, University of Southern California, Los Angeles, CA, 90089, United States

**1 - Labor Planning and Shift Scheduling in Retail Stores Using Customer Traffic Data**

Marcelo Olivares, Universidad de Chile, Beauchef 851, Santiago, Chile

This work combines empirical analysis of point-of-sales data, customer traffic and employee staffing, with optimization methods to build a decision support tool that can be used by managers to plan labor allocation and working schedules, balancing gross margins, labor costs and employee satisfaction. An econometric model is developed to estimate the effect of labor on sales in an hourly basis, decomposing the effect of labor into conversion and ticket value. The empirical results are used in mathematical program that seeks to find the best feasible schedule to maximize store profitability, accounting for labor regulation restrictions and practical constraints.

**2 - Sooner or Later? Learning from Delivery Speed Information**

Ruomeng Cui, Emory University, 1935 Ridgmont Lane, Decatur, GA, 30033, United States, Tianshu Sun

Online retailers who sell physical products need to inform customers how fast an order can be delivered. The delivery speed is a crucial service metrics that online retailers can easily adjust on the website. On one hand, an aggressive (faster) delivery estimate could meet more demand and thus may increase current sales. On the other hand, it may also raise the likelihood of customers experiencing a loss in time due to a longer than expected wait, which might hurt future sales. Collaborating with an online store selling custom products, we leverage the exogenous shipping policy change and use a difference-in-difference approach to examine whether and how consumers respond to the delivery information.

**3 - Spatially Differentiated Services: Bike-share, Ride-hailing, Etc.**

Karan Girotra, Cornell Tech, New York, NY, 10044, United States

We present the the key common patterns from our findings from collaborations with bike-share operators in Paris and London, ride-hailing companies and a shuttle service operator. We find that there are consistent patterns of commuter behavior and preferences in all these systems and use these patterns to provide guidance on the design of such systems.

**1 - Trade-off Analytics with Quantitative Set-based Design**

Eric Specking, University of Arkansas, 4207 Bell Engineering Center, Fayetteville, AR, 72701, United States, Gregory S. Parnell, Edward A. Pohl

Traditional system design (Point-Based Design), involves identifying and comparing a small number of design solutions. Set-Based Design (SBD) is an alternative approach that evaluates many points in sets of design choices. Repeatable quantitative techniques to perform SBD trade-off analysis of systems do not exist. This presentation will provide insights into SBD quantification literature and demonstrate mathematical methods to perform SBD trade-off analytics. These SBD techniques are enabled by an integrated MBE framework for system trade-off analytics using models and simulations.

**2 - Multi-objective Decision Analysis in Transportation System Planning**

Edward A. Pohl, Professor, University of Arkansas, Department of Industrial Engineering, 4207 Bell Engineering Center, Fayetteville, AR, 72701, United States, Bobby Cottam, Gregory S. Parnell

Decision analysis is important for designing an optimal transportation system. With a large variety of stakeholders, different types of users, and unique a set of considerations for every project multiple objective decision analysis is a useful tool to understand the tradeoffs and values of different alternatives in transportation planning. Resilience is another important consideration in transportation planning, between accidents weather and special events there are numerous times when a system is not functioning at optimal capacity, considering which alternatives perform best under adverse conditions can allow for a consistently higher level of service for travelers.

**3 - An Alternative to Heat-map Risk Matrices for Project Risk Prioritization**

Jamie Peter Monat, Professor of Practice, Worcester Polytechnic Institute, 100 Institute Road, Worcester, MA, 01609-2280, United States, Scott Doremus

Heat map risk matrices are widely used to prioritize risks. They are widely used in projects and programs structured for product development, business, construction, R & D, medicine, and politics. However, they suffer from several weaknesses, notably subjectivity, symmetry, category prioritization reversal, and a failure to account for Risk Aversion. Because of this, they can lead to serious mis-prioritization and mismanagement of risks. We propose an alternative to the standard risk matrix that accounts for these deficiencies and provides a significantly better risk prioritization tool. Two field trials were conducted to demonstrate the benefits of the alternative method.

**4 - Optimal Verification Strategies in Multi-firm Projects: A Multiscale Decision Theory Approach**

Aditya Umesh Kulkarni, Virginia Commonwealth University, 1008 East Clay Street, Box 980203, Richmond, VA, 23298-0203, United States, Alejandro Salado, Christian Wernz

Incentivizing verification activities of sub-contractors in multi-firm projects is a significant challenge for the main contractor. We present a belief-based model of verification that utilizes the multiscale decision theory (MSDT) modeling approach to determine optimal incentives and verification strategies in a multi-firm design project. Exact solution algorithms that determine optimal incentive and verification strategies are then presented for multiple scenarios. Our work contributes to MSDT and systems engineering literature by studying the hitherto unexplored problem of optimal verification and incentive strategies in multi-firm scenarios.

Sponsored Session

Chair: Manaf Zargoush

**1 - Predicting Health and Economic Outcomes of Providing Subsidy for Contraception in British Columbia, Canada**

Saied Samiedaluae, University of Alberta, 3-40C Business Building, Alberta School of Business, Edmonton, AB, T6G 2R6, Canada, Steven Shechter, Wendy Norman, Stirling Bryan

Almost half of pregnancies in Canada are unintended. Cost is among the major barriers to effective family planning methods and services. Extending government subsidy for contraception has proven to be a cost-effective intervention in many countries. However, in Canada there is a paucity of evidence to support such programs. In this research, we developed a simulation model that can predict the related health and economic cost and benefit streams likely to result from any policy change in this area, such as provision of universal subsidy for contraception.

## 2 - Support Clinical Decision Making Using Genetic Analytics

Cheng Zhu, McGill University, 701-801 Sherbrooke Est,  
Montreal, QC, H2L 0B7, Canada

Cancer has been one of the most dangerous risk factors to people's health during last few decades. Though there have been several mainstream interventions of cancer, oncologists do NOT have a unanimous decision on the optimal treatment for an individual diagnosed with a cancer. Based on a mRNA sample from the Gene Expression Omnibus (GEO), we are identifying the key modules for PDAC metastasis, in order to provide solid support for clinical decision making.

## 3 - Experience of Disability Among Older Adults

Manaf Zargoush, McMaster University, 1280 Main Street West-  
DSB 204, Hamilton, ON, L8S 4M4, Canada, Farrokh Alemi,  
Somayeh Ghazalbash

Limited information is available regarding the complex sequence of functional change and death for older adults. Clinicians use this information to set priorities for their treatments. Policymakers can use these data to set value-based incentives for care-providers. We fill the gap by using an innovative blend of several data analytics methods based on 1.8M functional assessments of 300K residents in VA Community Living Centers. We report details on the likelihood, duration until next event, and sequence of functional change and death. Such a patient-centric benchmark is vital to ensuring optimal care for persons in nursing home settings and can be used for planning for end-of-life disabilities.

Blacksburg, VA, 24061, United States

### 1 - Four Ways to Kill a Vampire: An Agent-based Simulation of the Emergence of Dominant Technologies

Christian Stummer, Prof., Bielefeld University, Universitaetsstr. 25,  
Bielefeld, 33615, Germany, Michelle D. Haurand

Although superior technologies often establish themselves as a standard in a market, sometimes an inferior one succeeds instead. We have developed an agent-based simulation as a means for studying the corresponding formation processes and for analyzing the effectivity of some management measures (e.g., marketing campaigns). As a field of application, we chose the (fictitious) world of vampires, in which humans must adopt weapon technologies to defend themselves against their supernatural adversaries. In the model, we account for learning effects, word of mouth, and normative social influence.

### 2 - Gradient Based Criteria for Sequential Experiment Design

Collin Erickson, Northwestern University, 2145 Sheridan Road,  
Room C210, Evanston, IL, 60208, United States,  
Bruce Ankenman, Matthew Plumlee, Susan M. Sanchez

Computer simulation experiments are commonly used as an inexpensive alternative to real-world experiments to form a metamodel that approximates the input-output relationship of the real-world experiment. While a user may want to understand the entire response surface, they may also want to focus on interesting regions of the design space, such as where the gradient is large. In this paper we present an algorithm that adaptively runs a simulation experiment that focuses on finding areas of the response surface with a large gradient while also gathering an understanding of the entire surface. We consider the scenario where batches of points can be run simultaneously, such as with multicore processors.

### 3 - A Methodology for Using Simulation as Tools for Collecting Data

Farhad Moeeni, Professor, Arkansas State University, Cit Dept,  
P.O. Box 130, State University, AR, 72467, United States

Data collection is a challenging and time-consuming phase of simulation modeling cycle. The task becomes more challenging when the data is related to human perception or behavior. One common approach for collecting such data has been surveys and interviews. Unfortunately, good survey instruments are hard to design and interviews or open-ended questionnaires are difficult to analyze and quantify. In order to alleviate these shortcomings, we propose a method to apply simulation systems as tools for collecting data on human behavior that otherwise is hard or impossible to collect. We will demonstrate the methodology through an example.

### 4 - A Dual-metamodeling Approach for Robust Optimization in Simulation

Wenjing Wang, Virginia Polytechnic Institute and State University,  
1145 Perry Street, Durham 106, Blacksburg, VA, 24061,  
United States, Xi Chen

In this work, we propose a dual metamodeling approach for robust optimization in simulation. We will investigate different dual-metamodeling approaches for robust optimization in simulation, including a dual Gaussian process model which models the mean and variance response surfaces separately and a variational inference-based heteroscedastic Gaussian process approach that models these two surfaces simultaneously. The performance of the proposed approaches will be demonstrated through numerical examples.

## 5 - An Efficient Morris Method-based Framework for Simulation Factor Screening

Xi Chen, Assistant Professor, Virginia Tech, 1145 Perry Street,  
Blacksburg, VA, 24061, United States

We study the methodological underpinnings of the Morris's elementary effects method, a model-free factor screening technique originally proposed for deterministic simulation experiments, and develop an efficient Morris method-based framework (EMM) for simulation factor screening. Equipped with an efficient cluster sampling procedure, EMM can simultaneously screen the main and interaction (or nonlinear) effects of all factors and control the overall false discovery rate at a prescribed level. We reveal the connections between EMM and other factor screening methods and examine the resulting implications under some commonly stipulated assumptions in design of experiments.

## ■ TE43

### Long-term Sustainable Energy/Power System Expansion Planning

Emerging Topic: Energy and Climate

Emerging Topic Session

Chair: Qipeng Zheng, University of Central Florida, FL, United States

### 1 - A Multistage Decision-Dependent Stochastic Bi-level Programming Approach for Power Generation Investment Expansion Planning

Qipeng Phil Zheng, University of Central Florida, 12800 Pegasus  
Dr., P.O. Box 162993, Orlando, FL, 32816, United States,  
Yiduo Zhan

We propose a bi-level optimization model that includes an upper-level multistage stochastic nonlinear expansion planning problem and a collection of lower-level problems that solves for economic dispatch problems under different scenarios. This model seeks for the optimal sizing and siting for both thermal and wind power units to be built to maximizing the expected profit for a profit-oriented power investor. We design probability distribution functions of decision variables and input parameters based on the economies-of-scale theory in electricity systems. We develop a solution algorithm based on column generation for this program.

### 3 - Proximal-based Dual Decomposition Algorithms With Applications To Capacity Expansion

Run Chen, Purdue University, West Lafayette, IN, United States,  
Andrew Lu Liu

Power grids' planning and operation exhibit extreme multi-scale, ranging from hourly operation to decades of planning. We use proximal-based predictor-corrector enabled dual decomposition to decouple the linkage between different time-scales, proposing a distributed algorithm where primal-minimization is decomposed into massive parallel sub-problems. Convergence is established, as well as the linear convergence rate. Explicit non-anticipativity constraints are used to deal with stochasticity. Applications demonstrate significance of considering ramping constraints in finer time-scale.

### Renewable Energy

Sponsored: Energy, Natural Res & the Environment/Electricity

Sponsored Session

Chair: Ming Jin, UC Berkeley, Berkeley, CA, 94720, United States

Co-Chair: Somayeh Sojoudi, University of California-Berkeley,  
Berkeley, CA, 94703, United States

### 1 - Risked Investment in Renewable Electricity Generation

Andy Philpott, University of Auckland, Dept of Engineering  
Science, Private Bag 92109, Auckland, New Zealand,  
Michael C. Ferris

Using data from New Zealand, we discuss models of the national electricity system that will deliver 100% renewable electricity. Wind and solar energy are intermittent, and run-of-river hydroelectricity plants convert uncertain inflows into uncertain levels of energy, so the planning problem must account for these uncertainties. To compensate, hydroelectric reservoirs provide a means of storing energy, and geothermal power provides a predictable base-load energy source. We compare a socially optimal solution with one that arises from competitive equilibrium with risk-averse investors.

## 2 - Leveraging Machine Learning Approach to Optimize the Participation of a Wind and Storage Power Plant

Md. Noor-E-Alam, Northeastern University, 360 Huntington Ave, Boston, MA, 02021, United States, Jose L. Crespo-Vazquez, Jose A. Martinez-Lorenzo, C. Carrillo, E. Diaz-Dorado

In this talk, we will introduce a robust decision making framework for a wind and storage power plant participating in day-ahead and reserve markets. At first we discuss our proposed two-stage convex stochastic model to maximize the net benefit. Then we discuss a number of machine learning techniques used to generate influential scenarios to be used in our proposed stochastic model. Finally, we will share our results obtained from several simulation experiments to evaluate the quality of the proposed stochastic approach using real-world wind farm data.

## 3 - Volatility, A Barrier to Renewable Energy Future

Jingxing Wang, University of Michigan, 1205 Beal Ave., Ann Arbor, MI, 48109, United States, Romesh Saigal, Eunshin Byon, Abdullah Alshelahi

Renewable energies, such as solar and wind, create volatilities in the power system, causing problems for the management of the power grid. The battery technology can be used to stabilize the volatile solar and wind energy power output. We use the principal multi-agent contract theory to model an aggregator who will bid the stabilized wind farm output to the ISO.

## 4 - A Structural Estimation Analysis of the Strategic Switching of Peaking Generators

Stein-Erik Fleten, Norwegian University of Science & Technology, Dept of Ind Econ & Tech Mgmt, Trondheim, Norway, Benjamin Fram, Alois Pichler, Carl J. Ullrich

We analyze the real options to shutdown, startup and abandon peak power plants. The plants' status for a given year is either operating, in standby or retired. The analysis is made using data for 1,121 individual power plants for the period 2001-2009, and peakers in PJM 2001-2016. We estimate the irreversible costs of switching status by structural estimation of a real options model. The results on switching and maintenance costs are new to the literature. There is a marked difference in behavior after the introduction of capacity payments in PJM.

## TE45

### 1 - Modeling and Solving Conservation Management Design Problem

Andres P. Weintraub, Universidad de Chile, Dept De Ingenieria Industrial, Republica 701 Casilla 86-D, Santiago, Chile, Jordi Garcia-Gonzalo, Eduardo Ivarez-Miranda, Virgilio Hermoso, Jos Salgado

We propose a MIP-based framework for modeling and solving a multi-action and multi-species conservation management design problem; we seek for plans that maximize ecological benefit and minimize spatial fragmentation, simultaneously, while ensuring an implementation cost no greater than a given budget. Using a case study from northern Australia, we show how the methodology exploits the trade-offs among the ecological, spatial and cost criteria, enabling to explore and analyze a broad range of conservation plans, and to select the one exhibiting the best quantitative and qualitative outcomes.

### 2 - New Stochastic Cell Based Fire Management Simulator

Cristobal Pais, PhD Student, University of California Berkeley, Berkeley, CA, 94720, United States, Jaime Carrasco, David L. Martell, Andres P. Weintraub, David L. Woodruff

Cell2Fire is a new stochastic cell-based woodland fire spread simulator. Incorporating fuel and fire models from the Canadian Fire Behavior Prediction (FPB) System, it is designed for assessing the impact of harvesting designated forest stands on landscape flammability and expected losses in a heterogeneous landscape. Cell2Fire exploits parallel computations allowing users to run large-scale simulations. It can be easily integrated with harvesting management decision models in order to determine the optimal forestry planning. Real instances are tested and compared to existing state-of-the-art simulators outputs for performance comparison. Future extensions are discussed.

### 3 - Smart Control of Fleets of Electric Vehicles in Smart and Connected Communities

Erotokritos Skordilis, PhD Student, University of Miami, 5202 University Dr, Coral Gables, FL, 33146, United States, Ramin Moghaddas

We present a multi-objective mixed integer-linear program for the electric vehicle (EV) charging scheduling problem. The proposed mathematical framework was developed from the perspective of optimal EV assignment to charging stations between specific time intervals. Static and dynamic model approaches were considered. As solution approaches, the augmented  $\epsilon$ -constraint method and a modified weighted-sum method were utilized. Scheduling results based on a real world charging station network and a large number of simulated EVs are

demonstrated.

### 4 - Real Time Localization of Objects via Passive RFID and KNN with Dynamic Neighborhood Selection Algorithm

Bijoy Dripta Barua Chowdhury, University of Arizona, Tucson, AZ, 85716, United States, Sara Masoud, Young-Jun Son

In this work, a novel localization framework is proposed to localize objects using a real-time, passive Radio Frequency Identification (RFID) system. After generating a statistically adequate regression model based on Received Signal Strength Indicator (RSSI), a fingerprinting database is generated to localize the tags based on dynamic k-nearest neighborhood (KNN) algorithm. The proposed framework continuously updates the models which makes it adaptable to the environmental changes. Experimental results at different scenarios demonstrate the effective performance of the proposed framework for localizing objects in dynamic environments.

### 5 - Sparse Modeling Approach for Optimizing Temperature-sensor Placements in Greenhouses

Tatsuya Ishikawa, IBM Research, Tokyo, Japan, Kenji Komiya

In greenhouse farming, controlling temperature is essential for crop growth. However, farmers often operate thermal equipment without knowing the details of temperature distributions. Deploying a large number of sensors can be a solution but is expensive and obstructive. To minimize the need for such intensive measurements, we developed a model that predicts temperature distributions from a small number of sensors. The sensors are selected using group regularization, such as the multi-task Lasso, that forces the model to reconstruct all sensor values of a pilot deployment from a subset of these values. Our experiments using real-world greenhouse data indicate the effectiveness of our approach.

## TE46

North Bldg 228B

## Natural Gas Markets

Sponsored: Energy, Natural Res & the Environment/Energy

Sponsored Session

Chair: Felipe A. Feijoo, Pontificia Universidad Calotica de Valparaiso, Chile

### 1 - The Economic Impact of Price Controls on China's Natural Gas Supply Chain

Felipe A. Feijoo, Pontificia Universidad Calotica de Valparaiso, Av. Brasil 2241, Office 6-8, Valparaiso, Chile, Bertrand Rioux, Philipp Galkin, Axel Pierru, Frederic H. Murphy, Kang Wu

We developed a Mixed Complementarity Problem (MCP) model of China's natural gas industry. The model was used to design several scenarios to assess how government pricing policies and restricted third party access to midstream infrastructure impacted the supply logistics of China's profit maximizing natural gas firms. We find that lifting the price caps for regulated natural gas demand sectors could yield a 4.7% reduction in total system cost and reduce the national average marginal supply cost by 16%. Liberalized prices combined with improved third party access to pipeline and regasification infrastructure would result in 2.2 billion USD costs saved (7.6%) and a 16% reduction in the spot price.

### 2 - A Framework for Calibrating Transportation Models:

#### A Spatial Price Equilibrium Based Method

Charalampos Avraam, Johns Hopkins University, Felipe A. Feijoo, Richard Poulton, Sauleh Ahmad Siddiqui

The lack of detailed cost data in the Natural Gas sector implies that there will exist more than one calibration that can reproduce a given baseline scenario for a planning model, leading to different responses under the same scenarios. Given the produced, consumed and traded quantities of all modeled regions, we propose a two - stage method for the exact calibration of such models. Stage 1 reconciles the physical system. Stage 2 uses the results of stage 1 and calibrates model parameters using a variation of Spatial Price Equilibrium that exploits the economic interpretation of the dual variables of the model. We implement our method to a transportation model of the North American Natural Gas Market.

### 3 - Locational Valuation of Natural Gas Subject to Pipeline Engineering Constraints

Anatoly Zlotnik, Los Alamos National Laboratory, Aleksandr Rudkevich

We present a pricing mechanism that maximizes social welfare for a pipeline network that delivers natural gas from suppliers to consumers. Engineering constraints on local pressures and energy applied by gas compressors are incorporated. Optimality conditions yield expressions for locational trade values (LTVs) for gas and a decomposition of LTVs into components corresponding to energy, compression, and congestion. We demonstrate that price and pressure differentials between nodes have the opposite sign, so that price cannot decline in the direction of flow, and prove that the pricing mechanism is revenue adequate.

#### 4 - Capturing Industrial Co2 Emissions in Spain: Infrastructures, Costs, and Break-even Prices

Olivier Massol, IFP School & City, University of London, 228 av. Napol on Bonaparte, Rueil-Malmaison, 92852, France, St phane Tchung-Ming, Albert Banal-Estanol

We examine the conditions for the deployment of a largescale CO2 pipeline and storage infrastructure in Spain by 2040. Our approach combines optimization and cooperative game-theoretic concepts. It allows to determine the optimal infrastructure needed to connect a geographically disaggregated set of emitting and storage clusters, along with the threshold CO2 values necessary to ensure that the considered emitters will make the necessary investment decisions. Policy implications derived from this model concern the elaboration of relevant, pragmatic recommendations to envisage CCS deployment locally, focusing on emitters with lower substitution options toward low-carbon alternatives.

### Risk-Averse Stochastic Modeling and Optimization

Emerging Topic Session

Chair: Jose Luis Walteros, University at Buffalo, SUNY, 413 Bell Hall, Buffalo, NY, 14260, United States

#### 1 - Risk-Averse Stochastic Modeling and Optimization

Nilay Noyan, Sabanci University, Sabanci University, Orhanli/Tuzla Istanbul, 34956, Turkey

The ability to compare random outcomes based on the decision makers' risk preferences is crucial to modeling decision making problems under uncertainty. In this tutorial, the primary focus is on the stochastic preference relations based on the widely-applied risk measure conditional value-at-risk (CVaR) and the second-order stochastic dominance (SSD). We present single- and two-stage stochastic optimization problems that feature such risk-averse preference relations. We discuss the main computational challenges in solving the problems of interest, and for finite probability spaces we describe alternative mathematical programming formulations and effective solution methods.

North Bldg 229B

### Sustainability and the Triple Bottom Line: Social, Environmental (or Ecological) and Financial

Sponsored: Energy, Natural Res & the Environment Environment & Sustainability

Sponsored Session

Chair: Jose Cruz, University of Connecticut, Hartford, CT, 06103, United States

#### 1 - The Sustainable Supply Chain Network Competition with Environmental Tax Policies

Dong Li, PhD, Babson College, Wellesley, MA, United States, Min Yu, Jose Cruz

This model captures different environmental tax policies in a multitiered supply chain network competition context. We investigate the impacts of emission tax policies and product differentiation on competing firms, and compare the effects of different environmental policies on firms' decisions and total emission. The results indicate that the implementation of such policies along with an increase in consumers' environmental concerns can not only motivate the firms to perform sustainable operations, but also reduce the total carbon footprint. This model can be used by firms and policymakers to evaluate the effects of different environmental tax policies in a supply chain competition context.

#### 2 - Risk Sharing Contracts in Sustainable Supply Chains

Shivani Shukla, PhD, University of San Francisco, San Francisco, CA, United States

In this paper, we develop a framework that captures the effects risk sharing contracts in sustainable supply chain management. In particular, we analyze the impact of strategic sharing on supply chain disruption risks and costs and we evaluate the supply chain performance of risk sharing contracts. The numerical examples highlight that it is not a priori clear which participant in the supply chain network will benefit from increased information sharing activities. Our models indicate that the beneficiary of reduced information sharing costs is in some cases dependent on the negotiation power of participants and that it is also dependent on the type of risk sharing contract used.

#### 3 - Quality in Competitive Fresh Produce Supply Chains with Application to Farmers' Market

Deniz Besik, Isenberg School of Management at UMass Amherst, 77 North Prospect, Amherst, MA, 01002, United States, Anna Nagurney

In this paper, we first present explicit formulae for fresh produce quality deterioration based on chemistry and temperature. We then focus on farmers' markets. The popularity of farmer's markets has been growing internationally due to consumers' greater awareness. Farmers' markets, as examples of direct to consumer channels and shorter supply chains, are then studied in the framework of game theory in both uncapacitated and capacitated versions. Illustrative examples in the case of peaches and various scenarios, including production disruptions, in a case study of apples in Massachusetts, provide quantitative evidence of the applicability of our supply chain network approach.

#### 4 - Supply Chain Network Competition Among Blood Service Organizations: A Generalized Nash Equilibrium Framework

Pritha Dutta, University of Massachusetts-Amherst, 9L Brandywine Drive, Amherst, MA, 01002, United States, Anna B. Nagurney

We present a Generalized Nash Equilibrium model of supply chain network competition among blood service organizations which compete for donors and business from hospitals. The model incorporates link capacities, associated arc multipliers to capture perishability, bounds on number of donors, and lower and upper bounds on the demands. The concept of a variational equilibrium is utilized to transform the problem into a variational inequality problem. The proposed algorithmic procedure is applied to numerical examples in order to illustrate the impacts of disruptions on RBC prices, net revenues of the blood service organizations, and their overall utilities.

North Bldg 230

### Practice- Game Theory I

Contributed Session

Chair: Ben Hermans, KU Leuven, Naamsestraat 69, Leuven, 3000, Belgium

#### 1 - Spectrum Measurement Markets for Tiered Spectrum Access

Arnob Ghosh, Post-Doctoral Research Associate, Purdue University, 300 N. Grant Street, West Lafayette, IN, 47905, United States,, Randall Berry, Vaneet Aggarwal

The framework for spectrum sharing in the 3.5 GHz band allows for Environment Sensing Capability operators (ESCs) to measure spectrum occupancy to enable commercial users to use this spectrum when it is idle. We consider a scenario in which two spectrum access firms (SAs) seek to access a shared band of spectrum and must purchase spectrum measurements from one of two ESCs. Given the measurements they purchase, the SAs compete on price to serve customers. We consider two cases. When the SAs share the same single band of spectrum, having different qualities of measurements available to different SAs can lead to better economic welfare. When each has a separate licensed band, this difference does not matter.

#### 2 - Coffee Supply Chain Optimization with Respect to Real Value of the Water

Shervin Espahbod, PhD Student, Wilfrid Laurier University, Waterloo, ON, Canada, Michael Houghton

On average, each cup of coffee consumes 500 liters of water. Water footprint clarifies whether the source of water for each product or activity is sustainable or unsustainable. We measured how awareness about water footprint and water taxation of products can shift consumption behavior. First, our behavioral survey explained average global water footprint of verity of coffee. Second, different coffee brands (e.g., Starbucks coffee, Tim Hortons) have different water footprints. With respect to the real value of water that brands consume, they maximize their total profits in an optimal Nash equilibrium.

#### 3 - Two-stage Invest-defend Game: Balancing Strategic and Operational Decisions

Abdolmajid Yolmeh, Rutgers, The State University of New Jersey, 96 Frelinghuysen Road CoRE Building, Room 201, Piscataway, NJ, 08854, United States, Melike Baykal-G rsoy

Protecting infrastructures involves making both strategic and operational decisions. Although usually analyzed separately, these decisions influence each other. To this end, we present a game-theoretic, two-stage model between a defender and an attacker involving multiple target sites. In the first stage, the defender (attacker) allocates investment resources to target sites in order to improve the defense (attack) capabilities. In the second stage, the players decide which target site to defend or to attack. The results reveal that an increase in defense (attack) investments on a target site (increases) decreases the probability of both defending and attacking that target.

#### 4 - Why Low Quality Firms Facilitate P2P Sharing While High Quality Firms do Not

Chenchen Di, UIUC, Champaign, IL, 61820, United States,  
Yunchuan Liu

We study whether and when should a firm actively facilitate consumers' sharing behavior by reducing transaction costs in a competitive market considering consumer usage uncertainty and consumer heterogeneity in transaction costs. This research provides another rationale for seller-induced sharing strategy. We show that seller-induced sharing behavior depends on consumers' usage uncertainty: when consumers face the great uncertainty of future needs, firms can actually benefit from facilitating consumer sharing by making it more convenient. In competitive sharing markets, the low-quality firm will choose to facilitate consumer sharing, and the high-quality firm will not.

#### 5 - Timely Exposure of a Secret Project: Which Activities to Monitor?

Ben Hermans, PhD Student, KU Leuven, Naamsestraat 69,  
Leuven, 3000, Belgium, Herbert Hamers, Roel Leus, Roy Lindelauf

A defender wants to detect as quickly as possible whether some attacker is secretly conducting a project that could harm the defender. The attacker, in turn, schedules his tasks so as to remain undiscovered. One pressing question for the defender is: which activities to focus intelligence efforts on? We model the situation as a zero-sum game, establish that the late start schedule is a dominant attacker strategy, and derive a dynamic program that identifies the defender's optimal response. We evaluate the harm-reduction thanks to each task's intelligence effort by means of the Banzhaf value and illustrate our methods on a nuclear weapons development project.

### TE50

North Bldg 231A

#### Practice- Retail Management I

Contributed Session

Chair: Rachel Rong Chen, University of California-Davis, 3208  
Gallagher Hall, One Shields Avenue, Davis, CA, 95616, United States

#### 1 - Differential Effects of Product Variety on Retailing Performance

Guanyi Lu, Florida State University, Tallahassee, FL, United States,  
Hyunseok Lee, Junbo Son

Using transaction-level data from a local grocery store, we study how different types of product variety affect retailing sales and profit. Our results have managerial implications on product assortment, which may help retailers achieve better performance.

#### 2 - Dynamic Labour Allocation to Improve Store Performance

Shandong Mou, University of Auckland, 12 Grafton Road, Room  
5121, OGGB, Auckland, 1142, New Zealand, David Robb

Despite considerable research on workforce planning, there is limited coverage of real-time labour allocation - a common practice to address real-time mismatches between the demand and supply of labour among departments. We propose a mathematical framework modelling real-time labour allocation and construct heuristics in the context of retail stores. We conduct simulation experiments to compare the performance of heuristics with static and intuitive policies. Simulation results show proposed heuristics outperform other policies.

#### 3 - The Impact of Capacity Changes on Labor Productivity in Retailing

Chien-Ming Chen, Nanyang Technological University-Singapore,  
50 Nanyang Avenue, Singapore, 639798, Singapore,  
Hao-Chun Chuang

Matching in-store staffing level with shopper traffic has been a long-standing principle in retail operations. Using data from a large retail chain, we show that increment of manpower can adversely affect marginal labor productivity in the conversion and sales-generation process. Our findings suggest that managers should be wary of the dark side of capacity increment in the retail environment.

#### 4 - Product Returns, Rebates, and Restocking Fees

Rachel Rong Chen, University of California-Davis, 3208 Gallagher  
Hall, One Shields Avenue, Davis, CA, 95616, United States,  
Eitan Gerstner, Daniele Ragaglia, Paolo Roma

We compare the profitability of rebate and restocking fee policies to manage consumer product returns. We show that the use of rebates can be more profitable than the commonly used restocking fee policy under certain conditions.

### TE52

North Bldg 231C

#### Flash Session III

General Session

Chair: INFORMS, 5521 Research Park Drive, Suite 200, Catonsville,  
MD, 21228, United States

#### 1 - Eco-conscious Returns for Retail

Andrew Downard, Senior Product Manager, Happy Returns,  
1106 Broadway, Santa Monica, CA, 90401, United States

Much of the cardboard used for online shopping is from the high return rates and the inefficiency of individual returns by mail. At Happy Returns, we created a new box-free return model designed for minimal environmental impact. Returns are accepted at a nationwide network of 250+ Return Bars at the beginning of the process and shipped in bulk in reusable packaging to nearby hubs for routing to the most efficient destinations. In this presentation we quantify the environmental impact of box-free returns, and share our vision for making returns even happier for shoppers and for the environment.

#### 2 - A Note on Newsvendor Problem with Optimism Coefficient

Milena Bieniek, Maria Curie-Skłodowska University Lublin,  
Lublin, Poland

We study the satisfying newsvendor problem, where the optimal order quantity is chosen by the maximization of the probability of exceeding the expected profit multiplied by a positive constant. This constant called optimism coefficient can be chosen by the firm's management by preference or by available market opportunities. The coefficient indicates whether we deal with low or high optimistic decision maker. For general demand distribution the results are significantly dependent on this coefficient. The numerical example is given for normally distributed demand.

#### 3 - Minimizing Idle Time and Late Start Time in Surgery Using Simulation

Vikas Agrawal, Jacksonville University, 204 Ann Scott Drive,  
Saint Johns, FL, 32259, United States, Aber Elsaleiby, Yue Zhang,  
P. Sundararaghavan, Andrew Casabianca

In this paper, we address a surgery scheduling problem in a hospital setting. Typically surgeries can be started only on or after the scheduled start time. Given that surgery time is stochastic in nature, it can go beyond the scheduled finish time in which case the next scheduled surgery will be delayed. Likewise, a surgery can be finished earlier than the scheduled finish time in which case the operating room will remain ideal until the start of next scheduled surgery. Both of these situations are undesirable. For this problem, we develop a simple method to assign start times so as to minimize the sum of idle times of the OR and late start times of the surgeries.

#### 4 - Approximating Maximin Fair Guarantee

Setareh Taki, University of Illinois at Urbana-Champaign,  
Champaign, IL, United States, Jugal Garg

We present new results in allocating indivisible items to agents which is within a constant factor of their maximin share.

#### 5 - Using Real-time Operational Data to Increase Labor Productivity in Retail

Pablo Jofr, Universidad de Chile, Beaucheff 851, Santiago,  
8370456, Chile, Marcelo Olivares, Andres I. Musalem

This research is focused on developing models to support dynamic systems that can reassign labor to different activities. This work utilizes data from a pilot study in a store of a home improvement retail chain in the U.S. Security cameras were used to track the number of customers and employees on different sections. We use these operational data to measure - in real time - the demand for services in a specific store department, and the service capacity. This information can be linked to point of sales data, to measure the effect of the number of employees on the sales of specific departments. All this provide information for a dynamic labor allocation system in order to prioritize where to allocate employees.

#### 6 - A Grounded Theory Model for Big Data in Supply Chain

Mohammad Baitalmal, PhD Candidate, University of North Texas,  
Denton, TX, 76210, United States  
Mohammad Baitalmal, PhD Candidate, King Saud University,  
Riyadh, Saudi Arabia, Victor R. Prybutok, Abdulrahman Habib

This research investigates the big data phenomena within supply chain and logistics using interviews to undertake a grounded theory approach. The current state of the literature indicates a gap in understanding the impact of big data's emergence on the supply chain. To answer the call of Waller and Fawcett (2013) for detailed inductive research to understand changes in the supply chain as a result of using big data. The results of this research provide a theoretical framework that relates big data and the supply chain.

### 7 - A Novel Dynamic Routing Framework for Shared Mobility Services

Yue Guan, PhD. Candidate @ MIT, Massachusetts Institute of Technology, 77 Massachusetts Avenue, Room 3-339K, Cambridge, MA, 02139, United States

Shared Mobility on Demand (MoD) services like Uber, Lyft, and Didi have shown that a continuum of solutions can be provided between traditional private transport and public mass transit. Here we propose a novel shared MoD framework which generates a dynamic route for multi-passenger transport, using a new concept of space window that introduces a degree of freedom to help reduce system cost in designing the optimal route. An Alternating Minimization based algorithm is developed. Its analytical properties are characterized. Detailed computational experiments are carried out that demonstrate its advantages in computational efficiency and optimality compared to standard optimization solvers.

### 8 - Dynamic Capabilities for Sustainable Smart Cities

Abdulrahman Habib, University of North Texas, 1404 Sombre Vista Drive, Denton, TX, 76205, United States, Victor R. Prybutok

This study explores the application of dynamic capabilities in smart city parking solutions. Dynamic capabilities theory includes a cycle of *æsense*, *æseize*, *æalign*, and *ætransform*. In the posited model the city can *æsense* problems and *æseize* data to make it available for data mining and machine learning that *ætransforms* the problems in parking and allow solutions. Sensing allows ongoing data evaluation and provides an opportunity for continuous quality improvement. This approach *æaligns* with a comprehensive sustainable smart city strategy.

### 9 - Fast Computation of Global Solutions to the Single-period Unit Commitment Problem for Electricity Market Applications

Zhibin Deng, University of Chinese Academy of Sciences, 80 E. Zhong Guan Cun, BLVD 7 RM 221, Beijing, 100190, China

The single-period unit commitment problem has significant applications in electricity markets. This paper proposes an extremely efficient global optimization algorithm for solving the problem. We propose a conjugate function based convex relaxation and design a special dual algorithm to compute a tight lower bound of the problem in  $O(n \log n)$  complexity. Computational experiments show that the proposed algorithm solves test instances with 500 integer variables in less than 0.01 seconds, whereas current state-of-the-art solvers fail to solve the same test instances in one hour.

### Multi-unit Auctions

Sponsored: Auction and Marketing Design

Sponsored Session

Chair: Kyle Woodward, University of North Carolina at Chapel Hill, Chapel Hill, NC, 27599-3305, United States

#### 1 - Multi-product Supply Function Equilibria

Par Holmberg, Research Institute of Industrial Economics, Grevatan 34, Stockholm, SE10215, Sweden, Keith Ruddell, Bert Willems

We solve for Nash equilibria in a procurement auction with two heterogeneous divisible goods and a uniform price for each good. There are (dis)economies of scope in production and goods could be substitutes or complements for the procurer. Before demand is realized, each firm offers a vector of supply functions where supply of a good depends on the prices of both goods. We show that payoffs and the allocation of underlying goods are invariant to bundling. For quadratic costs and linear demand, bundles can be chosen such that it is equivalent to trade divisible packages in two separate auctions. Such packaging simplifies the analysis of and the operation of a multi-product auction

#### 2 - Random Mechanisms for the Sale of Divisible Goods

Kyle Woodward, University of North Carolina at Chapel Hill, Department of Economics, Gardner Hall, CB #3305, Chapel Hill, NC, 27599-3305, United States

Uniform-price and discriminatory auction formats are used to allocate many divisible commodities, but which of these two formats generates better outcomes is both theoretically and practically ambiguous. I investigate mechanisms which are convex combinations of these two formats. I provide a characterization of equilibrium in this model, and prove uniqueness of equilibrium in a natural class. With linear marginal values, the discriminatory auction strictly revenue-dominates any convexification of the two auction formats. I show that the equilibrium multiplicity of the uniform-price auction smoothly disappears as the convexification tends toward a discriminatory auction.

### 3 - Coordinating Capacity Negotiations In Semiconductor Industry

Ankit Bansal, North Carolina State University, 304, Daniels Hall, 111 Lampe Drive, Raleigh, NC, 27695, United States, Reha Uzsoy, Karl Kempf

We model the negotiations between multiple product development groups (PDGs) and a manufacturing group (MFG) for access to manufacturing capacity to support product development activities in the semiconductor industry. We develop an iterative combinatorial auction framework based on Lagrangian relaxation that maximizes corporate profit subject to the resource constraints of both organizations. We consider the case when MFG and PDGs receive limited budgets from corporate management who acts as a trader for both groups. The approach aims to achieve coordinated decisions between the two groups with reasonable duality gaps and constrain them to behave truthfully in the negotiation framework.

### 4 - Refund Of Uncertainty-reducing Project Preparation In Procurement Auctions

Marion Ott, RWTH Aachen University, Templergraben 64/V, Aachen, 52062, Germany, Karl-Martin Ehrhart, Ann-Katrin Hanke

This paper analyzes second-price procurement auctions in which bidders can take costly pre-auction measures that reduce their uncertainty about their costs for their offered good or service. An example is project preparation for auctions for renewable energy support. The measures are either mandatory or optional prior to the auction, but need to be taken prior to project realization. For both cases, we investigate the effect of a refund of the costs for the measures by the auctioneer on his procurement costs, on the participation level in the auction, and on the probability of an efficient outcome. We compare different refunding options.

North Bldg 232C

### Managing Innovation in Novel Contexts

Emerging Topic: New Product Development

Emerging Topic Session

Chair: Xiaoyang Long, University of Wisconsin-Madison, Madison, WI, United States

#### 1 - Optimal Incentive Contracts in Project Management

Anyan Qi, The University of Texas at Dallas, 800 W. Campbell Rd SM 30, Richardson, TX, 75080, United States, Milind Dawande, Ganesh Janakiraman, Qi Wu

We study the contract-design problem faced by a firm for executing a project consisting of multiple tasks, each of which is performed by an individual contractor whose efforts (work-rates) are not observable. We study the case when these tasks can be performed in parallel as well as the case when they have to be performed sequentially.

#### 2 - Do Business Method Innovations Create Value. A Study of Public U. S. Firms in Manufacturing and Distribution

Tian Chan, Emory University's Goizueta Business School, 1300 Clifton Road, Atlanta, GA, 30322, United States, Anandhi S. Bharadwaj, Deepa Varadarajan

Ever since Amazon patented their "1-click" ordering method, there has been significant interest in understanding the value potential of business method patents. In this study, we examine the impact of business method patents on the financial performance of public US manufacturers and distributors, and find that firms investing in high-quality business method patents generate higher market value.

#### 3 - Patent Grant Delays and Inventors' Future Patenting

Param Pal Singh Chhabra, Student, Georgia Institute of Technology, 800 West Peachtree NW, Atlanta, GA, 30308, United States, Manpreet Singh Hora, Karthik Ramachandran

Patent grant delays have the potential of negatively affecting future patenting activities of inventors. Utilizing patents application data, spanning more than three decades, published by the USPTO, we verify this negative relationship. Our results also confirm that the negative relationship is more pronounced in lone-inventors (as compared to teams), and co-inventors (as compared to a prime inventor) in a team.

#### 4 - Employee Mobility and Process Innovation in Manufacturing

Fabian J. Sting, University of Cologne, Albertus-Magnus-Platz, c/o WiSo-Sekretariat Universitaetsstrasse 91, Cologne, 50923, Germany, Philipp Benjamin Cornelius, Bilal Gokpinar

Production employees can be a valuable source of innovative ideas to improve operational efficiency. We empirically investigate how mobility affects the innovation value created by those employees. We examine the immediate and long term (static and dynamic) implications as well as the role of direction of employee moves on innovation outcomes.

## ■ TE56

### Decision-making in Drug Research and Development

Sponsored: Health Applications

Sponsored Session

Chair: Alba Rojas-Cordova, Southern Methodist University, Dallas, TX, 75219, United States

#### 1 - An Approximation Approach for Response Adaptive Clinical Trial Design

Vishal Ahuja, Southern Methodist University, Cox School of Business, P.O. Box 750333, Dallas, TX, 75275, United States, John R. Birge

Multi-armed bandit problems exemplify the exploration vs. exploitation tradeoff. For many practical problem, the state space is intractably large, rendering exact solution approaches impractical. We propose a novel approximation approach that combines grid-based techniques, simulation, and methods to improve approximation accuracy, to obtain near-optimal solutions with minimal added computational burden.

#### 2 - Drug Shortages and Pharmaceutical Supply Chain Reliability

Emily L. Tucker, University of Michigan, Ann Arbor, MI, 48105, United States, Mark S. Daskin, Burgunda V. Sweet, Wallace J. Hopp

A major barrier to effective patient care is drug availability. Shortages within the United States are prevalent and are largely driven by supply chain resiliency decisions. We present a new model of pharmaceutical supply chain reliability to analyze the effect of design decisions on drug availability. We discuss competitive extensions.

#### 3 - Analysis of Medicines Shortages in Europe

Vincent Hargaden, University College Dublin, School of Mechanical & Materials Engineering, Engineering & Materials Science Centre, Belfield, DUBLIN 4, Ireland, Rachel Ward, Eoghan O'Reilly

The issue of medicines shortages across Europe has been receiving increased attention recently from governments, regulatory agencies and healthcare providers. We report on the work of a European Union research project "European Medicines Shortages Research Network - Addressing Supply Problems to Patients", funded by the Cooperation in Science and Technology (COST) program. This talk will focus on approaches (e.g. system dynamics) and analysis of the downstream supply chain issues which lead to shortages at both hospital and community pharmacies.

#### 4 - Adaptive Trial Supply Optimization

Wei-An Chen, Purdue University, Weldon School of Biomedical Engineering, MJIS Building, Room 1052, West Lafayette, IN, 47907-2032, United States, Nan Kong

As adaptive clinical trials receive growing attention, they incur additional challenges to drug supply chain management. Targeting on commonly-used adaptation schemes, size re-estimation and dosage dropping, we developed a stochastic production-inventory-distribution optimization model under participant enrollment and trial size uncertainty, which addresses important aspects such as trial span, resupply policy, drug wastage. Our numerical study shows our model can deliver promising operational responses from the supply chain aspect to the trial design adaptiveness.

## ■ TE57

### Joint Session HAS/DM: Modeling for Complex Conditions: Acute and Chronic

Sponsored: Health Applications

Sponsored Session

Chair: Julie Simmons Ivy, North Carolina State University, Raleigh, NC, 27695-7906, United States

#### 1 - Handling Missing Data in Severity of Illness Score Development: The Knowledge of Missing Information Combined with Imputation Improves Predictive Power

Joseph Kapena Agor, North Carolina State University, Raleigh, NC, 27606, United States, Osman Ozaltin, Julie Simmons Ivy, Muge Capan, Ryan Arnold, Santiago Romero-Brufau

The objective of this work is to quantify the impact of missing and imputed variables on the performance of prediction models used in the development of sepsis-related severity of illness scoring systems using EHR data. We find that there is a significant increase in performance when moving from models that do not indicate missing information to those that did ( $p$ -value $\leq 0.001$ ). This

increase is higher in models that use summary scores compared to those that use all variables as predictors. We conclude that there is important clinical information in the fact that certain fields are missing in EHR data and the development of scoring systems can perform better by considering which variables are missing.

#### 2 - Real-time Prediction Of Sepsis In Hospitalized Adults Using Continuous Bedside Physiological Data Streams

Franco van Wyk, University of Tennessee, Knoxville, TN, United States, Anahita Khojandi, Robert L. Davis, Rishikesan Kamaleswaran

Sepsis is an acute, life-threatening condition, often acquired in the hospital. Undetected, sepsis can progress to severe sepsis and septic shock, with a risk of death as high as 30% to 80%. Early detection of sepsis can improve patient outcomes. We use a multi-layer machine learning algorithm to analyze continuous, high frequency physiological data, such as vital signs, to identify at risk patients before sepsis onset. In our analysis of a cohort of 1,300 patients, the model only failed to predict 3.16% of sepsis patients earlier than Systemic Inflammatory Response Syndrome (SIRS) criteria. Sepsis patients were predicted on average 211.47 5.08 minutes earlier than SIRS criteria.

#### 3 - A Machine Learning Model to Predict Adult Inpatient Death, Cardiac Arrest, and ICU Transfer

Andres Garcia-Arce, Geisinger, Danville, PA, United States, John McIlwaine, Jason S. Puckey

There is a growing interest in including big data analytics into clinical decision support tools. This project involves the use of electronic records from 79,232 Geisinger patients to create a new early warning score (EWS) using machine learning algorithms. The new model predicts sudden death, cardiac arrest and unplanned transfers to the ICU. This model is expected to outperform other models such as MEWS and NEWS. By having a better EWS, Geisinger clinicians can better plan patient care and hopefully mitigate the effects of adverse events, improving patient outcomes and patient experience.

West Bldg 101C

### Joint Session HAS/ICS: Stochastic Modeling and Control in Health Care

Sponsored: Health Applications

Sponsored Session

Chair: Amin Khademi, Clemson University, Central, SC, 29630, United States

#### 1 - Optimal Pooling Schemes for Prevalence Estimation of Emerging Infections

Ngoc Nguyen, PhD Candidate, Virginia Tech, 1145 Perry Street, 210 Durham Hall, Blacksburg, VA, 24061, United States, Ebru Korular Bish, Douglas R. Bish

Accurate prevalence rate estimation is essential for surveillance of infections and diseases, and is typically conducted via pooled testing. The pooling design, i.e., the number and sizes of testing pools, impacts the estimation accuracy. However, determining an optimal pooling design requires an a priori estimate of the unknown prevalence rate, and can be challenging, especially for emerging infections with limited information. We develop robust optimization models and characterize structural properties of optimal pooling designs for surveillance. Our case study suggests that estimation accuracy can be substantially improved through optimal pooling designs.

#### 2 - Proportional Fairness Model of the Allocation for Heart Transplantation System

Farhad Hasankhani, Clemson University, Clemson, SC, United States

The allocation process of scarce resources such as donor hearts should be managed to be distributed efficiently and fairly among patients demanding transplant. In order to model fairness in heart allocation, we define utility of each patient as their total life-expectancy and use proportional fairness notion to develop an optimization problem. Objective function is the sum of logarithm of expected utilities of patients in which expected utilities are quadratic functions of the decision variables. The solution of the optimization problem characterizes the structure of the optimal fair allocation rule.

#### 3 - Antiretroviral Therapy Success

Huaiyang Zhong, Stanford University, Stanford, CA, 94305, United States

Thanks to the success of antiretroviral therapy (ART), HIV has become a chronic disease. Different individual characteristics such as sex, age and race, comorbidities conditions, and drug response history may lead to different optimal choices of ART regimens for a patient in different time periods. Our research aims to provide a personalized HIV treatment plan for patients based on individual characteristics, medical history and other information in patients' electronic medical records.

#### 4 - Proactive Dynamic Alteration of Hospital Operations Under Severe Weather Events with Forecast Updates

Mahsa Ghanbarpour, Northeastern University, 360 Huntington Ave, Boston, MA, 02215, United States, Ozlem Ergun

Preparedness and response planning are necessary to reduce the adverse impacts of severe weather and other environmental emergencies. This study introduces a decision-making framework that optimizes the level and timing of proactive actions by analyzing the trade-offs between making more accurate decisions with better weather forecasts vs. increasing cost of action as the event approaches. This tradeoff is captured by a stochastic dynamic programming. In this study, our aim is to apply this framework to cancel pro-actively and dynamically elective surgeries in anticipation of a snowstorm, with the goal of reducing the negative impact of the event before, during, and after the event.

#### Data-driven Decision Making in Pharmaceutical and Healthcare Supply Chains

Sponsored: Health Applications

Sponsored Session

Chair: Hui Zhao, Pennsylvania State University, University Park, PA, 16802, United States

Co-Chair: Liang Xu, Pennsylvania State University, State College, PA, 16801, United States

#### 1 - Analysis And Optimization in Recruitment Stocking Problems

Anh Tuan Ninh, 1604 Queens Crossing, Williamsburg, VA, 23185, United States, Yao Zhao, Benjamin Melamed

We study a new class of inventory control problems, the recruitment stocking problem (RSP), with applications to general recruitment systems, such as clinical trials, product sampling, and sales of products with limited supplies.

#### 2 - Informing Pharmaceutical Regulation Through Economic Modeling and Predictive Analytics

Matthew Rosenberg, US Food and Drug Administration, Silver Spring, MD, United States

The Food and Drug Administration (FDA) is the regulatory agency responsible for ensuring that prescription and over-the-counter pharmaceuticals are safe, effective, and of high manufacturing quality. As part of fulfilling its mission, FDA makes decisions that impact the supply chain, the marketplace, and public health. In this presentation, I will provide examples of research projects that have informed FDA's regulatory decisions; examples may be drawn from topics such as generic drug competition and resource capacity planning. I will also highlight potential opportunities for future collaboration with academic researchers.

#### 3 - Outcome-based Reimbursement for Pharmaceuticals with Uncertain Effectiveness

Liang Xu, Pennsylvania State University, 419A Business Building, Penn State University, State College, PA, 16801, United States, Hui Zhao, Hongmin Li

Insurers usually have to decide whether to cover an expensive new drug and the corresponding co-payment, given the uncertainty of the drug's effectiveness among general patients in clinical practices. As a result, insurers assume great risk of spending a substantial amount of money on drugs which may turn out not to deliver the intended health benefits. This paper investigates how the outcome-based reimbursement (OBR) scheme mitigates such risk and its impacts on the manufacturer, the insurer and patients.

#### 1 - How Early is Too Early for a Preemptive Kidney Transplant? An MDP-Based Retrospective Analysis

Masoud Barah, PhD Candidate, University of Tennessee, 524S John D. Tickle Building,, 851 Neyland Drive, Knoxville, TN, 37996-2315, United States, Murat Kurt, Anahita Khojandi, Bekir Tanriover

Living-donor preemptive kidney transplantation provides survival and financial benefits. We consider transplant timing decisions for chronic kidney disease patients, and develop an MDP model in which patient's evolving health is defined by glomerular filtration rate. We apply the model to identify optimal transplant decisions and associated survival outcomes for patients who received kidney transplants preemptively in US between 2000-2017, and compared the results with their actual counterparts.

#### 2 - Evaluating the Importance of Non-facetime Work in Patient Panel Complexity

Michael Hu, MIT, Cambridge, MA, 02139, United States, Joe Doyle, Stephanie Eisenstat, Retsef Levi

Primary care physicians (PCPs) have traditionally been paid according to activities-based compensation models. Health systems are now moving to patient panel-based payments. This requires determining the workload associated with different patient panels. Until now, panels have been evaluated using risk scores that measure clinical complexity. However, risk scores do not capture non-facetime work, such as visit documentation & staff communication, which consumes substantial PCP time. We demonstrate that risk scores do not accurately measure the workload of patient panels. We then create prediction models that reliably estimate the workload required to manage different patients.

#### 3 - Online Bed Assignment with Uncertain Length of Stays

Van-Anh Truong, Columbia University, 500 West 120th Street, 338 Mudd Hall, New York, NY, 10027, United States, Sicong Li

We study a resource-allocation problem that commonly arises in service settings. In these settings, there is a finite set of resources available over a horizon. Customers arrive over time, each of whom requires a resource for some duration of time that is possibly random, depending on his or her needs. The system collects a reward whenever it assigns a customer to a resource for the entire duration of need. This problem arises in a number of service applications, including healthcare and transportation applications.

#### 4 - A Centralized Allocation Mechanism for Public Housing

Weihua Zhang, University of British Columbia, Vancouver, BC, V6T 2G9, Canada, Yichuan Ding, Daniel Granot

In 2014, US programs of federal rental assistance helped nearly five million families. We model the affordable housing allocation problem as a centralized decision problem. The HA strives to accommodate move-in requests as well as requests of transfer between housing types. We assume that households list the housing types that they would accept without specifying their complete preference order. We further assume that the housing units of each type are homogeneous. For minimizing vacancy rate and maximizing portability (the responsiveness of the HA to households' accommodation requests), we formulate the problems as network flow problems and characterize the optimal solutions.

#### 1 - A Finite Capacity Queuing Network Model for Analysis of Patient Transitions within Hospitals

Hyo Kyung Lee, University of Wisconsin-Madison, Madison, WI, United States, Albert J. Musa, Philip A. Bain, Christine Baker, Jingshan Li

Although patient transfer plays a critical role in providing the continuity of medical care, the impact of transitions is often undertaken. Thus, we present a queueing network model to analyze patient transitions between emergency department, intensive care unit, and general ward within a hospital. Routings with feedback flows are considered under general arrival and service processes and the effects of blocking on performance measures are presented. In addition, the impacts of bed capacity, admission rate, as well as system variabilities, are discussed to seek managerial insights.

## 2 - A Dynamic Call-in Control for Unpunctual and Impatient Customers

Yunzhe Qiu, Washington University in St. Louis, 1 Brookings Dr., St. Louis, MO, 63130, United States, Jie Song

Motivated by the increasing demand for health care service and uncertainty of patient arrivals, we propose a real-time dynamic appointment scheduling system with heterogeneous customers whose sensitivity to the waiting time are varied. We construct a continuous time Markov Decision Process in a finite horizon, and derive a myopic optimal policy with the switching-line based on the current information to minimize the total waiting cost. The main finding is the widely used FCFS policy is optimal within homogeneous customers but not optimal if heterogeneity is allowed. An empirical study based on the Pediatric clinic of the Peking University Third Hospital validates our results.

## 3 - A Simulation Optimization Approach to Nursing Home Capacity Planning with Residents Heterogeneity

Xuxue Sun, University of South Florida, Tampa, FL, 33620, United States, Nazmus Sakib, Nan Kong, Chris Masterson, Hongdao Meng, Kathryn Hyer, Mingyang Li

With rapid population aging and overwhelming acute care utilization at hospitals, nursing homes (NHs) are responsible for meeting with the excess demand and increasing acuity of older adults. Successful NH care preparedness becomes significant yet challenging, since NH residents suffer from diverse chronic diseases and functional disabilities, and the service need of each resident varies over time. This work proposes a simulation optimization approach to determining the optimal bed number and staff capacities subject to the heterogeneous service demand.

## 4 - Hospital Readmission Reduction Strategy Using Stochastic Programming

Behshad Lahijanani, University of Florida, 303 Weil Hall, P.O. Box 116595, Gainesville, FL, United States, Michelle M. Alvarado

The Hospital Readmission Reduction Program (HRRP) aims to reduce hospital readmissions by applying a financial penalty to hospitals whose readmission rates are worse than their peer group median. We develop a stochastic program with probabilistic constraints for the hospital's optimal care strategy in response to HRRP. The model maximizes the hospital's profit and utilizes probabilistic constraints to control uncertain readmission probabilities across all patients. Additionally, we explore the impact of penalty and incentive HRRP designs on the hospital's profit and care strategies.

## 1 - A Multi-task Warped Gaussian Process Learning for Predicting the Optimal Next Line of Therapy in Multiple Myeloma

Emisa Nategh, PhD Student, University of Washington, Dept of Info Systems & Operations Management, Michael G. Foster School of Business, Seattle, WA, 98195-3226, United States, David Coffey, Hamed Mamani, Yingfei Wang

The objective of this research was to develop a model to predict the sequence of therapy which results in the best progression free survival (PFS). In this paper, we formulate the next line of treatment PFS based on previous line of treatment PFS and its effect on overall survival as a multi-task learning problem in the context of warped Gaussian process. We propose a novel methodology by using composite kernel over tasks in our model to improve our result. We illustrate its practicability by applying it to sequencing of therapy in cancer patients.

## 2 - Making Predictions of Pediatric Outpatient Clinic Room Requirements to Improve Room Allocation Policies

Tian He, Graduate Student, University of Pittsburgh, 3700 Ohara St, 1025 Benedum Hall, Pittsburgh, PA, 15261, United States, Kiatikun Louis Luangkesorn, Pranay Mohanty

Children's Hospital of Pittsburgh provides space for over 20 specialty outpatient pediatric clinics on site. These clinics have been having issues with patient access, the ability of patients to schedule an appointment in a timely fashion. While the specialties state that lack of additional space prevents them from increasing capacity, the rooms are currently underutilized on the whole. We develop and apply predictive models based on data found in Electronic Health Records to identify on a session by session basis the presence of excess room which could be reallocated to services that require additional rooms to meet known demand.

## 3 - A Data Driven Analytical Framework for Hospital Readmission Prediction

Kaiye Yu, Tsinghua University, Room 520, Shunde Building, Beijing, BJ100084, China, Xiaolei Xie

The improvement effort to reduce hospital readmissions necessitates reliable risk prediction tool. We develop and validate an analytics framework for predictive modeling of all-cause readmissions using data-driven approaches. Dimensionality reduction, predictors identification, data sampling and imbalance data handling are performed. A mix-ensemble framework which is integrated by the base machine learning classifiers is proposed after the comparison of the different prediction techniques using hospital administrative data. Finally, the models are assessed and managerial insights are obtained.

### Joint Session DM/Practice Curated: Data Science for Forecasting

Sponsored: Data Mining

Sponsored Session

Chair: Guangrui Xie, Virginia Tech, Blacksburg, VA, 24061, United States

## 1 - A Data-driven Forecasting Approach for Newly Launched Seasonal Products

Tugba Efendigil, MIT, Cambridge, MA, United States, Vicky Wing Kei Chan, Majd Kharlan

Demand forecasting is becoming a very complicated process in fashion industry due to the short product life-cycle, the obsolescence of the retail calendar, and the lack of information for newly launched seasonal items. Therefore, this study focuses on demand prediction with a data-driven perspective both leveraging machine-learning techniques and identifying significant predictor variables to help fashion retailers achieve better forecast accuracy.

## 2 - Sparse Reduced-rank Regression with Applications

Haileab Hilafu, Assistant Professor, University of Tennessee, 916 Volunteer Blvd, Knoxville, TN, 37996, United States

We present a sparse estimation of the reduced-rank multivariate regression model. Our estimation proposal minimizes the block- $\ell_{1,1}$  norm of the rows of the coefficient matrix subject to a sparsity inducing  $\ell_{1,\infty}$  norm. Extensive simulation results will be presented to demonstrate effectiveness of the method. We apply the method to build a predictive model for the interest rates time series covering treasuries, corporate, term spreads and public-private spreads, from the FREDQD data. Theoretical properties of the proposed method will also be presented.

## 3 - An Adaptive Data Communication Scheme for Bandwidth Limited Residential Load Forecasting

Guangrui Xie, Virginia Polytechnic Institute and State University, 112 Durham Hall, 1145 Perry Street, Blacksburg, VA, 24061, United States, Xi Chen, Yang Weng

While adding new capabilities, the proliferation of distributed energy resources makes it challenging to provide reliable power and voltage forecast for operational planning purposes. We propose an integrated Gaussian Process-based method (IGP) for hourly electric load forecasting, which utilizes not only the data streams generated by the target customer but also those of relevant customers in the feeder system. An adaptive data communication scheme is further proposed to maintain the high forecast accuracy of IGP when a data communication bandwidth constraint is imposed in some feeders. The superior efficacy of IGP and the adaptive data communication scheme is tested on various IEEE test cases.

- 1 - Learning the Best Metaheuristic Parameters Set for Car-passenger Matching Problem in on Demand Mobility Services**  
 Arslan Ali Syed, Bayerische Motoren Werke, Munich, 81375, Germany, Univ. der Bundeswehr, Munich, Germany, Klaus Bogenberger

Metaheuristics provide good suboptimal solution to an optimization problem in a reasonable time, but extensive effort is required to select a good set of parameters to obtain reasonable performance. In this work we propose that a neural network could be trained that takes specific features of the problem instance and outputs the best parameters for a specific metaheuristic algorithm. We extract various features for car-passenger matching problem to train a neural network that depending on problem instance returns the best metaheuristic parameters set.

- 2 - Distributed Reinforcement Control Learning Using Function Approximation**

Davood Hajinezhad, Duke University, 4225 Larchmont Road, 835, Durham, NC, 27707, United States, Michael Zavlanos

In this research we consider the Reinforcement Learning (RL) problem in a distributed network, and propose a primal-dual optimization algorithm to obtain the parameters of a possibly nonlinear function such as neural networks which approximates the action-value function of the underlying RL problem. Utilizing this we are able to achieve the optimal policy for all agents in the network. The proposed algorithm is incremental and online with provable convergence to the set of stationary solutions.

- 3 - Evaluating Recurrent Neural Networks as a Tool for Process Theory Testing**

Nicholas Evangelopoulos, University of North Texas, Denton, TX, United States, Anna Sidorova

Past events are often the best predictors of the future. Yet, the ability of management scholars to develop process theories is limited by the paucity of statistical tools for testing them. Here we examine the feasibility of Recurrent Neural Networks (RNN), a class of neural networks used for predicting future values based on sequences of historical data, as tools for process theory testing. Using data from SourceForge.net we evaluate selected propositions of the Event System Theory as they apply to the Free/Libre Open Source Software domain using RNN. Methodological recommendations and challenges associated with using RNN for process theory testing are discussed.

- 1 - Predicting Information Diffusion Probabilities in Social Networks Based on Neural Networks**

Zhecheng Qiang, PhD Student, University of Central Florida, 4000 Central Florida Blvd., Orlando, FL, 32826, United States, Alexander Semenov, Qipeng Zheng

Predicting information diffusion through social networks plays an important role in human activities analysis and influence maximization realization. Our paper focuses on predicting information diffusion probability in social networks based on artificial neural networks. In this paper, we analyze and study the fundamental factors that might affect the diffusion process. Then we implement deep neural network and generalized regression neural network to predict the diffusion probability. We evaluate our models on several real data sets and it shows our models are effective and outperform the state-of-the-art methods.

- 2 - Multiple Instance Learning via Quadratic Programming**

Emel Seyma Kucukasci, Istanbul Commerce University, Kucukyali E5 Kavasi Inonu Cad No 4, Istanbul, 34840, Turkey, Emel Seyma Kucukasci, Bogazici University, Istanbul, Turkey, Mustafa Gokce Baydogan, Z. Caner Taskin

In multiple instance learning (MIL), objects are represented by a bag of instances and the class labels are known for the bags, but not for the individual instances.

We present a novel quadratic programming-based approach to classify bags. Our algorithm imposes no additional constraints on relating instance labels to bag labels and applicable to many learning problems such as image classification, molecule activity prediction and text mining. We demonstrate the computational efficacy and classification success of our approach on a wide range of real world datasets.

- 3 - Features Level Opinion Mining from Informal Text Corpus Using Machine Learning Techniques**

Prabin Kumar Panigrahi, Indian Institute of Management Indore, Rau-Pithampur Road, Indore, 453556, India, Nishikant Bele

Due to Internet, torrent amount of informal text is generated. People express their views, emotion, feeling, and opinion on blogs, reviews, and social sites. This paper explores the use of machine learning technique at feature level sentiment categorization of Hindi blogs reviews at unigram, bigram, trigram and n gram level. We used six types of machine learning techniques to study whether unigram, bigram, trigram, and n-gram can be used for sentiment mining at the feature level. Our study shows that bi-gram with SVM outperformed the other methods.

- 4 - Robust Bayesian Level Set Estimation via Gaussian Processes**

Junzi Zhang, Stanford University, Palo Alto, CA, 94304, United States, Andrea Zanette, Mykel John Kochenderfer

This paper focuses on the problem of determining as large a region as possible where a function exceeds a given threshold with high probability. We assume that we only have access to a noise-corrupted version of the function and that function evaluations are costly. To select the next query point, we propose maximizing the expected area of the domain identified as above the threshold as predicted by a Gaussian process, robustified by a variance term. We also give asymptotic guarantees on the exploration effect of the algorithm, regardless of the prior misspecification. We show by various numerical examples that our approach also outperforms existing techniques in the literature in practice.

- 1 - Sparse Component Analysis of Locally Dominant Source**

Syed Mujahid, Asst. Professor, KFUPM, Dhahran, Saudi Arabia

In this talk, the linear case of Blind Signal Separation (BSS) problem is presented. Conventionally, the BSS problem is solved via the Independent Component Analysis (ICA) methods, which requires the statistically independence assumption. A different class of methods that are based on the notion of sparsity, are called as Sparse Component Analysis (SCA) methods. A novel LP model that can solve a specific class of SCA problems will be presented in this talk. Numerical results will be presented to illustrate the usability of the proposed model.

- 2 - Laplacian Regularized Gaussian Processes for Modeling Expensive Black-Box Functions**

Rajitha Meka, University of Texas-San Antonio, One UTSA Circle, San Antonio, TX, 78256, United States, Adel Alaeddini

In an increasing number of cases involving estimation of complex functions in the real world, one is often confronted with situations where there are several factors to be evaluated but experiments are prohibitively complex and/or expensive. Gaussian process (GP) is a well-known non-parametric regression method to fit nonlinear functions. We propose Laplacian regularized Gaussian processes with bilateral kernel to make use of both measured and unmeasured points for efficient modeling of expensive black-box functions.

- 3 - Probabilistic Distance Clustering on Networks**

Cem Iyigun, Associate Professor, Middle East Technical University, Inonu Blvd, Endustri Myhendisligi, Ankara, 06800, Turkey, Derya Ipek Eroglu

In this study, a soft clustering problem on networks is investigated. It is assumed that cluster centers are located not only on vertices, but also on the edges of the network. Two different soft assignment schemes are studied where different membership functions are considered for the assignments. Structural properties for the clustering problem have been derived for different problem settings and the relation to the p-median problem has been shown under specific conditions. As a solution approach, a metaheuristic algorithm using the properties of the problem has been proposed. Computational experiments have been conducted with different problem instances.

**4 - Tree-structured Data Clustering**

Derya Dinler, Middle East Technical University, ODTU Endustri  
Muhendisligi Bolumu, Cankaya, Ankara, 06800,  
Mustafa Kemal Tural, Nur Evim Ozdemirel

We consider a clustering problem in which data objects are rooted trees with unweighted or weighted edges and propose a k-means based algorithm which repeats assignment and update steps until convergence. The assignment step utilizes Vertex Edge Overlap to assign each data object to the most similar centroid. In the update step, each centroid is updated by considering the data objects assigned to it. For the unweighted edges case, we propose a Nonlinear Integer Programming (NIP) formulation to find the centroid of a given cluster and solve the formulation to optimality with a heuristic. When edges are weighted, we also provide an NIP formulation for which we have a heuristic not guaranteeing optimality.

**1 - Optimal Sentinel Placement on a Network to Infer Transmission  
Probability of a Contagion**

Samarth Swarup, PhD, Virginia Polytechnic Institute and State  
University, Blacksburg, VA, 24060, United States, Yihui Ren,  
Stephen Eubank

We study the problem of optimal sentinel placement on a network to estimate the probability of transmission of a contagion. We assume that only one partial observation of the outbreak is available, corresponding to locations (nodes) where sentinels are placed. The problem is to choose the sentinel locations, given the graph and source node. Our approach relies on the mathematical theory of network reliability, which can be used to estimate the probability distribution of the transmission rate given a partial observation and the network structure. We cast the problem in an entropy maximization setting and develop a greedy approach for sentinel placement. Results on two real-world networks are shown.

**2 - Planar Random Graph Representations of Spatio-temporal  
Evolution of Surface Morphology**

Ashif S. Iquebal, Texas A&M University, College Station, TX,  
77840, United States, Satish Bukkapatnam, Soundar Kumara

We present a random planar graph representation to quantify the spatiotemporal evolution of surface morphology during finishing processes. We show that the proposed representation captures the complex interflow among neighboring asperities during finishing, and establishes an efficient endpoint criterion, i.e., surface quality improves only until each asperity interflows with six neighbors.

**3 - A New Nonhomogenous Poisson Process Model for  
Spatiotemporal Event Data**

Yifei Yuan, University of Arizona, 651 E. Camino Lujosa, Tucson,  
AZ, 85704, United States, Yinwei Zhang, Jian Liu

Spatially distributed events occurred over time are usually modeled by spatiotemporal point processes with nonstationary occurrence rate. Conventional methods based on prespecified B splines may not be accurate if the knot locations are not properly defined. A free knot B spline approach is proposed to optimally model the spatiotemporally dependent occurrence rate, with the knot locations and spline coefficients estimated simultaneously. A real-world case study demonstrates the effectiveness of the proposed method.

**4 - Numerical Simulation of the Conduction and Propagation of  
Spatiotemporal Electrodynamics in Complex Systems**

Bing Yao, The Pennsylvania State University, 801 B6 Southgate Dr,  
University Park, PA, 16801, United States, Hui Yang

Heart disease is a major threat to human health. The key to improving the cardiac care services is to develop a better understanding of cardiac activity. Computer simulations facilitate quantitative elucidation of heart functions. Here, we propose a novel method to simulate cardiac spatiotemporal electrodynamics. We project the 3D heart into a 2D graph by the method of t-distributed stochastic neighbor embedding. Then, a moving-least-square mesh-free method is proposed to simulate the nonlinear electrodynamics on the 2D graph. Simulation results show that this model efficiently simulates the cardiac electrodynamics, and will be an effective tool for optimal medical decision-making.

**5 - An Adaptive Approach for Fusion of High-accuracy with  
Low-accuracy Data**

Mostafa Reisi Gahrooei, PhD, Georgia Institute of Technology ,  
GA, United States

Available data fusion techniques concentrate only on data fusion strategies without providing guidelines on how to sample high-accuracy (HA) data. This work addresses the problem of selecting HA data adaptively and sequentially so when it is integrated with the low-accuracy (LA) data a more accurate surrogate model is achieved.

Heat Effects**

Shyam Ranganathan, Virginia Polytechnic Institute and State  
University, VT, Blacksburg, VA, United States, Christopher Grubb,  
Samarth Swarup, Julia Gohlke, Yuhao Wu

Observational studies to estimate effects that are rare in the population often report small effect sizes. Spatio-temporal models with random effects and spatial clustering can help improve estimates by disentangling confounders. We develop a novel spatio-temporal model and address an important problem in health effects of heat waves. Adverse birth outcomes such as low birth weight and preterm birth due to heat effects have been studied for some time. We use anonymized birth records data from Virginia to present our results for this problem using our model.

**3 - Combining Constrained Bayesian Optimization And Spatio-  
temporal Surveillance For Optimal Water Quality Monitoring  
Network Design**

Junzhuo Chen, Georgia Institute of Technology, Atlanta, GA,  
30318, United States

The goal of designing an optimal water quality monitoring network for river systems is to identify the location of a finite number of sensors that minimizes the expected detection delay of a contaminant event. In practice, data collected by sensors are subject to measurement errors, which makes a statistical procedure necessary to control the false alarm rates when using such streaming data for contaminant detection. We propose a combined framework of Spatio-Temporal surveillance and Bayesian Optimization for robust sensor network design in the presence of sensor measurement error.

**4 - Spatio-temporal Modeling & Analysis For Wind Farm Data.**

Ahmed Aziz, Texas A&M University, 2500 Central Park Ln Unit  
2406, College Station, TX, 77840, United States

Wind data are known to exhibit dependencies across a broad spectrum of spatial and temporal scales. In this talk, we present several findings related to the spatio-temporal modeling and analysis of local wind dynamics using turbine-specific wind farm data. We discuss various concepts such as space-time interaction, flow-dependent asymmetry and regime-switching dynamics, and present novel ways to incorporate them into spatio-temporal models. Finally, we discuss the implications of such findings on the wind farm operational analytics such as wind speed forecasting and power estimation.

**5 - Spatiotemporal Transfer Learning for 3D Dynamic Field Modeling**

Di Wang, Peking University, Beijing, China, Xi Zhang

We propose a 3D field estimation method using limited sensor observations. A dynamic field transfer learning approach, to identify spatiotemporal correlation by integrating a multitask learning framework into an autoregressive model, is developed. Our proposed approach is verified through a real case study of grain thermal field estimation.

Emerging Topic: Productivity, Efficiency and Data Envelopment Analysis

Emerging Topic Session

Chair: Xiang Ji, University of Science and Technology of China, 800 W Renner Road, Richardson, TX, 75080, United States

**1 - A Heterogeneous DEA-based Eco-efficiency Measurement of China's Industrial Sectors**

Mingjun Li, University of Science and Technology of China, Hefei, China, Jie Wu

Environmental problems brought by industry are attracting extensive attention so a comprehensive analysis of industrial environmental performance is increasingly important. In this paper, we extend the DEA model to consider two-sided non-homogeneous problems, handling DMU sets that have non-homogeneity in both inputs and outputs. This is different from the previous researches which generally focus on regional data to avoid heterogeneity. With this more realistic analysis of environmental efficiency, the Chinese government can make more informed decisions to realize sustainable industrial development.

**2 - DEA Cross-efficiency Model with Reciprocal Behavior**

Feng Li, Southwestern University of Finance and Economics, Chengdu, 611130, China

A reciprocal behavior is responding much nicer to friendly actions and much nastier to hostile actions. This paper integrates the reciprocal behavior among Decision Making Units (DMUs) into Data Envelopment Analysis (DEA) cross-efficiency approaches. To this end, a series of games are developed by viewing each DMU as a player and adopting different evaluation strategies. Several equilibrium points are obtained for different strategies, and game theoretical implications are provided. Finally, the proposed approach is applied to logistics industries.

**3 - Using A Hybrid Heterogeneous DEA Method to Benchmark China's Sustainable Urbanization**

Xiang Ji, University of Science and Technology of China, 96 Jinzhai Rd, Hefei, 230026, China, Jie Wu, Qingyuan Zhu, Jiasen Sun

Due to recent official policy changes, China's sustainable urbanization has entered a new type of multi-target heterogeneous situation which has never been scientifically researched before. To deal with this new heterogeneous scenario, we introduce a hybrid heterogeneous data envelopment analysis (DEA) method that contains input segment estimation and efficient frontier construction. We also introduce a bi-level benchmarking method that benchmarks each city's eco-efficiency and uses those benchmarks to guide sustainable urbanization completion in an empirical study of 206 Chinese prefecture-level cities' sustainable urbanization.

Co-Chair: Christopher Ryan, University of Chicago, Chicago, IL, 60637, United States

**1 - Robust Optimization with Mixed-integer Uncertainty Sets**

Juan Sebastian Borrero, Assistant Professor, Oklahoma State University, 322 Engineering North, Stillwater, OK, 74078, United States, Leonardo Lozano

We consider robust linear optimization problems where the uncertainty set is a mixed-integer linear feasibility region. Such a class of sets allows us to model complex uncertain phenomena where there are logical, combinatorial, or disjunctive relationships in the uncertain data. We show that optimizing over this type of sets greatly reduce the conservativeness of the optimal solutions when compared to a convex counterpart. However, the reduction comes at the price of increasing the computational complexity of the problem. In particular, the problem is NP-hard and we develop iterative solution methods based on decomposition techniques that solve many instances of the problem in a reasonable time.

**2 - The Watermelon Algorithm for The Bilevel Integer Linear Programming Problem**

Lizhi Wang, Iowa State University, IMSE and ECPE, Ames, IA, 50011, United States

We will review the watermelon algorithm for the bilevel integer linear programming problem and present an improved version of the algorithm that uses a number of techniques specifically designed for the bilevel structure of the problem to improve the efficiency of the algorithm.

**3 - Lagrangian Dual Decision Rules for Multistage Stochastic Integer Programming**

Merve Bodur, University of Toronto, 5 King's College Road, Toronto, ON, M5S 3G8, Canada, James Luedtke, Maryam Daryalal

We propose Lagrangian dual decision rules that yield a new approximation approach for multi-stage stochastic integer programming problems. We investigate techniques for using these decision rules to obtain bounds on the optimal value and a primal feasible policy; and compare the strength of the relaxation from different techniques. Numerical results will be presented to illustrate the quality of the obtained bounds and policies.

**4 - Representability and Solvability of Mixed-integer Bilevel Programming Problems**

Sriram Sankaranarayanan, Johns Hopkins University, Baltimore, MD, 21218, United States, Amitabh Basu, Christopher Ryan

We show that the feasible regions modeled by continuous bilevel constraints, complementarity constraints and polyhedral reverse convex constraints are the same. We show that their feasible regions model the finite union of polyhedra. We contrast it with the modeling power of mixed-integer problems that model finite union of polytopes along with an integer cone. Then we show that allowing both integer constraints and continuous bilevel constraints, one can model finite union of polyhedra and finite union of integer cones. Having said that, by fixing certain variables, we show non-emptiness of a relaxed mixed-integer bilevel set can be decided in polynomial time.

Lingfeng Li, Vanguard Group, Wayne, PA, United States

Performance-based reward (PBR) has been adopted to facilitate the achievement of organizational goals. However, evidence on the effectiveness of PBR is limited, and methods to evaluate PBR effectiveness have not been well established. This work is the first effort to introduce an improved quasi-experiment (IQE) to obtain high level of evidence to support decision-making on the application of a PBR. Our pilot results suggest the effectiveness of a PBR could vary across operational settings: PBR could improve the productivity of employees who process not-in-good-order items by at least 5% (p-value = 0.00005). However, evidence is insufficient for employees who process in-good-order items.

**2 - Portfolio Choice of Renewable Energy**

Chen Wei, University of Electronic Science and Technology of China, Chengdu, China, Ma YongKai, Tang Xiao Wo

Most countries used the Energy Internet, which has a key feature that the electricity is mainly generated by renewable energy, to reduce carbon emissions. Renewable energy (i.e., wind and solar) is volatility, however, renewable energy combination on-grid can reduce the renewable energy volatility. This paper focuses on the portfolio choice of renewable energy. We constructed a model that utility firms, including conventional and renewable energy firms, supply the electricity to the market, in different pricing policies. We find that flat pricing leads to a higher investment level for solar energy, meanwhile, peak pricing leads to invest more wind energy.

**3 - Sequencing Mixed Models on an Assembly Line with Variable Rate Launching and Open Stations**

Tobias Moench, WHU-Otto Beisheim School of Management, Vallendar, Germany, Arnd H. Huchzermeier

Introduction of new models on an assembly line pools demand risk, but also increases costs of idle time, utility work and space. Opening up station boundaries and introducing variable rate launching instead of a fixed tact time reduces all costs simultaneously. Moreover, the overall line length is reduced significantly.

#### 4 - Efficiency and Risk Trade-off in Security Screening Operations

Mehmet Aydemir, Carnegie Mellon University, 5000 Forbes Ave, Pennsylvania, Pittsburgh, PA, 15213, United States, Alexandre Jacquillat, Alan Scheller-Wolf

The management of screening systems involves a trade-off between efficiency and risk. We model a screening system with a range of screening options having different service and risk mitigation characteristics, in which the controller can dynamically select the screening option based on job-level risk profile information. We propose a multi-class Markov decision process model of the control of such a screening system as a function of observed queue length and risk profile information. We show that the optimal policy exhibits a threshold behavior. We extend this model to a setting where customers are strategic. We find conditions where slower screening policies lead to shorter queue lengths.

#### 5 - Data Driven Variability Analysis of Vehicle Routes

Debdatta Sinha Roy, Robert H. Smith School of Business, University of Maryland, 7699 Mowatt Lane, 3330 Van Munching Hall, College Park, MD, 20742, United States, Bruce L. Golden

Delivery and service companies need to send out multiple vehicles to deliver customer products and provide services to customers in a city every single day. These companies generate the vehicle routes using routing software and algorithms provided by third party clients. It is a matter of great importance to maintain the workload balance among the drivers of a company, i.e., the drivers should have similar route times (inclusive of the service times). Based on real route times generated using two different third party software on various street networks, we perform statistical analysis to understand and quantify the variability in the route times and, thereby, make recommendations to the companies.

#### Preference-driven Decision Aiding II

Sponsored: Multiple Criteria Decision Making

Sponsored Session

Chair: Adiel Teixeira De Almeida Filho, Universidade Federal de Pernambuco, Recife-PE, 50.630-971, Brazil

Co-Chair: Roman Slowinski, Poznan University of Technology, 60-965, Poland

#### 1 - Resource Allocation with Fairness-based Preferences

Nikolaos Argyris, Loughborough University, School of Business and Economics, Loughborough University, Loughborough, LE11 3TU, United Kingdom

We consider the problem of a inequality-averse central planner distributing resources across different parties. Taking an axiomatic approach, we construct an "equitable preference ordering combining structural assumptions with preference information. We show that the set of functions that represent the preference

ordering has a succinct polyhedral characterization. We use this to compute the subset of "equitably-efficient" resource distributions. We show how these results can be used to introduce fairness constraints in optimization formulations of resource allocation problems (e.g. to stipulate that the optimal distribution must equitably-dominate a reference distribution).

#### 2 - Preference Driven Private Banking Decisions:

##### A Personal Investment Portfolio Optimization Framework

Adiel Teixeira De Almeida Filho, Universidade Federal de Pernambuco, Caixa Postal 7471, Cx Postal 7471, Av. General San Martin, 1083, Recife-PE, 50.630-971, Brazil, Drance Oliveira, Luciano Ferreira, Denis Borenstein, Marcelo Righi

Since the mean-variance approach, portfolio optimization has been developed and recent literature addresses two main streams: (i) the incorporation of alternative risk measures and (ii) the development of new models and innovative problem formulation to enable additional characteristics that the investor wish to consider or that financial services are obliged to comply due to regulation. This work focuses on the latter issue in portfolio modeling for private banking into a preference driven process by integrating throughout a decision process framework to support portfolio selection.

#### 3 - Evaluating Credit Risk of Brazilian Debentures Through a New Preference Disaggregation Approach

Diogo Ferreira de Lima Silva, MSc, Universidade Federal de Pernambuco, Recife-PE, 50630971, Brazil, Adiel Teixeira De Almeida Filho, Luciano Ferreira

Given the importance of credit risk evaluations for individual investors and financial agents, new approaches and models have been formulated over the years. In Brazil, sovereign and corporate bonds are among the leading investment alternatives. This work presents a preference disaggregation for sorting problems within the TOPSIS method. Using real data collected from public financial statements the proposed approach is used to evaluate these corporate bonds.

#### 4 - A Preference Driven Approach for Determining the Ideal Inspection Interval for a Runway with Delay Time Modeling

Naiara Meireles de Souza, Universidade Federal de Pernambuco, Recife, 50630971, Brazil, Marcelo Hazin Alencar, Adiel Teixeira De Almeida Filho

We sought to determine an inspection interval for an airport runway located in Northeast of Brazil through a maintenance and inspection policy based on Delay Time Modeling, considering cost and availability.

#### Development, Acquisition, and Maintenance

Sponsored: Military and Security

Sponsored Session

Chair: Jesse Pietz, U.S. Air Force, 8991 Shadowlake Way, Springfield, VA, 22153, United States

#### 1 - Tradespace Analytics for Air Force Acquisition Programs

Jesse Pietz, U.S. Air Force, Washington, DC, United States

Each year the United States Air Force (USAF) must weigh multiple priorities in order to determine how to allocate its multibillion-dollar budget among thousands of major acquisition programs. This talk describes an analytical approach that combines an Analytic Hierarchy Process (AHP) and cost forecasting within a Monte Carlo sampling framework to generate a tradespace that allows decision makers to visualize and assess the marginal value of their program decisions, and explores the many modeling challenges that result.

#### 2 - Advances in Obsolescence Management Utilizing Reliability Theory

Christina Mastrangelo, University of Washington, 2319 44th Avenue SW, Seattle, WA, 98116, United States

Obsolescence issues grow as the lifecycles of most electronic parts decrease. This talk focuses on forecasting obsolescence for a DoD application and describes a method to accurately forecast the likelihood of lifecycle duration to support a proactive strategy to manage future obsolescence events. The basis is the calculation of corresponding probabilities of obsolescence for each part in a system via reliability theory and Bayesian calculations. This approach is extended by examining the shortening of product life cycles in conjunction with the shape of the product life cycle curve which leads to the prediction of obsolescence. The research presents an innovation in system level obsolescence.

### 3 - Column Generation Algorithm for Preventive Maintenance Scheduling with Hierarchical Set-ups

Yongpei Guan, University of Florida, 303 Weil Hall, P.O. Box 116595, Gainesville, FL, 32611, United States, Eric C. Blair

We study a preventive maintenance (PM) scheduling problem where there are multiple PM activities that must be completed within some time-variant cycle limit, along with a group of set-up activities which must be performed in conjunction with certain PM activities based on a tree-like dependency graph. The objective is to minimize total cost of performing set-up and PM activities over a finite horizon. Relaxing the dependency constraints, we show the problem with only cycle limit constraints has the integrality property. We develop a column generation framework with pricing problems solvable in polynomial time exploiting this structure, and show computational results of the approach.

### Joint Session PSOR/MIF: Non-profit Operations in Humanitarian and Disaster Response Logistics

Sponsored: Minority Issues

Sponsored Session

Chair: Trilce Encarnacion, Rensselaer Polytechnic Institute, Troy, NY, 12180, United States

#### 1 - A Minimal Technology Routing System for Food Banks Mobile Food Pantry Programs

Eduardo Perez, Assistant Professor, Texas State University, Roy F. Mitte Complex, 749 N. Comanche St., San Marcos, TX, 78666, United States, Emilia Ochoa, Jesus Jimenez

The Mobile Pantry Program directly serves clients in areas of high need with the goal of supplementing other hunger-relief agencies. Through a Mobile Pantry, a truckload of food is distributed to clients in pre-packed boxes or through a market-style distribution where clients choose to take what they need. A novel routing system is developed to handle the daily routing of a limited number of vehicles serving varying number of delivery points. A case study is presented that shows how the new routing system can combine multiple visiting sites in one route to increase throughput rates.

#### 2 - Assessing Food Supply Chain Vulnerability Using Consumer Behavior and Mitigation/Compliance Strategies

Jessye Bemley Talley, Morgan State University, Baltimore, MD, 21251, United States

As the food supply chain continues to grow globally, it is important to have strategies (i.e. recall) and tools to keep products safe when purchased by the end consumer. However, the guidelines that indicate the best time to implement a recall is uncertain. It is also unclear on the best mode of messaging to communicate with consumers about these contamination events. An agent-based simulation approach is used to address the following: (1) consumer behavior, (2) messaging strategies, and (3) timing of mitigation strategies to reduce consumer illnesses.

#### 3 - Making Non-profit and Service-providing Agencies Smarter with Big Data Analytics

Charalampos Chelmiss, University at Albany, State University of New York, NY, United States, Daphney-Stavroula Zois, Wonhyung Lee

Currently, those in need of help often do not know how to locate or access service providers. Likewise, service-providing agencies often work in silos. Response becomes even more problematic when a problem demands the coordination of service providers, volunteers, and government structures, and after business hours, when the communication channels that can aid people in need become sparse. In this work, we report our ongoing project towards developing analytic solutions to help non-profit and community-based organizations respond effectively to the needs of their communities. We report our preliminary findings, and discuss key challenges and future plans.

#### 4 - Role of Non-established Groups in the Aftermath of Hurricanes Harvey, Irma, and Maria

Trilce Encarnacion, Rensselaer Polytechnic Institute, 110 8th Street, Jonsson Engineering Center # 4049, Troy, NY, 12180, United States, Jose Holguin-Veras, Diana Gineth Ramirez-Rios, Johanna Amaya

Research has already established that the civic society plays a major role in all aspects of the response to extreme events, from search and rescue and relief distribution, to rebuilding efforts. This paper presents preliminary findings of the role of civic society and other non-established groups in the disaster response efforts to Hurricanes Harvey, Irma, and Maria impacted the US and the Caribbean in 2017.

### 5 - Value Function Approximation for Last-mile Distribution in Humanitarian Relief

Robert Alexander Cook, University of Alabama, Northport, AL, 35473, United States, Emmett J. Lodree

This study describes a Value Function Approximation approach for solving a Markov Decision Problem in which we distribute stochastically-arriving donations to disaster survivors. Donations accumulate over time at collection sites and are periodically transported to a relief center where the donations are distributed to beneficiaries over a finite horizon.

## ■ TE77

West Bldg 213A

### Matching and Recommendation Systems with Social Impact

Sponsored: Public Sector OR

Sponsored Session

Chair: Tina Rezvani, Northeastern University, Boston, MA, 02115-4420, United States

Co-Chair: Ergun Ozlem

#### 1 - On-demand Volunteers Through a Hierarchical Approach with Personalized Recommendations and Choice

Jennifer A. Pazour, Rensselaer Polytechnic Institute, 110 8th Street, CII 5217, Troy, NY, 12180, United States, Seyed Shahab Mofidi

A new hierarchical approach enables on-demand volunteers by recasting the platform's role as one providing personalized recommendations (i.e., a menu of multiple requests) to ad hoc volunteers. Choice can increase participation (capacity) and resource utilization. A novel bilevel optimization framework captures the interdependent outcomes of volunteer selections. The computationally expensive mixed integer linear bilevel problem is transformed into a single level problem by proposing logical expressions. Insights on what influences the optimal number of choices and performance are explored.

#### 2 - Maintaining Diversity in Student Exchange

M. Utlu Unver, PhD, Boston College, Boston, MA, United States, Umut Dur

In Europe, annually 200,000 college students study in different countries through Erasmus Student Exchange. Although this exchange is successful in many dimensions, it has two major drawbacks. First, the number of students exchanged is not country-balanced. Unbalanced exchange causes a financial burden for countries that are importing more students than their exports. Second, certain countries are exchanging students mainly between each other, limiting diversity, one of the main goals of the exchange. We propose the diversity-motivated top-trading-cycles-and-chains mechanism to solve these problems by satisfying constrained efficiency, strategy-proofness, and fairness.

#### 3 - Centralized Mechanisms for Two-sided Stable Matching with Societal Impacts

Tina Rezvani, Boston, MA, United States

Agents often are not aware of all their options or making applications for all positions can be costly. We leverage the staff assignment problem in the World Food Programme where a perfect assignment of staff and job positions is required. Perfect matching under partial information is incompatible with ensuring stability. To address this issue, we design a multi-period mechanism that negotiates on behalf of self-interested agents and identifies an increased-cardinality matching that guarantees a minimum level of stability while maximizing social welfare for all agents across multiple periods.

#### 4 - Constructing Ordinal Preference Lists with Ties Using Spectral Clustering

Matthew Williams, Northeastern University, Boston, MA, United States

We study the matching of military cadets to assignments over two periods, modeling the problem as a weighted, rank-maximal capacitated house allocation problem with ties (CHAT). To ensure every instance of the problem admits an agent-complete matching, we propose obtaining agent-specified ranks of the categorical attributes of assignments. Using spectral clustering, with these weights as input, we construct complete ordinal preference lists, with ties, for each agent. Lastly, we propose a generalization of CHAT to include gender constraints for further study.

Co-Chair: Yudai Honma, The University of Tokyo, Tokyo, 153-8505, Japan

#### 1 - Electric Vehicle Routing Problem with Time Windows and Ambient Temperature Effect

Bulent Catay, Prof., Sabanci University, Orhanli, Tuzla, Istanbul, 34956, Turkey, Rastani Sina, Yuksel Tugce

We extend the Electric Vehicle Routing Problem with Time Windows by taking into account the ambient temperature. We formulate this problem as a mixed integer linear program and propose a set of network reduction rules. We perform an extensive experimental study to investigate how ambient temperature influences the routing decisions and to analyze the contribution of the proposed rules to run time. We present managerial insights to both researchers and practitioners by solving small instances using a commercial solver. The results show the effectiveness of the reduction rules and reveal that neglecting temperature effect may yield route plans that cannot be implemented in the business environment.

#### 2 - A Continuous Location Problem – Locating Refueling Points on Lines and Comb Trees

Yazhu Song, Arizona State University, 699 S. Mill Avenue, BYENG 219, Tempe, AZ, 85281, United States, Pitu B. Mirchandani

There is much reason to believe that many individuals and organizations will transform their vehicles to ones that utilize more sustainable alternative fuels. Among all, the EV is a promising candidate for this transformation. Unfortunately, little effort has gone into designing the layout of the battery charging/swapping infrastructure. This presentation discusses a new set of continuous location problems related to locating refueling points (RPs) on real lines, trees and general networks. Minimization of the number of RPs used to refuel all O-D flows is considered as the first objective. Then the objective is to locate a fixed number of RPs to minimize the total weighted travel distance.

#### 3 - Capacity and Location Design of Charging Facilities for Private Electronic Vehicles

Ting Wu, Associate Professor, Nanjing University, Department of Mathematics, No 22 Hankou Road, Nanjing, 210093, China, Cheng Zhu

Electronic Vehicles (EV) tend to have significant impacts on the economy, environment and the society. This study tends to address the design of charging facilities for EVs via robust optimization and analytics. Specifically, we aim to answer the following research questions: 1) what charging approach(es) is optimal for a specific region? 2) Does charging at close stations or locations outside transportation network improve the efficiency of the network? 3) How should we determine the location(s) and capacity of the optimal charging approach(es)?

#### 1 - Is Supplier-base Concentration Risky? Empirical Evidence from Small and Medium Sized Enterprises (SMES) of Manufacturing Sector in China

Feng Liu, Korea University Business School, Anam-ro 145, Seongbuk-gu,, Seoul, Korea, Republic of, Kwangtae Park

This study investigates whether and how supplier-base concentration affects the relationship of operational efficiency to performance and risk. We try to integrate inventory turnover with supplier-base concentration, firm performance and credit risk. The study shows that inventory turnover contributes positively to firm performance but supplier-base concentration has a negative impact on firm performance. Interestingly, supplier-base concentration negatively moderates the relationship between inventory turnover and firm performance. We also find that inventory turnover negatively affects credit risk and supplier-base concentration positively affects credit risk.

#### 2 - Outsourcing under Competition: When to Choose a Competitor as a Supplier?

Olga Perdikaki, University of South Carolina, Darla Moore School of Business, 1014 Greene Street, Columbia, SC, 29208, United States, H. Sebastian Heese, Eda Kemahlioglu Ziya

Motivated by several examples of sourcing from direct competitors in different industries, we study a stylized supply chain model with a single OEM that could outsource either to an independent supplier or to an integrated firm that carries out manufacturing in-house and competes with the OEM. We identify how the presence of scale economies and competition affects the OEM's supplier choice.

#### 3 - A Stochastic Framework for Designing Complementary Agricultural Supply Chains

Rodrigo Ulloa, Arizona State University, 513W 17th St, Tempe, AZ, 85281, United States, Hector Flores, J. Rene Villalobos

We present an integrated planning framework that allows the insertion of independent farmers into commercial agricultural supply chains. In particular, we discuss the design and planning aspects of agri-food supply chains that can attain profitability through the utilization of stochastic optimization. The output from this framework is a planting and harvesting schedule for identified regions along their assigned consumer market. The framework also helps identify geographical regions with hidden agricultural potential given by their geographical location and weather patterns, where a two-stage stochastic program is developed to address the stochasticity of the weather.

### Practice- Supply Chain Management II

Contributed Session

Chair: Mengke Tian, The Hong Kong University of Science, Room 3208, Dep. of IEDA, Acade, Hong Kong

#### 1 - Impact of Supplier's Lead Time on Assembler's Strategic Decisions

Yuhong He, Assistant Professor, California State University-Fullerton, 2550 Nutwood Avenue, SGMH 4149, Fullerton, CA, 92831, United States, Wenting Pan

This paper examines the impact the supplier's lead time has on the assembler's strategic choice of partnership. Specifically, we study when the assembler would buy components from the suppliers and when the assembler would have a vendor-managed consignment contract with the suppliers. Furthermore, we also explore the conditions under which a supplier would be selected by the assembler as a sub-assembler to manage other suppliers.

#### 2 - Partial Vertical Integration in Supply Chains

Yibin Zhang, Associate Professor, Lixin University of Accounting & Finance, 2800 Wenxiang Road, Songjiang University Town, Shanghai, 201620, China, Xiaoguang Wang, Victor Shi

It is widely assumed in the operations management literature that vertical integration can eliminate double marginalization and boost supply chain efficiency. However, a number of research studies find that full disintegration can be beneficial in certain strategic context. In this paper, motivated by the common business phenomenon that firms hold each other's ownership shares, we study partial vertical integration in supply chains. Our findings show that partial vertical integration can be the equilibrium channel structure in supply chains. Hence, our research provides another important justification for the business practice of partial ownership among firms.

#### 3 - A Supply Chain Framework to Improve Survival and Productivity of Small Firms in Developing Countries: A Case Study in Latin America

Cansu Tayaksi, Postdoctoral Associate, Massachusetts Institute of Technology, 77 Massachusetts Ave, Cambridge, MA, 02139, United States, Josue Velazquez Martinez, Ramon Paulino, Rafaela Pereira Nunes

Small firms represent more than 95% of the companies in developing countries. Due to a lack of productivity, only a fraction survives. In this paper, we study the impact of SC practices in small firms and show that by improving SC expertise, small firms also improve their survival rate. We present a conceptual framework based on a system dynamics model that provides guidance on how small firms can focus on SC and business priorities. We validate our framework via a field study conducted in 50 companies in three countries in Latin America.

#### 4 - Product Line Planning Under Uncertainty

Sakir Karakaya, Industry and Technology Expert, Ministry of Science, Industry and Technology, Mustafa Kemal Mah.  
Eskisehir Yolu 7.km, Ankara, 06510, Turkey, Gulser Koksak

This study addresses the problem of multi-period mix of product-lines under a product family, which incorporates launching decisions of new products, capacity planning decisions and product interdependencies. The problem is modelled as a two-stage stochastic program in which price, demand, production cost and cannibalisation effect of new products are characterised as uncertain parameters. The solution approach employs the Monte Carlo bounding technique and L-shaped method, which is tested on real-like cases considering VSS and EVPI performance measures. The data collected through two experimental studies is analysed using ANOVA and Random Forest methodology.

#### 5 - A Comparison of Stochastic Service Model and Guaranteed Service Model in Multi-echelon Inventory Systems

Yinan Liu, Lehigh University, Philadelphia, PA, 19144, United States

The Stochastic Service Model (SSM) and Guaranteed Service Model (GSM) are competing models for optimizing multi-echelon inventory systems. SSM accounts for the uncertainty in lead times due to stockouts, while GSM treats lead times as bounded. SSM is more representative of real-world supply chains, but GSM is more tractable and widely used in practice. Our research asks whether GSM is an effective heuristic for SSM. Our results suggest that SSM and GSM agree closely in serial and assembly systems under many conditions. However, the two models often diverge for distribution systems, making GSM more problematic for more complex topologies.

#### 6 - How Does Conspicuous Consumption Affect Product Line Design

Mengke Tian, the Hong Kong University of Science and Technology, Hong Kong, Ying-Ju Chen, Xin Wang

We analyze the effects of conspicuous consumption on the product line design when there is only a monopoly manufacturer who tends to directly serve the market with high and low-end products. We find that stronger conspicuous effect undercuts the quality and prices for both products which leads to the increase of demands. The total profit of the manufacturer is elevated. The gaps of quality standard and selling price are widened. We extend by adding a retailer in the distribution channel. We find that manufacturer adopts the same quality strategies as before. The double marginalization effect leads to higher prices and lower demands. But its influence is mitigated when conspicuous consumption is stronger.

Hyatt, Phoenix East

### Robust Optimization

Contributed Session

Chair: Duaa Serhan, Binghamton University, Binghamton, NY, United States

#### 1 - From Data to Multi-stage Decisions

Bradley E. Sturt, Massachusetts Institute of Technology, Cambridge, MA, 02139, United States, Dimitris Bertsimas, Shimrit Shtern

In this talk, we consider multi-stage linear optimization problems, where the uncertainty is correlated between stages and our only information comes from historical data. We propose a simple data-driven framework, which we refer to as “sample robust optimization” (SRO). First, we establish that, as more historical data is obtained, SRO prescribes decision rules with (asymptotically) optimal out-of-sample performance. Second, exploiting structural similarities between SRO and robust optimization, we present practically-tractable approaches for solving SRO problems. Finally, we discuss empirical experiments and compare to approaches from distributionally robust optimization.

#### 2 - Optimization Over Continuous and Multi-dimensional Decisions with Observational Data

Christopher G. McCord, Massachusetts Institute of Technology, 77 Massachusetts Ave, Cambridge, MA, United States, Dimitris Bertsimas

We consider optimization under uncertainty over continuous and multi-dimensional decision spaces in problems in which we are only provided with observational data. We propose a novel algorithmic framework that is tractable, asymptotically consistent, and superior to comparable methods on example problems. Our approach leverages highly effective predictive machine learning methods for the purpose of prescribing decisions. We demonstrate the efficacy of our method on examples involving both synthetic and real data sets.

#### 3 - A Nested Robustness Approach for the Mobile Vendor Location Problem

Juan Carlos Espinoza Garcia, Assistant Professor, Tecnológico de Monterrey, Queretaro, 76130, Mexico, Laurent Alfandari

We propose an operational-level variant of the Capacitated Facility Location Problem applicable to mobile vendors, where the demand to each potential

location is a function of the selected locations. For this problem (MVLN) the demands follow a Poisson process, which provides fractional functions in the objective of the robust model when considering uncertainty on demands. We introduce the concept of Nested Uncertainty Budgets to address overly conservative solutions and propose a method to manage global and local uncertainty in a hierarchical way. Numerical experiments are provided on adapted benchmark instances to assess the performance of the nested robust model and a classical approach.

#### 4 - Robust Optimization for Routing and Scheduling of Airport Surface and Terminal Airspace Operations under Pushback and Arrival Times Uncertainty

Duaa Serhan, Binghamton University, Binghamton, NY, 13902, United States, Sang Won Yoon

This research proposed robust optimization approach for scheduling and routing airport surface and terminal airspace (ASTA) operations under uncertain flight schedules. Convective weather is the leading cause of flight delay in the National Airspace System. This paper aims to develop a decision support tool for routing and scheduling of ASTA operations during convective weather and different levels of aircraft pushback and arrival time uncertainty. A robust optimization approach is proposed to identify aircraft routes and schedules that minimize flight delays and safely avoid areas of convective weather. The proposed approach is expected to safely and efficiently manage aircraft operations.

#### 5 - An Economic Model Explaining Asymmetric Price Responses

Dong Soo Kim, Assistant Professor of Marketing, Ohio State University, 500 Fisher Hall, 2100 Neil Ave., Columbus, OH, 43210, United States, Mingyu Joo, Greg Allenby

This paper proposes a model that considers both expectation and uncertainty of information that formulates reference points as a distribution of outside option prices in a utility maximization framework. The model assumes that consumers compare the expected maximum attainable utility of outside options with the marginal utility from inside goods with observed prices. In doing so, the model characterizes the opportunity cost as a certainty-equivalent value, a value-adjusted standard to compare against. It shows that reference prices operationalized as point estimates in the literature may over-estimate the actual subjective standard, leading to asymmetric gain and loss parameter estimates.

### Health Care V

Contributed Session

Chair: Stephen J. Stoyan, Abbott Laboratories, 100 Abbott Park Road, Chicago, IL, 60064, United States

#### 1 - A Dynamic Decision Framework of Vaccine Distribution for Influenza Interventions

Lo-Min Su, National Chiao Tung University, Hsinchu, Taiwan, Yu-Hsuan Wu, Sheng-I Chen

This study emphasizes on the vaccine distribution decision for national immunization programs with the consideration of uncertain epidemic pattern. We integrate disease and supply chain models, where a compartmental model is developed to provide the estimations of transmission intensity and population settlements, and a mixed-integer programming model to determine vaccine allocation according to the epidemic result at each stage. A forecast model of vaccine demand is also developed to acquire the demand for the integration model. We investigate the effectiveness of centralized and decentralized vaccine inventory policies under irregular pandemic and regular epidemic.

#### 2 - Grounding Frequent Flyers: Examining Utilization under the Patient Protection and Affordable Care Act

Eric Xu, University of Minnesota, Minneapolis, MN, United States

With the passage of the Patient Protection and Affordable Care Act, policy makers assumed that insurance coverage would encourage individuals to use primary care instead of emergency department care. One of the key tools to achieve this goal was Medicaid Expansion, which provided coverage to most vulnerable populations. However, under Medicaid Expansion, it appears that the utilization of ED and primary care services is rising. This research seeks to understand how the policy has impacted care delivery and utilization, in addition to capacity planning initiatives moving forward.

#### 3 - The Effect of Lifestyle Choices on Cancer: Which One has the Strongest Influence?

Banafsheh Behzad, California State University, Long Beach, CA, United States

Cancer is known to be caused by both genetic and environmental factors, with 80% of cancers being related to environmental factors. This shows the significance of our lifestyle choices in preventing cancer. The main lifestyle choices that affect the occurrence and mortality of cancer, analyzed in this study, are alcohol consumption, lack of physical activity, obesity, and tobacco usage. The strength of the association between cancer and these lifestyle choices are studied. The results show that the most influential lifestyle choices in predicting cancer are alcohol consumption and obesity.

#### 4 - An Alternative Method for Measuring Performance Outcomes of Hospital Acquired Infections

Christine Pitocco, Research Professor, Stony Brook University, 333 Harriman Hall, Stony Brook, NY, 11794, United States, Herbert F. Lewis, Jonathan Liu

Many hospital acquired infections (HAI) are preventable however it is estimated 2 million patients will acquire one. In this paper, we utilize NYS health data to measure the performance of hospitals in four categories of HAIs. We demonstrate the current method used by NYS is flawed and we propose an alternative method based on standard statistical methods.

#### 5 - Characterizing Obstructive Sleep Apnea with Association Rule Mining and Sequence Analysis

Rupesh Agrawal, Research Assistant, Oklahoma State University, Tulsa, OK, 74136, United States, Dursun Delen, Bruce Benjamin

A healthy individual goes through five stages of sleep in one standard sequence from wake (W) stage to rapid eye movement (REM) stage and three non-REM stages (NREM1, NREM2, NREM3). Obstructive sleep apnea (OSA) is highly correlated with several life-changing health manifestations such as atrial fibrillation, obesity, hypertension, etc. Pathological changes due to OSA and the severity of OSA (mild, moderate & severe) cause disturbances to the sleep pattern transition from one stage to another. This study aims to use association mining and sequence analysis to discover underlying patterns in sleep stage transitions.

#### 6 - Advanced Analytics in Healthcare

Stephen J. Stoyan, Director, Business Analytics & Strategy, Abbott, 100 Abbott Park Road, Chicago, IL, 60064, United States

Digital platforms, global demands, and customers have evolved in today's healthcare industry, where innovation, connecting with customers, and servicing the supply chain require higher levels of precision and execution. Abbott is a global leader in healthcare and advanced analytics is becoming an integral part of business operations and sales effectiveness. We present analytically tuned tools that are providing information that discover new opportunities, allow for better predictions, and provide business value.

#### 1 - Master Surgical Scheduling and Elective Surgeries Scheduling

M'Hallah Rym, Professor, Kuwait University, P.O. Box 5969, Safat, Kuwait, 13060, Kuwait

This paper proposes a stochastic model that determines a two-week master surgical schedule for a leading hospital. It determines the optimal expected number of surgeries per surgery type to plan for every two-week planning horizon. The model accounts for the random duration of both surgery times and post-surgery length of stays and the availability of post-surgery beds. It maximizes the expected operating theater's throughput. The model is solved via a sample average approximation with ranking and selection. Its application illustrates the potential savings it induces, the results' sensitivity to the length of the planning horizon and to the pooling of post-surgery beds.

#### 2 - A Two Stage Stochastic Mixed Integer Programming Approach for Short Term Nurse Schedule Adjustments

Osman Tuncay Aydas, Assistant Professor of Supply Chain Management, Oakland University, 275 Varner Drive, Elliot Hall 308, Rochester, MI, 48309, United States, Anthony Ross, Buket Aydas

We study short-term staffing adjustments of nurse schedules for the upcoming 4-hour shift. Developed two-stage stochastic programming model minimizes total nurse staffing costs, and the cost of adjustments to the original schedules developed in the medium-term planning phase, while ensuring adequate coverage of nursing demand. Our findings indicate, short-term stochastic schedule adjustments can deliver cost savings of up to 20%. As the number of unscheduled admissions increase there is a greater need for scheduling flexibility. We demonstrate the significance of part-time nurses, which alleviate under- and over-staffing risks and provide scheduling flexibility to the nurse managers.

#### 3 - Differentiating the Types of Inter-hospital Transfer Helps Hospital Choice Decisions

Lei (Raymond) Fan, Student, University of Houston, 4800 Calhoun Rd, Houston, TX, 77004, United States, Ming Zhao, Xiaosong David Peng

Inter-hospital patient transfer adds complexity to healthcare operations. We study inter-hospital transfers at the patient level. We develop a methodology to classify the transfers, and for each transfer type, we investigate the effects of transfer decisions on patient care performance. The results may be used by healthcare providers to develop better inter-hospital transfer guidelines.

#### 4 - Does Announcing the Visit Matter? An Empirical Examination in US Nursing Homes

Sehwon Kang, PhD Student, University of Minnesota, Carlson School of Management, Minneapolis, MN, 55455, United States, Rachna Shah, Kevin Linderman

Recently, healthcare accrediting agencies changed their on-site accreditation survey visits from announced to unannounced. In this study, using panel data from more than 3,000 US nursing homes over 4 years, we empirically examine the impact of this two regimes in terms of improving and sustaining quality performance.

#### 5 - Leveling of Intensive Care Unit Utilization by Efficient Surgery Scheduling

Jens Brunner, Prof. Dr., University of Augsburg, Universitätsstraße 16, Faculty of Business and Economics, Augsburg, 86159, Germany, Steffen Heider

The intensive care unit (ICU) is an expensive hospital resource serving both emergency and elective patients. The vast majority of ICU patients arrive from the operating theatre. In order to increase efficiency, we propose a mixed-integer programming model to optimize surgery scheduling with the goal of balancing the expected occupancy of patients in the ICU. The model is applied to two years of data from our cooperating hospital. We show that a more balanced utilization is possible without changing the master surgery schedule and that days without elective surgery have a negative effect when leveling the utilization at the ICU.

#### Practice- Disaster and Disruption Management I

Contributed Session

Chair: Duygu Pamukcu, Middle East Technical University, Ind., Ankara, 06400, Turkey

#### 1 - A Multistage Robust Model for Blood Transshipment Problem in Disasters

Jie Deng, Lecturer, Jiangnan University, School of Business, Jiangnan University, Wuxi, China

This research introduces a robust multi-echelon multi-stage model that can assist in blood transshipment problem with uncertain demand and supply in disasters, the proposed model considers service level-based policy in the blood scheduling process to minimize the unsatisfied demand and the time span between blood production in regional blood centers and consumption in demand zones for reducing blood shortage and wastage.

#### 2 - A Hypercube Queuing Equilibrium Approach to Dynamic Volunteer Firefighter Planning under Probabilistic Service Disruptions

Han Liu, University of Illinois, Urbana-Champaign, 722 Foley Ave, Champaign, IL, 61820, United States, CHAO LEI, Yanfeng Ouyang

We propose a multi-period hypercube queuing equilibrium model for the dynamic volunteer firefighter planning problem with multiple rescue rounds, with the consideration of that rescue services are under the risk of being disrupted. The applicability of the proposed model is tested on an empirical case study in Baoding. Numerical results show that more rescue resources should be dispatched in the first rescue round if the disaster deteriorates fast.

#### 3 - Minimization of the Social Impact of an Earthquake in Lima Metropolitana and Callao Optimizing the Speed of Response with Mathematical Models

Renzo Benavente, Pontificia Universidad Católica del Perú, Universitaria 1801, Lima, LIMA 32, Peru, Jonatán Edward Rojas Polo

This research shows opportunities for improvement in the response plan after an earthquake for the distribution of humanitarian aid. The proposed methodology begins with a clustering of the geographic area of Lima Metropolitana and Callao in 9 groups with a main warehouse in each. Then, the amount and location of temporary warehouses that will supply the affected population is calculated. Finally, a linear programming model is executed for the distribution of humanitarian aid goods from the central warehouse to the temporary ones. With this, it is possible to reduce the response time and make it more dynamic for the population.

#### 4 - Routing for Post-disaster Needs Assessment to Improve Information Accuracy and Precision

Duygu Pamukcu, Middle East Technical University, Middle East Technical Uni. Ind, Ankara, 06400, Turkey, Melih Celik, Burcu Balcik

Reliable information in the post-disaster needs assessment depends on how much time is spent for statistical sampling to collect information and how many different beneficiary groups visited. Estimated information is an input for relief distribution, so accuracy and precision of the estimation directly effect the efficiency of relief operations. The scarce resource, namely time, restricts visits to affected sites. Since information collection and travel time decisions are subject to the same total time constraint, there exists an inherent trade-off between them. Exact and heuristic methods are presented to analyze this tradeoff and support sample size and site selection decisions.

#### 5 - Multi-objective Robust Model of Stochastic and Possibilistic Programming for Mitigation Planning and Emergency Response

Luis Yáñez, Universidad de Chile, Santiago, Chile, Cristian Eduardo Cortes, Pablo Andres Rey

We propose a multi-objective robust model of stochastic and possibilistic programming for facility location, inventories allocation and distribution in the context of mitigation planning and emergency response. Our model seeks to optimize the risk associated with scenario planning and minimal total cost, including a social component, deprivation costs, faults of organization and convergence of materials. In addition, protection with respect to uncertain parameters is included in the model, as epistemic uncertainty given by the use of imprecise parameters and scarcely systematized information.

#### 1 - Appointment Scheduling under Time Dependent Patient No-Show Behavior

Zhenzhen Yan, Nanyang Technological University, 21 Nanyang Link, Singapore 637371, Qingxia Kong, Shan Li, Nan Liu, Chung-Piaw Teo

This paper studies how to schedule medical appointments with time-dependent patient no-show behavior and random service times. We observe a significant time-of-day effect on patient show-up probabilities from two clinic datasets. We deploy a distributionally robust approach to model the schedule problem. To tackle the case when patient no-shows are endogenous on the schedule, we construct a set of dual prices to guide the search for a good schedule and use the technique iteratively to obtain a near-optimal schedule. Our computational studies reveal a significant reduction in total expected cost by taking into account the time-of-day variation in show-up probabilities.

#### 2 - Hedging the Overtime Riskiness in Online Surgery Assignments

Minglong Zhou, National University of Singapore, Singapore, Melvyn Sim

We study an advanced scheduling problem where patients are assigned to different operating theatre slots. We propose an extended riskiness index as the risk measure. We show such riskiness index shares a representation in terms of a family of measures of risk. We further propose the lexicographical riskiness index, which defines a unifying framework to capture multi-priority or piece-wise preferences. We minimize the risk of failing to meet some targets in a forward looking framework with a non-anticipative policy to incorporate future uncertainty. Simulation results show that our approach controls the risk of overtime while not compromising overall number of surgeries compared to a Benchmark.

#### 3 - Nurse Staffing under Uncertain Demand and Absenteeism

Minseok Ryu, University of Michigan, 1911 McIntyre St, Ann Arbor, MI, 48105, United States, Ruiwei Jiang

This paper describes a data-driven approach for nurse staffing decision under uncertain demand and absenteeism. We propose a distributionally robust nurse staffing (DRNS) model with both exogenous (stemming from demand uncertainty) and endogenous uncertainty (stemming from nurse absenteeism).

We provide a separation approach to solve the DRNS model with general nurse pool structures. Also, we identify several classes of nurse pool structures that often arise in practice and show how the DRNS model in each of these structures can be reformulated as a monolithic mixed-integer linear program that facilitates off-the-shelf commercial software. Also, we propose an optimal nurse pool design model.

#### 4 - Integer Programming Approaches for Appointment Scheduling with Random No-shows and Service Durations

Yiling Zhang, University of Michigan, Ann Arbor, MI, 48105, United States, Ruiwei Jiang, Siqian Shen

We consider a single-server scheduling problem given a fixed sequence of appointment arrivals with random no-shows and service durations, of which only the support and first moments are known. We formulate a class of distributionally robust (DR) optimization models that incorporate the worst-case expectation/conditional Value-at-Risk (CVaR) penalty cost of appointment waiting, server idleness, and overtime as the objective or constraints. We obtain exact mixed-integer nonlinear programming reformulations and derive valid inequalities to strengthen the reformulations. Convex hulls are derived for the least and the most conservative supports of no-shows. Various instances are tested.

#### Joint Session OPT/MIF: Multistage Mean-Risk Stochastic Programming

Sponsored: Optimization/Optimization under Uncertainty

Sponsored Session

Chair: Prasad Parab, Texas A&M University, College Station, TX, 77840, United States

#### 1 - Column Generation Algorithm for Risk-averse Two-stage Stochastic Programs

Saravanan Venkatachalam, Wayne State University, Detroit, MI, 48377, United States, Sujeevraja Sanjeevi

In the airlines operations, re-timing of flight legs is a tactic used in the schedules to minimize the cost of delay propagation. In this talk, we propose a two-stage mean-risk stochastic programming approach to determine the re-timing of flights and minimize the expected delay propagations due to disruptions on the day of operations. The mean-risk models pose computational challenges. In this talk, we present decomposition algorithms and computational results.

#### 2 - Decomposition for Risk-averse Multistage Stochastic Programs with Expected Conditional Risk Measures

Lewis Ntamo, Professor, Texas A&M University, 3131 TAMU, College Station, TX, 77843, United States, Maryam Khatami, Bernardo Pagnoncelli

We formulate risk-averse multistage stochastic programs (MSLPs) with expected conditional risk measures (ECRMs) in the context of both quantile and deviation mean-risk measures. We study decomposition algorithms for this class of problems. Using MSLPs with ECRM, we model and solve hydrothermal scheduling and lifetime portfolio selection problems. We investigate the impact of risk-aversion on decision making for these applications.

#### 3 - Stochastic Decomposition for Mean-risk Multistage Stochastic Linear Programs

Prasad Parab, Texas A&M University, College Station, TX, 77840, United States, Lewis Ntamo, Bernardo Kulnig Pagnoncelli

Mean-risk multistage stochastic linear programs (MR-SLPs) are difficult to solve due to the incorporation of risk measures in the objective function and their large-scale nature. In this talk, we present stochastic decomposition for MR-SLPs with deviation and quantile risk measures and report on its application to hydrothermal scheduling problems.

#### 4 - Multi-stage Risk-averse Stochastic Mixed-integer Programming for Mixed-model Assembly Line Sequencing

Ge Guo, Iowa State University, 4701 Todd Dr. Unit 208, Ames, IA, 50014, United States, Sarah M. Ryan

The existing optimization formulations for mixed-model assembly line sequencing do not consider some major real-world uncertainty factors such as timely part delivery and material quality. We present a multistage stochastic mixed-integer formulation to make sequencing decisions with optimal on-time performance considering uncertainties of part delivery and material quality. A risk-averse model is further developed to guarantee customers' satisfaction with on-time performance. Computational studies are performed with the Progressive Hedging algorithm and a lower bounding approach in real-time resequencing.

### Stochastic and Robust Optimization

Sponsored: Optimization/Optimization under Uncertainty

Sponsored Session

Chair: Ruiwei Jiang, University of Michigan, Ann Arbor, MI, 48109, United States

#### 1 - Data-driven Chance Constrained Programs over Wasserstein Balls

Zhi Chen, Imperial College Business School, London, United Kingdom, Daniel Kuhn, Wolfram Wiesemann

We provide an exact deterministic reformulation for data-driven chance constrained programs over Wasserstein balls. For individual chance constraints as well as joint chance constraints with right-hand side uncertainty, our reformulation amounts to a mixed-integer conic program. In the special case of a Wasserstein ball with the 1-norm or the infinity norm, the chance constrained program can be reformulated as a mixed-integer linear program. Using our reformulation, we show that two popular approximation schemes based on the conditional-value-at-risk and the Bonferroni inequality can perform conservatively in practice and that these two schemes are generally incomparable with each other.

#### 2 - Exploiting Partial Correlations in Distributionally Robust Optimization

Karthik Murthy, Singapore University of Technology and Design, Singapore, Karthik Natarajan, Divya Padmanabhan

We aim to identify partial covariance structures that allow polynomial-time solvable tight reformulations for evaluating the worst-case expected value of mixed integer linear programs whose objective coefficients are uncertain. Assuming only the knowledge of the mean and covariance entries restricted to block-diagonal patterns, we develop a reduced SDP formulation whose complexity is characterized by a suitable projection of the convex hull of  $\{(1,x)'(1,x): x \in X\}$ , where  $X$  is the feasible region. These projected constraints lead to efficient characterizations for appointment scheduling problem, PERT networks, and linear assignment problems that are polynomial-time solvable.

#### 3 - The Discrete Moment Problem with Nonconvex Shape Constraints

Christopher Ryan, University of Chicago, 5807 S. Woodlawn Ave, Chicago, IL, 60637, United States, Xi Chen, Simai He, Bo Jiang, Teng Zhang

The discrete moment problem finds a worst-case discrete distribution that satisfies a given set of moments. We study the problem with additional “shape constraints that guarantee the worst case distribution is either log-concave or has an increasing failure rate. We characterize the structure of optimal extreme point distributions by developing new results in reverse convex optimization. We are able to show that an optimal extreme point solution to a moment problem with  $m$  moments and log-concave shape constraints is piecewise geometric with at most  $m$  pieces. This structure allows us to design an exact algorithm for computing optimal solutions in a low-dimensional space of parameters.

#### 4 - Distributionally Robust Combinatorial Optimization

Ruiwei Jiang, University of Michigan, 1205 Beal Ave., Ann Arbor, MI, 48109, United States, Shabbir Ahmed, Mohit Singh

We study distributionally robust analogs of combinatorial optimization problem with uncertain objective coefficients. We provide equivalent deterministic reformulations of such problems under several types of ambiguity sets, and discuss corresponding solution approaches.

### Joint Session OPT/Practice Curated: Infinite Dimensional LP with Applications to Sphere Packing

Sponsored: Optimization/Integer and Discrete Optimization

Sponsored Session

Chair: Elahesadat Naghib, Princeton University, Princeton, NJ, United States

#### 1 - The Slater Conundrum: Duality and Pricing in Infinite-dimensional Optimization

Christopher Ryan, University of Chicago, 5807 S. Woodlawn Ave, Chicago, IL, 60637, United States, Kipp Martin, Matthew Stern

In finite dimensions, a dual solution is a vector of “dual prices that index the primal constraints and have a natural economic interpretation. In infinite dimensions, this structure may fail to hold for a broad class of problems with constraint vector spaces that are Riesz spaces that are  $s$ -order complete or satisfy the projection property. In these spaces, the existence of interior points required

by common constraint qualifications for zero duality gap imply the existence of singular dual solutions that are difficult to find and interpret. We call this the Slater conundrum. We provide sufficient conditions that guarantee that there exists an optimal dual solution that is not singular.

#### 2 - Linear Programming with Fourier Transform Constraints

Elahesadat Naghib, Princeton University, Princeton, NJ, United States, Robert J. Vanderbei

We exploit the special structure of Fourier Transforms that appear in certain linear optimizations to efficiently approximate their optimal solution. In many important instances of this family of problems such as upper-bounds on Sphere Packing, and Turan’s extremal problem, computational results can shed light and provide intuition about the form of solutions in these problems. Especially for higher geometrical dimensions that the computational efforts suffer from curse of dimensionality, and a theoretical understanding is very much lacking.

#### 3 - Bounding Infinite Dimensional LPs by Finite Dimensional LPs via Poisson Summation

Jacob Carruth, PhD, University of Texas at Austin, Austin, TX, United States

Optimization problems in which both a function and its Fourier transform are pointwise constrained by inequalities are common in applied and pure math problems. We demonstrate a technique which, if the problem has the right structure, allows one to bound the value of this infinite dimensional problem by the value of a finite dimensional linear programming problem. We’ll discuss applications of this technique to sphere packings and to the Beurling-Selberg box minorant problem.

### Perturbation Analysis of Conic Optimization

Sponsored: Optimization/Linear and Conic Optimization

Sponsored Session

Chair: Ali Mohammad Nezhad, Lehigh University, Bethlehem, PA, 18015, United States

#### 1 - Parametric Analysis of Linear Conic Optimization

Ali Mohammad Nezhad, Lehigh University, Bethlehem, PA, 18015, United States, Tamas Terlaky

We consider the parametric and stability analysis of a linear conic optimization problem when the objective function is perturbed along a fixed direction. We study the continuity of the optimal set mapping and present the behavior of the so called optimal partition with respect to the perturbation of the objective vector. We estimate the length of a nonlinearity interval, where the dimension of the minimal faces containing the primal and dual optimal sets stays constant.

#### 2 - Condition Numbers for Convex Functions with Polytope Domains

David Gutman, Carnegie Mellon University, Pittsburgh, PA, United States, Javier Pena

We propose a condition number of a smooth convex function relative to a reference polytope. This relative condition number is defined as the ratio of a relative smooth constant to a relative strong convexity constant of the function, where both constants are relative to the reference polytope. The relative condition number extends the main properties of the traditional condition number. In particular, we show that the condition number of a quadratic convex function relative to a polytope is precisely the square of the diameter-to-facial-distance ratio of a scaled polytope for a canonical scaling induced by the function. Furthermore, we illustrate how the relative condition number of a function bounds the linear rate of convergence of first-order methods for minimization of the function over the polytope. In the final part of the talk, we will discuss possible extensions of the condition numbers to non-polytope domains.

#### 3 - On the Structure of the Inverse-feasible Region of a Linear Program

Onur Tavaslioglu, Research Assistant, University of Pittsburgh, 708 William Pitt Union, Pittsburgh, PA, 15260, United States, Taewoo Lee, Silviya Valeva, Andrew J. Schaefer

Given a set of feasible solution  $X$  to a linear program, we study the set of objectives that make  $X$  optimal, known as the inverse-feasible region. We show the relationship between the dimension of a face of a polyhedron and the dimension of the corresponding inverse-feasible region, which leads to necessary and sufficient conditions of the extreme, boundary, and inner points of a linear program. We also characterize the set of objectives that render a given solution uniquely optimal.

Sponsored Session

Chair: Sergiy Butenko, Texas A&amp;M University, College Station, TX, 77843-3131, United States

**1 - On Branching-point Selection for Trilinear Monomials in Spatial Branch-and-bound: The Hull Relaxation**

Emily Speakman, Otto von Guericke University, Universitatplatz 2, IMO, G2-213, Magdeburg, 39106, Germany, Jon Lee

In Speakman and Lee (2017), we analytically developed the idea of using volume as a measure for comparing relaxations in the context of spatial branch-and-bound. Specifically, for trilinear monomials, we analytically compared the three possible “double-McCormick relaxations” with the tight convex-hull relaxation. Here, again using volume as a measure, for the convex-hull relaxation of trilinear monomials, we establish simple rules for determining the optimal branching variable and optimal branching point. Additionally, we compare our results with current software practice.

**2 - Unifying Local-global Type Properties in Vector Optimization**

Ovidiu Bagdasar, University of Derby, Derby, United Kingdom, Nicolae Popovici

It is well-known that all local minimum points of a semistrictly quasiconvex real-valued function are global minimum points. Also, any local maximum point of an explicitly quasiconvex real-valued function is a global minimum point, provided that it belongs to the intrinsic core of the function's domain. We have shown that these “local min - global min and “local max - global min type properties can be extended and unified by a general local-global extremality principle for generalized convex vector-valued functions with respect to two proper subsets of the outcome space.

**3 - A Simplicial Homology Algorithm for Lipschitz Optimisation**

Stefan Endres, University of Pretoria, Pretoria, South Africa, Carl Sandrock, Walter W. Focke

The simplicial homology global optimisation (SHGO) algorithm is a general purpose global optimisation algorithm based on applications of simplicial integral homology and combinatorial topology. SHGO approximates the homology groups of a complex built on a hypersurface homeomorphic to a complex on the objective function. This provides both approximations of locally convex subdomains in the search space through Sperner's lemma and a useful visual tool for characterising and efficiently solving higher dimensional black and grey box optimisation problems. The algorithm is specialised in finding all the local minima of an objective function with expensive function evaluations efficiently.

**4 - A Nonconvex Quadratic Optimization Approach to the Maximum Edge Weight Clique Problem**

Seyedmohammadhossein Hosseini, Texas A&amp;M University, College Station, TX, 77843-3131, United States, Dalila B.M.M. Fontes, Sergiy Butenko

Given an undirected and edge-weighted graph, the maximum edge weight clique (MEWC) problem is to find a subset of vertices inducing a complete subgraph with the maximum total sum of edge weights. We propose a quadratic optimization formulation for the MEWC problem and study characteristics of this formulation in terms of local and global optimality. In addition, we present an exact algorithm to solve the MEWC problem. The algorithm is a combinatorial branch-and-bound procedure that takes advantage of a new upper bound as well as an efficient construction heuristic based on the proposed quadratic formulation. Results of computational experiments on some benchmark instances are also presented.

**5 - Exploiting Algebraic Structure in the Belgian Chocolate Problem**

Zachary Burr Charles, University of Wisconsin, Madison, WI, United States

The Belgian chocolate problem involves maximizing a parameter  $\delta$  over a non-convex region of polynomials. Prior methods may require many iterations or find non-optimal  $\delta$ . We give a global optimization method that outperforms these methods by exploiting algebraic structure. This allows us to find large values of  $\delta$  via a simpler combinatorial optimization problem. Our approach leads to the largest known value of  $\delta$  to date,  $\delta = 0.9808348$ . We also show that in low degree settings, our method recovers previous known upper bounds on  $\delta$ .

**1 - Understanding the Positions, Activeness and Contributions in Online Task-oriented Community Network**Ruiyao Xie, Xi'an Jiaotong University, Xi'an, 710049, China  
City University of Hong Kong, Kowloon, Nam Shan Chuen Road, Nam Shan Building, Hong Kong, Qingpeng Zhang, Wentian Cui

Open source software community is a prominent case of online task-oriented community. We focused on the relationship between actors' positions in the network and contributions. Through the empirical study, we found that: Structural holes have the advantage in coding contributions. Brokerage of developers' positions is positively associated with coding contributions; Closure of positions is negatively associated with coding contributions; Developers' activeness moderates the relationship between closure positions and two types contributions. We analyzed time-lag effects of relationship between coding contribution and structural hole positions.

**2 - Applied Lagrangian Relaxed Linear Sum Assignment Problem in Social Networks Analysis**

Ivan Belik, Norwegian School of Economics, Helleveien 30, Bergen, 5045, Norway

We present a reformulation of the linear sum assignment problem (LSAP) and Lagrangian relaxation algorithm for the social networks analysis. The Lagrangian relaxation has only one Lagrangian multiplier that can only take on a limited number of values, making the search for the optimal multiplier easy. The interpretation of the optimal Lagrangian parameter is that its value is equal to the price that has to be paid to get all  $n$  objects assigned. In the given research, we show the practical application of the Lagrangian-relaxed LSAP in the quantitative analysis of social networks.

**3 - An Algorithm to Find Multiple Distinct K-clubs in an Undirected Graph**

Ali Rahim Taleqani, North Dakota State University, 310 East Bison Court, Fargo, ND, 58102, United States, Chrysafis Vogiatzis, Jill Hough

In this work, we discussed a new algorithm to identify multiple distinct highly centralized  $k$ -clubs. A  $k$ -club is connected set of nodes of a restricted diameter that is, where any two nodes are reachable within  $k$  hops using nodes inside the set.  $K$ -clubs have many applications in social network analysis, computer network, and communications. We implemented and evaluated the algorithm on a bike-sharing system.

**1 - Accelerated Minibatch Coordinate Descent Method with Arbitrary Sampling**

Filip Hanzely, King Abdullah University of Science and Technology, Thuwal, Jeddah, 23955, Saudi Arabia, Peter Richtarik

Accelerated coordinate descent is a widely popular optimization algorithm due to its efficiency on large-dimensional problems. It achieves state-of-the-art complexity on an important class of empirical risk minimization problems. In this paper we design and analyze an accelerated coordinate descent (ACD) method which in each iteration updates a random subset of coordinates according to an arbitrary but fixed probability law. We therefore generalize “NUACDM” of Allen-Zhu et al (ICML 2016), which performs a single coordinate update. We also provide importance sampling for more popular mini-batch variants of ACD, which yields a faster convergence than the standard uniform mini-batch sampling.

**2 - Accelerated Sarah: Some Classical Variants**

Majid Jahani, Lehigh University, Bethlehem, PA, United States, Nicolas Loizou, Lam Minh Nguyen, Martin Takac

In this study, we propose some optimization algorithms for the finite-sum minimization problems. Our methods incorporate the ideas of Heavy Ball (HB) momentum, LBFGS and Stochastic Recursive Gradient algorithm (SARAH). The proposed methods are called HBSARAH and LBFG2SARAH, respectively. We demonstrate experimentally that our algorithms perform well on large-scale convex optimization problems.

**1 - Tipping Point in Ride-hailing Service Systems with Sharing Option**

Jianfu Wang, Nanyang Business School, Nanyang Technological University, Block S3-B2C-85, 50 Nanyang Avenue, Singapore, 639798, Singapore, Geoffrey Chua, Arvind Sainathan, Akshay Vijayendiran

This paper examines different car-sharing models offered by ride-hailing firms. In the traditional car-hailing model, customers are served individually by taxis or private cars. In the sharing-only model, all customers are willing to share the ride with other customers. In the hybrid model, customers may choose either individual or shared service provided by the same fleet of cars. We develop a queueing game-theoretic model to help determine the arrival rates that create the maximum customer value. We discover a tipping point in the hybrid model. When the hassle cost decreases to this point, the optimal customer behavior switches from less than 80% using shared service to all using it.

**2 - Do Ratings Cut Both Ways? Impact of Bilateral Ratings on Platforms**

Senthil Veeraraghavan, University of Pennsylvania, Wharton School OPIM Department, 545 3730 Walnut Street, Philadelphia, PA, 19104, United States, Kartik Hosanagar, Chen Jin

Traditional platforms (e.g., Amazon) use Unilateral Rating System (URS), in which customers rate sellers. However, sharing economy platforms (e.g., Uber, Lyft, Airbnb) have adopted Bilateral Rating System (BRS) that allows service providers to rate customers, and even select customers based on ratings. BRS is often purported to be better than URS, as it unlocks the hidden information for one-time interactions, by revealing ratings of customers to service providers before they make accept/reject decisions. We find that Bilateral Ratings, despite containing more information and choice, are not necessarily better for platform revenues, and they may reduce driver revenues and consumer welfare.

**3 - Proactive Customer Service: Operational Benefits and Economic Frictions**

Kraig Delana, London Business School, PhD Program Office, London, NW1 4SA, United Kingdom, Nicos Savva, Tolga Tezcan

We study a service setting where the provider may learn about customers' future service needs and initiate service for these customers proactively if they are flexible with respect to the timing of service delivery. Utilizing both exact and asymptotic analysis, we find that proactive service can generate a significant reduction in delays for customers. Despite this, we find that customers are less willing to be flexible compared to the social optimum because of a positive externality - flexible customers benefit not only themselves but inflexible customers as well. Hence to achieve the benefits of proactive service, providers may have to incentivize customers to overcome this economic friction.

**4 - Bundle Pricing of Congested Services**

Chenguang (Allen) Wu, Hong Kong University of Science and Technology, Clear Water Bay, Hong Kong, Luyi Yang

We study whether a monopolist running a congestion-prone service system (e.g., theme park) should sell multiple services (e.g., amusement rides) separately or together as a bundle when customers are delay- and price-sensitive. We show when and how the presence of congestion challenges prescriptive guidelines proposed by the prior literature on product bundling.

**1 - Optimizing SKU Selection for promotional Display Space at Grocery Retailers**

Olga Pak, University of South Carolina, Columbia, SC, United States, Mark Ferguson, Olga Perdikaki, Su-Ming Wu

Promotional displays are a powerful tool to boost consumer engagement. As a result, we propose a methodology to identify a profit-maximizing selection of products for promotional display using grocery store sales transaction data. Our methodology results in substantial improvement in profit when compared to an industry benchmark.

**2 - Category Captainship in the Presence of Retail Competition**

Alper Nakkas, University of Texas at Arlington, Arlington, TX, United States, Mumin Kurtulus, Yasin Alan

Category captainship (CC) is a retailing practice wherein a retailer collaborates with a manufacturer to implement a category management strategy. We consider a game-theoretic model in which two retailers compete on category appeals and analyze the impact of CC on the retail competition. We find that, CC in the presence of retail competition may enable the focal retailer to steal market share from its competitor, leading to a share shifting effect. This effect is a significant determinant of the benefits of implementing CC for a retailer. In addition, we show that despite competing head-to-head with the focal retailer, the competing retailer can benefit from the focal retailer's CC implementation.

**3 - Intertemporal Segmentation via Flexible-duration Group Buying**

Jingchen Liu, Peking University, 5 Yiheyuan Road, Haidian District, Beijing, 100871, China, Ming Hu, Xin Zhai

Motivated by the cosmetic industry, we study an innovative group buying strategy. Different from the traditional group buying, a special edition of the product is unlocked only when the number of sign-ups reaches a preset threshold, with no duration constraint. Customers need to anticipate their expected waiting time, which varies depending on their arrival time. Then such a group buying with flexible duration can result in intertemporal consumer segmentation, as different consumer segments are admitted at different times in the dynamic sign-up process. As a unique feature of group buying with flexible duration, intertemporal consumer segmentation has several nontrivial implications.

**4 - Intermediation in the Supply of Agricultural Products in Developing Economies**

Ehsan Valavi, Harvard Business School, Boston, MA, United States, Kris Johnson Ferreira, Joel Goh

The agricultural industry has been growing in developing economies, yet farmers continue to struggle. One reason for this is that farmers bear the risk of mismatched supply and demand, since farmers must make planting and harvesting decisions prior to knowing the price they can get for their crop at an auction. Recently, e-intermediaries have emerged as an alternative channel to the auction for which farmers can sell their crop; e-intermediaries use technology to inform farmers about a fixed crop price prior to harvest. We study the impact that e-intermediaries have on the supply chain.

**5 - Scan-based Trading and Bargaining Power:****A Structural Model of Vertical Retail Supply Relationships**

Stanley Lim, University of Cambridge, Cambridge, United Kingdom, Arizona State University, Tempe, AZ, United States, Min Choi, Timothy Richards, Elliot Rabinovich

Rather than exchange title for goods upon delivery to store, under scan-based trading (SBT) contracts, supplier retains title until the item is purchased by the customer. The emergence of SBT raises questions of how bilateral market power affects vertical supplier-retailer relationships in a food supply network. Using a Nash-in-Nash bargaining model, panel data combining supply and demand data, and structural econometrics, we examine the relationship between SBT contracting and degree of bargaining power exercised by retailers/wholesalers in a vertical retail channel. We find both retailer bargaining power and inventory shrink are higher under SBT than direct-to-store delivery contracts.

**Joint Session MSOM/Practice Curated:  
Empirical and Theoretical Studies of the  
Sharing Economy**

Sponsored: Manufacturing &amp; Service Oper Mgmt

Sponsored Session

Chair: Maxime Cohen, NYU Stern, New York, NY, 10012, United States

Co-Chair: Gad Allon, University of Pennsylvania, Philadelphia, PA, 19104, United States

**1 - The Impact of Behavioral and Economic Drivers on Gig Economy Workers**

Park Sinchaisri, The Wharton School, University of Pennsylvania, Philadelphia, PA, United States, Gad Allon, Maxime Cohen

While gig economy firms benefit from increased labor flexibility, ensuring that their services appeal to independent providers poses a great challenge in planning and committing to a service capacity. We study how on-demand workers make labor decisions: when to work and for how long? Our project is in collaboration with a ride-hailing company with the goal to not only improve the way of predicting the number of active drivers, but also understand how to better recruit them, as a way to match supply and demand. Careful analysis of actual work decisions and responses to incentives, accounted for sample selection and endogeneity, has revealed behavioral insights that can inform better incentive design.

**2 - Under the Same Roof: Value of Shared Living in Airbnb**

Yao Cui, Cornell University, Ithaca, NY, 14853, United States, Ming Hu

An important difference between Airbnb and traditional hotels is that the guest may be sharing the property with the host. Due to the shared living it enables, Airbnb blurs the line between economic and social exchanges. In this paper, we study how the social exchanges affect transaction prices in Airbnb. We first offer empirical evidence that the guest's desire to stay with the host impacts transaction prices. The empirical evidence thus suggests that the guest may obtain a utility from staying with the host, which we term the social utility. We then theoretically investigate the implications of social utility for the sharing economy stakeholders.

**3 - Free-floating Vehicle Sharing Networks**

Einar Gunnarsson, University of Minnesota, Minneapolis, MN, United States, Saif Benjaafar

We describe a queueing model of free-floating vehicle sharing networks, such as dockless bikes. We characterize the relationship between service level, fleet size, and the size of the service region. We show that maintaining a high service level can require a disproportionately large fleet.

**4 - Dockless Bike-share Systems**

Ashish Kabra, INSEAD, Boulevard de Constance, Fontainebleau, 77305, France

Dockless bike-share systems have taken over the VC landscape. We study how their ridership compares and more importantly interacts with station based bike-share systems.

Chair: Konstantinos (Constantine) Moros, EY (Ernst &amp; Young) - Advisory Services, 3 Ipsilandou Street, Alimos, Athens, 17455, Greece

**1 - Implementing Blockchain Solution using Smart Contracts for Efficient Container Cargo Tracking**

Raja Jayaraman, Khalifa University, P. O. Box 127788, Abu Dhabi, United Arab Emirates, Khaled Salah

Efficient tracking of container cargo is critical in managing global trade and logistics activities. The volume of global container movement combined with information opaqueness and complexity necessitates implementing a robust technology solution with real time tracking capabilities. Blockchain is an emerging technology that offers the necessary framework to track and manage container cargo movements across the supply chain using a peer-to-peer, secured, distributed ledger. In this talk, we present the implementation approach, architectural design, interactions between sender and receiver, and testing of the overall system functionality.

**2 - Procurement Design under Asymmetric Information of Uncertain Supply**

Feng Liu, Dr., Dongbei University of Finance and Economics, Dalian, China, Qingkai Ji, Jun Zhuang

Unreliable suppliers may pose a substantial threat to supply chains, especially when they hold private reliability information. We consider a dyadic supply chain where the production yield information of supplier is asymmetric. We propose a new mechanism-design model and derive the buyer's optimal procurement contract menu that can screen the suppliers with private information. We prove that the contract menu is as simple as offering two different inflated order amounts and setting the procuring price sufficiently low to let the suppliers earn reservation profits. This paper provides some new insights into supply chain management under asymmetric information of uncertain supply.

**3 - Information Signaling of Superior Supply Chain Management Capability**

Suvankar Ghosh, University of Toledo, 2801 W. Bancroft Street, Toledo, OH, 43606, United States, John Thornton, Yewmun Yip

Exceling in managing the supply chain is a challenge. Firms with superior supply chain management (SCM) capability play a key role as other businesses try to emulate them. But businesses have to first know who these capable firms are. Information signaling models assert that having a credential can signal the requisite capability. Gartner publishes annually a list of the top 25 firms that it believes excel in SCM. We treat being in Gartner's list as a credential of superior SCM capability. We study the value of this credential from 2004 to 2014 and find worrying signs that its value may be eroding with time. This has serious implications for both Gartner and the business community.

**4 - Multi-criteria Evaluation of Supply Chain Structures**

Ravi Suman, University of Wisconsin-Madison, Madison, WI, 53726, United States, Aqueel Nazim Altaf, Ananth Krishnamurthy, Sushanta Sahu

Strategic decisions of which products to make at which facility are often influenced by a combination of quantitative factors (capacity and costs) and qualitative factors (political stability and supply reliability). We develop a decision-making framework that effectively balances these diverse factors and evaluates alternatives. The approach uses a mixed integer programming model to capture the effects of quantitative factors and a generalized TOPSIS model to address the qualitative factors. We show that the combination of the two methods provides a true assessment of alternative scenarios facilitating effective decision making.

**5 - Supply Chain Finance Program Offered by Major Retailers: A Strategic Framework of Supplier Assessment Process**

Konstantinos Moros, Senior Manager - EY Advisory Services, EY (Ernst &amp; Young) - Advisory Services, 3 Ipsilandou Street, Alimos, Athens, 17455, Greece, Daniel Corsten

The focus of this empirical research is positioned within the intersectional research area of Buyer-Supplier Relationships and Supply Chain Finance. By conducting a survey in a group of suppliers who have been exposed to, informed, and invited to adopt a SCF program, offered by one of the largest multinational retailers, we examine the main non-finance and finance related drivers of supplier-perceived satisfaction and trust and propose a strategic framework of ex-ante and ex-post assessment process followed by suppliers. We also explore the link of these two BSR constructs to the supplier perceived SCF program attractiveness and the risk of buyer opportunism, following a potential adoption.

**6 - Supply Chain & Innovation in Consumer Goods Manufacturing: The Operational Impact of New Product Introductions**

Rafael D az, Professor of Supply Chain Management, MIT-Zaragoza Logistics Center, Zaragoza, 50197, Spain, Leo Laranjeira Gomes

We analyze and measure the impact of new product introductions into the supply chain of a consumer goods manufacturer. Based on an in-depth analysis of operational panel data from a European company, we identified the factors that impact its supply chain performance and should be considered when analyzing exploration versus exploitation trade-offs.

### Emerging Topics in Service Operations

Sponsored: Manufacturing & Service Oper Mgmt/Service Operations

Sponsored Session

Chair: Yuqian Xu, University of Illinois at Urbana-Champaign, Champaign, IL, 61820, United States

#### 1 - Evolution of Ride Services

Daehoon Noh, University of Maryland, College Park, MD, 20742, United States, Tunay Tunca, Yi Xu

Ride services bring together drivers and customers in two-sided matching markets. As these services mature multiple competing operational models emerge. In this paper, we utilize a multi-stage multi-firm model to analyze the competition between different ride service models. We study the market equilibrium and identify the factors that determine pricing and shaping of market segmentation.

#### 2 - Information and Coordination in Supply Chain Management: A Case of Fast Food Restaurant Chain

Jiahua Wu, Imperial College Business School, Imperial College London, London, SW7 2AZ, United Kingdom, Ming Hu, Peng Luo

Our study is based on a data set from a fast-food restaurant chain. During the observation window, this restaurant chain switched from third-party POS systems to their own system, which allows them to gather real-time sales information from stores. We study store managers' adjustment of operational decisions in response to this change, as well as the resulting impact on customer satisfactions. Surprisingly, customer satisfaction deteriorates as a result of this change. We show that mis-coordination between supply and system update is the reason for that.

#### 3 - The Impact of Bike Sharing on Environment

Shuai Hao, University of Illinois Urbana-Champaign, Champaign, IL, United States, Yuqian Xu, Anindya Ghose

Bike sharing is becoming more and more popular across the world and has drawn increasing attention from the operations management and other research community. However, so far as we know, limited work has been done on quantifying the environmental impact of bike sharing. This work aims to quantify the impact of bike sharing on air quality and estimate the causal effects. Also, we want to take one step further to understand the mechanism behind this impact through analyzing the public transportation data.

#### 4 - A Model of Network Formation with Heterogeneous Players

Lingjiong Zhu, Florida State University, 1017 Academic Way, Room 208, Tallahassee, FL, 32306, United States, Angelo Mele

We study an equilibrium model of sequential network formation with heterogeneous players. The payoffs depend on the number and composition of direct connections, but also the number of indirect links. We show that the network formation process is a potential game and in the long run the model converges to an exponential random graph (ERGM). Since standard simulation-based inference methods for ERGMs could have exponentially slow convergence, we propose an alternative deterministic method, based on a variational approximation of the likelihood.

Sponsored Session

Chair: Tarek Abdallah, New York University, New York, NY, 10029, United States

#### 1 - Nudging Flexible Workforce: Empirical Evidence from Online Cleaning Services Platform

Ruslan Momot, HEC Paris, 1 Rue de la Libération, Jouy-en-Josas, 78350, France, Ekaterina Astashkina, Marat Salikhov

This study focuses on platforms that facilitate matching of heterogeneous customers (tasks) with heterogeneous contractors. Centralized platforms (e.g. Uber) rigidly assign contractors to customers, while decentralized platforms (e.g. TaskRabbit) let contractors choose tasks they prefer. We compose the right personalized assortment of tasks that hybrid platforms should offer to its contractors. We build an econometric model of contractors' choice, which we estimate on a proprietary dataset of the cleaning platform (similar to HomeJoy). We then formulate platform's online optimization problem of assortment personalization and identify policies that achieve near-optimal performance.

#### 2 - Randomized Product Display (Ranking), Pricing, and Order Fulfillment for E-commerce Retailers

Yanzhe Lei, Queen's University, Kingston, ON, Canada, Stefanus Jasin, Joline Uichanco, Andrew Vakhutinsky

We consider an e-tailer selling multiple products stored in multiple warehouses to customers from multiple regions. For each customer, e-tailer may customize the pricing decision, the product display decision (i.e. which products to display in what order on the website), and the fulfillment decision (i.e., where to dispatch individual items from). We propose a tractable LP formulation and then construct a novel randomization scheme that translates the solutions to the LP into control parameters. We test the performance of the proposed control in large-scale numerical experiments with real retail data.

#### 3 - Revenue Management with Bundles

Tarek Abdallah, Kellogg School of Management, Northwestern University, 2211 Campus Dr, Evanston, IL, 60208, United States, Joshua Reed, Arash Asadpour

We study the impact of operational levers such as limited inventory and short selling horizons on the optimal bundling strategy. We incorporate the bundling problem into a classical network revenue management problem and go beyond the classical fluid regime. In particular, in our problem there are three main parameters that can be scaled: (1) the arrival rate, (2) the inventory, and (3) the number of product types. By considering the different ways these parameters can be scaled, we can capture different dynamics of the problem that correspond to different market properties. Our preliminary results reveal an interesting interplay between the operational parameters and the optimal selling strategy.

### Joint Session MSOM/Practice Curated: Waste Issues

Sponsored: Manufacturing & Service Oper Mgmt/Sustainable Operations

Sponsored Session

Chair: Arzum E. Akkas, Boston University, Cambridge, MA, 02142, United States

Co-Chair: Dorothee Honhon, University of Texas at Dallas, Richardson, TX, 75080, United States

#### 1 - Package Size and Pricing Decisions with a Bulk Sale Option

Dorothee Honhon, University of Texas at Dallas, 800 West Campbell Road, SM30, Richardson, TX, 75080, United States, Ismail Kirci, Alp Muharremoglu

We investigate the package size and pricing decisions of a retailer selling a perishable product to a population of heterogeneous customers who choose between buying the product in packages of a fixed pre-set size or buying the product in bulk, which allows them to buy the exact quantity which maximizes their expected net utility. We show that, contrary to popular beliefs, the existence of a bulk sale option at the retailer's may not always be environmentally beneficial as it may, in some cases, lead to more waste at the consumer level.

#### 2 - Reducing Carbon Footprint of Grocery Retailing

Elena Belavina, SC Johnson College of Business, Cornell University, Ithaca, NY, 14853, United States, Ekaterina Astashkina, Simone Marinesi

This paper studies how e-retailing of perishables impacts market emissions. With low online adoption, inventory decentralization (due to extra stocking location of an e-retailer) is harmful and increases emissions (the result that is in line with conventional wisdom). However, with high enough adoption, the e-retailer gains enough scale, rendering decentralization, surprisingly, beneficial to the environment. Interestingly, equal demand split among retail locations leads to the worst environmental outcome. That is, we find that traditional models consider the worst kind of inventory decentralization.

#### 3 - Implications of Eliminating Aesthetic Grading in Agricultural Supply Chains

Karthik Murali, University of Alabama, 351 Alston Hall, Tuscaloosa, AL, 35487, United States, Isil Alev

The grading of produce based on aesthetics is among the biggest contributors to food waste. Using a stylized model, we explore how crop yield and consumer preferences shape the economic and environmental consequences of eliminating grading in the agricultural supply chain by introducing aesthetically differentiated produce at the retail level.

#### 4 - The Race for Product Renewal

Xabier Barriola, IESE Business School, Barcelona, Spain,  
Victor Martinez de Albaniz

The continuous renewal of products for electronics or apparel has been criticized for increasing waste. While consumers appreciate novelty in settings where product utility decays over time, it is not clear how and why producers take product renewal decisions. In this work, we build a model where consumers decide to renew their products as a function of product launches, and firms optimize product features and introduction times. We find that a monopoly leads to efficient launch decisions while competition results in an oversupply of new products.

#### 1 - Government-to-Government (G2G) Contracts for India's Pulses Procurement: Ad-Hoc Bargaining, Long-Term Contracting and Supplier Diversification

Liying Mu, University of Delaware, Newark, DE, United States,  
Bin Hu, Srinagesh Gavirneni

India depends on pulses as a vital source of protein, yet has faced pulses crises driven by insufficient and uncertain internal yields and ad-hoc importing policies. The government is experimenting with long-term importing policies. Inspired by India's importing practice, we set out to examine G2G ad-hoc bargaining versus long-term contracts under the Nash-bargaining framework. Our main results are: (a) buyer's bargaining power does not necessarily improve its utility in ad-hoc bargaining, (b) long-term contracts can improve the buyer's utility if the buyer has sufficiently high bargaining power, and (c) bargaining power of the buyer can be improved through supplier diversification.

#### 2 - Does Competition Help Drug Shortage Recovery?

Junghee Lee, University of California, San Diego, CA, 92093-0553,  
United States, Hyun Seok Lee, Vixh Krishnan, Hyoduk Shin

There are ongoing shortages of generic drugs in the U.S., which threaten public healthcare. While manufacturing firms argue limiting competition may mitigate the issue, the FDA and patients seriously challenge the idea. Using historical drug shortage data and competition level, we reconcile both perspectives and provide better insights.

#### 3 - Data Analytics in Supply Chain Quality

Ahmet Colak, Clemson University, Greenville, SC, 29601,  
United States, Robert Bray

Combining public and private auto industry data, we derive novel consumer-level and firm-level variables that influence quality improvement decisions such as recalls. Accounting for various product characteristics and spillover effects, we study a panel data from 1994 to 2015. We use data analytics and structural estimation.

#### 4 - Organizational Design and the Ability to Exploit Complementarities: A Naturally Occurring Experiment

Changseung Yoo, McGill University, Montreal, QC, Canada,  
Anitesh Barua, Genaro J. Gutierrez

Using a naturally occurring experiment, we empirically investigate how a firm's organizational design involving centralized or decentralized decision making can affect its ability to exploit synergies among business practices in the context of digital advertising. We find that the centralized mode better recognizes and incorporates complementarities into its decision making, while the decentralized mode fails to exploit complementarities, and thus systematically under-invests in its decisions, leading to less overall profit.

North Bldg 128A

### Operations Management I

Contributed Session

Chair: Weixin Shang, Lingnan University (Hong Kong),  
8 Castle Peak Rd, Tuen Mun, Hong Kong

#### 1 - Simple Sequential Allocation Mechanisms

Kun Soo Park, Seoul National University, 1, Gwanak-ro,  
Gwanak-gu, Seoul, 08826, Korea, Republic of, Bosung Kim,  
Seyed Iravani, Sang Won Kim

We consider an allocation of a firm's capacity to its retail branches. The firm allocates the capacity to each branch to maximize the overall profit of the firm. Each branch makes ordering decision independently by using private information. We focus on the situation where an allocation to a retail branch should be made without full information about orders from other branches who may order later. We also incorporate branch manager's incentive to inflate their orders (i.e., strategic ordering) to receive a more favorable allocation.

#### 2 - Technology Upgrade in a Supply Chain with Entry Threat

Guanmei Liu, Shanghai Jiao Tong University, 1954 Huashan Rd.,  
Shanghai, 200030, China, Xiaofeng Shao

This study examines a strategy that an existing buyer (he) upgrades a supplier's production technology through direct investment when a potential buyer (she) may enter the market. We show the entry, without technology spillover, benefits the incumbent buyer under certain conditions, while it does not with technology spillover. Importantly, we reveal investing in technology upgrade may affect the concentration of the product market. Given a high production cost and a low investment cost without technology spillover, the supplier refuses to feed the entrant, incurring her entry failure and thus market monopoly. With technology spillover, it approves the entry, causing market competition.

#### 3 - Evaluating Contract Differentiation and Participation Options under Heterogeneous Agent Information

Wenbo (Selina) Cai, Assistant Professor, New Jersey Institute of  
Tech, Mec 308, University Heights, Newark, NJ, 07102,  
United States, Dashi Singham

We develop a framework for optimization of contracts for agents with heterogeneous demand distributions, where agents can have a number of demand distributions, each with a number of possible demand realizations. We develop pricing schedules for this framework under two types of contracts: 1) aggregation vs. differentiation of contract options, and 2) whether agents can choose to not participate in the future after contract commitment. We show that the principal always prefers differentiation and required participations at each time period. A dual result exists for the agents, and when participation is required, contract differentiation maximizes the overall social welfare of both parties.

#### 4 - An Empirical Analysis of Pricing Strategies for Two-sided Platforms

Onur Altintas, University of Rochester, 500 Joseph C. Wilson Blvd  
4-349, Rochester, NY, 14627, United States, Min-Seok Pang,  
Avi Seidmann

Two-Sided business platforms have gained significant economic power over recent years. However, the competitive pricing decision processes at these multi-sided platforms are highly complex due to their temporal externality effects. In this study, we present the result of an extensive longitudinal analysis of pricing strategies for competitive two-sided platform games. We analyze the participants' strategies and subsidizing behavior under different price contract structures. Our results explain how and why the winning strategy changes with the contract structure.

#### 5 - Data-driven Inventory Allocation in Bike Sharing Network

Zhenyu Gao, Tsinghua, Room 430B, Zijing Department #14,  
Beijing, 100084, China, Chen Wang

Bike-sharing network gains an expanding popularity for its effectiveness in satisfying last-mile demand. It brings a new variant to inventory management with the demand outflow of one region also being a supply inflow to another, which makes it difficult to estimate lost sales for multiple interdependent regions. We propose a novel linear statistical model to incorporate inventory levels when estimating real demand from censored observations. Inventory redeployment policies are derived from the estimation results on a rolling basis. Numerical results show that our estimation resembles the real demand and the proposed inventory policy significantly reduces lost sales of the entire network.

#### 6 - Incentive-driven Bilateral Transshipment in Inventory Competition

Weixin Shang, Lingnan University, Hong Kong,  
Qi Fu, Liming Liu

We construct a two-stage game model to examine the transshipment and inventory decisions in overlapping markets with both customer switching and transshipment. We find that there could be no transshipment, partial transshipment, or full transshipment, and obtain the conditions under which a unique equilibrium of order quantities exists. We show that transshipment may intensify or mitigate inventory competition and that there can exist a real incentive for competing firms to transship to others cooperatively. We show the existence of coordinating transshipment prices under which the transshipment and inventory decisions of the competing firms mimic those of the centralized optimal decisions.

### Innovative Pricing Strategies

Sponsored: Revenue Management & Pricing

Sponsored Session

Chair: Pnina Feldman, University of Pennsylvania, Philadelphia, PA, United States

#### 1 - Pricing Capacity over Time and Recourse Strategies:

##### Facilitate Reselling, Offer Refunds, or Overbook?

Pnina Feldman, Boston University, 595 Commonwealth Ave, Boston, MA, 02215, United States, Gerard P. Cachon

Perishable capacity is often sold before it is used which creates the opportunity to include in the pricing mechanism a recourse strategy, such as resale, refunds and overbooking. We investigate alternative recourse strategies and the implication for firm's profit and social welfare.

#### 2 - On the Power of Bounded Memory Peak End Demand Models

Tamar Cohen, MIT, Somerville, MA, 02144, United States, Kiran Panchamgam, Georgia Perakis

We consider the problem of promotion planning for a single product, with bounded memory peak end demand. We show that when using this demand model, the optimal promotion policy will require at most two price levels. We then show that with a finite planning time horizon and a limit on the number of deviations from full price, we can find the structure of the optimal pricing policy. We characterize when the optimal policy is cyclic, as well as when a cyclic policy is not optimal. Finally, we show that even in the cases that we misclassify the demand model, and the true demand model does not fit the bounded memory peak end model, the estimation error is small. We provide an analytical bound on this estimation error

#### 3 - Intertemporal Price Discrimination via Randomized Pricing

Jiahua Wu, Imperial College Business School, Office 382, Tanaka Building, Imperial College London, London, SW7 2AZ, United Kingdom, Hongqiao Chen, Ming Hu

The undesirable, but inevitable, consequence of dynamic pricing is that consumers are trained to time their purchases strategically. We consider a novel randomized pricing approach, where the firm varies prices in a random fashion, and study its effectiveness in addressing consumers' strategic behavior. We show that the optimal price distribution follows a simple structure. We also benchmark the optimal randomized pricing policy against optimal static pricing and cyclic pricing policies, and characterize conditions when the former dominates. Lastly, we extend randomized pricing in two different directions, namely, cyclic randomized pricing and Markovian pricing.

#### 4 - Revenue Optimization under a Preannounced Dynamic Price Function

Dana Pizarro, University of Chile, Beauchef 851, Santiago, 8320000, Chile, Jose Correa, Gustavo J. Vulcano

We consider a dynamic game between a seller and a single buyer. The seller operates over an infinite time horizon. At the beginning of the horizon the seller commits to a price function  $p(t)$ . The buyer arrives according to a general random process, has a private valuation for the item, and decides when to buy in order to maximize his expected utility. The seller's problem is to determine the price function  $p(t)$  to maximize her expected revenue. We analyze this dynamic game and provide numerics to show the achievable revenue performance.

### Revenue Management in Retail and Online Platforms

Sponsored: Revenue Management & Pricing

Sponsored Session

Chair: Yanzhe Lei, University of Michigan, Ann Arbor, MI, 48104, United States

Co-Chair: Stefanus Jasin, University of Michigan, Ann Arbor, MI, 48105, United States

#### 1 - Online Demand Fulfillment under Limited Flexibility

Zhen Xu, Columbia University, New York City, NY, United States, Rachel Q. Zhang, Jiheng Zhang

We extend the work by Asadpour et al. (2016) on online demand fulfillment for systems with the same number of resources and request types to general systems and show that a positive Generalized Capacity Gap (GCG) introduced by Shi et al. (2016) is both necessary and sufficient for a system to achieve bounded performance. Both theoretical and numerical evidence point to the GCG as the most important indicator of system performance, which leads to simple inventory

allocation rules and guidelines for designing sparse network structures such as generalized long chains. A real case study is conducted to confirm our findings as well as some of the flexibility principals conjectured in the literature.

#### 2 - Management and Effects of In-store Promotional Displays

Oguz Cetin, University of North Carolina, Chapel Hill, NC, United States, Adam J. Mersereau, Ali Kemal Parlakturk

We examine a brick-and-mortar retailer's choice of which product to include in a promotional display. The display provides a visibility advantage to both the featured product and its category, but it also has consequences for customer traffic and substitution. While there has been considerable academic interest in the assortment planning problem and in the shelf-space allocation problem, little attention has been paid to the problem of where to place products in the store. We develop analytical insights using a problem formulation based on a nested multinomial logit model. Our work provides guidance for how retailers can use and value promotional displays effectively.

#### 3 - Dynamic Pricing under a Static Calendar

Jinglong Zhao, Massachusetts Institute of Technology, 77 Massachusetts Avenue, E17 IDSS 495G, Cambridge, MA, 02139, United States, Will Ma, David Simchi-Levi

Our work is based on the classical dynamic pricing problem. From our collaborations with a large Consumer Packaged Goods company, we have found that while they appreciate the advantages of dynamic pricing, it is operationally beneficial for them to plan out a deterministic price calendar in advance. It is possible to deviate from this calendar as demand is observed, but there is a significant overhead in doing so, and thus deviation should be reserved for situations where the realized demand was drastically higher or lower than expected. Motivated by this, we formulate the dynamic pricing problem under static calendar constraints, and study how classical dynamic pricing intuition may break down.

#### 4 - Contingent Stimulus in Crowdfunding

Longyuan Du, Rotman School of Management, University of Toronto, 105 St George St, Toronto, ON, M5S 3E6, Canada, Ming Hu, Jiahua Wu

We study a model where backers arrive sequentially at a crowdfunding project. We characterize the dynamics of the pledging process. To boost success, we focus on a commonly practiced stimulus policy of running promotions, e.g., on social media, to attract backers. We show that the optimal promotion intensity depends on the pledge progress and is not monotone. We analyze the deterministic heuristics and show that their performances are compromised because of the all or nothing nature of crowdfunding. We propose a modified resolving heuristic that greatly improves the performance and has provable optimality gaps. Testing with the Kickstarter data, we demonstrate the benefit of the stimulus policies.

North Bldg 129B

### Practice- Optimization I

Contributed Session

Chair: Maziar Sanjabi, University of Southern California, Los Angeles, CA, 90007, United States

#### 1 - Job Scheduling with Simultaneous Assignment of Machines and Multi-skilled Workers: A Mathematical Model

Cinna Seifi, Research Assistant, Clausthal University of Technology, Julius-Albert-Strasse, Clausthal-Zellerfeld, 38678, Germany, Jürgen Zimmermann

The primary task of mining companies is the extraction of raw materials. Based on a planning program, a certain quantity of materials is expected to be extracted within a given time horizon. The applied mining method is characterized by nine process steps each of which has to be executed by an appropriate machine and worker. The processing time of a process step depends on the assigned devices and workforces. In this paper, we formulate a mathematical program for a simultaneous assignment of devices and personnel to a selection of jobs. The aim is to minimize the difference between the predetermined quantity and the amount of extracted material, cumulatively over all the process steps, for a work shift.

#### 2 - Effective Rules of Thumb in Analytics Modeling

Yanqi Xu, Director of Applied Technology, Princess Cruises, Valencia, CA, 91355, United States

Various industries build optimization models to provide meaningful solutions to practical problems so as to increase revenue, reduce costs, manage risks, streamline operations, etc. In this talk, we will share our model building experience and lessons learned across different industries. Topics (with real world examples) include: number one concern of model building, how to solve the problem at the right level of details, what to include/exclude, signs that the issues of a model cannot be fixed by incremental improvement, performance tradeoffs, and modeling with sparse data.

### 3 - Generative Adversarial Network Formulations with Convergence Guarantees

Maziar Sanjabi, USC, Los Angeles, CA, United States

Generative Adversarial Networks (GANs) are one of the most practical strategies to learn data distributions. A popular GAN formulation is to use Wasserstein distance as a metric between probability distributions. Unfortunately, minimizing this distance is difficult as its objective is non-convex and non-smooth. In this work, we use smooth approximations of this objective. We show that obtaining gradient information of the smoothed formulations is easy. Based on this observation, we propose a class of first-order algorithms with guaranteed theoretical convergence to stationarity. We apply our method to MNIST and CIFAR-10 datasets and show its effectiveness.

### Practice- Pricing and Revenue Management I

Contributed Session

Chair: Hao Lu, University of Science and Technology of China, 96 JinZhai Road, Baohe District, Hefei, 230026, China

#### 1 - Which Outlier Detection Approach is Better for Estimating the Elasticity Value

Shuguang Ji, Sr. Data Scientist, Delta Airlines, Atlanta, GA, 30339, United States

In cases where outliers are present, finding an accurate model to make prediction becomes more difficult. In practice, the mean  $\pm$  3 standard deviations remains common method for outlier detection. Unfortunately, 3 problems can be identified when using this method. Firstly, it assumes that the distribution is normal. Secondly, the mean and standard deviation are strongly impacted by outliers. Thirdly, this method is very unlikely to detect outliers in small samples. In this presentation, the author wants to review the popular outlier detection methods for the elasticity estimation at first. Then the most effective detection methods will be recommended according to the cases in practice.

#### 2 - Pricing and Service Throttling in Cloud Computing

Yingda Zhai, The University of Texas at Austin, Austin, TX, 78703, United States, Maxwell B. Stinchcombe, Andrew B. Whinston

Motivated by unprecedented surging demand for computing resource, we consider a monopoly provider with queue technology prices and allocates computing resource in a complex environment. We establish a service model with no aggregate risk which allows provider accurately to predict and manage queue capacity. A profit-maximizing provider throttles service by (i) limiting overall market supply and (ii) tranching her capacity in terms of service quantity and interruption. We then propose an appealing auction mechanism in the cloud computing spot market to implement the profit-maximizing allocation where users find it a weakly dominant bidding strategy to bid the optimal prices.

#### 3 - Dynamic Pricing Strategy and Simulation Research Considering Strategic Consumers in Perfect Competition Electricity Market

Lingchunzi Li, Huazhong University of Science and Technology, School of Management, No. 1037, Luoyu Road, Hongshan District, Hubei Province, China, Wuhan, 430074, China, Haijun Wang, Nancy Shuoqia Guo, Penghong Cheng

China is in the key stage of electricity market reform. This paper is to explore an appropriate pricing strategy to provide reference for reformation and power pricing research in China. Under centralized transactions, a game model considering customers' strategic choice behavior is established. And a time-sharing dynamic pricing scheme is solved to maximize both power enterprises' equilibrium revenue. Simulation results show that the competition between power producers can reduce power price and increase power supply volume effectively. The model we built and the factor of equilibrium validity we introduced are innovations in this paper.

#### 4 - An Optimization Framework for Pricing of Port Services: Case of Major Ports in India

Deepankar Sinha, Associate Professor, Indian Institute of Foreign Trade, 1583 Madurdah, Kolkata, 700107, India

Ports enable inter and intra-modal cargo transshipment to and from ships. The cost incurred in ports impact the total landed cost of any maritime cargo. The ports need to achieve three basic objectives. One, it needs to be efficient in achieving the desired level of productivity with optimal use of resources; second, minimize cost of operation; and third minimize total landed cost of shippers. So far, studies and researches have focused on part of these objectives. In this paper an attempt has been made to encompass all the three objectives. It proposes to use a non-parametric approach to develop a multi-objective optimization model to arrive at a rational pricing framework for port services.

### 5 - Multinational Merger and Acquisition and Market Value of China's Service Enterprises in the Belt and Road Strip

Hao Lu, PhD Student, University of Science and Technology of China, 96 JinZhai Road, Baohe District, Hefei, 230026, China

The Belt and Road strip (BRS) provides a broad stage for Chinese service enterprises to enter into M&As overseas. However, whether such multinational M&As achieved the expected market value return? This paper uses event study methods to analyse the development of multinational M&As in the service industry in BRS for the period 2013-2017. We found that since 2013, most of China's multinational service M&As have achieved significantly positive abnormal returns (ARs). The ARs of M&As in the technology services and public services were found to be more significant than other sub-industries of service. Among the factors that affect AR, the ratio of M&A contract size is the most significantly positive.

### Systemic Risk and Financial Risk Management

Sponsored: Finance

Sponsored Session

Chair: Luitgard Veraart, London School of Economics and Political Science, Houghton Street, London, WC2A 2AE, United Kingdom

#### 1 - Optimal Portfolio Allocations in a Heterogeneous Banking System

Marko Weber, Columbia University, New York, NY, United States

We study the portfolio choice implications of leverage constrained banks, which may need to deleverage in response to price shocks to satisfy regulatory requirements. Banks select their asset holdings in order to minimize their expected execution costs. Consistent with the classic theory of portfolio selection, diversification is optimal if each bank neglects the impact caused by the other agents' liquidation actions. If banks are heterogeneous in their leverage ratios, in equilibrium they reduce portfolio overlapping and seek diversity, at the expenses of sacrificing diversification benefits on the individual level. The bank's equilibrium allocation is not socially efficient. A benevolent social planner aiming at minimizing liquidation costs should provide banks with incentives to increase their diversity.

#### 2 - Interbank Clearing in Financial Networks with Multiple Maturities

Luitgard Veraart, Associate Professor, London School of Economics and Political Science, Houghton Street, Department of Mathematics, London, WC2A2AE, United Kingdom, Michael Kusnetsov

We consider the problem of systemic risk assessment in interbank networks in which interbank liabilities can have multiple maturities. We develop a clearing mechanism for the interbank liabilities to deal with the default of one or more market participants. Our approach generalises the clearing approach for the single maturity setting by Eisenberg & Noe (2001). We show that in the context of multiple maturities, specifying a set of defaulted banks is challenging. We propose two approaches to overcome this challenge: an algorithmic and a functional approach. Our analysis permits construction of simple dynamic clearing models.

#### 3 - Buffered Probability of Exceedance (bPOE) Ratings

Stan Uryasev, University of Florida-Gainesville, AOD, 303 Weilhall, Gainesville, FL, 32611, United States, Giorgi Pertaia

Credit ratings are widely used by investors to assess the credit risk of a security. The financial crisis of 2008 showed that credit ratings might not measure the risk appropriately for the synthetic instruments such as CDOs. This paper presents a new rating assignment model based on Buffered Probability of Exceedance, that is an improvement over the current POE based methodology.

#### 4 - Risk in Production Networks

Peng-Chu Chen, The University of Hong Kong, Kowloon, Hong Kong

We investigate systemic risk in a production network, where firms are connected through demand and supply orders. A financial shock causing disruptions to some firms propagates through the supply-chain network via the input-output linkages between suppliers and customers. Each firm in the network takes contingency plans to mitigate the impact generated from disruptions and reroutes orders through different suppliers. An equilibrium is reached when contagion from disruption stops. We develop an algorithm to recover the equilibrium with the greatest amount of delivered orders. We then analyze the impact of industrial integration on systemic risk in the production network."

### Service Queueing

Sponsored: Service Science

Sponsored Session

Chair: Thomas Robbins, East Carolina University, 3212 Bate Building, Greenville, NC, 27858, United States

#### 1 - Evaluating Tail Performance of Queueing Systems Using a Novel Stochastic Ordering Approach

Hung T. Do, Assistant Professor, University of Vermont, 55 Colchester Ave., 207 Kalkin Hall, Burlington, VT, 05405, United States, Masha Shunko, Alan Scheller-Wolf

In some service systems, performance in the right tail of the queue size and/or waiting time distribution is the main source of managerial concern. We propose a new perspective on analyzing performance of such systems by defining new stochastic orders to compare the tail of distributions and performance measures.

#### 2 - Call Center Staffing with Uncertain Dependent Arrival, Service, and Abandonment Rates

Tahir Ekin, Assistant Professor of Quantitative Methods, Texas State University, 601 University Dr. McCoy 451, San Marcos, TX, 78666, United States, Tevfik Aktekin

Many stochastic service models assume the system (arrival, service, and abandonment) rates to be deterministic inputs and those that treat them as uncertain assume they are independent. We propose methods for determining the optimal number of servers of a service system while modeling the system rates as dependent random variables. In doing so, we take the Bayesian point of view of inference and obtain joint posterior distributions of these system rates. Then, we utilize an augmented probability simulation based optimization method to solve the resulting decision model. We illustrate the proposed method and implications of ignoring dependence in system rates using real world call center data.

#### 3 - Balancing Service Speed and Agent Utilization for an Online Insurance Platform

Andres I. Musalem, U. of Chile, Beauchef 851, Santiago, 8370456, Chile, Marcelo Olivares, Daniel Yung

We study an online platform that sells car insurance policies. Customers who do not purchase online are then contacted via telephone. We find that as the time that it takes the platform to contact a customer increases, the probability that the customer purchases an insurance policy decreases. Hence the platform might gain from improving the speed at which it contacts its website visitors, for example by hiring more agents, which however affects their utilization and compensation. We empirically study this trade-off for the platform where on the one hand a greater call center capacity leads to better speed of contact but also reduces the incentives for experienced agents to keep their jobs at the platform.

#### 4 - An Exact Algorithm for the Service Bundles Design Problem

Yifu Li, Hong Kong University of Science and Technology, Clear Water Bay, Kowloon, 999077, Hong Kong, Xiangtong Qi

The service sector has become to dominate the global economy and evolves at a fast speed. Among the vast category of the service product, experiential service has become an indispensable part of our daily life. A crucial problem is how to create service bundles with given activities in considering both customer experience and practical constraints. Based on the results of the experiential studies, we model and analyses the service bundles design problem, which is proved to be a binary sum of ratios problem. We develop a geometric branch and bound algorithm to solve it to optimality and improve the algorithm with several techniques. It has been tested to be more efficient than the traditional algorithms.

#### 5 - The Impact of Order Ahead Apps on Fast Food Queues

Thomas Robbins, Associate Professor, East Carolina University, 3136 Bate Building, Greenville, NC, 27858, United States

Order ahead mobile apps are becoming increasingly popular at Quick Serve Restaurants. These apps allow customers to pre-order their meal and skip the line when arriving at the store. In this talk we investigate the hybrid queuing system created by these applications. Using discrete event simulation we examine the impact these apps can have on system performance for customers who use the app, customers who do not, and the system as a whole.

#### 1 - Development of a Context-aware Serendipitous Recommendation System

Changhun Lee, UNIST School of Management Engineering, Ulsan, Korea, Republic of, Gyumin Lee, Chiehyeon Lim

Recommendation system development has been an important domain over last several decades. However, as technique has improved and research on recommendation system increased, the importance of developing a “serendipitous” recommendation system has emerged. For that, we paid attention to the latent feature the items are recognized. We assumed that people would move from an item to a next item through a latent feature reflected in a sequence of items. We indirectly show latent features by presenting a topic map, and suggest a context-aware based serendipitous recommendation system. Our interim result seems only context-aware-accurate, but at least showed a possibility of being serendipitous.

#### 2 - Understanding Relations among ERP Success Factors: A Quantitative Approach based on Association Rules Mining

Jonghyeon Ko, UNIST School of Management Engineering, Ulsan, Korea, Republic of, Marco Comuzzi

The critical success factors (CSFs) of ERP implementation have been widely researched on the definition and the rank of CSFs and categorization according to each type of companies. The CSFs of ERP implementation is related and affected each other so that a lot of experts and researchers have studied different interrelationships among CSFs of ERP implementation and conceptual model of interrelationships. This paper approaches to this problem differently with data-driven model using a company data-set from literatures. The association rule method is used to find interrelationship among groups of CSFs as well as each factor of CSFs. The result shows the entire interrelationships of CSFs with numerical metrics representing the direction and strength of rule.

#### 3 - Mechanism and Development of Blockchain-based Smart Service Systems

Chiehyeon Lim, UNIST, Room #606-5, Building #114, Ulsan, 44919, Korea, Republic of, Marco Comuzzi, Byoung Ki Seo

In this presentation, first, we define the mechanism how the blockchain technology can contribute to improving service systems. Second, we report R&D project cases on the development of blockchain-based smart service systems. Third, we discuss implications of our work to the Service Science theory and practice.

#### 4 - Smart Services in European Mechanical Engineering Companies

Thomas Meiren, Fraunhofer IAO, Nobelstr. 12, Stuttgart, 70569, Germany, Anastasia Tzitimidou

Digitally supported services like advanced remote condition monitoring, predictive maintenance, new control and automation solutions as well as profiling and behaviour tracking play an increasing role in mechanical engineering industry. They are making use of the growing volume of data that is being captured every day and are combined in innovative ways in order to create on-demand, personalized solutions for customers. Moreover, product performance and customer behaviours will get visible as they have never been before. The conference presentation will show results from an empirical study within the European mechanical engineering industry.

### Practice- Logistics 1

Contributed Session

Chair: Josue Velazquez Martinez, Massachusetts Institute of Technology, Cambridge, MA, 02139, United States

#### 1 - A Unified Dynamic Control for Energy-aware Electrical Vehicle Operations

Seokgi Lee, Assistant Professor, University of Miami, 1251 Memorial Drive, McArthur Engineering Building, Room 281, Coral Gables, FL, 33146, United States, Hyun Woo Jeon

This study investigates the time and cost benefits that can be gained by the integrated control of EMV operations combined with an energy consumption prediction. Dynamic models for EMV charging capacity and operations control systems will be developed and serve as a scientific basis for a unified control algorithm, in which charging capacity, routing, and battery charging schedules of EMV are simultaneously controlled in a real-time manner. An electrical load variation at the warehouse facility level will be predicted by developing a novel electrical load forecasting model based on cutting-edge machine learning techniques, which will serve as important guidelines for unified decision-making.

## 2 - Real-time Package Consolidation for Split Orders in Online Retailing

Yuancai Zhang, Dalian University of Technology, Office Room A1214 Innovation Park Building, Dalian, 116024, China  
Yuancai Zhang, University of Arizona, Tucson, AZ, 85719, United States, Xiangpei Hu, Wei-Hua Lin

The order splitting has been one of the main challenging problems for multi-item order fulfillment in online retailing. The key issue to fulfill split orders with fast-delivery options in lower costs is: how to make package consolidation (consolidating and packing items of several sub-orders together) decisions in real-time using capacitated warehouses. We formulate an analytic model and propose a rolling horizon based heuristic algorithm to generate efficient real-time package consolidation schemes for online retailers.

## 3 - A Benders Decomposition Algorithm for the Fulfilment Planning Problem of an Online Retailer with a Self Owned Logistics System

Shuqin Li, Shanghai Jiao Tong University, No.800 Dongchuan Rd., Shanghai, China, Shuai Jia

We consider an order fulfilment planning problem in an e-tailing environment. For each planning period, the e-tailer makes decisions for assigning orders to the fulfilment centers and the delivery stations, as well as the decision for shipping orders under a time window constraint. We develop a mixed integer program to minimize the order processing cost and shipping cost. We show that the problem is strongly NP-hard, and propose a benders decomposition algorithm for solving the problem. We evaluate the computational performance of the algorithm on problem instances that are generated based on the logistics network of JD.com, a leading e-tailer in China who operates a self-owned logistics system.

## 4 - How Survival of Micro Retail Companies Affects Logistics Costs in Large Consumer Packaged Goods Companies

Josue Velazquez Martinez, Research Scientist, Massachusetts Institute of Technology, Cambridge, MA, 02139, United States, Ximena Castanon Choque, Christopher Mejia Argueta, Jan C. Fransoo

In developing economies, many mom-and-pop stores disappeared per year due to a lack of productivity, while many others appeared because of low barrier of entry. Therefore, the overall micro-retailing market grows per year and represents from 40-70% of demand of large CPG companies. In this paper, we study the impact of these dynamics on logistics costs. We discuss a practical case for a distributor in Mexico City, and by using cost-to-serve estimations and continuous approximation models for routing; we show that by improving survival rate, we may avoid losses in logistics costs up to 30%.

## Joint Session TSL/Practice Curated: Patrolling and Service Delivery Problems

Sponsored: TSL/Urban Transportation

Sponsored Session

Chair: Rajan Batta, University at Buffalo (SUNY), Buffalo, NY, 14260, United States

## 1 - Taking Out the Guesswork: An Analytics Approach to Police Contraband Searches

Anthony Bonifonte, Denison University, 3267 Raccoon Valley Rd, Granville, OH, 30106, United States, Tong Zhou

Police searches of vehicles stopped for traffic violations can seize contraband and improve public safety, but unnecessary searches are time consuming and can lead to community ill will. Using publicly available data, we develop an analytics approach to assisting officer decisions in whether to search a vehicle or not. Using variables such as time and location of stop, we create an objective estimate of whether a vehicle search will discover contraband. We adopt a reject inference approach to account for having outcome data only for vehicles searched. These findings can improve the use of police time and safety, while simultaneously reducing bias in decisions and improving community relations.

## 2 - Using the Hypercube Queueing Model for Response to Jobs with Degradation

Rajan Batta, University at Buffalo (SUNY), 410 Bell Hall, Buffalo, NY, 14260, United States, Fatemeh Aarabi

The problem of scheduling dynamically arriving jobs over a region is considered, with the features of job degradation, travel time, and multiple servers. A modification of the Hypercube queueing model is studied to address job degradation considerations. A 3 server example is presented along with optimization of response areas, server dispatch preferences and idle server management. Numerical results will be provided.

## 3 - Post Disaster Assessment Routing

Bahar Yetis, Bilkent University, Ankara, Turkey, Buse Eylul Oruc

We propose a post-disaster assessment strategy as part of response operations. The arcs and nodes to perform assessment activities on are selected based on the value they add to the consecutive response operations. The model considers motorcycles, which can be utilized under off-road conditions, and/or drones. The first objective aims to maximize the total value added by the assessment of the road segments (arcs) and the second maximizes the total profit generated by assessing points of interests (nodes). An epsilon-constraint method and a heuristic is proposed. To test the mathematical model and the heuristic method, a data set belonging to Kartal district of Istanbul is used.

North Bldg 221C

## Computational Problems in Warehousing and Order Picking

Sponsored: TSL/Facility Logistics

Sponsored Session

Chair: Sabahattin Gokhan Ozden, Penn State University, Abington, PA, United States

## 1 - Wait or Start? A Dynamic Warehouse Order-picking Process Phenomenon

Atieh Madani, University at Buffalo (SUNY), Buffalo, NY, 14260, United States, Rajan Batta, Mark Henry Karwan

This study focuses on optimizing warehouse order picking process in a dynamic environment. The logic behind this process determines the timing for any picker to start the tour to pick up the items of orders. The number of items in the picking list has the opposite effect on transportation cost and customer waiting time and this phenomenon brings us to one of the challenging problem in warehousing. Our approach to solve this problem involves probabilistic methods such as dynamic programming along with a heuristic on TSP to calculate the expected length of tour for the future periods.

## 2 - Optimization of a Fast-pick Area in a Cosmetics Distribution Center

Alice E. Smith, Auburn University, 3301 Shelby Center, Dept of Industrial/Sys Engineering, Auburn, AL, 36849, United States, Mario Velez Gallego

Fast-pick areas are used in warehouses to improve labor efficiency by concentrating picking activities within a compact area, minimizing the distance traveled by the pickers. One problem that must be solved when a fast-pick area is to be implemented is the assignment-allocation problem. This deals with deciding which products should be assigned to the fast-pick area, and how much space should be allocated to these products. This research was motivated by the picking operation of a cosmetics distribution center where several fast-pick areas are in place. A mixed integer linear programming formulation is proposed for solving the variant of the assignment-allocation problem found in this company.

## 3 - The Aisle Design Problem for Order Picking Warehouses

Kevin Gue, University of Louisville, Louisville, KY, 40292, United States, Alice E. Smith, Sabahattin Gokhan Ozden

The aisle design problem is to arrange picking and cross aisles in a warehouse such that expected distance to store or retrieve items is minimized. This problem has been addressed for unit-load warehouses, in which workers must visit only one or two locations per tour, but until now not for order picking warehouses, in which workers must visit many locations. We present results of a multi-year quest for the best aisle designs for order picking. Our computational system produced many interesting designs unknown to theory or practice, but surprisingly, none is significantly better than traditional designs. We conclude that current practice is likely the best practice.

## 4 - A Computational System to Solve Warehouse Aisle Design Problem

Sabahattin Gokhan Ozden, Penn State Abington, 1600 Woodland Rd., Abington, PA, 19001, United States, Alice E. Smith, Kevin Gue

We develop a warehouse layout optimization system that models layouts, allocates products to storage locations, calculates routing distances, and performs heuristic optimization over a comprehensive set of layout design parameters. The system searches over 19 different design classes simultaneously by using a layout encoding. The system is scalable which means that certain calculations such as routing can be distributed to run on multiple computers to decrease the overall computational time. It can solve optimization experiments or single design assessments in batch. In this way, researchers can create design of experiments in Excel and import it to the system to get the results.

North Bldg 222A

### Transportation-Planning I

Contributed Session

Chair: Albert Schrottenboer, University of Groningen, Vlasstraat 19, Groningen, 7912KS, Netherlands

#### 1 - A Simulation Approach to the Stochastic Vehicle Routing Without Fitting Demands

Robert A. Russell, University of Tulsa, Finance & Operations Mgmt Dept, 800 South Tucker Drive, Tulsa, OK, 74104, United States, Wen-Chyuan Chiang, Lijian Chen

We propose a method to solve the Stochastic Vehicle Routing Problem (SVRP) with stochastic demands. We realize that the distributional information of customer demands is, at best, empirical data only and the real-life SVRPs would be in a very difficult form. In this paper, we discuss the similarity of different demand scenarios and remove many scenarios, which are quite similar to each other. By greatly reducing the number of scenarios, we build a tractable SVRP model with a large number of demand scenarios considered. We then compared our model with two other models: the metaheuristic of vehicle routing, and the vehicle routing model with two-stage recourse.

#### 2 - Freight Mode Choice: A Machine Learning Approach

Rodrigo Mesa Arango, Florida Institute of Technology, Melbourne, FL, 32901, United States

Presents a machine learning application for mode choice prediction in freight transportation planning. Discusses model training through algorithm selection, model parameter optimization, and over-fitting avoidance. Contrasts challenges and opportunities related to classic econometric approaches. Employs 4.5 million shipments available in the 2012 Commodity Flow Survey Public Use Microdata for model estimation/validation.

#### 3 - Proactive Medical Transportation Planning

Mohammed Skiredj, PhD Student, École Nationale Supérieure des Mines de Saint-Étienne, 158 cours Fauriel, Saint-Étienne, 42023, France, Xiaolan Xie, Thierry Garaix

This work treats a real-life health-care transportation problem for Non-Emergency ambulance service. The problem can be seen as a multi-trip pickup and delivery problem with time windows and Trip-Crew-Vehicle assignment. The objective is to serve as many patients as possible, minimizes the total distance traveled by vehicles, and finally preserves as far as possible the forecaster starting and ending time of each driver. To solve the problem we proposed an adaptive large neighborhood search metaheuristic that uses a constructive greedy heuristic to build the initial solution.

#### 4 - Data-driven Methodology for Bicycle use Propensity Estimation

Pablo Andrés Uriza-Antorveza, Universidad de los Andes, Edificio Mario Laserna Cra 1 Este No 19A - 40, Bogotá, 10101, Colombia, Sergio Cabrales, Andres L. Medaglia, Olga L. Sarmiento

As part of adopting greener and healthier lifestyles, local governments are promoting bicycle use by implementing policies linked to the built environment. As part of a larger analytics framework designed to support transit planners, we developed a bicycle-use propensity model that lies at the core of the decision support system and feeds from geospatial data from different sources. We illustrate how the proposed method is able to support strategic decisions by quantifying the impact of a policy with data from Bogotá (Colombia).

#### 5 - Robust Fleet Size and Mix at Offshore Wind Farms

Albert Schrottenboer, PhD Candidate, University of Groningen, Groningen, Netherlands, Evrim Ursavas, Iris F. Vis

We introduce the Robust Fleet Size and Mix Problem (RFSMP) inspired by vehicle chartering decisions at offshore wind farms. A novel multi-commodity flow formulation is proposed and reformulated by means of a Dantzig-Wolfe decomposition into a set partitioning-like formulation. This leads to a master problem of which both the number of rows and the number of columns is extremely large. In addition, the number of subproblems depends on the number of included scenarios. In this talk, we discuss an exact approach based on column generation that is capable of solving the RFSMP.

## ■ WA32

North Bldg 222B

### Practice- Vehicle Routing I

Contributed Session

Chair: Amro El-Adle, University of Massachusetts, 121 Presidents Drive, Amherst, MA, 01003, United States

#### 1 - Vehicle Routing Problem with Overlapped Time Windows on Shipping from Online Store

Takashi Irohara, Professor, Sophia University, 7-1 Kiou-cho, Chiyoda-ku, Tokyo, 102-8554, Japan

Due to expansion of online shopping market, online store is increasing. Many companies are focusing on improving delivery as it leads to greater customer satisfaction and reduced delivery costs. In many companies, delivery of online stores is delivered with shifted time window by several hours from the time window, in addition to the conventional time window, in order to improve the usage rate of delivery docks. This is called an overlapped time window. In this paper, we aim to contribute to the delivery planning of online store by proposing a model of delivery planning considering overlapped time window and approximate solution using simulated annealing.

#### 2 - Solving Real World Vehicle Routing Problems at Scale

Bhanu Krishna Potluri, Llamasoft Inc., Ann Arbor, MI, 48104, United States

Vehicle routing problems are known to be notoriously difficult to solve. Modeling real-world constraints such as pickup-delivery time windows, driver hours of service, fleet sizing, etc. further increases complexity. With expanding logistics networks and ever increasing global freight volumes, businesses want to solve problems of realistic scale with real world constraints. This session explores meta-heuristics and cloud computing to achieve scalability of vehicle routing algorithms.

#### 3 - Allowing for Re-optimisation in the Vehicle Routing Problem with Time Windows, Stochastic Customers and Stochastic Demand: Model and Solution Methods

Vincentius Cornelis Gerardus Karels, PhD, Technical University Eindhoven, Duikerstraat 12 Bis, Utrecht, 3582 TB, Netherlands, Lucas Petrus Veelenturf, Tom Van Woensel

We solve a vehicle routing problem with both deterministic and stochastic customers and stochastic demands. For the deterministic customers furthermore self-imposed time-windows are determined. The problem is modeled as a two-stage stochastic programming model. Whereas most similar problems allow for simple recourse in the second stage, we allow for re-optimisation. This introduces additional complexity in the model, for which we will introduce novel solution methods.

#### 4 - Multi-depot Electric Vehicle Routing Problem with Time Windows Considering Non-linear Charging and Discharging

Surendra Reddy Kancharla, Indian Institute of Technology Madras, #238, Building Sciences Block, Alumni Ave, Chennai, 600036, India, Gitakrishnan Ramadurai

A new variant of Electric Vehicle Routing Problem with Time Windows (EVRPTW) to find the routes and charging schedules of vehicles operating from multiple depots with the objective of minimizing energy consumption is proposed. The present variant does not limit the number of visits to a charging station and considers non-linear charging and discharging. A mixed-integer program is formulated and an effective heuristic solution algorithm is presented.

#### 5 - A Vehicle Routing Problem with Drones

Amro El-Adle, University of Massachusetts Amherst, 121 Presidents Drive, Amherst, MA, 01003, United States, Mohammad Reihaneh, Ahmed Ghoniem

We investigate a vehicle routing problem with drones (VRPD) in which customers may be served either by delivery vehicles or by unmanned aerial drones launched from the vehicles. Building on the success of branch-and-price (BP) algorithms for vehicle routing problems, we use a labeling algorithm that generates synchronized drone and vehicle routes. We demonstrate the usefulness of the proposed methodology in our computational study.

Chair: Shunichi Ohmori, Waseda University, Room 0903A, Okubo 3-4-1, Shinjuku, Tokyo, Japan

#### 1 - Determination of Order Amounts for Multiple Spare Parts of Products in the Post-production Phase

Nicholas William Leifker, Associate Professor, St. John Fisher College, 3690 East Ave., Rochester, NY, 14618, United States, Timothy Joe Lowe, Philip C. Jones

Manufacturers often encounter difficulties in supplying an adequate number of spare parts for a product that is in its post-production phase. As a result, manufacturers will sometimes make one final order of spare parts, which is used to satisfy any demand for spare parts going forward. This order may be complicated if the failure rate for one type of spare part is partially dependent on the demand for other types of spare parts, if the failure rate of the product is partially dependent of the failure rates of its parts, or if it becomes advantageous for a spare part to be salvaged. We compare two solution methods to find the order amount: a dynamic programming method, and an iterative optimization method.

## 2 - Optimal Cooperative Stocking Policy under Demand and Lead-time Uncertainties with Space Constraint and Penalty for Late Delivery

Md Shahriar Jahan Hossain, Louisiana State University, 4141  
Burbank Dr. Apt. 3, Baton Rouge, LA, 70808, United States,  
Bhaba R. Sarker

This research presents a single-vendor single-buyer cooperative inventory model for a nonperishable item. The model deals with both demand and lead-time uncertainties, space constraint and a penalty cost for late delivery. A joint total cost function is formulated as a constrained non-linear programming problem. The joint total cost is minimized in order to determine the optimum order quantity, reorder point and number of shipments. Solution procedures are demonstrated through complete numerical examples with different probability distributions of demand and lead time. A set of efficient and good solutions obtained are predictive of an economic operating policy for the joint contract.

## 3 - Strategic Safety Placement under Stochastic optimal Control Policy

Shunichi Ohmori, Assistant Professor, Waseda University,  
Room 0903A, Okubo 3-4-1, Shinjuku, Tokyo, Japan

Strategic safety stock placement problem is a tactical model to determine optimal places and levels of safety stocks in multi-echelon system. Existing models, such as guaranteed-service model or stochastic-service model, use the base-stock policy as a building block, under which each stage observes demand and places an order on its suppliers equal to the observed demand. In this study, we propose a safety stock placement model under stochastic optimal control policy, where order-quantity is calculated so as to minimize weighted sum of variation of inventory and order-quantity over infinite time horizon. By doing so, variation of order-quantity can be reduced as well as inventory level.

## Practice- Disaster and Disruption Management II

Contributed Session

Chair: John Doeringhaus, University of Arkansas, Fayetteville, AR, 72701, United States

## 1 - An Optimization Model for Wildfire Suppression Process and Resident Evacuation

Siqiong Zhou, San Jose State University, San Jose, CA, 95123,  
United States, Ayca Erdogan

Wildland-urban interface (WUI) wildfires have been big threats in many countries. We present a two-stage stochastic integer programming model for efficient wildfire comprehensive response on firefighting resource allocation and resident evacuation. This model minimizes the number of residents at risk and considers the total cost of resource operation and property loss. Resource preparation and allocation decisions are made based on both fire spread process and population density.

## 2 - Smart City Emergency Response Simulation Framework

Charles Njelita, Data Scientist, TATA America International Inc,  
379 Thornall Street, Edison, NJ, 08837, United States

Cities around the world are becoming smarter and one of the criteria of a smart city is its ability to evacuate its citizens and visitors in the case of natural disaster, bomb blast, highway accident etc. How fast the first responder to the scene of the incidence determines the number of lives saved and injury prevented. The purpose of the paper is to develop a simulation framework which can be used by decision makers in response to an emergency that may have impacts on multiple aspects of the urban environments and socio-economical operations. These researchers will develop a multi-level simulation framework used by decision makers in city to make timely and effective responses to an emergency.

## 3 - Simulating and Analyzing Cascading Failures in Power Networks in Disaster Aftermath

Alireza Inanlouganji, Arizona State University, 699 S. Mill Ave,  
Tempe, AZ, 85281, United States, Giulia Pedrielli

Proactive response to disasters is an increasingly interesting area of research with high potential of cost reduction and safety improvement. We propose a novel framework to efficiently simulate and quickly analyze power networks and their interactions with other critical interdependent infrastructures. Both initial, exogenous, failures and failures due to cascading effects are considered and we seek a set of interesting scenarios that lead to worst adverse effects on the power network using an efficient simulation-optimization algorithm.

## 4 - Management of Interdependent Infrastructure Networks under Disaster-related Uncertainties

Tugce Canbilen, Research Assistant, Middle East Technical  
University, Universiteler Mahallesi, Dumlupinar Bulvarı No: 1,  
Endustri Myhendisligi Balumu, Ofis: 326, Ankara, 06800, Turkey,  
Sakine Batun, Melih Celik

After a disaster, multiple infrastructures have disruptions in their services. During the restoration of these services, we need to consider the operational and restoration interdependencies among these infrastructures. In this study, the problem under consideration is Interdependent Infrastructure Restoration with disaster related uncertainties. We propose a two-stage program for this problem. First stage makes reinforcement decisions on the arcs of the network while second stage schedules the restoration activities considering the available resources and inherent interdependencies in the network. We will present our computational tests and preliminary results in the presentation.

## 5 - Classification of the Interdependencies in the Food and Agriculture Critical Infrastructure in Arkansas

John Doeringhaus, University of Arkansas, 4207 Bell Engineering  
Center, Fayetteville, AR, 72701, United States, Sarah G. Nurre,  
Kelly Sullivan, Benjamin R. Runkle

Classifying infrastructure interdependencies is vital for the creation of realistic disaster preparedness and response models. The existing interdependency classifications do not capture many intricacies of the critical food and agriculture infrastructure. We propose new infrastructure interdependency classifications relevant to food and agriculture which can be generalized to many critical infrastructures. With each new classification, we provide real accounts and examples based on over 30 interviews with stakeholders in the food and agriculture critical infrastructure sector.

## Passenger Demand Forecasting and Airline Capacity Management

Sponsored: Aviation Applications

Sponsored Session

Chair: Farbod Farhadi, Roger Williams University, 1 Old Ferry Road,  
Bristol, RI, 02809, United States

## 1 - A Modeling Framework for the Airline Near-term Capacity Adjustment Problem

Ahmed Abdelghany, Professor, Embry-Riddle Aeronautical  
University, College of Business, 600 S. Clyde Morris Boulevard,  
Daytona Beach, FL, 32114, United States, Khaled Abdelghany,  
Farshid Azadian

A modeling framework for the airline's near-term capacity adjustment problem is presented. The input to the model is an initial schedule for the host airline and any expected near-term changes in origin-destination (OD) demand, competition, and resources (aircraft, gates, etc.). The model searches for the best possible adjustments for flight frequency for each fleet type in each city-pair to maximize profitability. The performance of the framework is evaluated through several experiments in a hypothetical setting that mimics the U.S. domestic market, where the model is used to study the capacity adjustment for two major airlines.

## 2 - Flight Outsourcing in the U.S. Domestic Market

David F. Pyke, University of San Diego, Coronado 108, 5998 Alcalá  
Park, San Diego, CA, 92110-2492, United States, Farbod Farhadi,  
Soheil Sibdari

Major airlines, while maintaining route and airport dominance, outsource a portion of their services to smaller operators for a fee. Smaller operators offer their services either exclusively to a single major airline, or partner with multiple airlines within the same markets. In this research, we investigate the impact of such phenomena on total capacity and average prices.

## 3 - Passengers Demand Forecasting of the U.S. Domestic Airline Market

Nahid Jafari, Farmingdale State College, 2350 Broadhollow Road,  
Farmingdale, NY, 11735, United States

This research examines the strategies followed by the U.S. domestic airlines in 21st century to achieve their highest revenue in regard with their capacity choices. During this period, although the airlines experienced higher load factors and inflated airfares, in addition to the fluctuation of fuel expenses, they were having profit losses. The analysis is conducted on 16 major airlines on primary factors such as the load factor, market supply (seats) and demand (passengers), unemployment rate, fuel expenses, flight frequency, and aircraft size. We deploy the Long Short-Term Memory network to forecast the U.S. domestic airline passengers.

### Joint Session Drones/Practice Curated: Drone Applications in Healthcare

Emerging Topic: Robotics, Drones and Autonomous Vehicles in Logistics

Emerging Topic Session

Chair: Justin James Boutilier, University of Toronto, Toronto, ON, M6G 2P5, Canada

#### 1 - Response Time Optimization with Queuing Constraints for Drone Delivered Defibrillators

Justin James Boutilier, University of Toronto, Toronto, ON, M6G 2P5, Canada, Timothy Chan

Out-of-hospital cardiac arrest (OHCA) is a time-sensitive medical emergency claiming over 400,000 lives each year and an automated external defibrillator (AED) is one of the only effective methods for treating OHCA. In this paper, we propose an integrated location-queuing model to minimize the total number of drones required to meet an average response time goal while guaranteeing a sufficient number of drones are located at each base. We develop a novel reformulation technique that allows us to solve real-world instances and determine the optimal deployment of AED-enabled drone resources using eight years of data covering 26,000 square kilometers around Toronto, Canada.

#### 2 - Drone-aided Healthcare Services for Patients with Chronic Diseases in Rural Areas

Gino Lim, University of Houston, Professor and Chairman, Dept of Industrial Engineering, Houston, TX, 77204, United States, Seon Jin Kim

We present the drone-aided delivery and pickup planning of medication and test kits for patients with chronic diseases in rural areas. A two-stage decision model is proposed to find the optimal number of drone center locations and schedule pickup and delivery in which drones deliver medicine to patients and pick up exam kits on the way back such as blood and urine samples. A preprocessing algorithm, a Partition method, and a Lagrangian Relaxation (LR) method are developed to solve the model. A cost-benefit analysis method is developed as a tool to analyze the benefits of drone-aided healthcare service.

#### 3 - Cure for Healthcare Using Drone Technology in Hospital Processes an Explorative Analysis

Mike Krey, Zurich University of Applied Sciences, Winterthur, Switzerland

The paper at hand aims at outlining the potential and possible fields of application using drone technology inside the Swiss hospital environment. As part of a survey, face-to-face interviews with IT executives of four Swiss hospitals were conducted on the status quo of drone technology providing valuable insights about the current situation and the possible fields of application. The study revealed that different priorities, lack of motivation, and budget constraints were mentioned as the three major obstacles to improving the situation.

#### 4 - A Framework for Using Drones after a Tornado

Sean Grogan, PhD Candidate, École Polytechnique de Montréal, 2500 Edouard Monpetit, 2900 Chemin Polytechnique Office C314.6, Montreal, QC, H3T 1J4, Canada, Robert Pellerin, Michel Gamache

Recent innovations and advancements in unmanned aerial vehicles (UAVs) have increased their utility while reducing the cost of the devices. UAVs in the aftermath of a disaster have an obvious utility where they can fly over a search area rather than be subject to potential road blocks and other impediments. To allocate the UAVs in the aftermath of a tornado has the potential to incorporate weather information and predictions from the National Weather Service, sighting information from spotters and the media, and geographic information system information to allocate UAV resources and, in turn, rescuer resources.

North Bldg 225A

### Advances in Approximate Dynamic Programming

Sponsored: Applied Probability

Sponsored Session

Chair: David Brown, Duke University, Durham, NC, 27708, United States

#### 1 - On the Taylor Expansion of Value Functions

Itai Gurvich, Cornell University, 2 W. Loop Rd, New York, NY, 10044, United States, Anton Braverman, Junfei Huang

We introduce a framework for approximate dynamic programming that we apply to discrete time and space chains. Simply put, our approach stipulates applying Taylor expansion to the value function in the Bellman equation to obtain an

optimality equation in continuous space and time. In cases where the "Taylor-ed" equation is tractable, it provides a useful modeling tool coupled with explicit optimality-gap bounds. Computationally, our framework leads to an "aggregation" approach with performance guarantees. While the guarantees are grounded in PDE theory, the practical use of this approach requires no knowledge of such theory.

#### 2 - Interpretable Optimal Stopping

Velibor Misić, UCLA Anderson School of Management, 110 Westwood Plaza, Suite B406, Los Angeles, CA, 90095, United States, Florin Ciocan

Optimal stopping is the problem of deciding when to stop a stochastic system to obtain the greatest reward. State of the art methods for this problem rely on obtaining an approximate value function for use within a greedy policy. However, such policies are generally not interpretable, in that it is often difficult to see how the policy maps each system state to a decision. We propose a new data-driven method for optimal stopping that directly learns interpretable policies in the form of binary trees. We apply our approach to a canonical option pricing problem and show that it quickly obtains interpretable policies that outperform existing non-interpretable policies based on simulation-regression.

#### 3 - Dynamic Credit-collections Optimization

Naveed Chehraz, McCombs School of Business, 2110 Speedway, Stop B6000, Austin, TX, 78712, United States, Peter W. Glynn, Thomas A. Weber

Based on a dynamic model of the stochastic repayment behavior exhibited by delinquent credit-card accounts in the form of a self-exciting point process, a bank can control the arrival intensity of repayments using costly account-treatment actions. A semi-analytic solution to the corresponding stochastic optimal control problem is obtained. For a linear cost of treatment effort, the optimal policy in the two-dimensional (intensity, balance)-space is described by the frontier of a convex action region. The unique optimal policy significantly reduces a bank's loss given default and concentrates the collection effort onto the best possible actions at the best possible times.

#### 4 - Dynamic Pricing of Scarce and Relocating Resources in Large Networks

Chen Chen, Duke University, Santiago Balseiro, David Brown

We study dynamic pricing of resources distributed over a network of locations (e.g., shared vehicle systems). Customers with private willingness-to-pay sequentially request to relocate one resource. We focus on networks with a hub-and-spokes structure. We develop a dynamic pricing policy based on a Lagrangian decomposition and show that the policy is asymptotically optimal as the number of spokes grows large but the number of resources per location remains fixed.

## ■ WA38

North Bldg 225B

### Dynamic Queueing Control

Sponsored: Applied Probability

Sponsored Session

Chair: Mark E. Lewis, Cornell University, Ithaca, NY, 14853, United States

#### 1 - Dynamic Control of Running Servers

Douglas Down, McMaster University, Department of Computing and Software, 1280 Main Street West, Hamilton, ON, L8S 4K1, Canada, Esa Hyytiä, Pasi Lassila, Samuli Aalto

Motivated by a data center setting, we study the problem of joint dispatching and server sleep state control in a system consisting of two queues in parallel. Using the theory of Markov decision processes and a novel lookahead approach, we explicitly determine near-optimal control policies that minimize a combination of QoE costs, energy costs, and wear and tear costs due to switching. Guidelines are provided as to when these combined policies are most effective.

#### 2 - Server Collaboration in Queueing Systems: When and How?

Junqi Hu, Georgia Institute of Technology, Atlanta, GA, United States, Sigrun Andradottir, Hayriye Ayhan

Consider a form of server collaboration where each job is decomposed into subtasks, and the job is finished when all its subtasks are completed. We identify the task assignment policy that maximizes the long-run average throughput for one station when servers are either static, flexible, or collaborative and internal buffers are either finite or infinite. Then we compare this model with other forms of server collaboration to determine when and how servers should collaborate. Finally, we investigate server collaboration for longer lines, and provide numerical results for two tandem stations.

### 3 - Assigning Priorities (or Not) in Service Systems with Nonlinear Waiting Costs

Nilay Argon, PhD, University of North Carolina, Chapel Hill, NC, United States, Huiyin Ouyang, Serhan Ziya

For a single-server queueing system with two types of customers and nonlinear waiting costs, we compare static queueing rules that use information on customers' types and order of arrival. Our main theorem ranks the type-based priority policies and first-come-first-serve rule according to their long-run average waiting costs under general cost functions. We then apply this result to polynomial cost functions to generate insights into when static prioritization is advantageous and when it is beneficial to consider state-dependent priority policies.

### 4 - Optimal Control Policies for an M/M/1 Queue with a Removable Server and Dynamic Service Rates

Pamela Badian-Pessot, Cornell University, Ithaca, NY, 14850, United States, Mark E. Lewis, Douglas Down

We consider an M/M/1 queue with a removable server that dynamically chooses one of two service rates. If the server is off, the system must warm up for a random, exponential amount of time, before it can begin processing jobs. We show under the average cost criterion, that work conserving policies are optimal. We then demonstrate the optimal policy can be characterized by two thresholds, one for turning on the server and another for the service rate. Finally, we explore the implications of such policies for system design.

### Queueing Models for Healthcare Systems

Sponsored: Applied Probability

Sponsored Session

Chair: Ohad Perry, Northwestern University, Evanston, IL, 60208, United States

#### 1 - Run-through Experiments for Queues

Harsha Honnappa, Purdue, Anna Tata

We develop a simulation and theoretical framework for selecting a fitted traffic model for a queueing system. Given a dataset of inter-arrival times that displays time-of-day effects, it is often the case that a modeler wishes to fit a non-homogeneous Poisson process to this dataset. The main question we address in this talk is how to select appropriate time-buckets to aggregate the arrivals in order to fit the Poisson model, by using a simulation estimate of an appropriate performance metric as a measure of 'goodness of fit.'

#### 2 - Efficiently Selecting Arrival Models

Zeyu Zheng, Stanford University, Stanford, CA, 94305, United States

In modeling non-stationary and time-inhomogeneous data, a standard approach is to break the time horizon into multiple intervals, and then to fit a piecewise model. We propose a principled maximum likelihood approach that includes efficient model fitting, optimal interval boundary selection, and selection of model degree.

#### 3 - Optimal Scheduling in Presence of Proactive Care

Yue Hu, Columbia University, New York, NY, 10027, United States, Carri Chan, Jing Dong

Healthcare is a limited resource environment where capacity is often reserved for needy patients. A new trend in medicine is the use of preventative care models that treat patients early to eliminate the need for more expensive resource later. We study the optimal scheduling policy for a two-class multi-server queueing model to understand how patients should be prioritized for care when preventative care is an option. We study both the transient system dynamics and the steady-state performance. In the first case, we analyze the most cost effective way to bring the system back to equilibrium when it is started far from "normal operation". In the second case, we minimize the long-run average holding cost.

#### 4 - A Fluid Diffusion Hybrid Limit for Service Systems with Fast and Slow Customers

Lun Yu, Northwestern University, Evanston, IL, 60208, United States

Motivated by emergency departments, we consider a queueing system with two customer classes; the first class (of "high acuity") requires long service times and receives priority over the second class ("low acuity"), whose average service times are substantially shorter. Unfortunately, the dynamics of such a system are intractable, and existing heavy-traffic regimes cannot capture the fact that, in practice, a non-negligible proportion of the arrivals from either class must wait for service. We propose a Fluid-Diffusion Hybrid limit to approximate the two queues, and demonstrate how it can be employed to study the benefits of de-pooling (namely, of having a "fast-track").

### Decision Analysis and Research Study Design

Sponsored: Decision Analysis

Sponsored Session

Chair: Saurabh Bansal, Penn State University, State College, PA, 16801, United States

#### 1 - Qualitative Not as Lesser Than: Guidelines for Deciding Between a Qualitative and Quantitative Decision Approach

Kara M. Morgan, Quant Policy Strategies, LLC, 8375 Nemain Loop, Dublin, OH, 43016, United States

In practice, decision methodologies can drive decisions, and biases against using qualitative methods can limit the options considered by decision analysts. There is a common conception that qualitative research is more appropriate for exploratory research rather than for informing decision making. In fact, there are many general cases in which taking a quantitative approach can obscure the issues and therefore reduce the potential impact of decision analysis on the decision. This talk will identify conditions under which qualitative methods could lead to better decisions and provide pointers for utilizing rigorous qualitative methods for decision making support.

#### 2 - Research Methodologies and the Field of Decision Analysis

Jeffrey M. Keisler, University of Massachusetts-Boston, M/5 249, 100 Morrissey Boulevard, Boston, MA, 02125, United States

This presentation considers three questions. (1) What is a research methodology as opposed to any old methodology and what is the role of research methodologies in scholarship? (2) In what ways do and in what ways can decision analysis scholars incorporate common research methodologies? (3) How and why might we think of decision analysis itself as a research methodology?

#### 3 - Accelerating Learning using Expert Judgment about the Relationship between Model and Reality

Eva D. Regnier, Naval Postgraduate School, 555 Dyer Road, Bldg. 330, Room 287, Monterey, CA, 93943, United States, Melissa A. Kenney, Michael Gerst

Because of their power to influence decisions, it's useful to consider how the modeling process can be improved by formalizing the role of expert judgments in building, validating, and interpreting models. Bayesian reasoning - asking what model output we ought to expect as a function of the possible states of the modeled system - is rarely applied in mechanistic (vs. statistical) models. By formalizing expert judgments regarding the joint relationship between reality and model output, our framework (i) suggests new questions that should be asked in the model building and validation process and (ii) guides how model outputs should be interpreted, resulting in higher-value models and inferences.

#### 4 - Using Software to Help Engage with Clients

Max Henrion, Lumina Decision Systems, Inc, Campbell, CA, United States

We will share experience on how decision analysts can use software tools to facilitate understanding and analyzing new problems, by using influence diagrams to frame and bound decision problems, an agile modeling process driven by interactive sensitivity analysis, and model exploration and visualization to help clients get a visceral understanding of how decisions affect the objectives they care about.

## ■ WA41

North Bldg 226C

### DA Arcade I

Sponsored: Decision Analysis

Sponsored Session

Chair: William Nicholas Caballero, Air Force Institute of Technology, 6465 Hemingway Road, Dayton, OH, 45424, United States

#### 1 - Valuation of Strategic Adaptation

Byunghee Choi, Penn State University, University Park, PA, United States, Robert D. Weaver

We introduce a continuous time economic model of multiple stage processes with fixed stage commitment. Stage-based commitment is made within the context dynamic evolution of uncertainty with respect to process performance. Within this context, we introduce a method for valuation of strategic adaptation to change in uncertainty and information evolution. We illustrate our approach with simulation.

## 2 - Coordinating Decisions in Decentralized Perishable-products Supply Chains via Contracts

Sandra Transchel, Kuehne Logistics University, Grosser Grasbrook 17, Hamburg, 20457, Germany

We consider a two-stage supply chain consisting of a vendor and buyer selling a perishable product, more specifically, a product with a finite life time. We investigate different contracts and their impact on both the vendor's and the buyer's inventory decision in a decentralized decision-making environment. Beside the wholesale price, the contracts specify the minimum residual shelf life the buyer is willing to accept as well as a service level agreement and penalty payments. We compare the decentralized solution with the inventory policy of a centralized decision-maker and show the impact on the supply chains profitability and waste performance.

## 3 - Head Against the Wall: The Connection between Concussions and Overconfidence

Dominik Piehlmaier, Dissertator in Consumer Behavior, University of Wisconsin-Madison, Madison, WI, 53703, United States

An estimated average of 3.8 million concussions occur every year within the US. However, only approximately half of all cases are reported (Harmon et al., 2013). This study sheds light on the influence of overconfidence on the propensity to experience a concussion and on the likelihood to report it. Data drawn from survey responses from around 1,000 athletes were used to analyze these aspects. A set of Bayesian regressions and Bayesian structural models, using an efficient Hamiltonian Monte Carlo sampler, was fitted to analyze the data. The results suggest that athletes who are overconfident in their ability to detect a concussion, are more likely to experience one but are less likely to report it.

## 4 - Influence Modeling: Mathematical Programming Representations of Persuasion under Either Risk or Uncertainty

William Nicholas Caballero, Air Force Institute of Technology, 6465 Hemingway Road, Dayton, OH, 45424, United States, Brian J. Lunday

Persuasion is a fundamental element of human interaction applied to both individuals and populations. Although the study of persuasion has historically been dominated by qualitative models, this research advances its quantitative characterization and future use. This research complements the qualitative psychological literature with respect to the processing of persuasive messages by developing an influence campaign design framework. We adapt the classic Decision Analysis problem to a bilevel mathematical program, wherein a persuader has the opportunity to affect the environment prior to the decisionmaker's choice. Thereby, we define a new class of problems for modeling persuasion.

## 5 - When Payoffs Look Like Probabilities: Separating Form and Content in Risky Choice

Johannes Müller-Trede, IESE Business School, Barcelona, Spain, Shlomi Sher, Craig R. McKenzie

Prospect theory assumes a value function that is concave for gains and convex for losses, and an inverse S-shaped probability weighting function. But in typical studies, form and content are confounded: Probabilities are represented on a bounded scale, whereas representations of gains (losses) are unbounded above (below). To unconfound form and content, we ran studies employing a probability-like representation of outcomes and an outcome-like representation of probability. We show that interchanging numerical representations can interchange the resulting psychophysical functions. Traditional models may reflect subjective reactions to numerical form rather than substantive content.

### Simulation and Optimization

Contributed Session

Chair: Harri K. Ehtamo, Aalto University, P.O. Box 1100, FIN-02015 HUT, Espoo, 02150, Finland

## 1 - Modeling Systematic Technology Adoption with Heterogeneous Interacting Agents

Huayi Chen, Nanjing University of Aeronautics and Astronautics, 29 Yudao street, Nanjing, 210016, China

Traditional systematic technology adoption models often assume one representative agent. However, researchers have been arguing that even a well calibrated representative agent cannot represent heterogeneous agents due to several reasons, of which one, is that there could be no trade. This paper intends to build a systematic optimization model of technology adoption with heterogeneous interacting agents. Agents are cost minimizing entities and the interaction among them could be the trade in goods, new advanced technology,

and further, in carbon emission credits.

## 2 - An Analysis of Overlapping Appointments in Outpatient Oncology Centers

Melissa Marquez, Binghamton University, New York, NY, 10033, United States

This research proposes a simulation-based optimization approach to minimize the total cost by considering appointment overlapping for chemotherapy scheduling in outpatient oncology centers (OOC). The model considers waiting time, chair idle time, and total clinic overtime, uses on-line Best Fit bin packing heuristic, and optimizes pre-treatment and infusion duration. The model considers uncertainties such as patient no-shows, patient tardiness, and variability in scheduled infusion duration and processing times. The appointment overlapping with efficient scheduling increases infusion chair utilization, and reduces total cost in OOC with high no-show rates.

## 3 - A Surrogate-based Tabu Search Heuristic to Optimise the People Flows in a Timetable

Hendrik Vermuyten, KU Leuven, Warmoesberg 26, Brussel, 2800, Belgium, Jeroen Belien, Liesje De Boeck, Tony Wauters

In this work, we address the problem of minimizing people flows that are the result of timetabling decisions. We assume that each event has already been assigned to a certain timeslot and we only take the decision of assigning events to rooms into account. The crowd dynamics are modelled by Menge, which is an open source microscopic pedestrian simulator, and tabu search is used to iteratively find improved solutions. To speed up the computations, a surrogate model is used that approximates the real objective function values of candidate solutions and is computationally much less costly.

## 4 - Optimizing People Flow and Safety in Buildings

Harri Ehtamo, Professor, Aalto University, P.O. Box 11100, 00076 Aalto, Espoo, 02150, Finland, Juha-Matti Kuusinen, Janne Sorsa, Marja-Liisa Siikonen, Henri Hakonen

We discuss some key advances in people flow and building safety modeling based on several years of collaborative research carried out by KONE Corporation, one of the global leaders in the elevator and escalator industry, and Systems Analysis Laboratory of the AALTO University. The talk is partly based on our OR/MS Today, April 2017, article on the subject.

### Stochastic Optimization I

Contributed Session

Chair: Cheng-Yu Rao, Shanghai St., Taitung County 950, New Taipei City, 95048, Taiwan

## 1 - Stochastic Integer Programming Formulation for Process Discovery

Georges Spyrides, Student, PUC-Rio, Rua Marques de Sao Vicente 225 - Gávea, Rio de Janeiro, 22451900, Brazil, Marcus V. Poggi

Process discovery algorithms try to build meaningful Petri-nets from a log of events. Bergeth (2008) proposes that candidates for Petri-net places are related as basic solutions on an ILP formulation. Van Der Werf et al (2009) proposed a general method called ILP Miner. This method generates fully replayable Petri-nets, but with a downside of producing hard to understand process models in practice. This work aims to address the simplicity problem by interpreting the frequency of a sequence of events as the probability of materialization in the future. We propose a novel two stage stochastic formulation with chance constraints, which produces models not so sensitive to outlier process variants.

## 2 - A Long-term Analysis of Renewable-dominated Regions: A Stochastic Co-optimization of Expansion Planning and Dynamic Probabilistic Reserve

Alessandro Soares, Engineer, PSR, Praia de Botafogo 228, Rio de Janeiro, Brazil

As consequence of the variability in the renewable generation, system reserve requirement must be increased to maintain security and thermal units may need to operate outside their efficient operation point. Since thermal flexibility and reserve may result in substantial costs to the system, expansion planning models need to consider these costs and co-optimize them along with the expansion. We present a Multiscale Stochastic Optimization approach to optimize dynamic probabilistic reserves (DPR) and system flexibility costs due to high renewable penetration. A real-case study of the Chilean system will be analyzed to illustrate the methodology.

### 3 - Q-learning Applied to Multistage Generation Expansion Planning

Vijay Kumar, PhD Candidate, Pennsylvania State University, State College, PA, 16801, United States, Mort Webster, Uday Shanbhag

Generation expansion planning is a multi-stage decision about the technology, size and the timing for new electricity generators under uncertainty in future technical and economic uncertainties. The dynamic programming formulation for a time horizon of 10-50 years faces the Curse of Dimensionality and is computationally intractable. We demonstrate a novel adaptive sampling algorithm within a Q-Learning framework applied to multistage expansion under uncertainties in fuel prices and carbon limits.

### 4 - Solving Appointment Scheduling and Staffing Problem in Radiotherapy by Progressive Hedging Algorithm

Cheng-Yu Rao, National Chiao Tung University, Hsinchu, Taiwan, Yu-Jyun Tang, Sheng-I Chen

A two-stage integer stochastic programming model for appointment scheduling and staffing decisions in a radiotherapy department is developed. The treatment start and staff assignment are determined in the first stage, and the number of treatments and overtimes are decided in the second stage. A scenario decomposition scheme, along with the implementation of progressive hedging algorithm is presented. The computational experiment investigates different penalty settings for nonanticipative decisions. The convergence of the algorithm has been shown despite of oscillatory behavior is observed. We report the solution quality and runtime for general branch-and-bound and our proposed methods.

### 5 - Capacity Optimization for Innovating Firms

Rita Pimentel, RISE SICS Vasteras, Vasteras, Sweden  
Rita Pimentel, Cemat, Instituto Superior Técnico, Lisboa, Portugal,  
Verena Hagspiel, Kuno Huisman, Peter M. Kort, Cláudia Nunes

In case of a product innovation the firms start producing a new product. While doing so, they should decide what to do with their existing production process. They can choose between replacing the established production process by the new one, or keep on producing the established product so that they produce two products at the same time. Due to technological progress, the quality of the newest available technology increases over time. So, the firms face the tradeoff between innovating fast that enlarges the payoff soon but only by a small amount, or innovating later that leads to a larger payoff increase, the drawback being that they are stuck with producing the established product for a longer time.

### Real-time Optimization in Power Systems

Sponsored: Energy, Natural Res & the Environment/Electricity

Sponsored Session

Chair: Na Li, Harvard University, Cambridge, MA, 02138, United States

Co-Chair: Hao Zhu, The University of Texas at Austin, Austin, TX, 78712, United States

#### 1 - Real-time Resilient Operation of Multi-microgrid Networks

Amin Gholami, Georgia Institute of Technology, Atlanta, GA, United States, Andy Sun

Although microgrids pave the way for integrating various distributed energy resources, they raise many challenges. Emergency control of dangerous transients caused by the transition between the grid-connected and island modes is one of such challenges. To address this, we propose an optimization and real-time control framework for maintaining the frequency stability of multi-microgrid networks under an islanding event. We develop a strong MISOPC-based reformulation as well as a cutting plane algorithm for scalable computation. Our framework provides the optimal load shedding and optimal topology reconfiguration, while the frequency dynamics and AC power flow limitations are considered.

#### 2 - Event Identification and Data Recovery from Highly Quantized Measurements

Meng Wang, Rensselaer Polytechnic Institute (RPI), Troy, NY, 12180, United States, Ren Wang

One can add noise and apply quantization to synchrophasor measurements to increase the data privacy and reduce the communication cost. This talk focuses on event identification and data recovery at the operators' side from the highly quantized measurements. Event identification can be achieved by solving a data clustering problem that aims to group measurements affected by the same event together. The recovery and clustering are achieved simultaneously by solving a nonconvex constrained maximum likelihood problem. A fast algorithm with the performance guarantee is proposed to solve the nonconvex problem. The proposed method is evaluated numerically on recorded synchrophasor datasets.

### 3 - Online Localization of Forced Oscillations in the Power Grid

Le Xie, Texas A&M University, College Station, TX, United States, Tong Huan, P.R. Kumar, Nickolaos M. Freris

In this talk, we will present a data-driven method to pinpoint the source of a new emerging dynamical phenomenon in the power grid, referred to "forced oscillations in the difficult but highly risky case where there is a resonance phenomenon. By exploiting the low-rank and sparse properties of PMU measurements, the localization problem is formulated as a matrix decomposition problem, which can be efficiently solved by the ALM algorithm. The data-driven nature of the proposed method allows for a very efficient implementation. The proposed method may possibly be more broadly useful in other situations for identifying the source of forced oscillations in resonant systems.

### 4 - Online Optimization with Feedback for Power Systems

Emiliano Dall'Anese, University of Colorado, Boulder, CO, United States

This talk focuses on real-time incentive-based mechanisms to coordinate distributed energy resources (DERs) with both continuous and discrete control variables. A multi-period social welfare maximization problem is formulated and, based on its convex relaxation, a distributed stochastic dual gradient algorithm is proposed. Real-time implementations involve asynchronous updates and feedback being leveraged to account for nonlinear power flows as well as to reduce communication overhead. The resulting algorithm provides a general online stochastic optimization algorithm for coordinating networked DERs with discrete.

### 5 - Second-order Decomposition ACOPF

Shenyinying Tu, Northwestern University, Evanston, IL, 60201, United States, Ermin Wei, Andreas Waechter

This project proposes an algorithm to speed up solving large scale Alternating Current Optimal Power Flow (ACOPF) problem through decomposition and parallelization. In this project, we decompose the power flow network into a meshed network and a number of radial networks, and formulate the entire ACOPF problem as a bilevel optimization problem. In the upper level meshed network, we optimize the entire network and pass the information to the lower level tree networks. Then in each of the lower level problem, we solve it exactly via its relaxed SOCP formulation. The performance of the algorithm can be improved by parallel computing of the lower level problems.

Chair: Yanyan Ding, North China Electric Power University, Beinong road, Changping, Beijing, 102206, China

#### 1 - Resilient Based Optimal Interconnection Planning of Community Microgrids in Power Grids

Masoud Barati, Assistant Professor, University of Pittsburgh, Patrick F. Taylor Hall, Room 3325, Benedum Hall, 3700 O'Hara Street, Pittsburgh, PA, 15261, United States

We proposed a resilient planning problem of networked microgrids with DERs. We integrate the investment problem and two sets of operating problems associated with the grid-connected and islanding modes of microgrids into a two-stage stochastic model to capture randomness nature of hazard events and long-term load growth, as well as the islanding risk caused by external disturbances with a joint-chance constraint to prevent the risks. A SOCP formulation is presented to incorporate AC-OPF in short-term operation. Numerical results on distribution systems prove the effectiveness of the model.

#### 2 - An Inter-hourly Methodology for Valuation of Windfarms

Sergio Cabrales, Assistant Professor, Universidad de los Andes, Calle 19 A. no 1-37 Este, ML-325, Bogota, 111711, Colombia, Carlos Valencia, Daniela Moreno, Sebastian Toro

This paper proposes a methodology for the financial valuation of wind power generation based on an hourly estimation approach, including inter-hour velocity and energy spot market. For this purpose, we propose that the energy generation is modelled through an autoregressive copula methodology for univariate series and the spot prices are estimated as the function of two components, a deterministic seasonal pattern and a Gaussian mean-reversion process. We applied the developed methodology to a case study in La Guajira, Colombia, reinforces the idea that an inter-hour approach improves significantly the precision of the financial indicators.

### 3 - Game Theoretic Demand Side Management with a Shared Storage Device

Jinkyoo Park, Korea Advanced Institute of Science and Technology, 291 Daehak-ro, Yuseong-gu, Daejeon, 34141, Korea, Republic of, Jaeyeon Jo

In this study, we propose a decentralized control strategy for distributed energy storage units in a single shared energy storage system. In the proposed control strategy, each ESS user tries to minimize their energy cost while optimizing the charging and discharging schedule of their storage unit and, at the same time, trading their storage capacity among other users, which results in a Nash equilibrium strategy of all the ESS users. We show the derived Nash equilibrium strategy with capacity trading significantly reduces the average energy cost of users and reduces the peak load of the grid.

### 4 - A Contract Design Model for Power Demand Side Management

Lakshmi Palaparambil Dinesh, Visiting Instructor, Purdue University Fort Wayne, 2101 E. Coliseum Boulevard, Neff 340Q, Fort Wayne, IN, 46805-1445, United States

Demand Response (DR) is a mechanism of adjusting electricity usage with respect to peak demand and prices for electricity. DR helps consumers save energy as well as reduce utility bills. This paper covers a novel contract design model that combines customer preferences with utility provider cost minimization model. This novel Contract Design (CD) model has 20% cost savings compared to a benchmark model used in practice. Additionally, we use the CD model to determine the factors leading to cost savings and also identify how customer preferences affect contract design.

### 5 - Maximum Renewable Utilization with Large Number of Electric Vehicles

Pouya Sharifi, Texas A&M University, Emerging Technologies Building,, 3131 TAMU, 101 Bizzell Street, College Station, TX, 77840, United States

Vehicle to grid uses electric vehicles (EV) as distributed generation/storage devices to maintain the balance of supply and demand. However, the volatile power generation of renewable energy sources (RES) and unpredictable charging schedule of EV owners may cause problems in system scheduling and as a result, may lead to power curtailment. In this work, we propose a new scheduling framework that exploits the charging information and car owners' flexibility to build a reliable system while maximizing the RES utilization. We will simulate the proposed algorithm to check the quality of the solutions and schedules.

### 6 - Research on the Connection and Construction of Sustainable Development for Smart City and Smart Grid

Yanyan Ding, Research Assistant, North China Electric Power University, No. 2, Beining road, Changping, Beijing, 102206, China

Smart city is a new form of urban development with the deep integration of ICT technology into the urban life, and the distributed renewable energy has become an indispensable element of the sustainable development of smart cities. Smart grids, an application of ICTs, can support to connect the energy production and consumption with plenty of electronic components. This article describes the internal relationship between the construction of smart grids and the sustainable development of smart cities. It points out that building an integrated energy system with millions and thousands of self-equilibrium cells in it can serve as an effective approach for the sustainable development.

### Operational and Planning Issues of Integrated Energy Markets

Sponsored: Energy, Natural Res & the Environment/Energy

Sponsored Session

Chair: Stefanos Delikaraoglou, ETH Zurich, Zurich, 8092, Switzerland

#### 1 - Unit Commitment for an Integrated Electricity and Gas Market

Pascal Van Hentenryck, University of Michigan, 1813 IOE Building, 1205 Beal Avenue, Ann Arbor, MI, 48108-2117, United States, Geunyeong Byeon

We consider the joint operations of the electricity and gas networks, capturing the operations of both networks and the market considerations with high fidelity. We present a mixed convex optimization programming approach to the unit commitment problems for the joint operations and compare its benefits to the practice in the field.

#### 2 - Security Assessment in Gas-electric Networks

Line Roald, University of Wisconsin-Madison, Madison, WI, United States, Conor O'Malley, Gabriela Hug

The flexibility offered by gas generation is beneficial for electric grids, particularly in the face of increasing renewable generation. However, the gas system sometimes experiences limitations in the ability to deliver gas, with potentially detrimental impacts on the electric grids. We investigate how different operational

criteria for the gas system cause different levels of post-contingency gas curtailments to generators, with different impact on electric grid operation. Our case study confirms that the security criterion used to determine the required gas curtailments has significant impact the operational cost of the electric grid.

### 3 - Optimal Short-term Operation of Combined Heat and Power Plants Using Different Operation Modes

Ignacio Blanco, Technical University of Denmark, Asmussens Alle, Bygning 303B, Kgs Lyngby, 2800, Denmark, Daniela Guericke, Juan M. Morales, Henrik Madsen, Jong-Bae Park

The optimal operation of combined heat and power plants (CHP) is a relevant approach to achieve the integration of both the power grid and the district heating network, where the latter can be used as a buffer to accommodate the fluctuation of renewable energy sources. Large combined cycle gas turbines (CCGT) and coal-based CHP plants can operate in several operation modes. Therefore, the optimal operation of these units results in a computationally hard optimization problem. We propose a stochastic MILP model that can efficiently operate large CHP units making use of the different operation modes to achieve a better co-optimization of the district heating and power networks.

### 4 - Modelling Long-term and Short-term Uncertainty in Power Market Investments

Asgeir Tomasgard, Norwegian University of Science and Technology, Dept. of industrial economics, Alfred getz vei 3, Trondheim, 7491, Norway

The EMPIRE model is a European multiscale power market model with investments towards 2050 as well as representative hours. It is well suited to capture operational uncertainty in generation from intermittent energy sources like wind and sun. In this paper we add long-term uncertainty to the formulation. This makes it possible to also study uncertain learning curves, policy uncertainty, long-term commodity process and demand trends. The resulting models are large scale stochastic multi-stage recourse models with hundred of millions of variables. We present both solution methods and analysis of the most important factors.

### 5 - Information Sharing for Independent Scheduling of Electricity and Natural Gas Systems

Stefanos Delikaraoglou, ETH Zurich, Physikstrasse 3, ETL G22, Zurich, 8092, Switzerland, Gabriela Hug

The increasing shares of gas-fired electricity generation call for improved coordination between power systems and gas networks. Ideally, these systems should be co-optimized, sharing all the necessary technical and economic information to ensure feasible operation and to minimize total system cost. However, according to the current framework, the scheduling of electricity and natural gas operations is performed through independent and nonconcurrent markets. To address this issue of partial coordination we propose an asynchronous information sharing mechanism, which allows dispatching the gas system accounting for the feasible re-dispatch actions and their cost on the electricity side.

Chair: Fikri Kucuksayacgil, Iowa State University, 610 Squaw Creek Drive, Unit 18, Ames, IA, 50010, United States

#### 1 - Asynchronous Decentralized Solution Framework for Large Scale Unit Commitment

Paritosh Raman, Georgia Institute of Technology, Atlanta, GA, United States

The unit commitment problem for power networks is a critical and a computationally challenging problem especially for large-scale power systems. We propose an asynchronous decentralized solution to the unit commitment problem that preserves privacy of infrastructural data and is also resilient to cyber attacks. We demonstrate that our method is highly scalable, improves computational efficiency and provides a competitive and stable solution quality.

#### 2 - Enabling the Smart Grid with Power Cloud

Lida Haghnegahdar, PhD Candidate and Research Assistant, SUNY, Vestal, NY, United States, Yong Wang

Dynamic pricing, load management and responding to the demands of the energy market are some of the characteristics of a smart grid. And a reliable and cost-effective modern smart grid is desired. One way to achieve these objectives is to implement a cloud approach, where monitoring power grid data flow and data center management are key. A cloud-based approach provides a suitable environment with tools to manage and access data effectively. The objective of this paper is to introduce the power cloud model: an energy system model based on enabling accessible service to computing resources, real-time data stream processing and an environment to integrate data sharing.

### 3 - Valuation of Long-duration Grid Energy Storage using Production Cost Models

Jiazi Zhang, Postdoctoral Researcher - Electrical Engineering, National Renewable Energy Laboratory, 15013 Denver West Parkway, Golden, CO, 80401, United States, Joshua Eichman, Omar Jose Guerra Fernandez

The integration of high shares of variable renewable energies raises challenges for the reliability and cost-effectiveness of power systems. Long-duration storage is one of the most promising options to solve these problems. In this study, the system-level impacts of long-duration storage on the Western Interconnect (WI) power system will be explored. The operations of future WI with 50%, 70%, and 90% renewable penetration are simulated using a production cost modeling tool - PLEXOS. The net system benefits of different storage and demand response technologies are assessed including pumped hydro, compressed air energy storage, flow batteries, power-to-gas, and power-to-gas-to-power.

### 4 - Electric Generation Investment under Uncertainty: Applying Decision Analysis to a Complex Electric Power Systems Model

David Young, EPRI, Palo Alto, CA, 94304, United States, Nidhi Santen

We adapt the deterministic US-REGEN inter-temporal capacity expansion model to approximate a stochastic model by wrapping it within a decision tree framework. We apply this framework to study how the anticipation of future climate policy or natural gas price shocks in the U.S. impacts generation investment decisions ex-ante. We find investing in new wind/solar or gas-fired units is generally robust to a range of futures, but investing in new nuclear units or units with carbon capture and storage prior to the shock may lead to high regretted costs.

### 5 - Performance Evaluation in Distributed Photovoltaic Systems Using Data Envelopment Analysis

Adiel Teixeira De Almeida Filho, Universidade Federal de Pernambuco, Caixa Postal 7471, Av. General San Martin, 1083, Recife-PE, 50.630-971, Brazil, Ivaro Cavalcanti, Francisco de Assis dos Santos Neves, Gustavo Medeiros Azevedo

This paper uses the Data Envelopment Analysis (DEA) technique to verify the performance of micro- and mini-generation systems in order to reveal the best practices that could be observed so that these may be replicated in order to justify the increase in photovoltaic generation in this type of system that will be distributed and managed by the population. During the analysis, data were collected on 123 micro- and mini-generation units distributed in an area of 98.5 km<sup>2</sup> in the Northeast region of Brazil.

### 6 - A Lattice Method for Jump-diffusion Process Applied to Transmission Expansion Investments under Demand and Distributed Generation Uncertainties

Fikri Kucukayacigil, Iowa State University, Ames, IA, 50010, United States, K. Jo Min

In recent years, decision makers of expansion investments in transmission sector have faced critical uncertainties such as growth of demand for electricity and installation of distributed generations (DGs) owned by customers. Power lines should be expanded strategically as installation of DGs may create stranded costs for transmission owners as they meet a portion of local demand. We develop a computationally efficient lattice method to model uncertainties in the form of geometric Brownian motion and compound Poisson process. We propose a real options framework which quantifies the value of expansion investments. Proposed framework is demonstrated on a hypothetical example.

### Practice- Game Theory II

Contributed Session

Chair: Patanjali Kumar, Indian Institute of Management Rohtak, MDU Campus, Everest Hostel, Rohtak, 124001, India

#### 1 - A Decentralized Algorithm for Finding Nash Equilibrium under Imperfect and Incomplete Information

Kyuree Ahn, KAIST, Daejeon, Korea, Republic of, Jinkyoo Park

In this study, we propose a nonparametric decentralized algorithm to find a Nash equilibrium of a repeated game with imperfect and incomplete information. At each iteration of the game, each player executes his own action and observes the reward and other players' executed actions (strategies). Each player then updates his belief both on his own reward function and on other players' joint strategy using Gaussian Process Regression and Log Gaussian Cox Process, respectively. As each player best responds to their beliefs that is being updated, the joint of individually updated strategy converges to a Nash equilibrium in a distributed way.

#### 2 - Socially Differentiated Products: A Game Theoretic Approach

Hannan Sadjady Naeeni, University of Houston, Houston, TX, United States, Powell Robinson

We propose a game-theoretic duopoly model to identify equilibria configurations where one, none, or both of the firms offer socially responsible (SR) products. Our analysis shows how firms' commitment to socially responsible products depends on the marginal cost differences, market growth, and changes in consumer's perception of brand.

#### 3 - Information Aggregation via Rational Learning in Imperfect Information Routing Games

Manxi Wu, Massachusetts Institute of Technology, Cambridge, MA, 02142, United States, Saurabh Amin, Asuman Ozdaglar

We study rational learning dynamics in traffic routing games when travelers have imperfect information about an unknown network state. In each stage, travelers myopically choose routes based on their current belief distribution, and noisy realizations of travel costs on the chosen routes become publicly available. We show that rational learning can lead to a self-confirming equilibrium in which average traveler cost is higher than the cost under full knowledge of the state. We specialize our results in situations in which self-confirming equilibrium does not exhibit such informational inefficiency, i.e., travelers make route choice as if they have complete information about the state.

#### 4 - Using Auditing and Commitment for Engaging a Supplier for Supply Chain Sustainability

Hossein Rikhtehgar Berenji, PhD Candidate, University of Oregon, Lundquist College of Business, 1208 University of Oregon, Eugene, OR, 97403-1208, United States, Nagesh N. Murthy, Zhibin Yang

We model a buyer auditing a supplier for sustainable business practices. We investigate the effect of buyer's upfront commitment to price and quantity on supplier's compliance with the code of conduct and buyer's auditing effort and supply chain sustainability. We analyze implications of raising the standard of code of conduct on sustainability and financial performance.

#### 5 - Impact of Virtual Organization in Sustainable Supply Chain Contracts

Patanjali Kumar, Indian Institute of Management Rohtak, MDU Campus, Everest Hostel, Rohtak, 124001, India, Peeyush Pandey, Gourav Dwivedi

This paper presents a novel approach to coordinate green and socially responsible supply chain using contracts. We compare the traditional and virtually integrated form of an organization using game theoretic approach. Through numerical examples, we demonstrate the effectiveness of our models. Our results reveal that virtual organization performs better than the traditional form of an organization under specific conditions.

### Practice- Retail Management II

Contributed Session

Chair: Wenli Peng, Katholieke Universiteit Leuven, Voie du Roman Pays 34 bte L1.03.01, Louvain la Neuve, 1348, Belgium

#### 1 - Win the Buy Box - Reselling or Marketplace

Hao Su, University of Maryland-College Park, 3330 Van Munching Hall, College Park, MD, 20742, United States, Laharish Guntuka, Martin E. Dresner

This paper examines an internet retailer's decision to directly sell a product. The internet retailer offers customers both direct sales and sales through a marketplace. Using empirical analysis, we determine product characteristics that predict the internet retailer's decision to directly sell a product. We hypothesize that the internet retailer is more likely to sell (1) popular (vs. unpopular) products and (2) the products that have large (vs. limited) spillovers onto other products. Findings provide implications to marketplace sellers seeking to avoid direct competition with the internet retailer.

#### 2 - An Investigation of Multi-staged, Dual-pronged Order Fulfillment in E-commerce Marketplace

Hyun Seok (Huck) Lee, Assistant Professor, College of Business, Oregon State University, 3007 NW Morning Glory Drive, Corvallis, OR, 97330, United States, Yusoon Kim, Junbo Son

Increasingly large e-commerce marketplaces bring order fulfillment function in-house. As a result, we observe two internal fulfillment systems: conventional fulfillment by individual merchants (FBM) and emerging fulfillment by e-commerce platform (FBP). And they compete internally over efficiency. In this research, based on real-world e-commerce data on transactions and logistics, we compare the two internal fulfillment systems through uncovering distinctive mechanisms driving different operational and logistical decisions. By doing so, we suggest contingent conditions for moving towards the FBP option.

### 3 - Coalition Analysis of Basic Hierarchical Graph Model in Solving Climate Change Disputes

Shawei He, Assistant Professor, Nanjing University of Aeronautics and Astronautics, Nanjing, China

Coalition in hierarchical conflicts is studied in basic hierarchical graph model (BHGM). A BHGM consists of two local graph models (LGMs), containing a common decision maker (CDM) in both LGMs and two local decision makers (LDMs), each of which plays in one LGM. Coalition between CDM and an LDM, and between two LDMs, are discussed. Theorems indicate that transition from an equilibrium to another only takes place jointly by CDM and an LDM. An example of disputes over achieving emission goals between the national and provincial governments in China are investigated, suggesting that agreements on achieving stricter emission goals by a province can be reached if being subsidized by the national government.

### 4 - Cost of Information Sharing Under Group Purchasing

Wenli Peng, Université Catholique de Louvain, Voie du Roman Pays 34 bte L1.03.01, Louvain La Neuve, 1348, Belgium, Gilles Merckx, Philippe Chevalier, Aadhaar Chaturvedi

This paper investigates how information sharing dimension affects OEMs' motivations towards group purchasing, specifically in industries characterized by market demand and technology level uncertainties. Under Cournot competition, we find that group purchasing is preferred by OEMs when product technology strongly affects market demand, and that preference for group purchasing would depend on product substitutability, market demand variability and supplier rebate when influence of the product technology is low. We further find that group purchasing can benefit both the OEMs and the consumers.

### 1 - A Mixed Integer Linear Programming Formulation for Permutation Flowshop Lot Streaming Problems

Ramakrishna Govindu, University of South Florida, 8350 N. Tamiami Tr, Sarasota, FL, 34243, United States, Anurag Agarwal

MxN flowshop problems are known to be NP-hard. Lot streaming problems, being more complex than flowshop problems, are typically solved using heuristics and meta-heuristics. It is a well-known fact that problem formulations play a crucial role determining in solution times for integer and mixed integer programming problems. Given the computational power and advanced solvers available these days, is there any value in solving lot streaming as an MILP problem? We propose an MILP formulation, conduct experiments, and present the results.

### 2 - The Cutting Stock Problem with Diameter Conversion in Construction Industry

Deniz Altinpulluk, Baskent University, Ankara, Turkey, Haldun Sural

One-dimensional cutting stock problem has been widely used for reinforcement rebar steel in the construction industry. Diameter size of a rebar is determined by structural designer to provide tensile strength to the structure and it can be changed if cross-section area per concrete area stays constant. We study the problem that decides diameter size and required number of rebar providing tensile strength and cutting patterns to minimize usage of raw material. It differs from classical cutting stock as it is not known how many pieces should be cut until diameter sizes are chosen. We propose a Reflect Arc-Flow Formulation to solve the problem and provide our computational results.

### 3 - Integrated Production Planning and Scheduling in the Multistage Production System with Dynamic Forecast Updates

Hakeem-Ur Rehman, Shanghai Jiao Tong University, Shanghai, 54000, China, Guohua Wan, Zhan Yang

We study the multilevel multistage lot sizing and scheduling problem with demand information updating. We employ the Martingale Model for Forecast Evolution to model the evolving demand over the time with demand information updating and build a shortfall-based chance constraints MIP model using hybrid period approach. To solve the problem, three heuristic algorithms based on the relax-and-fix method within rolling horizon framework are developed. The results of the computational experiments show that Heuristic 1 performs better than Heuristic 2 and 3 for all the problem instances.

### 4 - Integrated Optimization of Production Scheduling and Preventive Maintenance Planning In the Flexible Job Shop.

Baoru Zhou, Tsinghua University, Beijing, 100084, China, Changchun Liu, Li Zheng

This study addresses the problem of integrating production scheduling and preventive maintenance planning in the flexible job shop. A model aimed to minimize the total tardiness is formulated. To solve the model, we propose a heuristic and an adapted Genetic Algorithm. Finally, extensive numerical experiments are conducted to test the performance of the proposed methods.

### 5 - A Biobjective Production Planning and Scheduling Model Dealing with Reworking the Perishable Items in a Parallel Machine System

Elham Taghizadeh, Wayne State University, Detroit, MI, 48035, United States, Farshid Evazabadian, Setareh Torabzadeh, Abdollah Mohammadi

Production systems could struggle with defective products due to human error, machine break-down, and imperfect production system. Reworking is one strategy to deal with this issue. Rework planning involves the production planning and scheduling of the defected items along the master production planning. This paper presents a multi-objective mathematical model to determine how the work and rework must be scheduled in a parallel machine system for perishable products. The model objective functions are the Min of cost and makespan. A linear model is developed and numerical experiments are based on a case study from the literature for biopharmaceutical industry.

### Practice – Integer Programming & Applications I

Contributed Session

Chair: Reed Harder, Dartmouth, 14 Engineering Drive, Hanover, NH, 03755, United States

### 1 - Least Cost Energy Optimization: Pakistan Power Sector Analysis

Raza Ali Rafique, Assistant Professor, Lahore University of Management Sciences, Sector 'U', DHA, Lahore Cantt., Lahore, 54792, Pakistan

In our study, the optimal energy-mix for power generation is sought. We propose a mixed integer linear programming (MILP) model for minimizing the power generation infrastructure cost considering indigenous energy resources of Pakistan. The proposed optimization tool can assist policy makers for strategic planning and development of future energy-mix for power generation in Pakistan.

### 2 - A Weighting Local Search Algorithm for the Constrained Binary Quadratic Program

Ryutaro Matsumoto, Osaka University, Osaka, Japan, Shunji Umetani, Hiroshi Morita

We develop a 2-flip neighborhood local search algorithm for the constrained binary quadratic program (CBQP) that incorporates an incremental evaluation of solutions and an adaptive control of penalty weights. The proposed method detects the special type of constraints and specifies a suitable neighborhood search. Computational results for a variety of combinatorial optimization problems show that the proposed method achieves comparable results to the specially tailored algorithms for them.

### 3 - A Software Tool for Interfacing with Linear Programming Solvers

Zachary Steever, University at Buffalo, Buffalo, NY, United States, Chase Murray

Note: We are finalizing a provisional patent for this tool, so we can't disclose details yet. We will update the abstract to be more descriptive well in advance of the conference. We present a new tool to help researchers more efficiently interact with application programming interfaces (APIs) that are often provided by integer programming solvers. This tool streamlines a researcher's typical workflow by automating some steps of the code-writing process. The talk will feature a demonstration of the new software. A roadmap of future enhancements to the tool will be presented, followed by a discussion on how the OR community can influence the incorporation of new functionality into the software.

### 4 - A Novel Lattice-based Douglas Rachford Splitting to Solve Convex Optimization Problems over Integers

Shuvomoy Das Gupta, Thales Canada, Research & Technology, 105 Moatfield Drive, Toronto, ON, M3B 0A4, Canada

Convex optimization problems over integer decision variables have a wide range of applications in transportation, management science, computer science and engineering. In this study, we combine results from lattice theory and monotone operator methods to construct a novel lattice-based Douglas-Rachford splitting algorithm to solve convex optimization problems over integers. The algorithm has several desirable properties, namely: its convex steps are parallelizable, and its nonconvex projection step is reducible into projection onto a lattice in a potentially much smaller dimension. We also establish sufficient conditions for the convergence of the algorithm to an optimal solution.

## 5 - Integer Programming Approaches to Fisheries Observer Assignment

Reed Harder, Dartmouth, 14 Engineering Drive, Hanover, NH, 03755, United States, Vikrant Vaze

Fisheries observers are deployed on commercial fishing vessels to provide independent monitoring of fishing activity. However, effective deployment of observers can present significant challenges in the Western and Central Pacific Ocean: observers board and disembark hundreds of fishing vessels operated by multiple nations at remote ports scattered across the region, and transportation costs between ports can be high. In order to minimize the costs of effective observer deployment, we develop an integer programming approach for assigning observers to scheduled vessel trips, while meeting constraints imposed by the need for impartiality.

#### 1 - How Auctioneers Set Ex Ante and Ex Post Reserve Prices in English Auctions

Lijia Tan, Eindhoven University of Technology, Pastoor van Arslaan, 6B, Eindhoven, 5622 CK, Netherlands

We provide the direct experimental comparison of auctioneer behavior in two popular methods of procurement: reserve price English auction and English auction with renegotiation. In our experiment, the auctioneers in these two mechanisms demonstrate systematic biases relative theoretical predictions. We develop a model of subjective conditional probability judgement explains the biases. To demonstrate the robustness of our model, especially relative to standard models and those of anticipated regret we then show in a subsequent experiment that the auctioneer's expected benefit is predicted well out of sample in an environment in which the distribution of seller's cost is right skewed.

#### 2 - Game Theoretic Approaches for Government Acquisition

Scott L. Rosen, Mitre Corporation, 2016 Kenilworth Street, Arlington, VA, 22205, United States, Andreas Tolk, Kelly Horinek, Les Servi, Alex Odeh

This talk investigates the application of game-theoretic models with an optimization engine to provide a quantitative decision support system for the government to illuminate real-time tradeoffs for acquisition decisions. The insight gained is intended to enable the generation of strategies that can quickly move vendors towards the government's preferred negotiation point thus expediting process in acquisition while adding transparency.

#### 3 - An Analysis of Capacity Procurement Game

Lusheng Shao, University of Melbourne, 198 Berkeley Street, Level 10, Melbourne, 3010, Australia

We study a procurement game in which a principal contractor procures production capacities from multiple subcontractors. The subcontractors are heterogeneous in terms of their capacities and production costs. Subcontractor each quote a price that is charged to the principal contractor in exchange for their capacities. We study the optimal bidding strategies of the subcontractors and the optimal procurement strategy of the contractor. We show that in equilibrium the social optimum and collaboration between the subcontractors is achieved.

#### 4 - Bidding and Learning in Repeated Auctions

Srinivasa Kartikeya Puranam, Rutgers University, 227 Penn St, Camden, NJ, 08102, United States, Michael N. Katehakis

We consider the problem of a firm that procures substitutable items in a sequence of auctions by bidding against the "market. The firm and the "market learn from each winning bid. We study bidding strategies for the firm when the objective of the firm is to maximize long run discounted profit.

### Behavioral Operations – Beyond Lab Experiments

Sponsored: Behavioral Operations Management

Sponsored Session

Chair: Yinghao Zhang, University of Cincinnati, Cincinnati, OH, 45221, United States

#### 1 - Is Simplicity the Ultimate Sophistication? Wholesale Pricing vs. Non-linear Pricing

Behrooz Pourghannad, University of Minnesota, Minneapolis, MN, 55414, United States, Guangwen Kong, Tony H. Cui

This paper studies a manufacturer's choice of contract when facing a boundedly rational retailer. In a supply chain with a fully rational retailer a wholesale price contract cannot perform better than buy-back and revenue sharing contracts. When the retailer is boundedly rational, we find that a wholesale price contract can dominate both buy-back and revenue sharing contracts. We characterize the condition under which a wholesale price contract is the optimal choice of the manufacturer. Our findings are supported by laboratory experiments in which human suppliers choose a contract to offer to computerized boundedly rational retailers.

#### 2 - Does Loss Aversion Preclude Price Variation?

Ningyuan Chen, Hong Kong University of Science and Technology, Clear Water Bay, Kowloon, Hong Kong

In modern retailing, frequent discounts are seemingly at odds with the idea that price variation antagonizes loss-averse consumers and hence diminishes their demand for products and services. We model a firm selling a product over time to loss-averse consumers who differ in their sensitivity to gains/losses. We show that charging a long-run constant price may be suboptimal and then derive conditions under which the optimal policy is cyclic (e.g., a periodic markdown policy). These findings establish that loss aversion does not preclude price variation and thereby underscore the importance of incorporating consumer heterogeneity into pricing policies.

#### 3 - The Impact of Social Learning on Consumer Subsidies for Green Technology Adoption

Hang Ren, George Mason University, Enterprise Hall, 4400 University Drive, Fairfax, VA, 22030, United States, Tingliang Huang, Georgia Perakis

To incentivize consumer adoption of expensive green-tech products, governments typically order consumers subsidies through rebates and tax credits. Apart from subsidies, consumers' adoption decisions are usually also influenced by the word-of-mouth information about product quality from earlier adopters. In this paper, we study a government's optimal dynamic subsidy decision in the presence of consumers' social learning.

#### 4 - Overconfident Distribution Channels

Meng Li, Rutgers University, 227 Penn Street, Camden, NJ, 08102, United States

We study the effects associated with overconfidence in distribution channels, where overconfidence is defined as a decision maker's cognitive bias in perceiving the expected outcome of an uncertain event as more certain than it likely is. Our results shed some light on the design and adoption of strategies aimed at enhancing decisions and curtailing overconfidence bias of supply chain executives.

#### 5 - Consumer Quality Reference and Offshoring in Product Recalls

Kefeng Xu, University of Texas at San Antonio, 1 UTSA Circle, San Antonio, TX, 78249, United States, Yan Dong, Sining Song, Chen Zhou

Product recalls are often associated with quality failures. We develop an endogenous consumer reference model with stochastic quality levels and consumer valuation of gain-loss utility, to examine the consumer's willingness to buy in the events of recalls. We find that a product recall may revise the consumer belief toward a more negative quality outcome and therefore a lower reference point. The consumer expects a greater gain from buying the product against the lower reference point, leading to higher willingness to buy. Consumer loss aversion and supply chain offshoring are found to significantly affect the consumer willingness to buy and thus firm performance.

### The Roles of Supply Chain Knowledge on New Product Introduction

Emerging Topic: New Product Development

Emerging Topic Session

Chair: Junghee Lee, Tulane University, New Orleans, LA, United States

#### 1 - Knowledge-based View of Outsourcing Strategies for New Product: A Game Theory Model

Qiong Chen, University of Science and Technology of China, School of Management, Hefei, 230026, China, Gulru F. Ozkan-Seely, Shouqiang Wang, Aleda Roth

We introduce a signaling game to examine the outsourcing strategies of a buying firm that faces two options in determining a manufacturer to produce its new product: outsource directly or indirectly (through an intermediary). We demonstrate the critical yet interesting role of outsourcing knowledge on the buying firm's outsourcing strategies.

## 2 - Knowledge Outsourcing for Competing Buyers

Jaeseok Lee, Georgia Institute of Technology, 800 West Peachtree  
NW, Atlanta, GA, 30308, United States, Cheryl Gaimon,  
Karthik Ramachandran

We study the knowledge development and outsourcing decisions of competing firms (buyers), who can obtain knowledge from a common supplier. We identify a condition whereby buyers benefit from knowledge outsourcing. We also discuss how the supplier is better off if he serves only one buyer.

## 3 - Market Entry and Location Choice under Market Uncertainty

Wenxin Xu, The Hong Kong Polytechnic University, Hong Kong  
When a new bicycle-sharing company considers pursuing the growth opportunities in emerging markets, e.g., the second or third-tier cities, it often grapples with those questions such as: When should I enter this new market? Where should I locate the docks to serve the customers while avoiding the fierce competitions? This paper provides some managerial insights into the entry timing and location choice under market uncertainty for those companies with a dynamic game-theoretical model.

## 4 - Initial Stage Success Strategies for Mobile Applications

Moonwon Chung, University of South Carolina, Cayce, SC, 29033,  
United States, Luv Sharma, Manoj Malhotra

This study examines the implications of operations decisions in the hypercompetitive context of software development, dissimulation, and sustained service delivery. Specifically, we estimate performance impact of user engagement impacted by the choice of mobile app feature decisions, product launch timing decisions, decentralized value chains, and organizational focus. A panel data of Top 500 ranked mobile game apps in the US was extracted from app market APIs in daily observations over 3 years. We perform econometric analyses to reveal software development and value chain configuration implications for managers.

## Optimization in Cancer Treatment

Sponsored: Health Applications

Sponsored Session

Chair: Ali Ajdari, Massachusetts General Hospital & Harvard Medical School, Seattle, WA, 98199, United States

### 1 - A Progressive Hedging Approach for Chemotherapy Appointment Scheduling

Nur Banu Demir, Middle East Technical University, Ankara,  
Turkey, Serhat Gul, Melih Celik

Chemotherapy appointment scheduling in oncology clinics is a challenging combinatorial optimization problem due to the assignment of patients to nurses and chairs. Furthermore, the patient appointment times of a daily patient list must be determined under the uncertainty of the infusion preparation and treatment times. The problem is formulated as a two-stage stochastic mixed integer programming model that minimizes the expected weighted sum of nurse overtime and patient waiting time. A Progressive Hedging Algorithm is applied in order to obtain appointment times for patients. Computational experiments are performed using real data of a major university hospital.

### 2 - Including Edge-penalization Aperture Control Methodologies into VMAT Optimization

Wilmer Henao, University of Michigan, Ann Arbor, MI, United States, Marina A. Epelman, Martha Matuszak, Kelly Younge, Edwin Romeijn

Complex beam aperture shapes consisting of excessive perimeter per unit of area can potentially give rise to dose inaccuracies in VMAT radiation therapy treatments. Standard practice does not explicitly take aperture shape into account at the planning optimization stage. We intend to correct this issue by approximating previously well-established edge penalties, and explicitly incorporating them into the optimization using a column-generation based heuristic. Our algorithm was tested in real cases obtaining a reduction of aperture complexity, an ensuing increase in dose accuracy and a negligible decrease in treatment quality as measured by Dose-Volume Histograms.

### 3 - A Novel Optimal Stopping Approach to Formulate the Radiation Therapy Problem

Ali Ajdari, Research fellow, Massachusetts General Hospital & Harvard Medical School, 125 Nashua st, Boston, MA, 02114,  
United States, Thomas Bortfeld

In the fractionated radiation therapy problem, the treatment is delivered over the course of several sessions. The length of the treatment is usually determined by one-size-fits-all guidelines and is therefore fixed prior to the beginning of radiotherapy course. In some cases however it might be optimal to stop the treatment early to avoid severe normal tissue toxicities and/or over-treating the patient. Using tools in dynamic programming and control theory, we formulate the problem as an optimal stopping model and try to find the optimal time to stop the treatment, based on the observed tumor and normal tissue response.

## Resilient Pharmaceutical Supply Chains

Sponsored: Health Applications

Sponsored Session

Chair: Rozhin Doroudi, Northeastern University, Boston, MA, United States

### 1 - Policies to Improve Pharmaceutical Supply Chain Resiliency:

#### A Multi-stage Stochastic Programming Approach

Emily L. Tucker, University of Michigan, Ann Arbor, MI, 48105,  
United States, Mark S. Daskin, Wallace J. Hopp,  
Burgunda V. Sweet

Drug shortages continue to be a major, though little-discussed, public health crisis. They are often caused by disruptions to non-resilient pharmaceutical supply chains. We present a new multi-stage stochastic programming model of the supply chain design problem when components may be disrupted. We discuss the application of a variant of the Stochastic Dual Dynamic Programming algorithm and analyze how policy proposals would affect the risk of shortages under a variety of market conditions.

### 2 - Minimization of Drug Shortages in the Pharmaceutical Supply Chains: A Simulation-Based Analysis of Drug Recall Patterns and Inventory Policies

Rana Azghandi, Northeastern University, Boston, MA, 02215,  
United States, Jacqueline Griffin, Mohammad S. Jalali

The drug shortage crisis in the last decade not only increased health care costs but also put patients' health at risk in the United States. Managing pharmaceutical supply chains is very complex, as inevitable disruptions occur to these supply chains (exogenous factors), which are followed by decisions that members make after such disruptions (internal factors). The current research employs a system dynamics simulation model to examine the effects of different disruption profiles, e.g., the propagation in time and space, and the interactions of decision makers on drug shortages to ascertain how these shortages can be mitigated by changing the inventory policy decisions.

### 3 - Building Up Resilience in a Pharmaceutical Supply Chain through Inventory, Dual Sourcing, and Agility Capacity

Florian Lucker, Cass Business School, 106 Bunhill Row, London,  
EC1Y 8TZ, United Kingdom, Ralf W. Seifert

In this talk we investigate the relationship between the three operational risk mitigation measures inventory, dual sourcing, and agility capacity by modelling a drug manufacturing firm. We quantify the decrease in inventory levels in the presence of dual sourcing and agility capacity. Furthermore, we show how to determine optimal inventory and dual sourcing decisions holistically. Within our modeling framework we introduce an operational metric that quantifies supply chain resilience.

### 4 - Drivers of Drug Shortages: Theoretical and Empirical Investigations

Iva Petrova Rashkova, Washington University-St Louis, Campus  
Box 1156, Business School Faculty, St Louis, MO, 63130,  
United States, Panos Kouvelis

We use the drug shortages FDA data during 2012-2016 to identify the driving forces of drug shortages. We first develop a stylized model illustrating the relationship between drug shortages and changes in the product portfolio of a drug manufacturer. Our key insight is that the potential new drugs, regardless of whether they end up being successful or not, drive drug shortages. We then use data on new brand and generic drugs to show their usefulness in predicting manufacturer's drug shortages. We compare linear regression and random forest predictive models and recommend the latter based on its lower MAPEs both in-sample and out-of-sample.

### 5 - Identifying Critical Components of a Multi Agent Drug Supply Chain

Rozhin Doroudi, Northeastern University, Boston, MA, 02116,  
United States, Ozlem Ergun

The growing epidemic of drug shortages in the US indicates the fragility of drug supply chain in the face of disruptions. Identifying most critical components in the supply chain can assist policy makers in mitigating these shortages. In this study we propose a node criticality measure for underlying network of a drug supply chain in which nodes are agents and arcs are material flow between them. Unlike most node criticality measures in network science literature this measure does not abstract away domain-specific functions of network components. Therefore, it can be used in predicting the effect that disruption of one node can have on the overall supply chain performance.

**Joint Session HAS/PSOR/Practice Curated: Emerging Issues in Treatment Planning and Management**

Sponsored: Health Applications

Sponsored Session

Chair: Shengfan Zhang, University of Arkansas, Fayetteville, AR, 72701, United States

**1 - Opioid Overdose and the Role of Comorbidity in US Emergency Departments**

Nisha Nataraj, Centers for Disease Control and Prevention, 4770 Buford Highway, MS - F62, Atlanta, GA, 30319, United States, Kun Zhang, Gery Guy, Christina Mikosz

The United States is in the midst of an opioid overdose epidemic with 42,249 opioid overdose-related deaths in 2016. Certain medical comorbidities may increase the risk for opioid overdose. We use regression and variable clustering models on national-level hospital discharge data to identify comorbidities most associated with opioid overdose in patients presenting to emergency departments. Results show that the overall number of comorbid chronic conditions is increasing in this population and that comorbid psychiatric, neurologic, and fluid/electrolyte disorders are especially associated with overdose.

**2 - A Markov Decision Process Approach to Find the Optimal Time of Operating Lung Volume Reduction Surgery in Patients with Severe Emphysema**

Maryam Alimohammadi, University of Arkansas, Fayetteville, AR, 72701, United States, Shengfan Zhang, Art Chaovalitwongse

Emphysema is a chronic lung disease that can be treated with lung volume reduction surgery (LVRS). Despite the advantages of LVRS in specific patients, it has mortality and morbidity risks and costs more than other treatments which makes it crucial to determine the subgroup of patients that can benefit the most from LVRS and assign them to surgery at the best time. To develop an optimization model that maximizes the quality-adjusted life time of the patients, we used Markov Decision Process (MDP) based on the National Emphysema Treatment Trial (NETT), a comprehensive dataset that collected the data of 1218 patients with severe emphysema who were randomized to undergo surgery or have medical treatment.

**3 - Characterizing the Uncertainty Associated with Treatment Outcomes for Tuberculosis Patients**

Shengfan Zhang, University of Arkansas, 4207 Bell Engineering Center, Department of Industrial Engineering, Fayetteville, AR, 72701, United States

The goal of this research is to use data analytics and stochastic modeling approaches to characterize patient recovery pathway from treatment for tuberculosis (TB). This research will use an existing anonymous data that contain information about follow-up test results for TB patients in Moldova upon initiation of treatment. Specifically, we aim to (1) characterize the pattern of recovery as denoted by the smear and culture test results at follow-ups; and (2) predict patient disposition (i.e., recovered to died) based on the recovery pattern.

**4 - Enhancing Community Resilience to Combat Crisis of Opioid Addiction**

MD Noor E. Alam, Assistant Professor, Northeastern University, 334 Snell Engineering Center, 360 Huntington Avenue, Boston, MA 02115, United States, MD Mahmudul Hasan, Gary Young, Alicia Modestino

This study focuses on detecting the variation of opioids prescribing pattern by leveraging the Massachusetts All Payer Claim Data (MA APCD) set. Based on the meaningful insights obtained from the data mining, we will devise a set of optimal policies to improve the community resilience to combat the opioid addiction epidemic.

Sponsored Session

Chair: Hadi El-Amine, George Mason University, Fairfax, VA, 22030, United States

**1 - Optimization of Human Leukocyte Antigen Based Donor Recipient Matching in Kidney Transplantation**

Naoru Koizumi, George Mason University, School of Public Policy, 3351 North Fairfax Drive, Arlington, VA, 22201, United States,

Mehdi Nayeypour, Hadi El-Amine

Cold ischemic time and post-operative complications are associated with 30-day mortality of the donor graft. However, long-term patient survival is related primarily to tissue matching, vasculopathy, immunosuppression, and infection. This study examines the preeminent role of tissue matching using an optimization regression algorithm to examine the effect of randomly allocated HLA: A, B, and DR kidney donor on long term patient survival in the largest retrospective study known to date.

**2 - Exploring Models for Reducing Geographical Disparity in Organ Allocation**

Michal Mankowski, King Abdullah University of Science and Technology, Thuwal, Saudi Arabia, Sommer Gentry

Reducing the geographic disparity in access to organs is emerging issues in the transplant community. The OPTN/UNOS has recently appointed the Ad Hoc Geography Committee to define guiding principle and review models for the use of geographic constraints in organ allocation. We investigate a potential impact of some of the approved models.

**3 - Information Theoretic Learning in Markov Decision Processes**

Peeyush Kumar, B14, Industrian and Systems Engineering, MEB, University of Washington Seattle, Seattle, WA, 98195-2650, United States

I will present my research on Markov decision processes where the decision maker is uncertain about the model of the system. To maximize expected reward over the planning horizon, we must balance the exploration versus exploitation tradeoff: learn the transition probabilities sufficiently well, and utilize this information to quickly zero-in on actions with high rewards. I propose Information Directed Policy Sampling, which is an information theoretic framework that explicitly manages this tradeoff. We obtain a worst-case regret bound for IDPS. The theoretical guarantees are supplemented with numerical results on a sequential auction-design problem, and a response-guided dosing problem.

**4 - The Impact of Imperfect Testing on the Performance of Personalized Medical Interventions**

Hadi El-Amine, George Mason University, 4310 Cotswolds Hill Ln, Fairfax, VA, 22030, United States

In this paper, we develop a general framework that analyzes the performance of personalized medical interventions driven by historical patient data. We prove that finding optimal interventions is hard and provide structural properties that provide policy insights.

Sponsored Session

Chair: Soroush Saghaian, Harvard University, Cambridge, MA, 02138, United States

**1 - The Adoption and Diffusion of Medical Technology: Evidence from Cardiac Procedures**

Ariel Stern, Harvard Business School, Morgan Hall 433, Boston, MA, 02163, United States, Robert Huckman

The adoption of new health care technologies is a learning process, with evidence showing that new products and procedures often involve physician learning and tradeoffs in quality and productivity. We consider the early years of uptake for a new cardiac procedure - transcatheter aortic valve replacement (TAVR) - and its implications for physician procedure mix and patient outcomes. Using data on all aortic valve replacement procedures performed in New York State over five years, we evaluate patterns in the uptake of TAVR across physicians and hospitals as well as patterns of access and receipt among (potential) patients.

**2 - Development of Imminent Mortality Predictor for Advanced Cancer, a Tool to Predict Short-term Mortality in Hospitalized Advanced Cancer Patients**

Junchao Ma, Yale School of Management, New Haven, CT, United States, Edieal J. Pinker, Donald Lee

End-of-life care for advanced cancer patients is aggressive and costly. Although cancer patients rely on oncologists for information about prognosis to make decisions about end-of-life care, physicians tend to over-estimate life expectancy and inconsistently initiate goals of care discussions. We developed and evaluated a novel prognostic tool, which generates life expectancy probabilities in real time using EHR time series to support oncologists in counseling patients about end-of-life care. We will also discuss use of similar decision-support tools to improve quality of care in intensive care units.

### 3 - Do Hospital Closures Improve the Efficiency and Quality of Other Hospitals?

Lina Song, Harvard University, Soroush Saghaian

We study the impact of hospital closures on the surrounding hospitals' efficiency and the mechanisms through which the changes occur. We also investigate the implications of hospital closures on quality. We do these by examining the efficiency, bed utilization, service duration, patient experience, readmissions, and mortality using a nationally representative panel data of Medicare patients. We find that the closure of a hospital in a market results in improvement in efficiency at the remaining hospitals, but this happens at an expense of reducing the service duration. Furthermore, hospital closures are associated with an increase in 30-day mortality of the surrounding hospitals.

### 4 - Can Public Reporting Cure Healthcare? The Role of Quality Transparency in Improving Patient-provider Alignment

Soroush Saghaian, Harvard University, Kennedy School of Government, 79 John F. Kennedy Street, Cambridge, MA, 02138, United States, Wallace J. Hopp

Public reporting of medical treatment outcomes is being widely adopted by policymakers in an effort to increase quality transparency and improve alignment between patient choices and provider capabilities. We examine the soundness of this approach by studying the effects of quality transparency on patient choices, hospital investments, societal outcomes (e.g., patients' social welfare and inequality), and the healthcare market structure (e.g., medical or geographical specialization). Our results offer insights into why previous public reporting efforts have been less than fully successful and suggest ways in which future efforts can be more effective.

### Supply Chain Management VI

Contributed Session

Chair: Laharish Guntuka, University of Maryland-College Park, College Park, MD, 20740, United States

#### 1 - A Multi Echelon Supply Chain Model with Multiple Customer Classes

Mohammad Najjartabar Bisheh, Kansas State University, 2061 Rathbone Hall, 1701D Platt St., Manhattan, KS, 66506, United States, Behnam Malmir, Aram Bahrini, Gholamreza Nasiri

In this paper, an integrated model of location-allocation with inventory control decisions is proposed. This model highlights that customers have different value to the central company. The model is single-product and multi-period with stochastic demands. Also, warehouses were considered to have some capacity constraints. The method was solved on a small scale and in the real size as well. For small instances, GMAS software used and for large instances, two meta-heuristic algorithms of classic genetic and hybrid of genetic-simulated annealing were employed. Finally, the quality of solutions and running time of algorithms was analyzed drawing upon the model parameters.

#### 2 - A Contingency Theory Approach to Mitigating Counterfeiting Risk in the Supply Chain

John F. Kros, Vincent K. McMahon Distinguished Professor, East Carolina University, College of Business Dept of M&SCM, 3205 Harold Bate Building, Greenville, NC, 27858-4353, United States, Scott Dellana, Jason Rowe, Mauro Falasca

Counterfeiting is an emerging issue supply chain managers confront. A contingency theory perspective is developed to model the impact of counterfeit prevention efforts on SC performance. A structural equation model examines the relationships among five SC constructs. Our findings suggest that firms with greater SC risk management integration have stronger orientation toward counterfeit risk, greater maturity in counterfeit risk mitigation, more consistent metrics, & better performance outcomes. Interestingly, counterfeit orientation alone was not found to significantly improve metric consistency.

#### 3 - Electric Cars Propagation with Subsidized Supply Chain

Amir Naderpour, PhD Student & EGTA, University of Texas at Arlington, 701 S. West Street, Box 19437, Arlington, TX, 76019, United States

When government's goal is to propagate electric cars in the society, and has the potential to give the same subsidy to the supplier or the retailer of a product, which one should be subsidized to encourage higher quantity of that product? We answered this question in a couple of ways. The first way was game theory. And the theory predicted this supplier retailer relation. To answer our research question, we also used experiment study to see if the results from experiment is consistent with the theory prediction.

### 4 - Collaborative Emission Targets Joining

Dincer Konur, Texas State University, San Marcos, TX, United States

This study analyzes a two-echelon channel under a Stackelberg setting. Particularly, the leader of the channel determines the quantity flow along the channel. Both agents have environmental targets that should be respected. We investigate collaboration mechanisms between the leader and the follower for joining their environmental targets. Two mechanisms are discussed in detail. A comparison between non-collaborative and collaborative emission targets joining decisions is presented.

### 5 - The Impact of Supply Chain Disruptions on Competitors: Propagation of Disruption Impacts Through Supply Chain

Laharish Guntuka, Doctoral Student, University of Maryland-College Park, 4335 Rowalt Drive, #301, College Park, MD, 20740, United States, Adams Steven

We investigate spillover effect of supply chain disruptions on competitor firms who themselves are not involved in the disruption. Measured through abnormal returns and return on assets, the competitors gain when a firm announces a major disruption but the gain is watered down by the number of shared suppliers, vertical relatedness, and supplier exposure, but exacerbated by event exposure.

#### 1 - Heteroskedasticity-based Instrumental Variables for Endogeneity Treatment

Bernardo F. Quiroga, Assistant Professor, Pontificia Universidad Católica de Chile, Av. Vicuña Mackenna 4860, Comuna de Macul, Santiago, 29601, Chile

We present a way to achieve econometric identification in instances when outside instruments are not available. By exploiting the structure of the variance-covariance matrix under heteroskedasticity, it is plausible to build orthogonality conditions in presence of endogeneity in otherwise unidentified systems of linear regression equations. Our results build upon the findings presented by different authors in the internal instruments literature (e.g., Arellano and Bond (1991); Lewbel (1996, 2013))

#### 2 - Recent Progresses in Continuous-time Contract Theory

Dylan Possama, Assistant Professor, Columbia University, 500W 120th Street, Mudd 308, New York, NY, 10027, United States

This talk will consists in an overview of recent progresses made in contracting theory, using the so-called dynamic programming approach. The basic situation is that of a principal wanting to hire an Agent to do a task on his behalf, and who has to be properly incentivized. We will show how this general framework allows to treat volatility control problems arising for instance in delegated portfolio management, in electricity pricing, or in central clearing houses. We will also, if time permits, analyze the situation of a Principal hiring a finite number of Agents who can interact with each other, as well as the associated mean-field problem.

#### 3 - How to Project Outpatient Appointments Utilization

Fangzheng Yuan, Doctoral Candidate, UGPTI, 1340 Administration Avenue, Fargo, ND, 58108, United States, Joseph Szmerekovsky, Vera Tilson

In this paper, a probability model known as "shifted-beta-geometric model is implemented as an alternative to commonly used regression models to project the outpatient appointments utilization. This model is easy to use and can be implemented using a simple Excel spreadsheet and the result shows a great accuracy of forecasts and diagnostics for appointment utilization.

#### 4 - A Comparative Study for Patient Workload Prediction

Kai Yang, Wayne State University, 4815 Fourth Street, Detroit, MI, 48201, United States, Mohammad Hessam Olya

This paper suggests a framework for patient workload prediction by using patients' data from VA facilities across the US. To capture the information of patients with similar attributes and make the prediction more accurate, a heuristic cluster-based algorithm for single-task learning is developed in this research. In this research, we have considered patient-dependent and facility-dependent attributes and the relation between tasks into the model while implementing Multi-Task Learning (MTL) approach and training multiple related tasks simultaneously.

#### 1 - L1 Norm Based Major Component Detection Analysis

Qi An, North Carolina State University, Raleigh, NC, 27606,  
United States, Shu-Cherng Fang, Shan Jiang

11 MCDA is a state-of-the-art tool to identify the major components of data with irregularly positioned "spokes". We develop an algorithmic framework of 11 MCDA for multivariate asymmetric radial data clouds. It consists of locating a central point and calculating the major directions and median radii in those direction via a two-level median fitting process. The central point analysis features a pre-selection procedure to screen out candidate points with sufficient data points in the vicinity. Numerical experiments test the proposed analysis methods on high dimensional data set of various configurations and indicate our proposed method demonstrates superior accuracy and robustness.

#### 2 - A Novel Optimization Based Algorithm for Multi-class Data Classification Problem

Fatih Rahim, Ko University, Rumelifeneri Yolu, Sariyer, Istanbul, 34450, Turkey, Metin T rkay

Multi-class data classification is a supervised machine learning problem that involves assigning data to multiple groups. We present a novel MILP-based algorithm that splits each class's data set into subsets such that the subsets of different classes are linearly separable. At each iteration we form a subset of samples out of the set of unassigned samples by a MILP model that maximizes the cardinality of the new subset. The algorithm terminates when all the samples are assigned. We build classifiers based on the convex hulls of the subsets and the polyhedral regions for the testing phase. We conclude that our optimization based algorithm provides competitive results in terms of prediction accuracy.

#### 3 - Heart Rate Estimation using Wrist-type Photoplethysmography Based on Neural Network

Lianning Zhu, Texas Tech University, Lubbock, TX, 79416,  
United States, Dongping Du

Photoplethysmography (PPG) signals from wearable devices are easily corrupted by motion artifact (MA), which poses great difficulties on heart rate (HR) estimation. A moving time window was used to segment PPG signals and ACC signals. Here, a new HR tracking algorithm was developed and denoted as NN-Bayesian. HR prediction was performed by a neural network and HR estimation was performed based on predicted HR and Bayesian decision theory. To validate proposed HR tracking framework, HR estimation was performed using raw PPG signals and cleansed PPG signals which were obtained by spectrum subtraction (SS). The proposed framework shows its accuracy and robustness to track HR.

#### 1 - Active Batch Learning With Cluster-based Stochastic Query-by-forest (CSQBF)

Ghazal Shams, Arizona State University, Tempe, AZ, 85282, United States, Seho Kee, Enrique Del Castillo, Eugene Tuv, George Runger

Modern systems use automated sensing that can generate a large number of unlabeled instances at low cost, but obtaining labels may require human effort that is time-consuming and expensive. In this work, we propose the Cluster-based Stochastic Query-By-Forest (CSQBF) algorithm which introduces an enhanced stochastic querying strategy by combining the supervised knowledge of a trained classifier on the labeled data with unlabeled data cluster information iteratively in a pool-based active learning scenario.

#### 2 - Matched Forest for High-dimensional Matched Case-control Studies

Nooshin Shomal Zadeh, PhD Student, Arizona State University, 699 S. Mill Ave, Tempe, AZ, 85281, United States, Sangdi Lin, George Runger

Matched case-control study designs are commonly used in clinical studies to identify exposure variables associated with a medical condition. Matching is a preprocessing approach which is used in case-control studies to improve the efficiency by enforcing the confounding variables to have same distributions for cases and controls. Existing methods for analyzing matched case-control data sets have limitations in high-dimensional setting (for matching or exposure variables) and with interaction effects. This research proposes a new learning method which is not only flexible for a number of matching and exposure variables, but can also detect interaction effects.

#### 3 - A Multi-model Approach for Sports Betting Recommendation

Ismail T. Yumru, Data Scientist, Algopoly, Istanbul, 34342, Turkey, Mustafa Gokce Baydogan, Berk Orbay

Statistical learning methods are increasingly used in the domain of sports result prediction, where estimating the probabilities of possible outcomes (odds) of a game better than a bookmaker does is key to making profit. In this study, several learning techniques such as multinomial penalized regression, random forest and gradient boosting are carried out first to estimate the odds, then to select the subsets of games that are most likely to be profitable.

#### 4 - Learning Based Mission Planning for Solar Powered Multi Robot System

Di Wang, University of Illinois at Chicago, Chicago, IL, 60607, United States, Mengqi Hu, Yang Gao

To improve the long duration operation for multi-robot system, the solar-powered robot has attracted greater attention. In this research, we propose a Markov decision model for solar-powered multi-robot mission planning to co-optimize the task allocation and energy schedule. A deep reinforcement learning algorithm is developed to solve the Markov model considering various objectives, such as minimizing traveling distance, traveling time and net energy consumption. Without retraining for new problem instance, the proposed algorithm can generate near optimal mission planning and energy scheduling decisions.

Chair: Arun Chockalingam, Eindhoven University of Technology, Hoog Gagel 62, Eindhoven, 5611BG, Netherlands

#### 1 - Machine Learning-based Quality Prediction for Smart Manufacturing in SMT Process

Dongil Kim, Assistant Professor, Chungnam National University, 99 Daehak-ro, Yuseong-gu, Daejeon, Korea, Republic of, Hyein Kim, Jeongin Koo, Sungsoo Choi, Sang-Hyun Lee, Jeong Tae Kang

Surface Mount Technology (SMT) process is one of the most important processes in electronics industry. Through the SMT process, electronic chips are mounted on a Printed Circuit Board (PCB), and released as final products. Hence, the final quality of product is determined with the SMT process. In this paper, we propose a machine learning-based quality prediction method for SMT process. The input data were collected from the equipment in the process, such as reflow/soldering process. In addition, external variables, such as weather information, were also employed. We evaluate the performance of the proposed method through a real-world SMT process dataset, and the important factors are analyzed.

#### 2 - A Study on Data Preprocessing Method for Relationship and Characterization of Cutting Process Monitoring Signals

Hyein Kim, Korea Institute of Industrial Technology, Cheonan, Korea, Republic of, Dongil Kim, Jeongin Koo

The importance of monitoring, anomalous prediction and autonomous control is increasing to prevent and respond to unusual situation for maintaining the accuracy and operation rate of CNC. To propose optimal machining conditions, we measure the status of real time process through the CNC communication. Based on this, we have attached various sensors to the CNC to collect data on all the situations that occur during machining to understand the relationship and characteristics between the monitoring signals. To clarify relationships of collected data, we set up a machining section based on the position of the axis and applied a variety of analytical methods to perform the data preprocessing process.

#### 3 - Operationalizing the Offshoring Decision

Arun Chockalingam, Assistant Professor, Eindhoven University of Technology, Den Dolech 2, Eindhoven, 5612AZ, Netherlands, Haolin Feng

We consider a manufacturer who has both onshore and offshore production facilities. The manufacturer can dynamically allocate production between both facilities. Adjusting the production allocation incurs both fixed and proportional costs. We formulate this allocation problem as a stochastic-impulse control problem and derive the optimal allocation policy.

#### 4 - Time Allocation Strategy for Evolutionary Process in Biomanufacturing

Mahdi Fatihi, University of Florida, 401 Weil Hall P.O. Box 116595, Gainesville, FL, United States, Marzieh Khakifirooz, Chen-Fu Chien

The most challenging issue in Biomanufacturing is the process constrained on minimal and maximal times for specific process. When molecules limitation versus time limitation assessing the relative incidence of the exhaustion between supply before death versus death before exhaustion of supply and highly depends on the quality of molecules. On the other hand, the stochasticity in market demand precludes a precise evolutionary matching of time allocation and productivity opportunity. This problem is modeled as a multiobjective Pareto optimality problem to minimize the cost per material and cost per time subject to constraints of accelerated evolutionary distribution of molecules.

#### Joint Session ISS/Practice Curated: Empirical Studies on Platforms

Sponsored: Information Systems

Sponsored Session

Chair: Fujie Jin, Kelley School of Business, Indiana University, Bloomington, IN, 47401, United States

#### 1 - A Deep Learning Approach to Better Understanding of Hospital Quality

Weiguang Wang, University of Maryland, 3330 Van Munching Hall, R.H. Smith Business School, College Park, MD, 20740, United States, Guodong (Gordon) Gao

Hospitals are plagued with quality issues. It is well recognized that factors of providers and patients both contribute to quality issues, but how to separate their effects remains a challenge. We design a deep-learning based method that shows great promise in solving this problem. Firstly, word embedding techniques are adopted to vectorize all elements captured by EHRs. Then a one-to-one model is built using machine learning to link vector representations to hospital quality. Finally, a modification process to remove the effect of certain factors is performed to examine the impact of them on hospital quality. The proposed model is applied to real-world examples using the Florida provider data.

#### 2 - Seeking a Reward or Helping the Entrepreneur-backers Response to a Low-price Probabilistic Choice in Reward-based Crowdfunding

Alvin Zuyin Zheng, Temple University, 1801 N. Broad St, Pennsylvania, Philadelphia, PA, 19122, United States, Jing Gong, Paul Pavlou

Crowdfunding aims to collect small investments from a large number of backers. Since crowdfunding projects typically attract a small number of backers, this study examines the role of the lottery in crowdfunding outcomes. Using a four-year dataset from a reward-based crowdfunding platform in China, we show that although the lottery does indeed help attract a higher number of backers for a project, it reduces the total money raised and the probability of reaching the funding goal. Mechanism analyses show the lottery incentivizes people who would otherwise not fund the project to become opportunistic backers, the lottery also cannibalizes prospective rewarders and donors.

#### 3 - How Does Online Lending Influence Bankruptcy Filings? Evidence from a Natural Experiment

Hongchang Wang, Georgia Institute of Technology, Atlanta, GA, United States, Eric Overby

By providing relatively quick and easy access to credit, online lending platforms may help people overcome financial setbacks and/or refinance high-interest debt, thereby decreasing bankruptcy filings. On the other hand, these platforms may cause people to overextend themselves financially, leading to a "debt trap and increasing bankruptcy filings. To investigate the impact of online lending on bankruptcy filings, we leverage a natural experiment: Lending Club's entry into different states at different times. Using coarsened exact matching and a difference-in-differences approach, we find that Lending Club's entry increases bankruptcy filings by approximately 8%.

#### 4 - Beauty and Counter-signaling in Two-sided Matching Markets: Evidence from a Randomized Field Experiment

Lanfei Shi, University of Maryland, 3330 Van Munching Hall, College Park, MD, 20742, United States

While online platforms place trust at the center, markets with few alternative trust-inducing signals face an even bigger challenge. In such cases, we find that phone verification, when making it optional and visible to others, plays a more significant and strategic role that works as an effective signaling device. We also identify interesting differential ex-ante opt-in decisions and ex-post impact of verification across two sides of the platform. We further discuss the underlying mechanism by applying state-of-the-art deep learning techniques to mine attractiveness using images. Moreover, upon verification users become more proactive, which also contributes to the increase in matching.

#### 1 - Unsupervised Point Anomaly Detection Using Neighborhood Structure Assisted Non-negative Matrix Factorization

Imtiaz Ahmed, Texas A. & M. University, College Station, TX, 77840, United States, Yu Ding, Xia Ben Hu

Anomaly detection is unsupervised in nature and we can only rely on the neighborhood structure of a point for its evaluation. In this paper, we develop an anomaly detection procedure under the non-negative matrix factorization (NMF) framework. We incorporate the structural similarity information in the original NMF setting and propose a new approach called Neighborhood Structure Assisted NMF (NS-NMF). We argue that it will increase the anomaly detection capability of the regular NMF and provide numerical evidence in support of our claim. We also compare our method with other close developments in the same family and provide a detailed comparative evaluation on 20 benchmark data sets.

#### 2 - Concept Drift Monitoring of Supervised Learning Models via Score Functions

Kungang Zhang, Daniel Apley, Anh Bui

Predictive models are trained on historical data and applied to new data. However, the true predictive relationship between the response and the predictors may change over time (aka, concept drift), rendering the fitted model obsolete. We propose to monitor such drift via multivariate control charting to detect changes in the mean of the score function, which is zero-mean if there is no drift. The score function is automatically produced in stochastic gradient optimization as the derivative of the log-likelihood. The method provides guidance on when the model should be updated for optimal prediction following a drift, as well as diagnostic information on the nature of the drift.

#### 3 - A Density-based Index for Clustering Validation

Behnam Tavakkol, Stockton University, Galloway, NJ, United States, Myong Kee Jeong, Susan Albin

Clustering validity indices are the main tools of evaluating the quality of clusters. In this study, we develop a density-based clustering validity index. As opposed to most clustering validity indices that capture the characteristics of clusters by representative statistics, the proposed validity index performances well on clusters with arbitrary shapes.

#### 4 - Spatiotemporal Modeling and Real-time Prediction of Origin-destination Traffic Demand

Xiaochen Xian, UW-Madison, Madison, WI, 53705, United States, Kaibo Liu

New technology has enabled new opportunities in a data-rich environment for the traffic research. To provide an accurate input for traffic planning, scheduling, and optimization problems, we propose a spatiotemporal modeling technique for the OD demand of the traffic network. In particular, the OD demand counts are handled by a Poisson log-normal model; and the mean and covariance matrix of the model are parametrized by the features of the traffic network. Then the method estimates the parameters using the EM algorithm and online predicts the traffic demand collectively considering both the spatial and temporal correlations.

#### 1 - Asymmetric Kriging Emulator for Risk Measurement of Stochastic Simulation

Qiong Zhang, 1015 Floyd Ave, Richmond, VA, 23284, United States

Expectile is known to be the only risk measure that is both coherent and elicitable. Due to its good property, expectile recently attracts more and more attention in risk management. In stochastic simulation, it is often required to precisely estimate the system risk performance for a large number of input points. Therefore, it is particularly important to develop a statistical emulator for the expectiles of stochastic simulation. In this talk, I will introduce a new approach, called Asymmetric Kriging, to emulate the expectile risk measure of stochastic simulation. Our approach can be reduced to the state-of-art approach, stochastic Kriging, in emulating the mean performance measure.

## 2 - A Metamodel-assisted Framework for Two-stage Optimization via Simulation

Wei Xie, Yuan Yi

For the discrete two-stage optimization with the unknown response obtained from simulation, we introduce a metamodel-assisted framework that can efficiently employ the simulation resource to iteratively solve for the optimal first- and second-stage decisions. At each visited first-stage decision, we develop a local metamodel to solve a set of deterministic recourse problems simultaneously. Then, we construct a global metamodel accounting for the finite sampling error from SAA and the second-stage optimality gap. Assisted by this global-local metamodel, we propose a simulation optimization approach that can efficiently guide the search for the optimal first- and second-stage decisions.

## 3 - Design & Analysis of a Computer Experiment for an Aerospace Conformance Study

David Edwards, Virginia Commonwealth University, 1015 Floyd Avenue, P.O. Box 843083, Richmond, VA, 23284, United States

Within NASA's Air Traffic Management Technology Demonstration, Interval Management (IM) is a flight deck tool that enables pilots to achieve or maintain a precise in-trail spacing behind a target aircraft. Previous research has shown that violations of aircraft spacing requirements can occur between an IM aircraft and its surrounding non-IM aircraft when it is following a target on a separate route. This talk focuses on the experimental design and analysis of a computer experiment which models the airspace configuration of interest in order to determine airspace/aircraft conditions leading to spacing violations during IM operation.

## 4 - Varying Coefficient Gaussian Processes for Computer Models with Quantitative and Qualitative Inputs

Xinwei Deng, Department of Statistics, Virginia Tech, 406 Hutcheson Hall, Blacksburg, VA, 24061, United States

Computer experiments with both qualitative and quantitative factors attracts wide attentions. Analysis of such experiments is not yet completely resolved. In this work, we propose a varying coefficient Gaussian process to model computer experiments with qualitative and quantitative factors. The proposed method considers the coefficient associated with the qualitative factor to be a varying coefficient of the quantitative factors. It embraces a flexible structure of incorporating qualitative factors in modeling the complex systems of computer experiments. The merits of the proposed method are illustrated by both numerical examples and real-data applications.

## 5 - Modeling and Forecast of Noisy Nonlinear Dynamics

Youngdeok Hwang, Sungkyunkwan University, Department of Statistics, 25-2 Sungkyunkwanro, Seoul, 03063, Korea, Republic of, Kyongmin Yeo, EunKyung Lee

Data-driven modeling of a complex physical process is of current interest due to its direct relevance to manufacturing. Although domain knowledge on the underlying physical process has been playing a key role in understanding manufacturing processes, it is often impractical or impossible to build physics models from the first principles. Here, we propose a Recurrent Neural Network (RNN) based model for the nonlinear system identification and forecast of a stochastic process with an underlying physical process.

## 1 - The Prospect of Smart Cars: The Combination of Robotized Technology and Intelligent Vehicles

Yimin Zhou, Chinese Academy, 1068 Xueyuan Avenue, Shenzhen University Town, Shenzhen, Guangdong, 518055, China, Qin Lv, Qingtian Wu

In this paper, the development of the robotized technology has been described. Since the first robot has been designed, robots have been gone through three generations from the individual robots to intelligent robots from 60's. Potential development directions of the robotic technology is discussed. Besides, the problems encountered during the research are also analyzed, including stability control, reliability control and fault tolerant control. Furthermore, the robotized technologies are applied in the intelligent electric vehicles to improve the driving safety in human-road-vehicle environment. The driving strategy, vehicle monitoring and human-machine interaction are reviewed in details.

## 2 - Action Detection and Abnormal Event Detection for Surveillance Monitoring Under Mobile Vehicle or Moving Camera

Qingtian Wu, Shenzhen Institutes of Advanced Technology, Beijing, China

In outdoor environments, many cameras have been fixed in main roads, entrances to monitor abnormal event for better security. However, in some areas such as shade or turning corner, coverage monitoring cannot be achieved due to the limited monitoring distance and angle constraints of fixed camera. In order to monitor the blind spots under the fixed camera and track the incident centroid, a rapid detection of abnormal behavior system based on the mobile robot is proposed to detect abnormal events. The system can be embedded in a patrol robot which is used in the community environment to shoot the real-time scene information by vehicle-mounted camera, then to analyze of the monitoring area through intelligent visual detection algorithm. If abnormal event occurs, alarm will be triggered to alarm the guard.

## 3 - Actuator Fault Tolerant Control Algorithm with Application to a Quadcopters

Yimin Zhou, Shenzhen Institutes of Advanced Technology, 1068 Xueyuan Avenue, Shenzhen University Town, Shenzhen, Guangdong, 518055, China, Kranthi Kumar Deveerasetty

This paper investigates a rotor failure on the quadcopter. The goal is to detect the fault and to design a controller to make the quadcopter to perform the hover and trajectory task. The task of the controller is to make the quadcopter to perform a stable spin around its vertical axis when a rotor fault occurs. The UAV will work as a tri-copter to perform the desired tasks. The proposed controller is developed based on the feedback linearization approach and compared with PID controllers. We consider only smooth trajectory by avoiding the sharp turn's to maintain the minimal acceleration. Simulation results show the efficacy of the proposed controller towards the UAV reliability and safety improvement.

## Joint Session ICS/Practice Curated: Dynamic Stochastic Optimization in Urban Transportation

Sponsored: Computing

Sponsored Session

Chair: Qie He, University of Minnesota, Minneapolis, MN, 55455, United States

## 1 - Travel Time Estimation in the Age of Big Data

Sebastian Martin, Massachusetts Institute of Technology, Cambridge, MA, 02139, United States, Patrick Jaillet, Dimitris Bertsimas, Arthur J. Delarue

While travel time estimation has become increasingly mainstream and accurate, it is hard to build application-specific estimations that are reliable and compare with the state of the art without access to clean travel time datasets and detailed routing network information. We develop a method that tractably exploits any amount of origin-destination data and only needs a simplified routing network to build accurate estimations. Using data from the Manhattan taxis, we show that our algorithm can provide insights about urban traffic patterns on different scales and accurate travel time estimations throughout the network. Boston also used it to better route school buses and save millions of dollars.

## 2 - Absenteeism Prediction and Extra-board Driver Scheduling for Bus Transit Operations

Xiaochen Zhang, University of Minnesota, Minneapolis, MN, 55454, United States, Qie He

We develop a data-driven analytics tool to assist daily scheduling of extra-board drivers in bus transit operations. Extra-board and overtime drivers are used to cover open jobs due to the absences of regular drivers. We build a hierarchical regression model to forecast the daily absences. With the prediction, we develop a two-stage stochastic programming model to determine the daily optimal assignment of extra-board drivers and use of overtime, which also makes recommendations on the daily extra-board size. Our model's recommended assignment based on historical data reduces the expected total operating cost significantly while the probability of losing service remains low.

## 3 - An Integrated Dynamic Ridesharing Dispatch and Idle Vehicle Repositioning Strategy on a Bimodal Transport Network

Saeid Rasulkhani, Tai-Yu Ma, Joseph Y.J. Chow, Sylvain Klein

In bimodal ridesharing, a private on-demand mobility service operator offers to drop off a passenger at a transit station, where the passenger uses the transit network to get to another transit station, and the service operator guarantees picking up the passenger (not necessarily with the same vehicle) to drop them off at the final destination. We consider dynamic bimodal ridesharing problems where real-time information is available to anticipate future demand. A new non-myopic vehicle dispatching and routing policy based on queueing-theoretical approach is proposed and integrated with a non-myopic idle vehicle repositioning strategy from the literature to solve the problem.

#### 4 - Dynamic Pricing and Resource Allocation in Driverless Ridesharing Systems

Chao Lei, University of Illinois at Urbana-Champaign, 205 N. Mathews Ave., Urbana, IL, 61801, United States, Zhoutong Jiang, Yanfeng Ouyang

We propose a multi-period game-theoretic model for the dynamic ridesharing pricing and idling vehicle reallocation problem in the context of driverless vehicles being applied to providing on-demand ridesharing services. The goal is to achieve the best utilization of ridesharing resources in both spatial and temporal dimensions through the game-theoretic optimization. A mathematical program with equilibrium constraints (MPEC) formulation is developed to capture the independent decision-making process of the mobility service provider and travelers. A non-myopic approximate dynamic programming (ADP) based algorithm is implemented as the solution approach.

##### 1 - Research on Decision Optimization of Low Carbon Remanufacturing Production under Financing Strategy

Xiaodong Xia, Southeast University, Nanjing, China, Weida Chen

**Abstract:** This paper devotes to integrating the financial strategies which consists of bank loan, stock financing, debt financing, and financing lease into low carbon remanufacturing production decisions. The remanufacturer can get economical aid by financing to optimize its promotion, which is a convex optimization problem in a nonlinear programming model that can be solved by intelligence algorithms. Finally, there is a hot discussion about optimal production decisions on different financing modes to get better production strategy. **Key words:** Remanufacturing production decision; financial strategies; Nonlinear programming model; Intelligence algorithms

##### 2 - How the Technology Constraint and Cannibalization Affect Firm's Product Introduction Strategy

Yi Liu, Pennsylvania State University, University Park, PA, 16802, United States, Nicholas C. Petruzzii

We consider the optimal product design question for a firm in a two-segment market characterized by heterogeneous customer valuations of product quality. The firm's product quality is currently limited by a technology constraint that can be removed if product introduction is delayed by one time period. The question is, what, if any product should be introduced now and what, if any, should be introduced later.

##### 3 - Forecast Horizons under Demand Substitution and Backlogging and Production Changeovers with Batch Production

Fuying Jing, Dr., University of Electronic Science and Technology of China, Chengdu, China, Yinping Mu

This paper studies forecast horizons for a two-product dynamic lot size problem under (i) one-way substitution, that is one product can be used to satisfy the demand of the other product but not vice versa; and (ii) the production rate to be any value in the set  $\{0, Q, 2Q, \dots, nQ\}$ , where  $n$  is nonnegative integer; and (iii) backlogging is permitted. It is assumed that the switching cost is occurred when production switches from one product to the other. Based on some properties of the optimal solution, we develop a DP algorithm to solve the problem. By establishing the monotonicity of the production point of two products, we give a sufficient condition to obtain the forecast horizon.

##### 4 - Supply Allocation of Multiple Services on the Ride-hailing Platform

Shuanglong Wang, PhD Student, University of Illinois-Urbana Champaign, Champaign, IL, 61820, United States, Xin Chen

It's a common practice for a ride-hailing platform to manage multiple substitutable services. The platform has to manage the qualities of services by allocating the incoming drivers among them. We use the expected waiting time to capture the qualities of different services and assume that the drivers arrive passively during demand shock. We use the MNL model to describe the choice behavior of waiting-time-sensitive riders and look at the long-term equilibrium between rider's choices and the platform's allocation policy. The optimal strategies of supply allocation are investigated accordingly.

##### 5 - Dynamic Capacitated Lot Sizing with Random Demand and Random Yield

Horst Tempelmeier, Professor, University of Cologne, Albertus Magnus Platz, Department of SCM and Production, Cologne, D. 50923, Germany

We consider a dynamic multi-item capacitated lot sizing problem under stochastic demand and random yield. We develop a planning model which is based on the static uncertainty strategy by Bookbinder and Tan (1988) whereby a cycle fill rate constraint is implemented to control the amount of backorders. We propose

several heuristic solution approaches which extend our earlier work on stochastic lotsizing to the considered case of imperfect yield. The performance of the new solution approaches is analyzed with a numerical experiment.

#### Joint Session MCDM/Practice Curated: Understanding Multiple Criteria in Healthcare Applications

Sponsored: Multiple Criteria Decision Making

Sponsored Session

Chair: Gilberto Montibeller, Loughborough University, School of Business & Economics, Loughborough, LE11 3TU, United Kingdom

##### 1 - Healthcare Resource Allocation in Accountable Care Organizations Based on Data Envelopment Analysis and Multi-objective Integer Programming Approach

Hasan Symum, Graduate Assistant, University of South Florida, Tampa, FL, 33612, United States

Accountable Care Organizations (ACOs) represents a major healthcare reform that aimed to better control cost while improving care quality. However, only (30% -35%) of the ACOs were able to generate savings from Medicare due to lack of coordination and consistency in care. We propose bi-level multi-objective DEA based decision support system that allocates patients and healthcare resources to the ACOs decision-making unit (DMU) by assigning protocols to minimize spending and variability in care under Medicare-ACO contract framework. It provides a comparison between centralized decision making with the existing system and bi-level model improves overall DMU's efficiency level significantly.

##### 2 - A Strategic Modeling for the Allocation of Ambulance Request to Emergency Departments in the United States System

Jorge Acuna, PhD Student, University of South Florida, 4202 E. Fowler Avenue, Tampa, FL, 33620, United States

Being able to assign efficiently the services request to emergency departments (ED's) is of paramount importance both from financial and life-threatening scenarios. Three strategies based on mixed integer programming for multi-objective optimization, min-max, and game theory approaches, are implemented to improve the ambulance allocation in the U.S. system. A hypothetical scenario of a county is used to compare the efficiency and fairness of each strategy. Policies and disparities implications are analyzed and discussed.

### 3 - A Multi-attribute Optimization Approach for Post-acute Provider Selection

Ashkan Hassani, Texas A&M University, 4050 ETB, College Station, TX, 77840, United States, Hossein Badri, Maryam Khatami, Kai Yang, Mark Alan Lawley

In this study a decision making approach is developed for Post-Acute Care Provider (PACP) selection problem. This approach includes two stages. In the first stage, some quality metrics are used in a TOPSIS method to calculate the closeness coefficients of each candidate PACP to short-stay patient's and long-stay patients. In the second stage, these coefficients are used in a mathematical programming model, along with some other cost and service level metrics to select the best PACP's for both short-stay and long-stay patients. The proposed approach is implemented for PACP selection problem in the city of Houston, TX, and the results are presented and analyzed.

### 4 - Using Pareto-efficient Analysis to Incorporate the Six Aims for Quality in the Analysis of Trauma Care Services

Lucy Aragon, Wichita State University, 1845 Fairmount Street, Wichita, KS, 67260, United States, Laila Cure

The Institute of Medicine proposed six aims to guide healthcare quality improvement efforts. However, most healthcare improvement programs still evaluate quality along one aim at a time, effectiveness. This research proposes a Pareto-efficient analysis to incorporate all six aims in the evaluation of healthcare quality. A trauma care setting is used to investigate data requirements, develop the methodology and evaluate its implications.

West Bldg 212B

### Planning for Assessments and Analyses

Sponsored: Military and Security

Sponsored Session

Chair: Andrew Keith, Air Force Institute of Technology, Dayton, OH, 45424, United States

#### 1 - Operations Assessment Planning Using Robust Partially Observable Markov Decision Processes

Andrew Keith, Air Force Institute of Technology, Dayton, OH, United States, Darryl K. Ahner

Military operations assessment planning involves sequential decision making under model uncertainty and partial state observability. Robust partially observable Markov decision processes extend traditional Markov decision processes to address this complex setting. We present a novel robust partially observable Markov decision process formulation and solution technique. Then, we compare the performance of the new solution technique to existing methods using classic problems from the literature. We demonstrate the application of the new methods to a notional operations assessment planning scenario.

#### 2 - Designing the Bayesian Enterprise Analysis Model (BEAM)

Mark Gallagher, Randy Saunders

Bayesian Enterprise Analysis Model (BEAM) is an enterprise model that models the probability distribution of quantities of assets in theater. BEAM is intended to search strategy tradeoffs where assets are assigned to different missions. BEAM also models Red assets to account for an adversary adapting their strategy. BEAM calculates the distribution of modeled results with Bayesian methods applied to the objects and missions in each cycle's plan. We describe the theoretic results, analysis challenges, and questions being explored in the prototype.

#### 3 - Weighted Laplacian-regularized Optimal Experimental Design for Expensive Tests with Outliers: An Application in Linear-elastic Fracture Mechanics

Stanford Martinez, Graduate Research Assistant, University of Texas at San Antonio, 1 Utsa Circle, San Antonio, TX, 78249, United States, Adel Alaeddini

In the design of experiments, traditional space-filling methods do not preserve the geometry of the design vectors involved in the experiment. This can be mitigated using Laplacian Regularization (LR), and rare events present in the experiment may be discovered via outlier detection. Such events may be caused by material defects or other occurrences during an experiment, as occasionally encountered in fracture mechanics. The effects of this combination of LR and outlier detection are studied alongside traditional methods in terms of design efficiency and practicality-of-use.

#### 4 - Optimization of Bandwidth in Constrained Networks of Cross-domain Unmanned Systems

McKenzie Worden, University at Buffalo-CUBRC, 4455 Genesee Street, Buffalo, NY, 14225, United States

Using a multi-phase, iterative heuristic approach, we aim to define information collection and exchange between unmanned resources and control stations in a bandwidth constrained network. Initial decisions will be made determining the areas from which resources' sensors will collect information. Using these decisions, and considering bandwidth and communication range restrictions, the

heuristic will then determine when, and how much of, the collected information will be sent back to the control station, either directly or via other resources as relays.

### Matchings and Assignments with Societal Impact

Sponsored: Public Sector OR

Sponsored Session

Chair: Andrew C. Trapp, Worcester Polytechnic Institute, Worcester, MA, 01609, United States

#### 1 - Machine Learning and Optimization for Service Classification and Assignment of Information Technology Services

Pitchaya Wiratchotisatian, Worcester Polytechnic Institute, Worcester, MA, 01609, United States, Andrew C. Trapp, Christopher J. Chagnon, Soussan Djamassbi

IT help desks assist users with a variety of services. However, ad-hoc, inconsistent handling of help desk tickets can lead to issues with customer experience and increasing cost. We propose a decision support system that embeds machine learning techniques to classify incoming tickets according to service categories. Based on the service category, along with available technician capacity and skill sets, it uses combinatorial optimization techniques to assign tickets to technicians. Our system ensures that the right tickets get to the right technicians, resulting in improved use of resources.

#### 2 - Optimization-based Mechanism for Matching Students to International Projects

Hoda Atef Yekta, University of Connecticut, Storrs, CT, 06066, United States, Andrew C. Trapp, Pitchaya Wiratchotisatian

Global projects are a cornerstone of the project-based curriculum at Worcester Polytechnic Institute (WPI), which has been recognized with the Bernard M. Gordon Prize from the US National Academy of Engineering. Recent increases in applications have caused the manual process of placing students (nearly 1,000) into international project centers (nearly 50) to become increasingly complex. We propose an optimization-based approach that matches students to project centers by considering student preferences, as well as center capacities and priorities over student skills. We compare the results of our model with other matching mechanisms based on efficiency, stability and strategy-proofness.

**3 - Refugee Resettlement via Integer Programming**

Andrew C. Trapp, Worcester Polytechnic Institute, School of Business, 100 Institute Rd., Worcester, MA, 01609, United States, Alexander Teytelboym, Narges Ahani, Tommy Andersson

Hundreds of thousands of refugees are resettled yearly from refugee camps to host countries. Local areas that host refugees are reluctant to open capacity, and most impose tight restrictions on the refugee family types they accept. We model this matching challenge as a 0-1 knapsack variant and explore outcomes-related objectives in the search toward an optimal allocation. Our employment optimization matching problem is embedded within a dynamic software tool that facilitates interactive use to fine-tune the recommended match results.

**4 - How (Not) to Allocate Affordable Housing**

Nicholas A. Arnosti, Columbia Business School, 3022 Broadway, Uris Hall, Rm 402, New York, NY, 10027, United States

We study the dynamic assignment of items to agents. We find that systems with very different descriptions can produce identical outcomes. In particular, a) Independent lotteries are equivalent to a waitlist in which participants lose their position after rejecting an offer, and b) Restricting lottery entry is equivalent to using a waitlist in which participants can reject offers without penalty. Furthermore, we show that there is often a tradeoff between matching (assigning agents to items that are a good fit) and targeting (assigning items to agents with the greatest need).

Chair: Pinar Keskinocak, Georgia Institute of Technology, Atlanta, GA, 30332, United States

Co-Chair: Amanda Chu, Georgia Tech, Huntsville, AL, 35802, United States

**1 - Data Analysis and Visualization of the Link between Transportation Access and Emergency Health Care**

John Cima, University of Michigan, Amy Cohn, Patrick Carter, Tawanna Dilllahunt

Transportation access can be a significant determinant of health, as it influences access to healthy foods, employment, healthcare, and more. We consider roughly half a million emergency department visits to a major university medical center and compare access to this facility via public versus private transportation. Using travel time to the hospital and other demographic data, we use data visualization techniques to highlight sources of disparity and hypothesize how these disparities impact care and outcomes for patients

**2 - Reducing Bus Transportation Cost through School Start Time Optimization**

Dipayan Banerjee, Northwestern University, Evanston, IL, United States, Liwei Zeng, Karen Smilowitz, Jill Hardin Wilson

We present new models to minimize the number of buses required to complete a set of school bus routes by shifting the start times of the associated schools. Our work extends existing integer programming models by introducing features which reflect realistic facets of public school transportation systems.

**3 - Dynamics of Quality as a Strategic Variable in Complex Food Supply Chain Network Competition: The Case of Fresh Produce**

Anna B. Nagurney, John F. Smith Memorial Professor, University of Massachusetts Amherst, Isenberg School of Management, Amherst, MA, 01003, United States, Deniz Besik, Min Yu

In this paper, we construct a competitive food supply chain network model in which the profit-maximizing producers decide not only as to the volume of fresh produce produced and distributed using various supply chain network pathways, but they also decide, with the associated costs, on the initial quality of the fresh produce. The quality of the fresh produce is captured through explicit formulae that incorporate time, temperature, and other link characteristics. The Nash equilibrium is formulated as a variational inequality problem, for which qualitative and numerical results are provided, with a case study on peaches that includes disruptions in transport.

**4 - School Bus Routing Problem with Fixed Bell Time Windows: Denver Public Schools**

Amanda Chu, Georgia Institute of Technology, Atlanta, GA, United States, Pinar Keskinocak, Monica Villarreal

For this project, we describe the bus route planning process of Denver Public Schools (DPS). Route planning has been challenging for DPS despite commercially available assistance and involves manual readjustment to the routes. This problem was solved using a multi-objective optimization model with Google Map data and parameters to reduce effects of delays integrated into a decision support tool. Initial analysis showed potential decrease in used buses by

15% and in total reposition time and mileage by 25%. Based on the promising results and increased control and flexibility provided by the tool, DPS is integrating the tool into the planning process for the 2018-2019 academic year.

**Keynote: Energy Industry Transformation through Advanced Analytics**

Keynote Session

Chair: Georgia Perakis, Massachusetts Institute of Technology, Cambridge, MA, 02142-1347, United States

**1 - Energy Industry Transformation through Advanced Analytics**

Jorge Calzada, National Grid, Boston, MA, United States

The regulated energy utility industry is in the midst of a massive transformation being driven by several inexorable trends: the growth of distributed energy resources, the desire to transition to a carbon-free economy, the desire of regulators to change the regulatory construct between society and utilities, asset digitization, the speed and costs of computing, and an aging workforce all contribute to an industry in a state of great flux. This presentation will explore how one utility, National Grid, is embracing Advanced Analytics to not only survive these disruptions, but to thrive in the energy landscape of the future.

North Bldg 229

**Keynote: OR and the Transportation Tech Revolution**

Keynote Session

Chair: Pavlo Krokhmal, University of Arizona, Tucson, AZ, 210020, United States

**1 - OR and the Transportation Tech Revolution**

Garrett van Ryzin, Cornell Tech/Lyft, Ithaca, NY, United States

Sparked by the growth of ridesharing startups (Uber, Lyft) - the transportation tech sector has already produced some of the highest valued startups in history. Soon after this initial ridesharing wave, attention turned to autonomous vehicles with significant R&D efforts launched by tech giants (Google, Tesla, Apple), major automakers (GM, Daimler, Ford, FCA), ridesharing companies (Uber, Lyft) and mobility startups (Adaptiv, Nutoonomy, Mobileye). Over the past year, the tech world pivoted yet again to scooters (Bird, Lime) and bikes (Jump, Motivate) - birthing yet another round of billion-dollar startups. In this talk, I examine the technological and economic forces behind this unprecedented wave of innovation and investment in transportation and why it creates an unprecedented opportunity for our field of Operations Research (OR).

**Joint Session OPT/Practice Curated: Hedging Against Uncertainty in Renewable Energy**

Sponsored: Optimization/Optimization under Uncertainty

Sponsored Session

Chair: Gokce Kahvecioglu, Northwestern University, Evanston, IL, 60208, United States

**1 - Robust Zonal Electricity Markets**

Ignacio Aravena, Lawrence Livermore National Laboratory, Livermore, CA, 94550, United States, Anthony Papavasiliou, Yves Smeers

We propose a consistent framework for modeling zonal electricity markets based on projecting the constraints of the nodal network onto the space of the zonal aggregation. We use the framework to model two zonal market designs and we develop cutting-plane algorithms for clearing these zonal markets while accounting for robustness of zonal exchanges to single element outages. We conduct numerical simulations of the zonal market designs for a realistic instance of the Central Western European system under 768000 different operating conditions. We find that robust zonal markets are unable to anticipate congestion and that they are outperformed by a nodal market design without robustness.

## 2 - Robust Power Dispatch and Renewable Energy Management

Ruiwei Jiang, University of Michigan, Ann Arbor, MI, 48109,  
United States, Hongyan Ma

In this paper, we propose a robust power dispatch approach through incorporating a corrective re-dispatch and integrating active management of renewable energy, which co-optimizes the power pre-dispatch strategies and the admissible ranges of renewable outputs. Case studies on the modified IEEE systems display the effectiveness and scalability of this approach.

## 3 - Risk Averse Energy Storage Optimization for High Penetration of Wind Energy

Juliana Nascimento, Princeton University, Sherrerd Hall,  
Operations Research and Finl Engineering, Princeton, NJ,  
United States, Joseph Durante, Warren B. Powell

We propose a modified stochastic dual dynamic programming (SDDP) method aimed at optimizing energy storage for a set of batteries scattered across the energy grid. With the fine-grained time scale of battery storage, we also have to optimize over hundreds of time periods. We consider a hidden semi-Markov model (HSMM) that accurately reproduces the crossing-time behavior of the wind, which captures the amount of time that actual wind sample paths are above or below the forecast. We show that we can significantly decrease the risk of shortages when we consider our HSMM model coupled with the proposed modified SDDP method over the classical iid stochastic model coupled with a standard SDDP algorithm.

## 4 - Planning Transmission Storage and Generation for Renewable Energy and Carbon Policies Uncertainty

Jing Peng, Johns Hopkins University, 3400 N. Charles Street,  
Baltimore, MD, 21218, United States, Qingyu Xu,  
Benjamin Field Hobbs

Renewable energy policies and carbon policies are reshaping the power system by providing incentives to invest more in renewables and displace coal generation. However, the particular timing and implementations of these policies are uncertain to the power system planners. Due to rapidly dropping costs, the energy storage is becoming an increasingly competitive option. We propose an optimization model to plan energy storage, accounting for its substitution and complementary relations with transmission and generation, to hedge against policy uncertainties in the western interconnection of North America.

### Joint Session OPT/Practice Curated: Stochastic Assignment Problem Applications to Healthcare and Network Design

Sponsored: Optimization/Optimization under Uncertainty  
Sponsored Session

Chair: Onur Tavaslioglu, University of Pittsburgh, Pittsburgh, PA,  
United States

## 1 - Stochastic Operating Room Scheduling Under Emergency Arrivals with Integrated Block Assignments

Onur Tavaslioglu, University of Pittsburgh, Houston, TX, 77025,  
United States, Oleg A. Prokopyev, Andrew J. Schaefer

Operating room scheduling for elective procedures is challenging due to the nonlinear structure and stochasticity. In this paper, we model the operating room scheduling problem as a two-stage stochastic mixed integer program with nonlinear objective and chance constraints. We then present a value function reformulation, which converts the mentioned model into a pure binary program. We propose a dynamic programming based approach to calculate the value functions. We compare our approach to a cut generation approximation from the literature. The performance of our approach is better in computational time and it offers optimal solutions.

## 2 - Facility Protection and Network Design when the Effect of Protection is Uncertain

Tanveer Hossain Bhuiyan, Mississippi State University,  
McCain Engineering Building, Room 321, Starkville, MS, 39759,  
United States, Hugh Medal

We study a facility location and network design problem that involves protecting facilities subject to random disruptions where the protection is imperfect, multi-level, and the effect of disruption is imperfect. The goal of our study is to optimally allocate protection resources to the facilities, and construct links in the network to minimize the expected transportation cost. We model the problem as a two-stage stochastic programming with decision dependent uncertainty where the post-disruption capacity states of the facilities depends probabilistically on the resource allocation decision and the disruption intensity. We implement an L-shaped algorithm to solve the model.

## 3 - Chance-constrained Bin Packing Problem with an Application to Operating Room Scheduling

Shanshan Wang, Beijing Institute of Technology, 5 South Street  
Zhongguancun, Haidian District, Beijing, 100081, China  
Shanshan Wang, Northwestern University, Evanston, IL,  
United States, Sanjay Mehrotra, Jinlin Li

We develop a branch-and-cut solution scheme for chance constrained optimization of bin-packing problems with random technology matrices. The problem is to allocate items with random weight to a set of bins with respect to bin size, so as to minimize the total open and allocation cost subjecting to the packing constraints with given probabilistic guarantees. We formulate the integer programs by assuming discrete distributions of random weight. We propose a branch-and-cut framework with several new classes of valid inequalities. Computational study on chance-constrained formulation of surgery assignment problem is conducted to verify the performance of our algorithms.

## 4 - Multi-mode Resource Constrained Project Scheduling with Optional Activities and Uncertain Network Structure

Chrysanthos Gounaris, Carnegie Mellon University, Doherty Hall  
3107, Dept of Chemical Engineering, Pittsburgh, PA, 15213,  
United States, Nikolaos Lappas, Hua Wang

The classical Multi-mode Resource Constrained Project Scheduling Problem (MMRCPSP) is defined upon a fixed directed graph modeling the precedence of activities that have to be executed exactly once in one of their available modes. In practice, however, there are cases where network structure can be altered both by internal strategic decisions as well as uncertain external factors. To that end, we extend MMRCPSP to accommodate flexible network structures that involve recycles and optional activities via the use of propositional logic, and we present a set of new applicable models that are compared extensively across a comprehensive list of benchmark problems.

### Risk-averse and Robust Optimization

Sponsored: Optimization/Optimization under Uncertainty  
Sponsored Session

Chair: Alexander Vinel, Auburn University, Auburn, AL, 36832,  
United States

## 1 - Hazardous Materials Routing and Network Design under Uncertainty Considering Risk Equity

Nasrin Mohabbati Kalejahi, PhD Candidate, Auburn University,  
Auburn, AL, United States, Alexander Vinel

Moving hazardous materials raises an inherent risk for public safety. One aspect that has received a significant attention in the literature recently relates to the observation that using a single route repeatedly can lead to an undesirable overload of hazmat risk on specific links of the network and risk inequity. In this work, we study hazmat route planning and network design with consideration of risk equity. We combined the concept of Risk Parity with modern risk functions and developed a two stage risk-reward-diversification framework for optimally selecting routes and distributing the exposure to the risk in a network.

## 2 - Distributionally Robust Optimization with Decision-dependent Ambiguity Set

Nilay Noyan, Sabanci University, Faculty of Engineering and  
Natural Sciences, Orhanli/Tuzla Istanbul, 34956, Turkey,  
Miguel Lejeune, Gabor Rudolf

We introduce a new class of distributionally robust optimization problems under decision-dependent ambiguity sets. In particular, as our ambiguity sets we consider balls centered on a decision-dependent probability distribution. The balls are based on a class of Earth Mover's Distances that includes both the Total Variation Distance and the Wasserstein-1 metric. We also consider a special class of problems where decisions are binary and the inherent randomness is characterized by a set of binary vectors, and develop mixed-integer linear programming reformulations.

## 3 - Adjustable Robust Optimization Applied to a Planning Problem in the Wine Industry

Jorge R. Vera, Catholic University of Chile, Dept of Ind Eng  
Campus San Joaquín, Vicuña Mackenna 4860, Santiago, Chile,  
Rodrigo Cofr

Uncertainty is common in industry and particularly in agriculture, where climate and crop yield are some of the relevant sources. In this work we consider a harvest planning problem in the wine industry, where grapes are harvested and transported to wineries. However, variability in the fermentation process introduces uncertainty in the processing capacity of the winery. Grapes cannot be stored, so harvest planning must take this into consideration. In this work we present a 2 Stage Stochastic approach as well as an Adjustable Robust approach for harvest planning, considering also the potential effect in product quality. We show results of different solution schemes for a real industrial case.

#### 4 - Robust Optimization and Control for Electricity Generation and Transmission

Haoxiang Yang, Northwestern University, 2145 Sheridan Road, Evanston, IL, 60208, United States, David Morton, Chaithanya Bandi, Krishnamurthy Dvijotham

We consider a robust optimization problem for the electric power system under uncertain demand and availability of renewable energy resources. Based on the recently developed convex relaxation schemes for the alternating current optimal power flow (ACOPF) problem, we construct a robust convex optimization problem with recourse. We propose a cutting-plane method with enhancements to solve this problem, and we establish convergence and other desirable properties. Experimental results indicate that our robust convex relaxation of the ACOPF problem can provide a tight lower bound and an acceptable solution for the non-convex robust ACOPF problem.

#### Formulations and Algorithms for MIP

Sponsored: Optimization/Integer and Discrete Optimization

Sponsored Session

Chair: Sahar Tahernejad, Lehigh University, Bethlehem, PA, 18015, United States

##### 1 - Finding Feasible Solutions to Integer Programs with Bounded Integrality Gap in Polynomial Time

Arash Haddadan, Carnegie Mellon University, 5000 Forbes Avenue, Pittsburgh, PA, 15213, United States, Robert D. Carr, Cynthia Phillips

We present a new algorithm for finding a feasible solution for a mixed integer linear program. The algorithm runs in polynomial time and is guaranteed to find a feasible integral solution provided the integrality gap is bounded. The algorithm computes convex decompositions and it provides a suite of integral solutions. The main application of our algorithm is to experimentally evaluate the integrality gap of IP formulations. We apply this technique to several network design problems such as 2-edge-connected subgraph, vertex-cover, and tree augmentation.

##### 2 - A New Integer Programming Formulation of the Graphical Traveling Salesman Problem

Robert D. Carr, University of New Mexico, Albuquerque, NM, United States, Neil Simonetti

In the Traveling Salesman Problem (TSP), a salesman wants to visit a set of cities and return home. There is a cost  $c_{ij}$  of traveling from city  $i$  to city  $j$ , which is the same in either direction for the Symmetric TSP. The objective is to visit each city exactly once, minimizing total travel costs. In the Graphical TSP, a city may be visited more than once, which may be necessary on a sparse graph. We present a new integer programming formulation for the Graphical TSP for sparse graphs.

##### 3 - Two-stage Mixed-integer Stochastic Bilevel Optimization Problems

Sahar Tahernejad, Lehigh University, Bethlehem, PA, 18015, United States, Ted K. Ralphs

Two-stage mixed-integer stochastic bilevel optimization problems (2SMISBLPs) unify the multi-level and multi-stage stochastic optimization problems, while the numbers of decision makers (DMs) and time stages are limited to two, and a subset of variables are constrained to be discrete. The importance of this new framework arises from the fact that in many real-world problems, two DMs (with possibly competing objectives) make the decisions, while the accurate values of some input parameters are unknown at the beginning. In this talk, we describe special cases of 2SMISBLPs and illustrate how the algorithms for these special cases can be integrated to be employed for solving general 2SMISBLPs.

##### 4 - Set Covering Problem with Conflict Constraints

Saeed Saffari, North Carolina State University, Raleigh, NC, 27607, United States, Yahya Fathi

We consider the well-known set covering problem in which we have incompatibilities between certain pairs of columns, i.e., from each conflicting pair at most one column can occur in the optimal subset. We introduce and discuss several classes of valid inequalities and pre-processing techniques for the IP model of this problem, and demonstrate their effectiveness in the context of a branch and cut algorithm.

##### 1 - Chordal Decomposition in Operator-splitting Methods for Sparse Semidefinite Programs

Yang Zheng, University of Oxford, Oxford, United Kingdom, Giovanni Fantuzzi, Antonis Papachristodoulou, Paul Goulart, Andrew Wynn

We employ chordal decomposition to reformulate a sparse SDP into an equivalent SDP with smaller positive semidefinite constraints. In contrast to previous approaches, the decomposed SDP is suitable for the application of first-order methods. We apply the alternating direction method of multipliers (ADMM) to solve decomposed SDPs either in primal, dual or self-dual embedding form. Each iteration of such ADMM algorithms requires a projection onto an affine subspace, and a set of projections onto small PSD cones that can be computed in parallel. All algorithms are implemented in the MATLAB solver CDCS. Numerical experiments on a range of sparse SDPs demonstrate the efficiency of our methods.

##### 2 - Globally Convergent Type I Anderson Acceleration for Non-smooth Fixed Point Iterations

Junzi Zhang, Stanford University, Stanford, CA, 94305, United States, Brendan O'Donoghue, Stephen P. Boyd

We consider the application of the type-I Anderson acceleration to solving general non-smooth fixed-point problems. By interleaving with safe-guarding steps, and employing a Powell-type regularization and a re-start checking for strong linear independence of the updates, we propose the first globally convergent variant of Anderson acceleration assuming only that the fixed-point iteration is non-expansive. We show by extensive numerical experiments that many first order algorithms can be improved with the proposed algorithm. Our proposed method of acceleration is being implemented in SCS 2.0, one of the default solvers used in the convex optimization parser-solver CVXPY 1.0.

##### 3 - On Robustness and Scalability of Semidefinite Relaxation Techniques for Optimal Power Flow

Anders Eltvad, DTU, Denmark

Semidefinite relaxation techniques have shown great promise for nonconvex optimal power flow problems. However, a number of independent numerical experiments have led to concerns about scalability and robustness of existing SDP solvers. To address these concerns, we investigate some numerical aspects of the problem and compare different state-of-the-art solvers. Our results demonstrate that large problem instances with a positive semidefinite cone of order up to 25,000 can be solved reliably and to reasonable accuracy within minutes.

##### 4 - Deep Belief Network with Surrogate Optimization for Cyanobacterial Risk Prediction

Peng Jiang, Shanghai Jiao Tong University, Shanghai, 200240, China, Xiao LIU, Karina Yew Gin

Cyanobacterial blooms are threatening human health and the sustainability of freshwater resources. For situations with massive data, deep learning models emerge to be workable solutions for predicting cyanobacterial risks. However, the high-dimensional hyperparameters of such a model are hard to calibrate. Traditional trial-and-error methods for tuning them are computationally expensive. We propose a surrogate optimization-assisted deep belief network model to predict cyanobacterial risks in a data-driven manner. Therein, a modified mixed-integer surrogate optimization algorithm is hybridized into the model. Finally, a real case is employed to demonstrate its effectiveness.

**Interface of Consumer Behavior and Retail Operations**

Sponsored: Manufacturing &amp; Service Oper Mgmt

Sponsored Session

Chair: Stanley Lim, University of Cambridge, Cambridge, United Kingdom

Co-Chair: Annibal Sodero, University of Arkansas, Fayetteville, AR, United States

**1 - Operational Execution and POP Display Effectiveness: Evidence from Adoption of an IoT Technology**

Ioannis Stamatopoulos, University of Texas at Austin, McCombs School of Business, 2110 Speedway, B6000 Austin, TX 7870, Austin, TX, 78705, United States, Ashish Agarwal, Jacob Zeng

POP displays are structures containing inventory outside of regular shelving. They are meant to be visually stimulating, are placed in prominent positions in retail stores, and their purpose is to excite spontaneous purchases. POP displays are perceived by suppliers to be highly effective and they invest in them heavily. However, poor operational execution is reducing their otherwise high effectiveness. We are interested in quantifying the extent of the problem, as well as exploring whether an IoT technology can improve operational execution.

**2 - Using Transactions Data to Improve Consumer Returns Forecasting**

Guangzhi Shang, PhD, Florida State University, Erin Cassandra McKie, Mark Ferguson, Michael Galbreth

Although an accurate returns forecast is the preliminary input into many decision support tools for managing returns, the development methods in this area received relatively little attention as compared with sales forecasting. We propose a new approach and benchmark its performance against a number of existing methods using two real world datasets.

**3 - Free Shipping is Not Free: A Data-driven Model to Design Free-shipping Threshold Policies**

Joseph Xu, PhD, Carnegie Mellon University, Gerard P. Cachon, Santiago Gallino

We provide a data-driven analytical model to (i) assess the profitability of an online retailer's free shipping threshold policy, and (ii) offer recommendations to determine a suitable level of free shipping threshold policy to maximize profit. The model accounts for various aspects of customer behavior, such as strategically adding items to shopping basket to receive free shipping and changing the quantity of item returned. We calibrate our model to data from an online apparel retailer and find that its decision to offer a lower free shipping threshold reduce its profitability considerably.

**4 - An Analysis of Shopping Behaviour at Warehouse-club Stores and its Store-network-density Implications**

Stanley Lim, University of Cambridge, Tempe, United Kingdom, Arizona State University, Tempe, AZ, United States, Elliot Rabinovich, Sungho Park, Minha Hwang

Warehouse club (WC) retailers have historically relied on low-density store networks as a source of competitive advantage. Despite their significant presence in the retail sector, we are aware of no empirical studies examining how significant this source of competitive advantage is for them. We use a quasi-natural experiment with households' subscriptions to Costco stores as a treatment mechanism to contrast members' purchasing behaviors at Costco stores against changes in behaviors at non-WC stores. We show that members' weekly mileage accumulated per visit, dollar spent per visit, and dollar spent per mile to Costco stores exceeds by 7.4%, 29% and 20%, respectively, relative to non-WC stores.

**5 - Inventory Allocation for Multi-channel Drop-shippers**

Annibal Sodero, PhD, University of Arkansas

Drop-shipping, an arrangement in which retailers sell products online and the products are sent directly from the vendors' facilities to the point of consumption, is growing in importance. For vendors of seasonal products who drop-ship but also sell wholesale to their retail customers, there are many questions left regarding inventory allocation and deployment, because they need to consider the usual tradeoffs between inventory costs and service levels. For instance, when should they segregate or keep a single pool of inventory to satisfy demand? When and whom to release inventory in the wholesale channel? We simulate scenarios to provide answers to those questions, among others.

**Models and Methods for Network Design**

Sponsored: Optimization/Network Optimization

Sponsored Session

Chair: Angelika Leskovskaya, Southern Methodist University, Caruth Hall 3145 Dyer Street, Suite 372, Dallas, TX, 75275, United States

**1 - Robust Service Network Design under Demand Uncertainty: An Exact Approach**

Mingyao Qi, Associate Professor, Tsinghua University, Room E204A, Shenzhen, 518055, China, Zujian Wang

Freight forwarding companies are faced with difficulties in handling uncertainties, especially demand uncertainty under the circumstances of no enough historical data or accurate forecasting approach. In this paper, we propose a two-stage robust optimization method for service network design under demand uncertainty. We employ probability-free uncertainty sets to describe the possible scenarios, and implement a column-and-constraint generation algorithm to solve the proposed two-stage robust models exactly and efficiently. Numerical results indicate that the proposed algorithm outperforms the Benders decomposition method in both solution quality and computational time.

**2 - Service Network Design with Node Capacity with Application in Parcel Delivery**

Huan Jin, MIT Global SCALE Network, 462 Wen Yuan Road, Bldg 3, Rm 504, Ningbo, 315100, China

The rapid development of e-commerce has made the explosion of online shopping. A large part of the urban logistics parcels come from online e-commerce orders. We consider a service network design for parcels urban logistics with node capacity. The node capacity is the space/quantity limit of holding resources (drivers, vehicles) at terminals. The node capacity, for instance, the parking limit at terminals, varies by the time of a day or the day of a week. We introduce a general formulation and design a Branch-and-Price method with heuristic algorithm to provide good quality solution of the formulation. A comprehensive analysis of the formulation and algorithm is given based on the numerical results.

**3 - Integer Programming Models for Freight Logistics Service Network Design with Tree Constraints**

Ira M. Wheaton, Postdoctoral Fellow, Georgia Institute of Technology, 755 Ferst Drive, NW, Atlanta, GA, 30332, United States, Natasha Bolland

Less-than-truckload (LTL) service providers often, in practice, route shipments so as to satisfy tree constraints: at any node in their service network, all shipments that are handled at that node and that have the same destination must be routed via the same outgoing arc. Although the design of LTL service networks has been widely studied, tree constraints have generally been ignored. Here, we consider integer programming (IP) models for the service network design problem with tree constraints. We formulate and analyze multiple IP models and report computational results.

**4 - A Mathematical Programming Model with Equilibrium Constraints for Competitive Closed Loop Supply Chain Network Design**

Qiang Qiang, Penn State University, Management Division, 30 E. Swedesford Rd, Malvern, PA, 19355, United States, Yuxiang Yang, zuqing huang

A firm sets up his facilities including manufacturing/remanufacturing plants and distribution/collection centers, incorporating an existing CLSC network. The entering firm has to compete with the existing firms in the existing network. The entering firm behaves as the leader of a Stackelberg game while the existing firms in the existing network are followers. We use a CLSC network equilibrium model to capture the existing firms' reaction. A mathematical programming model with equilibrium constraints is developed for this competitive CLSC network design problem. Numerical examples and the related results are studied for illustration purpose.

**5 - Data-driven Transit Network Design**

Julia Y. Yan, Massachusetts Institute of Technology, 77 Massachusetts Avenue, Cambridge, MA, 02139, United States, Dimitris Bertsimas, Yee Sian Ng

Modern transit agencies have to provide reliable and equitable transit services in the face of declining ridership and tight financial budgets. In 2012, this analysis was performed for MBTA bus services, involving a tedious procedure of "manual branch-and-bound". Instead, we provide a unified approach that optimally selects a subset of the routes to maximize ridership, while satisfying coverage requirements. It solves within minutes for networks with hundreds of services across 164 municipalities. In comparisons against a greedy heuristic, our approach is able to double the transit ridership while satisfying regulatory requirements under tight financial constraints.

## 6 - Extreme-point Search Heuristics for Solving Fixed-charge Generalized Network Problems Using Parametric Ghost Image Process Approach

Angelika Leskovskaya, PhD Candidate, Southern Methodist University, Caruth Hall 3145 Dyer Street, Suite 372, Dallas, TX, 75275, United States, Richard S. Barr

While researchers have studied generalized network flow problems extensively, the powerful addition of fixed charges on arcs has received scant attention. This work describes network-simplex-based algorithms that efficiently exploit the quasi-tree basis structure of the problem relaxations, proposes heuristics that utilize a tabu search and a progressive modification of a parameterized objective function for fixed-charge transportation problems, extends the parametric GIP approach to fixed-charge transshipment problems, and presents computational comparisons with commercial solution alternatives.

### 1 - Robust PCA by Manifold Optimization

Teng Zhang, University of Central Florida, Orlando, FL, United States

Robust PCA is a widely used statistical procedure to recover an underlying low-rank matrix with grossly corrupted observations. This work considers the problem of robust PCA as a nonconvex optimization problem on the manifold of low-rank matrices and proposes two algorithms based on manifold optimization. It is shown that, with a properly designed initialization, the proposed algorithms are guaranteed to converge to the underlying low-rank matrix linearly. Compared with a previous work based on the factorization of low-rank matrices the proposed algorithms reduce the dependence on the condition number of the underlying low-rank matrix theoretically. Simulations and real data examples confirm the competitive performance of our method.

### 2 - Kolmogorov Representation and Deep Learning

Xin Li, University of Central Florida, 4000 Central Florida Blvd, Orlando, FL, 32816, United States

In essence, Kolmogorov's representation theorem states that every continuous function of high dimensional space is completely determined by a function of a single variable. The drawback is that the single variable function used in the representation can be highly non-smooth and hard to compute. On the other hand, Barron proved an approximation theorem with a universal convergence guarantee. This talk will explore the connection between the ideas of Kolmogorov and Barron with the aim at a possible understanding of deep learning through a form or structure of function approximation that is not as rigid as Kolmogorov's representation but "deeper" and more inclusive than Barron's approximation.

### 3 - The Multiple Shades of Dropout for both Discriminative and Generative Deep Neural Networks

Boqing Gong, Principal Researcher, Tencent AI Lab, Seattle, WA, United States

Dropout, which independently zeros out the outputs of neurons at random, has become one of the most popular techniques in training deep neural networks due to its simplicity and remarkable effectiveness. This talk reveals multiple shades of dropout for both discriminative and generative deep neural networks. The first half of the talk focuses on the discriminative models and presents an improved version of the dropout. In the second half of the talk, I will provide a new perspective for understanding dropout under the context of deep generative neural networks. Despite being impactful on a variety of problems and applications, the generative adversarial nets (GANs) are remarkably difficult to train. In particular, our approach gives rise to the inception score of more than 5.0 with only 1,000 CIFAR-10 images and is the first that exceeds the accuracy of 90% on the CIFAR-10 dataset using only 4,000 labelled images, to the best of our knowledge.

### 1 - Signaling in Online Retail: Efficacy of Public Signals

David Lingenbrink, Cornell University, Ithaca, NY, 14850, United States, Krishnamurthy Iyer

We study an online retail setting, where strategic customers seek to purchase an item with a finite inventory in one of two time periods. Only the firm knows the inventory and demand, and seeks to persuade customers to buy in the more expensive first time period through signaling. We analyze both public and private signaling, and find that, with homogeneous customers, it is optimal to signal publicly: the firm cannot raise its revenue by sending a different private signal to each customer. However, when customers are heterogeneous, we find examples where private signaling outperforms public.

### 2 - Coffee Shop Operations with Mobile Ordering

Kang Kang, University of Minnesota, Minneapolis, MN, 55455, United States, Mohammad Delasay, Sherwin Doroudi

Mobile ordering is becoming popular in the world of coffee shop, fast food or restaurants. Our work examines the operations of a coffee shop where some customers can use a mobile app to skip the ordering and payment queue. Using queueing theory, we explore the impact of mobile customers on walk-in customers and vice versa across a variety of service policies.

### 3 - A Queueing Model and Analysis for Autonomous Vehicles on Highways

Neda Mirzaeian, Carnegie Mellon University, Pittsburgh, PA, United States, Soo-Haeng Cho, Alan Scheller-Wolf

Autonomous vehicles (AVs) have a potential to significantly improve highway congestion, since these vehicles are able to maintain smaller inter-vehicle gaps, and travel together in larger platoons (or batches) than human-driven vehicles (HVs). We model a highway segment as a queueing system, and analyze two policies: the designated-lane policy (designating one lane to AVs) and the integrated policy (allowing both AVs and HVs in any lane). After calibrating our model to data, we show that, depending on the proportion of AVs and the highway load, either of these policies can outperform the other.

### 4 - Assignment of Jobs to Servers under Interference

Scott Votke, Stony Brook University, Stony Brook, NY, United States, Jazeem Abdul Jaleel, Mohammad Delasay, Sherwin Doroudi, Anshul Gandhi

In cloud computing, interference is a major drawback to latency sensitivity and performance analysis. In this paper, we study an M/M/c queueing system where the individual servers are subject to periods of interference, which result in lower than normal service rates. A controller decides whether to send incoming jobs to an available server or to the queue. We assume that the length of interference for all servers are i.i.d. exponentially distributed random variables. By modeling such a system as a Markov decision process, we investigate the optimal policy on how to route incoming jobs.

## Joint Session MSOM/Practice Curated: Ride-sharing Services Research at Didi Chuxing

Sponsored: Manufacturing & Service Oper Mgmt  
Sponsored Session

Chair: Zhixi Wan, DiDi Chuxing, Beijing, China

### 1 - Modelling of Driver Supply Behaviour in On-demand Shared Transportation Platforms

Hai Wang, Singapore Management University, Room 5023, School of Information Systems, 178902, Singapore, Hao Sun, Zhixi Wan, Guobin Wu, Qun Li

With the popularization of ride-sharing services, drivers working as freelancers on ride-sharing platforms can design their schedules flexibly. They make daily decisions regarding whether to participate in work, and if so, how many hours to work. Driver's extra income, participation cost, and maximum allowed working time affect these decisions. We incorporate these features into classical theory of labour economics and propose a theoretical model to describe how drivers make working decisions on the shared platform. We characterize the labour supply pattern of participation, working hours, extensive and intensive margin elasticity on the platform and compare with the traditional taxi.

## 2 - Carpooling Service: Social Welfare and Pricing Strategies

Shuanglong Wang, University of Illinois at Urbana-Champaign, IL, United States, Zhixi Wan

This paper empirically studies the social welfare created by carpooling service on the ride-hailing platform over the counterfactual situation that only the regular-express service is provided. We use the data from Didichuxing, a leading ride-hailing platform in China, to estimate a nested logit model describing riders' choice behavior over regular express, carpooling and outside options. We also derive a carpooling pricing scheme for optimizing the social welfare and investigate its sensitivity properties. The results show that the carpooling service is advantageous in increasing riders' surplus and provides an alternative solution to supply-demand matching other than surge pricing.

## 3 - The Efficiency of a Dynamic Decentralized Two-sided Matching Market

Chenyu Yang, University of Rochester, NY, United States, Zhixi Wan, Xiao Liu

This paper empirically studies a decentralized dynamic matching market. We use data from a leading ride-sharing platform in China to estimate a continuous time dynamic model of search and match between drivers and passengers. In counterfactual simulations, we assess the efficiency of the decentralized market and examine how centralized algorithms may improve welfare. Compared with the equilibrium in the decentralized market, centralized algorithms can increase both the match quality and the number of matches by making matches less frequently and matching agents more assortatively.

## 4 - Balancing Supply and Demand: Queuing versus Surge Pricing Mechanisms

Zhixi Wan, DiDi Chuxing, Beijing, China, Yueyang Zhong, Max Shen

One of the most challenging market-making problem faced all ride-sharing platforms is to deal with the scenarios with high demand and limited supply. Dynamic pricing mechanisms, often called surge pricing, have been used by all major platforms. This talk describes a new mechanism adopted by Didi Chuxing, which uses virtual queuing mechanisms to allocate car supply to waiting riders. It then compares the queuing with the dynamic pricing mechanism in metrics of efficiency, fairness, consumer surplus, etc.

## 1 - Behavior Based Pricing with Heterogeneous Customer Fairness Concern

Runyu Tang, PhD Student, Tsinghua University, Haidian District, Beijing, 100084, China

Behavior-based pricing (BBP) strategy is getting popular with the development of big data technology. However, the different prices among customers also stir displeasure and may bring a loss of loyalty. Fairness is an essential issue when making BBP pricing decisions. Using an analytical model with heterogeneous fairness concern, I find a monopoly BBP seller's optimal profit and price gap decrease with stronger fairness concern. When there are two competing sellers with only one of them adopts BBP strategy, the optimal profit for the BBP seller first decreases then increases with customers fairness concern. What's more, the BBP seller should always charge the new customers with a lower price.

## 2 - The Effect of Delightful Surprise on Consumer Behavior in the Real World: A Large-scale Field Study

Peng-Chun Chen, PhD Student, National Taiwan University, 6F, No.45, Sec. 5, Zhongxiao E. Rd., Xinyi Dist, Taipei, 110, Taiwan

Previous research has established a causal relationship between delightful surprise and consumer satisfaction. However, little evidence in the real world has been provided to verify this effect. In this paper, several field studies have been conducted to test the relationship. We collaborate with an online wine e-commerce platform, manipulating the degree and the content of surprise gifts and measuring customers' satisfaction and the repurchasing behavior afterwards. Our current findings suggest that surprise gifts promote subjects' satisfaction in a large-scale, real-world setting.

## 3 - Consumer Choice under Limited Attention When Alternatives Have Different Information Costs

Frank Huettner, ESMT Berlin, Schlo platz 1, Berlin, 10407, Germany, Tamer Boyaci, Yalcin Akcay

Since information acquisition is costly, consumers trade off the value of better information against its cost and make their product choices based on imperfect information. We model this decision using the rational inattention approach and describe the rationally inattentive consumer's choice behavior when he faces alternatives with different information costs. We find that non-uniform info costs can have a strong impact on product choice, creating situations where it is

disadvantageous for the seller to provide easy access to information or where adding an inferior product increases the market share of another product. We discuss how our framework can be empirically estimated from choice data.

## 4 - Modeling Dynamics in Equity-based Crowdfunding

Chul Kim, Assistant Professor, Baruch College, CUNY, New York, NY, United States, Pallassana K. Kannan, Michael Trusov, Andrea Ordanini

We investigate dynamics characterizing an equity-based crowdfunding: stagnation, gradual increase, and acceleration. We develop a dynamic structural model to accommodate active social interactions among forward-looking investors to capture the contrasting dynamics within a unified framework. We analyze individual investment and network data from a crowdfunding platform, Sellaband. We find that the proposed model shows very good predictive performance. Using counterfactuals, we find the largest possible goal and the smallest possible proportion of profit sharing that maximize the chance of success and the fund raised.

## 5 - Impact of Structural Changes on Price Markups in Food Retail Sector

Lauren Chenarides, Assistant Professor, Arizona State University, 7231 E. Sonoran Arroyo Mall, San Tan 235D, Mesa, AZ, 85212, United States, Mahalingam Dhamodharan

We examine the effect of mergers and acquisitions in the food retail sector on price markups. Using store-level retail and defense commissary scanner data, we calculate price markups for nationally branded products at grocery store chains across the U.S. Low markups observed in concentrated markets due to a merger implies a realization of cost efficiencies for retailers, whereas high markups in similar markets post-merger suggest a gain in retailer market power. We use a diff-in-diff model to identify a causal effect of concentration on retail markups that explain these opposing outcomes and their implications.

## 6 - The Influence of Vague and Precise Waiting Information on Perception of Waiting Time

Shelly Rathee, PhD Candidate, University of Utah, Salt Lake City, UT, United States, Arul Mishra, Himanshu Mishra

Majority of patients consider waiting period as often the worst part of doctor's visit. The type of waiting information provided to patients can take different forms, with different degree of precision. We demonstrate that consumers estimate lower time perception with vague compared to precise waiting information. We employ "take-a-number" queuing system to operationalize vague waiting information with alphanumeric tokens and precise waiting information with numeric tokens and examine how these waiting information influence time perception and patient's satisfaction. We test our predictions across two field studies at a hospital and one controlled lab study.

Contributed Session

Chair: Ting Ji, University of Science and Technology of China, 1129 Huizhou Ave, Baohe Qu, Hefei Shi, Anhui Sheng, 230000, China

## 1 - Optimal (z, Z)-type Contracts for Vendor-managed Inventory

Jun-Yeon Lee, Associate Professor, California State University, Northridge, CA, 91330, United States, Richard Cho

We examine (z, Z)-type contracts for vendor-managed inventory (VMI) between a supplier and a retailer from the retailer's perspective. A (z, Z) VMI contract specifies minimum and maximum inventory levels and their corresponding under- and over-stocking penalties. We provide the optimal (z, Z) VMI contract for the retailer and the corresponding optimal replenishment decisions for the supplier and show that the optimal (z, Z) VMI contract can coordinate the supply chain under mild conditions. We also examine a VMI contract with stockout penalty and holding-cost sharing, which is a special type of (z, Z) contract, and find that it may perform well compared with the optimal (z, Z) VMI contract.

## 2 - Theory of Constraints Replenishment Solution for Managing Distribution of Perishable Items

Harshal Lowalekar, Associate Professor, Indian Institute of Management-Indore, Prabandh Shikhar, Rau-Pithampur Road, Indore, 453331, India

We develop an analytical model to study the performance of the TOC's replenishment solution in the context of perishable item supply chains. A setting with one producer and one retailer is considered. The retailer follows an order up to level policy with fixed time interval between two consecutive orders. The items are issued at the retailer's end in a random sequence. The analytical model shows that the TOC's replenishment solution will significantly increase the profits of both the producer and the retailer. The product variety and availability at the retailer will increase while the inventory of existing items will decrease due to the TOC approach.

### 3 - Research on Supplier Selection in Logistics Service Supply Chain of China Railway Express Based on Improved DEA Method

Yinying Tang, Southwest Jiaotong University, Chengdu, China,  
Qinglin Li, Qiyuan Peng, Yang Ge, Jingru Ren

In this paper, a new framework and a new method are proposed to do the supplier selection in logistics service supply chain of CHINA RAILWAY Express (CRE). Firstly, considering CRE's actual needs, we analyze the basic process of CRE selecting logistics supplier. Secondly, considering the demand & supply characteristics of the freight market between China and Europe, a new selection framework containing service quality, service price, service capacity and cooperation risk as second-level indicators is given. Thirdly, considering the uncertainty of CRE's international operation, the improved DEA (data envelopment analysis) Model is proposed and solved to evaluate and select suppliers.

### 4 - Analysis of a Manufacturer Issuing Free Gift Cards

Yuefeng Li, University of Electronic Science and Technology of China, School of Management of Economics, West Hi-Tech Zone, Chengdu, 611731, China, Jingming Pan, Xiaowo Tang

Manufacturers offer "free gift cards to consumers who buy the particular product. We structure a model of such gift card promotion in a two-product supply chain. It includes the manufacturer who plans to sponsor gift card promotion and takes the gift card cost, another manufacturer who is passively involved in the promotion and a retailer who sells the two products to consumers. The result shows that the two products are complementary with respect to consumers' demand in the promotion. Moreover, the gift cards have a cannibalization effect on the retailer and a spillover effect on the passive manufacturer. Furthermore, we offer a straightforward strategy which could lead to a win-win-win situation.

### 5 - Supply Chain Coordination with Sales Effort under Cap-and-Trade Regulation

Ting Ji, University of Science and Technology of China, Hefei, China

This paper explores the production decision and the sales effort level in a make-to-order supply chain consisting of a manufacturer and a retailer under cap-and-trade regulation. We explore the supply chain coordination with wholesale price and cost sharing contracts. First, as the marginal sales effort cost increases, the retailer's profit firstly increases and then decreases, while the monotonicity of the manufacturer's profit depends on the cap. Second, both wholesale price and cost sharing contracts can coordinate the supply chain. Third, cap-and-trade regulation has a positive effect on supply chain coordination with the two contracts.

### Choice Modeling in Online Platforms

Sponsored: Manufacturing & Service Oper Mgmt/Service Operations

Sponsored Session

Chair: Heng Zhang, Marshall School of Business, Bridge Memorial Hall - BRI 401, 701 W. Exposition Boulevard, Los Angeles, CA, 90007, United States

Co-Chair: Negin Golrezaei, Yale School of Management, Massachusetts Institute of Technology, 30 Memorial Dr, Cambridge, MA, 02142, United States

### 1 - Dynamic Learning in Assortment Selection: A Thompson Sampling Approach

Vashist Avadhanula, Columbia University, 3022 Broadway, 4th Floor West, New York, NY, 10027, United States, Assaf Zeevi, Shipra Agrawal, Vineet Goyal

We consider a dynamic assortment selection problem, where in every round the retailer offers a subset (assortment) of  $N$  substitutable products to a consumer, who selects one of these products according to a multinomial logit (MNL) choice model. The retailer observes this choice and the objective is to dynamically learn the model parameters, while optimizing cumulative revenues over a selling horizon of length  $T$ . We present an approach to adapt Thompson Sampling to this problem and show that it achieves near-optimal regret as well as attractive numerical performance on real world data.

### 2 - An Optimal Assortment for Complements

Xi Shan, University of Texas at Dallas, Richardson, TX, 75080, United States, Dorothee Honhon, Suresh P. Sethi, Chenglin Zhang

Using complements is common practice in assortment planning: Restaurants offer meals with drinks or a music environment, and even allow consumers to bring their own wine. Department stores use one category as complement to the other categories to stimulate purchases. We consider complements in the canonical assortment model (van Ryzin and Mahajan 1999) wherein a newsboy stimulates purchases by offering complements. We show that with complements the retailer uses lower variety and achieves higher profit under certain conditions. We obtain

the Nash equilibrium for category managers in the category management problem and demonstrate the coordination mechanism.

### 3 - Assortment Optimization for an Omnichannel Retailer with Features-based Value Boosts and Discounts

Venus Lo, Cornell University, 206 Rhodes Hall, Cornell University, Ithaca, NY, 14853, United States, Huseyin Topaloglu

We consider a retailer who sells online and in a physical store offline. Customers have initial product valuations, but boost/discount values if they observe under/over-hyped product features in-store. The retailer selects an assortment to offer in-store to maximize expected revenue while managing customers' valuation. Our model organizes products on a tree so that a leaf is a product and a non-leaf vertex is a feature common to leaves in its subtree. Online and offline customers have different consideration sets but both adjust valuations based on the offline assortment. This problem is NP-hard and we present a FPTAS, which performs much better than its theoretical guarantee under computation.

### 1 - Invite Your Friend and You'll Move Up in Line: Optimal Design of Referral Priority Programs

Luyi Yang, Johns Hopkins University, 100 International Drive, Baltimore, MD, 21202, United States

In a referral priority program, existing customers on a waitlist for products or services (e.g., mobile apps) can invite their friends to also sign up so that they can jump up in line and get early access. Firms vary in the amount of priority incentives they give, which begs the question of what the optimal program should be. We take a mechanism design approach combined with the achievable region method to this question. Our unifying framework subsumes different schemes used in practice (namely, FIFO, full priority, partial priority, and strategic delay) as special cases and characterizes the conditions under which each scheme is optimal.

### 2 - An Equilibrium Analysis of a Multiclass Queue with Endogenous Abandonments in Heavy Traffic

Xiaoshan Peng, Indiana University, Kelley School, Bloomington, IN, United States, Baris Ata

We study a multiclass queueing system with endogenous abandonments where congestion affects customers' abandonment behavior and vice versa. In the abandonment model, customers take the virtual waiting time distribution as given. Customers are forward looking and make wait or abandon decisions dynamically to maximize their expected discounted utilities. The queueing model takes the customers' abandonment time distribution as an input and studies the resulting virtual waiting time distribution. We show that there exists a unique equilibrium in which the customers' abandonment time and the virtual waiting time for the various classes are consistent in the two models.

### 3 - Service Pricing when Customers Collude

Chenguang (Allen) Wu, Hong Kong University of Science and Technology, Clear Water Bay, Hong Kong, Chen Jin, Senthil Veeraraghavan

Customers' strategic behavior of service procurement is typically modeled by assuming that customers are rational individuals. However, the understanding of customers' behavioral heterogeneity and the resulting implication on the service provider's operational problems is lacking. In this paper, we model the behavioral heterogeneity of customers by considering two customer segments, individual and group customers, who are endowed with different decision structures. Our results explain the operational incentive of a common practice in service systems: group customers receive special rates for service and enjoy a high priority in the admission line.

### 4 - Harnessing the Double-edged Sword: Information Disclosure on Ride-hailing Platforms

Dongyuan Zhan, University College London, School of Management, Gower Street, London, WC1E 6BT, United Kingdom, Leon Yang Chu, Zhixi Wan

We consider a ride-hailing platform that provides free information service to taxi drivers. Upon receiving a rider's request, the platform broadcasts the rider information to the idle taxi drivers, who may accept or decline the request based on the customer's profitability. The first driver who accepts the request gets the ride. If no driver accepts it then the rider leaves. As a result, information disclosure is a double-edged sword for drivers' profits: they may take more profitable rides via inefficient idling. We study the profit implication of this information disclosure, and propose a simple broadcast policy that can achieve close to the first best when the system is large.

#### 5 - Optimal Staffing under Endogenous Arrivals with Heterogeneous Customer Time-of-service Preferences

Yang Li, Chinese University of Hong Kong, 12 Chak Cheung Street, Cheng Yu Tung Building, Hong Kong, Hong Kong, Philipp Afeche

The service operations literature usually treats arrivals as exogenous processes. However, arrival processes may be endogenous in many settings. That is, customers may account for system congestion in choosing their time of service. We propose an equilibrium model that captures how rational customers with heterogeneous preferences decide their time-of-service. We also study the optimal staffing policies, taking into account customers' time-of-service choices.

#### 1 - Kicking Ash: Who (or What) is Winning the War on Coal

David F. Drake, Harvard Business School, Morgan Hall 425, Boston, MA, 02163, United States, Jeffrey York

Power generators throughout the U.S. have shed coal capacity at an unprecedented rate over the past several years. Multiple stakeholders have claimed credit - natural gas executives, policy makers, renewables advocates, and environmental NGOs. Through a survival analysis, we explore the extent to which each has impacted the expected life of coal-fired power generating units.

#### 2 - Greenest Grocer: Online or Offline?

Ekaterina Astashkina, INSEAD, Boulevard de Constance, Fontainebleau, 77305, France, Elena Belavina, Simone Marinesi

We compare environmental differences of traditional and online grocery retail channels. We build and calibrate the model that captures household food-buying patterns and the shopping mode choice. We find that, in high store density cities, the development of an online outlet is more efficient in reducing environmental impact in contrast to increased store density. In particular, online shopping attracts households for whom offline is least convenient — such households have the worst impact: they build up more inventories and travel longer distances. Higher store density, in turn, impacts households in a less targeted fashion and, thus, is more efficient only in very low store density scenarios.

#### 3 - Electricity Pricing with Limited Consumer Response

Fariba Farajbakhsh Mamaghani, University of Texas at Dallas, 800 West Campbell Road SM 30, Richardson, TX, 75080, United States, Saed Alizamir, Shouqiang Wang

Matching demand with supply has been a key challenge in operating residential electricity markets. Existence of exogenous random shocks (e.g., outdoor weather condition) and consumer's limited capability in adjusting their household appliance's settings on the other hand lead utility firms face stochastic demand functions which is not well understood in the literature. In this paper, we construct a demand model to explicitly account for such limited consumer response to changes in exogenous random shocks and We fully characterize the firm's optimal price.

#### 4 - Plugged in at the Right Time? Managing Electrical Vehicles Charging

Owen Wu, Indiana University, Kelley School of Business, 1309 E. 10th Street, Bloomington, IN, 47405, United States

As electric vehicles (EV) increasingly penetrate the electrical grid, new business models emerge to reduce the cost of charging EV batteries. We analyze how cost savings depend on the time windows that EVs are plugged in and the charging amount required by customers. We consider setting appropriate prices for the EV charging, in order to change customers' charging demand to maximize the cost savings.

#### Data-Driven Supply Chain Strategies

Sponsored: Manufacturing & Service Oper Mgmt/Supply Chain

Sponsored Session

Chair: Yun Zhang, Massachusetts Institute of Technology, 77 Massachusetts Ave, E18, Cambridge, MA, 02139, United States

#### 1 - Value of Analytics in Inventory Systems

Li Wang, Massachusetts Institute of Technology, 77 Massachusetts Ave, Cambridge, MA, 02139, United States, Jussi Keppo, David Simchi-Levi

We study the trade-off between holding safety stock and deploying data analytics for a retailer facing demand uncertainty. In Newsvendor models, safety stock is used to mitigate the risk of stockouts due to demand uncertainty. However, the demand risk can be reduced by investing in data analytics that creates more accurate demand forecasts and this way lowers the need of safety stock. We solve this joint problem of optimal quantity of analytics and safety stock, and study the comparative statics of the model. For instance, we show that the lower the cost of analytics is, the lower the safety stock.

#### 2 - Distributionally Robust Dynamic Inventory Management with Bank Finance

Zhenzhen Yan, Assistant Professor, Nanyang Technological University, 21 Nanyang Link, Singapore, 637371, Singapore, Ruijie Zhang, Yuanguang Zhong

In this paper, we study a stochastic dynamic inventory scheduling problem faced by a capital-constrained company who periodically replenishes its inventory from a supplier. The problem is to determine the optimal inventory and financing decisions to maximize its expected terminal cash flow. Instead of assuming a certain demand distribution, we only require mean and variance of demand are known. We formulate this problem as a convex conic optimization problem which can be approximated using a positive semi-definite program. We study and compare two types of financing strategies: unsecured loans and asset-based loans.

#### 3 - Quantile Forecasting and Data-driven Inventory Management under Nonstationary Demand

Ying Cao, University of California, Berkeley, CA, 94720, United States, Max Shen, Max Shen

Most work in data-driven inventory management assume that historical demand can be regarded as samples drawn from a real distribution; or when demand distribution changes over time, multiple sample paths are available. In reality, however, demand is time-correlated and may exhibit nonstationarity. In this talk, we consider a general autoregressive demand process without prespecified parametric structure. Based on which, we present a neural network framework for predicting its quantiles, and argue that it is a data-driven approach for determining stock levels in the environment of newsvendor problem and its multiperiod extension. This is a joint work with Professor Max Shen from UC Berkeley.

#### 4 - Supply Chain Network Design and Coordination

Yun Zhang, Massachusetts Institute of Technology, Cambridge, MA, United States, David Simchi-Levi

We explore network design and coordination strategies in the context of modern supply chains, with a focus in public health.

#### 1 - The Effect of Merger and Acquisition on Inventory Turnover

Zhihao Zhang, Student, University of South Carolina, Columbia, SC, United States

We evaluate the effect of merger and acquisition (M&A) on firms' inventory turnover, a well-developed measure of operations performance. By applying System Generalized Methods of Moments (GMM) and Discontinuous Growth Modeling (DGM), we are able to empirically test and show that mergers and acquisitions interrupt companies' inventory turnover in the short run, but eventually benefits companies in the long run. We also find that companies who face high demand uncertainty M&A benefits the most from the long-term synergies they created through M&A.

## 2 - Organizational Learning in Process Improvement Projects

Venkat Venkateswaran, Georgia Institute of Technology, Room 4143, 800 West Peachtree, NW, Atlanta, GA, 30308, United States  
Venkat Venkateswaran, University of Illinois, Urbana-Champaign, IL, United States, Edward Arnheiter

Many organizations engage in continuous process improvement activities. We study the learning that accrues when workers gain experience from such exercises. We use panel data from a large oil and natural gas extraction company to track the performance of 56 trained lean Six Sigma facilitators completing 233 projects over five years. The projects are all different, yet learning is discernible. Examples where trained personnel undertake activities not necessarily identical (the subject of traditional research) but falling within some discipline occur often in practice. For such applications, we propose a way to measure learning. The study data exhibits learning at an effective rate of about 85%.

## 3 - Optimal Decisions for Contract Farming under Weather Risk

Xinping Wang, Nanjing Agricultural University, Nanjing, China,  
Shengnan Sun

Agriculture has been greatly impacted by weather condition. In this paper, we consider a manufacturer who takes a farm crop as a raw material and transforms it into a finished product. The manufacturer encourages local farmers to grow the farm crop by offering them contracts to guarantee her supply under weather risk. Optimal decisions for two types of contracts, contract without reneging and contract with reneging, are analyzed. In addition, we numerically compare the optimal decisions of the company with different contracts and investigate the sensitivity of the results to the model parameters, such as weather condition.

### Design of Two-sided Marketplaces

Sponsored: Revenue Management & Pricing  
Sponsored Session

Chair: Siddhartha Banerjee, Cornell University, Ithaca, NY, 14853, United States

Co-Chair: Pengyu Qian, Columbia University-Graduate School of Business, New York, NY, 10027, United States

Co-Chair: Yashodhan Kanoria, Columbia Business School, New York, NY, United States

### 1 - Simple Mechanisms for Two-sided Markets

Yang Cai, Yale University, New Haven, CT, United States

We design simple mechanisms to approximate the Gains from Trade (GFT) in two-sided markets with multiple unit-supply sellers and multiple unit-demand buyers. A classical impossibility result by Myerson and Satterthwaite showed that even with only one seller and one buyer, no Individually Rational (IR), Bayesian Incentive Compatible (BIC) and Budget-Balanced (BB) mechanism can achieve full GFT (trade whenever buyer's value is higher than the seller's cost). On the other hand, they proposed the "second-best mechanism that maximizes the GFT subject to IR, BIC and BB constraints, which is unfortunately rather complex for even the single-seller single-buyer case. Our mechanism is simple, IR, BIC and BB, and achieves 1/2 of the optimal GFT among all IR, BIC and BB mechanisms. Our result holds for arbitrary distributions of the buyers' and sellers' values and can accommodate any downward-closed feasibility constraints over the allocations.

### 2 - Descending Price Optimally Coordinates Search

Bo Waggoner, University of Pennsylvania, Philadelphia, PA, United States, Robert Kleinberg, Glen Weyl

Contrary to common practice in selling homes and start-ups, mechanism design theory typically recommends English (increasing price) over Dutch (decreasing price) auctions. Yet this theory neglects the uncertain investment required to investigate purchases. We show that English and other standard auctions burden such investments with further uncertainty about the price necessary to win, potentially eliminating all gains from trade. In contrast, Dutch auctions preserve their properties without information costs because they guarantee, at the moment when investigation is optimal, a price at which the good can be purchased.

### 3 - State Dependent Control of Closed Queueing Networks

Pengyu Qian, Columbia University-Graduate School of Business, New York, NY, 10027, United States, Siddhartha Banerjee, Yash Kanoria

We study the state dependent control for a closed queueing network model inspired by ridesharing systems. The platform can choose which supply unit to assign to an incoming customer; the unit becomes available again at customer's destination. The platform aims to minimize proportion of dropped demand. We propose a family of simple policies called Scaled MaxWeight (SMW) and prove that under complete resource pooling (analogous to Hall's condition), any SMW policy induces an exponential decay of demand-drop probability as the number of supply units goes to infinity. We further show that there is an SMW policy that

achieves the optimal exponent among all assignment policies and specify it analytically.

## 4 - Asymptotically Optimal Thickness of a Centralized Dynamic Matching Market with Independent and Identically Distributed Utilities

Lawrence M. Wein, Stanford University, Graduate School of Business, 655 Knight Way, Stanford, CA, 94305-5015, United States, Martin I. Reiman

We consider a centralized dynamic matching market, where buyers and sellers arrive according to independent Poisson processes with the same rate, and abandon (if not matched) after an exponential amount of time with the same mean. The matching utility between any buyer and seller is an iid random variable. Under a large-market asymptotic regime, we use extreme value theory and Markov chain asymptotics to show how the optimal market thickness varies according to the domain of attraction of the underlying matching utility distribution.

### Revenue Management with Reusable Resources

Sponsored: Revenue Management & Pricing  
Sponsored Session

Chair: Cong Shi, University of Michigan, Ann Arbor, MI, 48105, United States

### 1 - Optimal Pricing Policy for Reusable Resource Systems with Strategic Customers

Yiwei Chen, University of Cincinnati, Cincinnati, OH, United States, Cong Shi

We consider a service system with a finite number of homogeneous reusable resources that dynamically serve customers. Customers stochastically arrive to the service system with heterogeneous requested service time intervals (allowing for advance reservations) and per unit of time service valuations. Customers are forward looking who strategize their purchase times. We propose a simple pricing policy that is fixed for each unit of time. This policy incentivizes customers to behave myopically. We show that this policy is asymptotically optimal.

### 2 - Real-time Dynamic Pricing for Revenue Management with Reusable Resources, Advance Reservation, and Deterministic Service Time Requirements

Yanzhe Lei, Queen's University, Kingston, ON, Canada, Stefanus Jasin

We study a dynamic pricing problem where a firm uses a finite amount of resources to serve price-sensitive customers arriving randomly over time. Each customer may request to consume a combination of different types of resources for a deterministic duration of time, after which the resource can be immediately used to serve new customers. We develop real-time pricing controls and show that they are near-optimal in the regime of large demand and large resource capacity. We further extend our result to a more general setting with heterogeneous service time and advance reservation.

### 3 - Reusable Revenue Management at Scale

Zachary Owen, David Simchi-Levi

We consider the problem of dynamic pricing and assortment optimization for reusable resource in continuous time under time-varying demand. We develop a time-discretization strategy that yields a constant factor performance guarantee relative to the optimal policy. Our policies are computationally feasible and asymptotically optimal for large systems. Additionally, we develop heuristic methods that implement a bid-price strategy that accounts for the changing value of resources over time.

### 4 - Dynamic Assortment Optimization for Reusable Products with Random Usage Durations

Mika Sumida, Cornell Tech, New York, NY, 10128, United States, Paat Rusmevichientong, Huseyin Topaloglu

We consider dynamic assortment problems with reusable products, in which each customer chooses a product within an offered assortment, uses the product for a random duration of time, and returns the product back to the firm to be used by other customers. The goal is to find a policy for deciding on the assortment to offer to each customer so that the total expected revenue over a finite selling horizon is maximized. We present a policy that is guaranteed to obtain at least 50% of the optimal total expected revenue. The policy is based on constructing linear approximations to the optimal value functions and is computed through an efficient backward recursion.

241 Mervis Hall, Katz Business School, Pittsburgh, PA, 15260,  
United States

Startup's raise capital by various means. One of them is by appealing to a Venture Capitalist whose primary stake in the form is the equity he owns. We model a situation when there are two 'types' of VCs and study the effect on the equity shared when both VCs are present. We observe that the equity that's given out is smaller with competition as compared to when there is no competition and that the equity demanded increases in the uncertainty of the potential market demand.

**2 - Cooperative Resolution of Crises in Financial Networks**Markku Kallio, Professor, Aalto University School of Business,  
Pohjoiskaari 17 D. 17, Helsinki, FIN-00200, Finland,  
Aein Khabazian

We examine the financial network of systemically important banks as a cooperative game. Governments can act as facilitators enforcing incentives for banks to cooperate and prevent the escalation of a financial crisis. To achieve fair allocation of bailout costs, we use nucleolus which implies a possible subsidizing pattern among the banks. Our approach helps avoid moral hazard and free rider problems. For a demonstration, we use major European banks and a scenario which is linked to the adverse economic scenario used in 2016 EU-wide stress testing. Rescue performance is compared with several alternative non-cooperative approaches.

**3 - A Linear Omega Portfolio Model with Optimizing Return Threshold**Jing-Rung Yu, Professor, National Chi Nan University,  
470 University Road, Puli, Nantou, 545, Taiwan, Paul Chiou,  
WenYi Lee

The omega ratio incorporates both the upside profit and downside risk with considering a return threshold. Although the threshold can affect the effectiveness of the Omega portfolio model, its determination has not been thoroughly studied yet. A conventional fixed-value approach simplifies investor's decision without taking economic dynamics into account. This study optimizes the threshold value in the Omega model under certain and uncertain return distributions. The empirical results using the daily returns of the S&P 500 Index composite stocks show that the proposed WOmega model yields lower loss values and better controlling the downside risk than the CVaR related counterparts.

**4 - Pass-through of Commodity Price Shocks in Distribution Channels with Risk-averse Agents**Phat Luong, Rutgers University, Piscataway, NJ, United States,  
Xiaowei Xu

This paper studies how to allocate risk in distribution channels, in which a risk averse supplier faces commodity price shocks and a risk averse buyer faces downstream market uncertainty. The supplier can pass-through commodity price shocks to the buyer under a surcharge pricing system, which is widely used in the steel industry. We model the buyer-supplier relationship as either a Stackelberg leadership game or a Nash bargaining solution. By conducting variance analysis on commodity price shocks and market uncertainty, we derive the closed-form optimal pass-through rate of commodity price shocks, which minimizes the weighted total channel risk and maximizes the channel throughput.

**5 - The Allocation of Financial Risk in a Supply Chain with Influence of Supply Chain Characteristics**Tiantian Lin, Zhejiang University, Hangzhou, China, Gangshu Cai,  
Weihua Zhou

Buyer financing from e-commerce platform and trade credit are two popular financing methods for e-commerce SMEs. The two represent different ways of risk allocation. To detect which kind of risk allocation is more efficient, and how supply chain features influence, we construct a supply chain with a retailer, a manufacturer and a distributor on a consignment basis. We find neither buyer financing nor trade credit always outperforms the other. And the supply chain features like leadership structure influences not only the efficiency of the same risk allocation, but also relative efficiency of different risk allocation.

**1 - Profitability of Electronic Market Making and Latency**Xuefeng Gao, Chinese University of Hong Kong, William M.W.  
Mong Engineering Building, Room 606, Shatin, Hong Kong

This paper studies the profitability of electronic market making strategies and the impact of latency on market makers' profits for large-tick assets. By analyzing the optimal market making problem using Markov Decision Processes, we provide simple conditions to identify when market making strategy is profitable. We also show that higher latency leads to reduced profits for market makers. Numerical experiments are conducted to illustrate the impact of latency and relative latency on the profitability of market making strategies. This is a joint work with Yunhan Wang.

**2 - Addressing Systemic Risk Using Contingent Convertible Debt – A Network Analysis**Yueliang Lu, UNC Charlotte, Charlotte, NC, United States,  
Aparna Gupta, Runzu Wang

We construct a balance sheet based network model to study the interconnectedness of US banking system. After a simulation analysis of the buffer effect of contingent convertible (CoCo) debt in controlling contagion in the banking network under a theoretically motivated model, we use 13-F filings made to the US Securities and Exchange Commission (SEC) to calibrate the theoretical model. Our results demonstrate that CoCo debt conversion significantly reduces the average number of bank failures, decreases the CoVaR of the banking system, and thus, mitigates systemic risk. While CoCo debt with dual-trigger is not so efficient as a single trigger design in reducing individual bank failures, the former is more effective at protecting the surviving banks, which leads to improved stability from the perspective of the banking system. We claim that the different designs of CoCo triggers result in trade-offs for addressing systemic risk, which may be evaluated in a network model developed in this work.

**3 - Portfolio Selection under Loss Aversion with a Mentally Adjusted Reference Point**Moris Strub, The Chinese University of Hong Kong, Shatin,  
Hong Kong, Xuedong He

Most models on portfolio selection under loss aversion make a strong assumption on what the reference point is or how it is formed. In this paper, we relax this assumption by proposing three models where the investor mentally adjusts an initial, exogenous reference point: A model of mental reference point updating, a model of a partially endogenous reference point and a model of a mentally optimal reference point. We find that optimal trading behavior is remarkably robust with respect to mental reference point formation and converges to the neoclassical prediction with increasing experience and sophistication of the investor.

**4 - Dynamic Mean-risk Asset Allocation**Xuedong He, The Chinese University of Hong Kong, Room 609  
William M.W. Mong Engineering Bldg, Shatin, Hong Kong,  
Zhaoli Jiang

In a market that consists of multiple stocks and one risk-free asset whose expected return rates and volatility are deterministic, we study a continuous-time mean-risk portfolio selection problem in which an agent is subject to a constraint that the expectation of her terminal wealth must exceed a target and minimizes the risk of her investment, which can be the variance or tail risk of her terminal wealth. Considering three types of expected terminal wealth target, we derive the equilibrium policy in closed form, and this policy is myopic and does not depend on the risk measure used by the agent nor on the agent's evaluation period.

### Finance - Theory & Empirics

Contributed Session

Chair: Peng Xie, California State University, Hayward, CA, 94542, United States

#### 1 - Politics and Inventory: Chief Executive Officer – White House Political Ideology Alignment and Inventory Management

Mazhar Arikan, University of Kansas, Lawrence, KS, 66045, United States, Yi Tan, Yaoyi Xi

We empirically examine whether and how CEO political ideology affects inventory strategies. Using a sample of 3,461 distinct U.S. domestic publicly traded firms, we find that firms tend to hold more inventories during the periods when their CEOs' personal political ideology (measured by donations to political parties) is in accordance with the President of the U.S. We perform further analyses on firm financial performance and economic policy uncertainty to investigate the underlying mechanisms for this finding. Results indicate that CEO-President political ideology alignment does not provide an information channel through which CEOs can exploit additional value-related information.

#### 2 - Distance-based Portfolio Combining Algorithm to Predict in Sample Optimal Portfolio

Hongseon Kim, Yonsei University, ShinChonDong, Daewoo Hall 610, Seoul, Korea, Republic of

We provide portfolio combination algorithms for reducing Euclidean distance between in-sample portfolio and out-of-sample portfolio. These algorithms combine various out-of-sample portfolio depending on the length of the Euclidean distance and tracking signal. We conducted an empirical experiment using 21 data sets. We find that combined portfolio which we propose often has a short Euclidean norm and higher Sharpe ratio than other benchmark portfolios.

#### 3 - The Effect of Initial Coin Offering Uniqueness on its Valuation and Trading Status

Peng Xie, Assistant Professor, California State University, Hayward, CA, 94542, United States

As the development of the cryptocurrency ecosystem, a new way to raise funds for new cryptocurrency ventures called Initial Coin Offering (ICO) becomes popular. Using data from more than 1,000 ICO campaigns from 2017 to 2018, we empirically show that the uniqueness of the ICO ideas is positively correlated with the cumulative returns and the probability of ongoing trading in cryptocurrency exchanges.

### Service Sharing

Sponsored: Service Science

Sponsored Session

Chair: Anita D. Bhappu, University of California-Merced, Merced, CA, 95343, United States

#### 1 - Bonus Scheme Design in Ride-sharing Economy under Competition

Puping Jiang, PhD, Washington University in St. Louis, Olin Business School, Campus Box 1156, St. Louis, MO, 63130-4899, United States, Fuqiang Zhang, Kaitlin Daniels

Nowadays in the ride-sharing economy, one phenomenon takes our attention is the platform's "convex"-like bonus policy towards drivers. In this research we mainly address two questions: First, what is the main driving force behind such bonus schemes? Second, why does the bonus scheme have the "convex"-like form? This is the first research in ride-sharing economy as far as we know looking at the competition between two ride-sharing platforms.

#### 2 - What Types of Drivers Do Our Society Need? The Effect of Drivers' Refusing Behavior

Xiaojing Feng, Shanghai Jiao Tong University, Minneapolis, MN, 55454, United States, Ying Rong, Tony H. Cui

Although the empirical evidence shows that the driver's strategic refusing behavior is one of the key factors that contribute to high incomes, it harms the feelings of the refused passengers, which may cause passengers' complaints. We propose an analytical model to capture the refusing behavior of different types of drivers, depict the game dynamics between drivers, and try to explore the effect of the refusing behavior on the social welfare under different regulations.

#### 3 - Social Determinants of Health Information Technology Enabled Patient Provider Engagement among Patients with Multimorbidity

Ajit Appari, Worcester Polytechnic Institute, Worcester, MA, 77030, United States, Meghan Hufstader-Gabriel

Our understanding of health information technology (IT) enabled patient-provider engagement by patients with multimorbidity is limited despite growing trends of health IT diffusion. We analyzed 2017-Health Information National Trends Survey data on American adults (18+ yrs old) using weighted ordered logistic regression to evaluate association of health IT enabled engagement (Low, moderate, High) with demographic and socioeconomic factors for Low (2-3 conditions) and High (4+ conditions) multimorbidity groups separately. Our study did not find association of health IT enabled engagement with any covariate, except older patients more likely to engage.

#### 4 - Online Demand Driven Car Sharing Rebalancing

Xiaopeng Li, Dr., University of South Florida, Tampa, FL, 33620, United States, Dongfang Zhao

This study proposes an online car-sharing rebalancing model to deal with the car sharing fleet management problem using reinforcement learning. We develop a multi-agent reinforcement learning framework using a deep Q-learning algorithm. The goal of the algorithm is to maximize the total profit of the platform by repositioning available cars to the locations with outstanding demand-supply gaps. This model does not make any assumption on the demand and is completely driven by spatially distributed demand data history. We show significant improvements of the proposed framework over state-of-the-art approaches through extensive empirical studies.

#### 5 - Service Delivery in the Sharing Economy: Platform Assumptions and Technology Affordances for Prosumer Service Interactions

Anita D. Bhappu, University of California Merced, 5200 N. Lake Road, SSM 233, Merced, CA, 95343, United States, Melanie Lisa Yeo, Ann Kovalchick, Tea Lempiala

We develop a framework for understanding the nature of service delivery in the sharing economy by applying the literature on service science to three exemplar ridesharing platforms. To facilitate and support our analysis, we critically examine and discuss these platforms' implicit assumptions about service interactions and prosumer motivations as evidenced by their designed technology features. We also assess these platforms' technology affordances for service governance and prosumer trust.

### Stochastic Models for Service Operations

Sponsored: Service Science

Sponsored Session

Chair: Xu Sun, Columbia University, New York City, NY, 10027, United States

#### 1 - Extremal Single-Server Queues Given Two Moments

Yan Chen, Columbia University, New York, NY, 10027, United States, Ward Whitt

This paper establishes tight upper bounds for the mean steady-state and transient waiting times in the GI/GI/1 queue given the first two moments of the inter-arrival times and service-time distributions. We apply the theory for the classical moment problem to show, for distributions with support on bounded intervals, that the bounds are attained at distributions with support on at most three points. For distributions with support on the unbounded positive real line, we show that the bounds are not attained directly, but are obtained asymptotically. We propose a simple approximation formula and provide a numerical comparison of the approximations and bounds.

#### 2 - Optimal Charging Control in an Electric Vehicle Battery Swap Station

Xu Sun, Columbia University, New York City, NY, 10027, United States, Bo Sun, Ward Whitt

We model an electric vehicle battery swap station as a closed-loop production-inventory system facing time-varying demand for battery swap and time-varying prices for recharging batteries. The objective is to find an optimal charging policy that best trade off the charging cost and the congestion. We first formulate a Markov decision process (MDO) and then develop a fluid model approximation for the (MDP). We gain important managerial insights by solving the fluid model optimization.

### 3 - To Pool or Not to Pool: Queueing Design for Large-scale Service Systems

Yunan Liu, North Carolina State University, Raleigh, NC, 27695-7906, United States, Ping Cao, Shuangchi He, Junfei Huang

Two queue structures are commonly adopted in service systems: pooled and dedicated. Although the pooled structure, known to minimize server idleness, is widely used in service systems, this study reveals that the dedicated structure, along with the join-the-shortest-queue policy, could help improve certain service levels such as the probability that waiting time is less than a delay target. Using a fluid model substantiated by asymptotic analysis, we provide performance comparison of the two structures in a queueing system with customer abandonment. We intend to answer the questions: To achieve a specified service level, which structure will be more cost-effective? How many servers can be saved?

### 4 - Asymptotically Optimal Priority Allocation for Transplant Queueing Systems

Xin Liu, Clemson University, Department of Mathematical Sciences, Clemson, SC, 29634, United States, Amin Khademi

We study the allocation problem for organ transplant systems. The system is formulated as a two-sided multi-class matching system, in which patients may change classes, or abandon the system. We develop a simple priority policy, and show that the proposed policy is asymptotically optimal under fluid scaling.

### Practice- Information Systems I

Contributed Session

Chair: Jiaying Deng, University of Washington, 4109 Stevens Way, Seattle, WA, 98195, United States

#### 1 - Understanding Post-adoption of Building Information Modeling in Organizations: A Behavior Perspective

Pei Ma, Tianjin University, Building 25, Weijin Road, Tianjin, 300072, China

Post-adoption is crucial for organizations to realize returns on BIM investment. However, employees rarely use BIM to its fullest potential. We identify exploitation (EI) and exploration (ER), that refer to using BIM in routine way or novel way separately, as two types of usage behaviors. Based on IS continuance model, we examine the impacts of satisfaction (SAT) and perceived usefulness (PU) on ER and EI, and the role of personal innovativeness with IT (PIIT) and organizational support (OS) as moderators. Empirical analysis indicates (1) SAT impacts ER and EI strongly, (2) PU has stronger impact on EI than ER, (3) PIIT positively moderates impacts on ER, (4) OS positively moderates impacts on EI and ER.

#### 2 - Social Responsibility Platforms and Sustainability Reporting

Xue Ning, Business School, University of Colorado, Denver, CO, 80202, United States, Dobin Yim, Jiban Khuntia

This study suggests and investigates the effect of a governance-practice-performance path for social responsibility platforms. Using a dataset of annual sustainability reports of 683 firms over a three-year period, findings of analysis provide insights to implement and steer sustainability governance to better performance.

#### 3 - How Different Incentives Influence Employee Behavior on Enterprise Social Media

Xiaopeng Luo, Beijing University of Posts and Telecommunications, 10 Xitucheng Road, Beijing, 100876, China, Jiayin Qi, Xiangling Fu, Yu Jeffrey Hu

Firms are currently eager to apply ESM (Enterprise Social Media) to facilitate internal information sharing. However, employee engagement on ESM decreases over time. Thus, incentives are widely used to motivate participation. In this paper, two different incentives adopted on ESM have been examined in the context of a large state-owned company. By conducting a quasi-experiment based on the data of 11,432 employees, this study indicates the effect of the two incentives are different: group incentives, which reflect a sense of collectivism, are welcomed to strengthen the social relationships. While individual incentives, which show a spirit of egoism, can be harmful to evoke participation.

#### 4 - Can Employees Benefit from Social Capital?

The Evidence from an Enterprise Social Media in China

Jiaying Deng, University of Washington, Seattle, WA, 98195, United States, Yong Tan

In this study, we focus on how employees use the ESM to communicate with each other, and how this communication will affect their collaborative project performance. There's a trade-off. On the one hand, employees may acquire knowledge from others through communication, both from project team members or other experts outside the team. On the other hand, the convenience

of chat may result in too many communications, which may distract employees from projects they are working on. In this paper, we try to examine these two effects. Our preliminary result shows that with more and more communication, the project performance significantly decreases over time.

### Practice – Logistics II

Contributed Session

Chair: Srimathy Mohan, Arizona State University, Department of Supply Chain Management, W.P. Carey School of Management, Phoenix, AZ, 85069-7100, United States

#### 1 - Locating a Biorefinery under Uncertainty Using a Multistage Scenario Tree

Javier Faulin, Public University of Navarra, Campus Arrosadia, Department of Statistics and OR, Pamplona, Navarra, 31006, Spain, Adrian Serrano-Hernandez, Luis Cadarso, Alejandro Garcia del Valle

This work introduces a case study in which a biorefinery has to be located in Navarre, Spain, considering uncertainty in prices and biomass availabilities. To address this problem, stochastic optimization is employed. A multistage scenario tree featuring strategic and operational scenarios is presented, where operational nodes are rooted in strategic nodes. Then, biorefinery location optimization is reached by solving a mixed integer linear programming model. Promising results are obtained at strategic (location of the facility), tactical (location of collection points), and operational (biomass purchase management) levels.

#### 2 - Sharing Loading Costs for Multi Compartment Vehicles

Bruce C. Hartman, Professor, California State University Maritime, Santa Rosa, CA, 95409, United States

Cold chains are important in world trade. Loading cold items into multiple compartment vehicles (MCVs) with different temperature compartments can keep goods at proper temperatures, allowing better load consolidation. Constructing the optimal load requires heuristics, and the cost must be allocated in a stable manner to the items being shipped. We outline the MCV loading problem, and suggest the optimization and cost allocation problems be solved together using an inductive approach. Constraints generated inductively from minimal balanced collections of subsets reduce the feasible set, helping heuristics find a stable result faster than optimizing first and allocating later.

#### 3 - Long Term Sorting Plan Model for Ecommerce Logistic Distribution Network

Jie Lu, Operations Research Scientist, JD.com, Beijing, China, Hengle Qin

A sorting plan organizes the package flows in the distribution network. It determines package flow combinations and the sequence of distribution centers for each origin-destination pair. In this study, we propose an optimal long-term sorting plan model for a distribution network. In particular, a mixed integer programming model with conditional constraints is developed. We derive a reformulation of the problem to handle the conditional constraints using logical equivalence. The results show that the model can handle hundreds of distribution centers and more than six thousands of routes.

#### 4 - A Beam Search Based Method for Single Container Mix Loading Problem

Tian Tian, Associate Professor, Dongbei University of Finance and Economics, Shahekou District, 217 Jianshan Street, Dalian, China, Jiafu Tang

An audio equipment manufacturer would like to depalletize PSUs and load the individual products, together with other PSUs, into a container, such that the volume utilization of the container is maximized. Once a PSU is depalletized, all of its products must be loaded into the Container. No PSU should be depalletized if the total volume of complete PSUs loaded in the container is not maximized. This problem is named as Single Container Mix-Loading Problem (SCMLP). We prove that SCMLP is a generalized container loading problem. We develop a beam search based two-phase constructive algorithm. We generated 60 test instances and conducted experiments to demonstrate the effectiveness of our approach.

#### 5 - Realizing Business Potentials from Digital Operations in a Smart Port. A Quantitative View on Container Terminal Operations

Leif Meier, University of Applied Sciences Bremerhaven, An der Karlstadt 8, Bremerhaven, 27568, Germany

Business Managers need to evaluate the impact and potentials from new technologies to change the current situation at any time, i.e. to decrease costs, to increase sales and/or increasing the process flexibility. Therefore, new smart procedures do not require a new thinking in management; they are just another technology that may influence the current business situation. Quant Methods allow unfolding potentials that arise from data-driven-technologies - if we understand and solve the right problems. This study shows potentials - and also limits - from smart Container Terminal operations.

## 6 - Impact of Facility Location and Inventory Allocation in a Blood Supply Chain

Srimathy Mohan, Arizona State University, Department of Supply Chain Management, W.P. Carey School Of Management, Tempe, AZ, 85287-4706, United States, Mohan Gopalakrishnan

The blood supply chain must be well coordinated and high performing. Using American Red Cross (ARC) data, this research focuses on analyzing the strategic decisions that are made when planning for non-blood inventories including, facility location and resource allocation decisions. We first formulate a fixed-charge model to minimize the total cost locating the non-blood supplies and transporting them to the demand points when required. We will also conduct sensitivity analyses for demand input and the fixed facility cost and analyze the impact on location and size decisions. We thus contribute to “management engineering” in the humanitarian logistics domain.

### Ride Sharing and Microtransit

Sponsored: TSL/Urban Transportation

Sponsored Session

Chair: Changhyun Kwon, University of South Florida, Tampa, FL, 33620, United States

#### 1 - Locality Sensitive Hashing Based Matching for Ride-Sharing

Chinmoy Dutta, Lyft, Mountain View, CA, 94040, United States

A standard approach to ride-matching is to generate all feasible matchings of rides, filter and score them, and solve a constraint optimization problem. For large ride-sharing platforms, generating all the feasible matchings is an impractical combinatorial problem. We propose a novel method to circumvent this combinatorial challenge using locality-sensitive hashing which lets us efficiently construct a high-quality set of feasible matches.

#### 2 - A Practical Iterative Combinatorial Auction Design for Fractional Ownership of Autonomous Vehicles

Aigerim Bogrybayeva, University of South Florida, Tampa, FL, United States, Mahdi Takaloo, Hadi Charkhgard, Changhyun Kwon

This study explores a market design for fractional ownership of autonomous vehicles (AVs), where an AV is co-owned by a group of individuals. In particular, a practical combinatorial auction design based on the well-known Combinatorial Clock Auction is proposed. The study discusses the unique features and challenges of the proposed auction and provides insights on the design performance based on numerical experiments.

#### 3 - Computationally Efficient Truthful Mechanisms for Large-scale P2P Ridesharing Systems

Neda Masoud, University of Michigan Ann Arbor, 2350 Hayward St., 2124 Gg Brown Bldg., Civil And Environmental Engineering, Ann Arbor, MI, 48109, United States, Roger Lloret

We present a truthful Maximal-In-Distributional-Range (MIDR) randomized mechanism for NP-hard large-scale P2P ride-sharing problems, based on the Lavi-Swamy scaling decomposition technique. Instead of using the ellipsoid algorithm, we design a column generation scheme which makes the technique tractable for large-scale problems. Two pricing problems are tested: exponential exact and quasi-polynomial state-space relaxation.

### Advances in Facility Location Algorithms

Sponsored: TSL/Facility Logistics

Sponsored Session

Chair: Xin Wang, University of Wisconsin-Madison, Madison, WI, 53562-4278, United States

#### 1 - Linear-Time Sweeping Algorithm for Discretization of Continuum Approximation

Xiaopeng Li, University of South Florida, Tampa, FL, 33620, United States, Hongqiang Fan, Lifan Yun

This paper proposes a construct-heuristic algorithm, the direct sweeping algorithm, to discretize a continuous location solution for the continuum approximation model. This algorithm is based on the idea of spatial searching and has only a linear computational complexity. Through the numerical examples, we study the performance of our proposed algorithm. The results of case studies indicate that this algorithm can solve the discrete facility locations problem more efficiently and has a robust performance compared with existing discretization algorithm.

#### 2 - Charging Electric Vehicle Sharing Fleet

Long He, National University of Singapore, Mochtar Riady Building, BIZ1 8-73, 15 Kent Ridge Drive, Singapore, 119245, Singapore, Guangrui Ma, Wei Qi, Xin Wang

In this paper, we develop models to jointly optimize the sites and sizes of charging stations, along with the coupled fleet charging and repositioning operations. We closely track EV energy levels and explicitly depict stochastic charging operations. We formulate the problem as a nonlinear optimization program and develop approximation optimization models as lower and upper bounds, which is computationally efficient. With real data sets of car2go's operations in San Diego, we further conduct retrospective and futuristic case studies to discuss several managerial implications.

#### 3 - Integrating Car-sharing with Public Transit

Xin Wang, University of Wisconsin-Madison, Madison, WI, 53562-4278, United States, Yikang Hua

Car sharing service complements public transit with flexibility while reducing personal vehicles ownership. We build a continuous approximation model to help design car sharing infrastructure based on existing public transit network. We consider both the profitability of car sharing service and improvement of travelers' utility.

#### 4 - Performance Evaluation and Optimization of Reliable Sensor Deployment

Zhoutong Jiang, University of Illinois, Champaign, IL, 61820, United States, Siyang Xie, Yanfeng Ouyang

The accuracy of object positioning and surveillance depends on how multiple sensors are deployed in the sensor system and might suffer from probabilistic disruptions. To evaluate the performance of such system and optimize the sensor deployment strategy under different design criteria, we first develop a continuum approximation model to estimate the system cost and then optimize the sensor deployment strategies for different objectives. A series of numerical experiments are conducted to illustrate how the proposed model can be applied to provide near-optimum results within a very short computation time.

### Transportation-Planning II

Contributed Session

Chair: Zhongxiang Wang, University of Maryland, Greenbelt, MD, 20770, United States

#### 1 - A Hub-based Rebalancing Method for Free-floating Bike Sharing Systems

Vahid Mahmoodian, PhD Student, University of South Florida, ENG 226, 4202 E. Fowler Ave, Tampa, FL, 33620, United States, Yu Zhang, Hadi Charkhgard

In this study, a hub-based simulation model is presented to rebalance bikes in a free-floating bike sharing system. Such systems are one of the new transportation modes that received attention in recent years. This is highlighted by the fact that many companies with station based bike sharing systems are switching to free-floating systems. The proposed model takes advantage of both user and operator based rebalancing in order to maximize the service level and minimize the cost. The approach is applied to a real-world bike sharing setting and computational results show its efficacy.

#### 2 - Taxonomy and Abstraction of the On-demand Mobility Aviation System for Smarter Cities

Wancheng Dai, Florida Institute of Technology, 150 W. University Blvd, Melbourne, FL, 32901, United States, Rodrigo Mesa Arango

On-demand mobility (ODM) is a new transportation system providing point-to-point air services to metropolitan travelers. ODM can significantly decrease travel times and potentially improve several ground-transportation externalities, like emissions and congestion. However, the complexity and novelty of future ODM systems impede its proper understanding for informed decisions. This work employs a system of systems framework to characterize the ODM system, and guide modeling efforts that can answer related questions by stakeholders of the system.

#### 3 - A Cell-based Transportation Planning Model of Humanitarian Logistics and its Application

Kazuaki Okubo, Associate Professor, Ehime University, 3 Bunkyo machi, Matsuyama city, Matsuyama, 790-8577, Japan, Pang-jo Chun

We proposed an optimal transportation model for emergency relief supplies based on cell-based Merchant Nemhauser model. The model minimizes the total transportation time from supply origins to shelters and provides an optimal allocation of the supplies and labors in a dynamic setting. We applied the model to an earthquake disaster in Ehime Prefecture to evaluate the effect of changes in depot location. We show an additional depot enables the transportation in the shorter time. And it also improves the robustness of transportation against variation in the amount of supply and demand.

#### 4 - A Design of a Socially Inclusive Bikeshare System with Station Location Optimization

Xiaodong Qian, University of California-Davis, Davis, CA, 95616, United States, Miguel A.Jaller Martelo

Bikeshare programs are increasingly popular in the United States. However, far less attention has been paid to bikeshare programs' potential to provide greater essential services for underserved communities. To date, there is virtually no quantitative research on how to design bikeshare systems for underserved communities. This research is aimed at designing a socially inclusive bikeshare system from the perspective of bikeshare station optimization. We will decide the optimized locations by solving a multi-objective optimization problem: 1) minimizing the differences of accessibility improvement between different communities and 2) maximizing the revenue generated.

#### 5 - Estimating the Influence of Time Perception in Mode Choice for a Gondola Lift Transit System – Metrocable Medellin

Daniela Jurado, Universidad Nacional De Colombia Sede Medellin, Carrera 78AA#56-49, Medellin, 050034, Colombia, Rodrigo Mesa Arango

This research studies the effect of access-queue time on the choice between competing transit modes, i.e., bus and Metrocable (an unconventional gondola lift transit system), in Medellin, Colombia. Data from Metrocable's critical influence areas are collected through stated/revealed preference surveys. Advanced econometric models are used to quantify the effect of queue waiting time perception on mode choice. Results support the implementation of policies to reduce queue-time subjectivities and increase system demand.

#### 6 - A Fast Heuristic Algorithm for School Bus Routing Problems with Trip Compatibility

Zhongxiang Wang, PhD Candidate, University of Maryland, Greenbelt, MD, 20770, United States, Ali Shafahi, Ali Haghani

School bus planning problem is decomposed into the routing and scheduling subproblems. We present a new approach to incorporate the scheduling information (trip compatibility) into the routing such that the interrelationship between subproblems is considered in the decomposed problems. A novel heuristic is presented to solve the decomposed school bus routing problem with the trip compatibility. The first step finds an initial solution using an iterative minimum cost matching-based insertion heuristic. Then, the initial trips are improved using a Simulated Annealing and Tabu Search hybrid method. Experiments show our heuristic improves existing solutions up to 25% on the benchmark problems.

Contributed Session

Chair: Darweesh E. Salamah, Mississippi State University, MS, 39763-9542, United States

#### 1 - The Model and Optimization of Container Drayage Problem in Truck Platooning Mode

Jintao You, PhD Candidate, Graduate School at Shenzhen, Tsinghua University, E302F, Datong building, University Town, Shenzhen, 518055, China, Zhaojie Xue

This paper investigates a container drayage problem in which trucks operate in platoon mode. One fleet can be operated by only one driver in the leading truck, while the rest trucks follow the leading one by using semi-autonomous driving technique. A group of leading manned trucks and following unmanned trucks are synchronously scheduled to serve a set of full-container-load customers within a time horizon. A general mathematical model is proposed to describe this problem as a variant of VRP with alterable capacity, temporal constraints and OD pairs. Considering the NP essence of this problem, a local search based heuristic method is proposed to solve the problem.

#### 2 - An Optimized Route for Q100's Bert and Kristin to Visit All Jersey Mike's Subs in Atlanta for Charity

Jessica Rudd, PhD Student, Kennesaw State University, 1000 Chastain Rd, Kennesaw, GA, 30144, United States, Lauren Staples, Sanjoosh Akkineni, Andrew Henshaw

The project built an optimal route for two popular radio show hosts to visit each of the 37 Atlanta area Jersey Mike's Subs in one day. This supported a fundraising effort to send children with chronic and terminal illnesses to Disney World. We developed a combined approach to the Multiple Traveling Salesman Problem that pairs a custom genetic algorithm with Google's combinatorial optimization solver.

#### 3 - Work Crew Routing Problem for Infrastructure Network Restoration

Nazanin Morshedlou, University of Oklahoma, Norman, OK, 73071, United States, Kash Barker, Andres David Gonzalez

This presentation introduces a synchronized routing problem for planning and scheduling restorative efforts for infrastructure networks in the aftermath of a

disruptive event. In this problem, a set of restoration crews are dispatched from depots to a road network to restore the disrupted infrastructure network. Two mathematical formulations are presented to scheduling and sequencing disrupted network components to restoration crews and route the crews towards disrupted components to maximize network resilience progress in any given time horizon. We further introduce a feasibility algorithm to derive a strong initial solution for the routing restorative capacity problem.

#### 4 - Management of Charging Stations' Interrelated Electrical Infrastructure Systems under Major Disruption:

##### A Mathematical Model

Darweesh E. Salamah, Mississippi State University, Mississippi State, MS, 39762, United States, Mohannad Kabli, Mohammad Marufuzzaman, Salem Batiyah

Electric vehicles are envisioned to become the main transportation mode for the future. Electrical Infrastructure is a vital component in the operation of electric vehicles' charging stations. Building a resilient electric system that minimizes the power restoration time is essential for a smooth operation of future transportation modes. This paper aims to fortify the connections within and in between all related electrical structures and charging stations to face against any deliberate or sudden power disruptions. A mathematical model is built with the aim of minimizing disruption costs.

#### Vehicle Routing

Contributed Session

Chair: Jihyun Jo, Pennsylvania State University, 234 Leonhard Building, University Park, PA, 16802, United States

#### 1 - Routing Optimization in Bulk Transportation with Compatibility Constraints

Ugandhar Delli, Graduate Research Assistant, Kansas State University, Manhattan, KS, 66502, United States, Ashesh Kumar Sinha

We analyze bulk transportation with specialized wash operation after every delivery. Unlike traditional vehicle routing problems, the interaction properties of chemical/liquid bulk orders must also be accounted for that impose complex product-sequencing constraints. We propose an integrated approach that combines the efficacy of column generation and efficient graph decomposition to account for compatibility constraints while optimizing trailer-wash-order combinations.

#### 2 - A Risk Based Border Surveillance Using Drones with a Dynamic Wireless Charging System

Navid Ahmadian, University of Houston, Houston, TX, United States, Gino J. Lim, Seon Jin Kim, Maryam Torabbeigi

We propose a risk-based surveillance model using unmanned aerial vehicles (UAVs) for border patrol. The short flight duration of drones is a major drawback for such a system. So, we use the dynamic wireless charging system to increase the flight time of the drones in real time. Assuming that each location is associated with a different priority of coverage, a risk-based MIP model is proposed to increase the frequency of visiting the highly critical locations. To accomplish our goal, we first split the total area into sub-areas based on the risk associated with their location, and assign a drone to each sub-area. Then, we find the optimal path and also location of the E-line system related to each drone.

#### 3 - Asymmetric Formulations for the Symmetric Capacitated Vehicle Routing Problem

Sune Lauth Gadegaard, Assistant Professor, Aarhus University, Fuglesangs Alle 4, Aarhus V, 8210, Denmark, Jens Lysgaard

In this talk, we present results obtained using new polynomial formulations for the symmetric capacitated vehicle routing problem. The formulations decompose each route into two paths originating at the depot and meeting at the customer having the largest index (the peak customer) on the route. We outline a branch and bound like algorithm exploiting the formulation and present computational results.

#### 4 - Multi Objective Models for Dynamic Vehicle Routing Problem in City Logistics

Gitae Kim, Hanbat National University, Dept. of Industrial Management Engineering, School of Engineering, Daejeon, 34158, Korea, Republic of

Stakeholders such as shippers, carriers, residents, and local authorities in city logistics have their own different objectives that may cause conflicts each other. Accordingly, the city vehicle routing problem could consider the benefits of stakeholders. However, there are lack of studies considering the concerns of multiple stakeholders. This paper investigates the multi objective models for the vehicle routing problems in city. We consider both dynamic and stochastic conditions for the vehicle routing problem. The stochastic dynamic programming model combined with multi objective model is proposed. We also provide the numerical results to present the models.

### 5 - The Time Dependent Vehicle Routing Problem with Time Windows and Real Traffic Penalties Benchmark Problems and a Simulated Annealing Heuristic

Shin-Yu Lin, Metropia, Tucson, AZ, 85719, United States  
National Taiwan University of Science and Technology, 43,  
Section 4, Keelung Road, Taipei, 10607, Taiwan, Yi-Chang Chiu,  
Vincent F. Yu, Ali Arian

In this study, the time dependent vehicle routing problem with time windows and real traffic penalties (TDVRPTW-RTP), a variant of vehicle routing problem (VRP) when considering time dependent travel times, time windows demands, and traffic behavior, is introduced and formulated. A new dataset is created by modifying Solomon dataset and is solved by our proposed simulated annealing heuristic (SA) and multi-start SA (MSA). This study collects time dependent travel time with traffic penalties data and apply our proposed heuristic to a real world application in Taipei, Taiwan. The best solutions during the sensitivity analysis are used as benchmarks for further research comparing.

### 6 - Vehicle Routing Problem with Markov Decision Process

Jihyun Jo, Pennsylvania State University, 234 Leonhard Building,  
University Park, PA, 16802, United States

Static delivery vehicle routing problem is difficult to apply in urban transportation network due to the several reasons. For example, traffic conditions are changed dynamically. In addition, it is difficult to adapt the other path options. To handle these problems, we consider Markov decision process model. The objective of the model is finding optimal action at a given network condition. Optimal action contains the next location to visit as well as path option that agent will take. We assume fully observable stochastic network conditions when the agent make a decision. In this presentation, we define the mathematical model and introduce simple approximate method.

### Game Theory I

Contributed Session

Chair: Xicheng Yin, Tongji University, 1239 Siping Road, Shanghai,  
P.R., China

#### 1 - Design of Third Party Intervention Strategy in the Conflict

Haiyan Xu, Nanjing University of Aeronautics and Astronautics,  
23 Avenue Guy de Collongue, Nanjing, 69130, China

This research aims to provide the intervention strategy for the third party to mediate the conflict between two decision makers. The intervention strategy is designed to minimize the adjustments of preferences of the two DMs to make them achieve an equilibrium easily based on the graph model for conflict resolution. Therefore, an integer program is constructed with the constraints based on the requests. The solutions of this model can assist the third party to guide DMs to be stable for a given state.

#### 2 - Compensation Regulation and More Hazard in Banking

Minglong Zhou, NUS, 1 Business Link, Singapore,  
Jussi Keppo

We model banking industry as a three stage asymmetric game between regulators, banks, and bankers. The regulators affect banks and bankers' incentives by using different compensation regulations. We identify conditions under which different compensation regulations are effective. Our results also explain observed behavior in the industry.

#### 3 - Online Privacy and Information Disclosure by Consumers

Shota Ichihashi, Stanford University, 579 Serra Mall, Stanford, CA,  
95051, United States

I study the welfare and price implications of consumer privacy. A consumer discloses information to a multi-product firm, which learns about his preferences, sets prices, and makes product recommendations. While the consumer benefits from accurate product recommendations, the firm may use the information to price discriminate. I show that the firm prefers to commit to not price discriminate to encourage information disclosure. However, this commitment hurts the consumer, who could be better off by precommitting to withhold some information. In contrast to single-product models, equilibrium is typically inefficient even if the consumer can disclose any information about his preferences.

#### 4 - Prospect Games and Regulated Prospect Games: Modeling Adversarial Inducement

Brian J. Lunday, Air Force Institute of Technology, 2950 Hobson  
Way, Wright Patterson Air Force Base, OH, 45433, United States,  
William Caballero, Richard F. Deckro

Populations are often confronted with multiple entities simultaneously attempting to influence their actions. Herein, we describe two new game theoretic frameworks, denoted as prospect games and regulated prospect games, that respectively model (a) the interactions of competing persuaders affecting a

populace and (b) the actions of a regulating agent to alter such a framework, and illustrate civil applications thereof. We provide a modeling framework for competitive persuasion operations, develop model variants that respectively correspond to scenario-specific modifications, and identify and selectively illustrate practical solution methods for the suite of models.

### 5 - Agent-based Opinion Formation Modeling in Social Network: A Perspective of Social Psychology and Evolutionary Game Theory

Xicheng Yin, PhD Student, Tongji University, Shanghai, 200092,  
China, Hongwei Wang, Pei Yin

We propose an agent-based online opinion formation model based on attitude change theory, group behavior theory and evolutionary game theory in the perspective of sociology and psychology. Three factors influence the persuasion process, including credibility of the leaders, characteristic of the recipient, and group environment. The model is applied to Twitter to analyze the influence of topic type, parameter changing, and opinion leaders on opinion formation. Results show that controversial topic shows greater uncertainty and sustainability. The ratio of benefit to cost has a significant impact on opinion formation. Celebrities are more capable of influencing public opinion than experts.

### Hub and Air Cargo Operations

Sponsored: Aviation Applications

Sponsored Session

Chair: Farshid Azadian, Embry-Riddle University, College of Business,  
Daytona Beach, FL, 32114, United States

#### 1 - A Sustainable-resilient Network Design for Indian Aviation Sector

Suresh Kumar Jakhar, Indian Institute of Management Lucknow,  
IIM Lucknow Campus, Lucknow, 226013, India

We propose a capacitated multiple allocation p-median hub location problem. The multiple objective functions consider economic, environmental, and social performance goals. We deal with inherent uncertainty in parameters by using mean absolute deviation and fuzzy possibilistic-stochastic programming. The proposed formulation is used in a case study of Indian aviation industry.

#### 2 - Comparing the Fixed and Flexible Hub Assignment Approaches When Solving the Express Shipment Service Network Design Problem

Jose Miguel Quesada, Universit  catholique de Louvain,  
Av Moliere 325, Uccle, 1180, Belgium, Jean-Charles Lange,  
Jean-Sebastien Tancrez

When solving the Express Shipment Service Network Design (ESSND) problem, most models from the literature assume that the assignment of packages to hubs is fixed. However, there are no methods in the literature to determine such hub assignments. We first develop an exact model that integrates the hub assignment decisions into the ESSND problem. Then, we develop 4 heuristic methods to determine the hub assignments for the fix hub assignment approach. Finally, we compare the fix and flexible hub assignment approaches with realistic instances, showing clear advantages for the flexible approach.

#### 3 - Unpaired Pickup and Delivery Problem with Time Dependent Assignment Costs

Farshid Azadian, Associate Professor, Embry-Riddle University,  
Daytona Beach, FL, 32114, United States

This study considers a freight forwarder's operational implementation of alternative access airport policy in a multi-airport region for cargo transportation. Given a set of heterogeneous air cargo customers, the forwarder's problem is to simultaneously select air cargo flight itineraries and schedule the pickup and delivery of customer loads to the airport(s). This problem is formulated as a novel pickup and delivery problem, where the delivery cost is both destination and time dependent. A mixed-integer linear model in presented and an efficient solution method based on decomposition is developed. The performance of the solution algorithm is evaluated by computational experimental study.

## ■ WB36

North Bldg 224B

### Inventory Management II

Contributed Session

Chair: Emre Berk, Bilkent University, Faculty of Business Administration, Ankara, 06533, Turkey

#### 1 - Inventory Model for Fresh Produce Considering Price, Freshness, and Displayed Stock Level Dependent Demand

Bhavin J. Shah, Associate Professor, Indian Institute of Management, Indore, Faculty Office # C-206, First Floor, Prabandh Shikhar, Indore - Madhya Pradesh, 453556, India, Hasmukh Gajjar

An inventory model is proposed for fresh produce items to determine unit price, cycle time, displayed stock level, and ending inventory to maximize retailer's total profit. Demand is considered to be deterministic and dependent on price, freshness and displayed stock. Numerical examples are presented to highlight the theoretical results.

#### 2 - Spare Parts Inventory Control with Phase-out Returns and Additive Manufacturing

Yayun Jin, North Carolina State University, Raleigh, NC, 27607, United States, Russell Edward King, Donald Paul Warsing, Semra Sebnem Ahiska

Manufacturers are concerned with the inventory control of spare parts in the final phase of their service lifecycle. The final phase starts when the specified tooling to produce this type of spare parts is disposed after the final production run, and it ends when the products associated with the spare parts are no longer used. We consider the inventory control with stochastic demand and deterministic returns where the stock is replenished by newly manufactured parts, phase-out returns and repaired defective parts. We formulate this problem as a Markov decision process model and based on the characterization of the optimal policy, we propose newsvendor-like heuristic policies that perform very well.

#### 3 - Newsvendor Model Revisited with Crowdfunding

Emre Berk, Bilkent University, Faculty of Business Administration, Ankara, 06533, Turkey

I revisit the classical newsvendor model in the presence of financing uncertainty. I consider reward-based P2P lending. The decision maker faces the possibility of not being able to raise enough capital to successfully launch the product. The financing phase is modeled in a two ways - each corresponding to a market segmentation. The impact of financing uncertainty on optimality is examined analytically and numerical examples are provided.

Chair: Jing Dong, Columbia University, New York, NY, 60208, United States

#### 1 - Time-varying Tandem Queues with Blocking: Comparing Operating Mechanisms in Hospital Networks

Noa Zychlinski, Avishai Mandelbaum, Petar Momcilovic

We focus on the mechanisms of Blocking After Service (BAS) and Blocking Before Service (BBS), in time-varying many-server queues in tandem. BAS arises in hospitals when patients must remain in their current ward even after completing their treatment, since there is no available bed at the next ward to which they are referred. BBS arises in short procedures such as cataract surgery, cardiac catheterization and hernia repair: the procedure begins only when there is an available bed for the patient in the recovery room. Using reflection analysis, we develop the fluid limit for each mechanism. This gives rise to design/operational insights including a performance comparison between the two mechanisms.

#### 2 - Forecasting Arrivals and Occupancy Levels in an Emergency Department

Xiaopei Zhang, Columbia University, New York, NY, 10025, United States, Ward Whitt

This is a sequel to Whitt and Zhang (2017), where we developed an aggregate stochastic model of an emergency department. The new work here focuses on forecasting future daily arrival totals and predicting hourly occupancy levels, given recent history. By involving more data, we identify i) long-term trends in both the arrival process and the length-of-stay distributions and ii) dependence among successive daily arrival totals. Both highly structured models and flexible machine learning methods are explored. We find that a SARIMAX time-series model is most effective. We then combine our previous ED model with the arrival prediction to create a real-time predictor for the future ED occupancy levels.

#### 3 - Value-based Healthcare Associated Infection Prevention Scheme Using Machine Learning

Elioth Sanabria, Columbia University, New York, NY, United States, David D. Yao

Healthcare associated infections (HAI) cost 9.8 billion USD per year, making them a major problem for the US healthcare system. We present a machine learning (ML) aided scheme to give patient targeted preventive measures. This scheme aligns the economic incentives of the hospital to give preventive measures to more patients while reducing overall infection costs. We provide probabilistic guarantees on the economic performance of the scheme for any fitted ML model based on a combination of machinery from NP (Neyman Pearson) classification and VC (Vapnik Chervonenkis) theory. We illustrate the methodology with data of hospital admissions between 2009 and 2016 at NewYork Presbyterian Hospital.

#### 4 - On Modeling Patient-flow Dynamics in the Obstetrics and Gynecology Inpatient Unit

Jing Dong, Columbia University, New York, NY, 60208, United States, Yue Hu, Ohad Perry

We study the patient flow dynamics of the Obstetric and Gynecologic inpatient unit of a large teaching hospital in the US. The model we build is easy to calibrate, highly interpretable and captures the main features of patient flow dynamics in the unit. We also study the day-of-the-week effect on the occupancy level and provide key insights on modeling and managing hospital queues.

#### 1 - Delay Asymptotics and Bounds for Multi-task Parallel Jobs

Weina Wang, Carnegie Mellon University, Pittsburgh, PA, United States, Mor Harchol-Balter, Haotian Jiang, Alan Scheller-Wolf, R. Srikant

Motivated by file retrieval in cloud storage systems, we study a problem where jobs consist of multiple tasks and a job is completed only when all of its tasks are completed. The goal is to characterize the tail probabilities of job delay. However, this is a difficult problem whereas computing tail probabilities of task delays is relatively easy. By proving that the task delays at the various servers are associated, we show that assuming independence among task delays yields upper bounds on the tail probabilities of job delay. We then further show that the job delay converges to this upper bound in an asymptotic regime where the number of servers grows and the number of tasks in a job is also allowed to grow.

#### 2 - Bayesian Learning with Random Arrivals

Randall Berry, Northwestern University, Department of EECS, 2145 Sheridan Road, Evanston, IL, 60208, United States, Tho Le, Vijay Subramanian

We consider the impact of uncertainty about agent arrivals on a model of Bayesian observational learning. We study a discrete-time model in which in each time-slot, an agent may randomly arrive. Agents who arrive have the opportunity to buy a given item. If an agent chooses to buy, this action is recorded for subsequent agents. However, the decisions of agents that choose not to buy are not recorded. Hence, if no one buys in a given slot, agents are unaware if this was due to no agent arriving or an agent choosing not to buy. We study the impact of this uncertainty on the emergence of information cascades.

#### 3 - Heavy Traffic Delay Analysis in Data Center Networks

Siva Theja Maguluri, Georgia Institute of Technology, Atlanta, GA, 30339, United States, Daniela Hurtado Lange

The drift method has been recently developed to study queueing systems in heavy traffic. This method was successfully used to obtain the heavy traffic scaled sum queue lengths in data center networks, even when the so-called complete resource pooling condition is not satisfied, i.e., when there is more than one bottle-neck resource. In this talk, I will present a novel view of the drift method. Using this view, we will present recent developments in obtaining the complete distribution of the queue lengths in heavy-traffic.

#### 4 - Achieving Small Delay in Data Center Networks

Carolyn Beck, University of Illinois, Urbana, IL, United States, Dimitris Katselis, R. Srikant, Weina Wang

We will consider packet-level and file-level models of data center networks. For both models, we will explore whether simple resource allocation schemes can achieve order-optimal delays.

### Recent Advances in Simulation Analysis Methodology

Sponsored: Applied Probability

Sponsored Session

Chair: Eunhye Song, Penn State University, University Park, PA, 16802, United States

#### 1 - Mo-score for Multi-objective Ranking and Selection

Eric Applegate, Purdue University, West Lafayette, IN, 47907, United States, Guy Feldman, Susan R. Hunter, Raghu Pasupathy

Consider the context of selecting Pareto-optimal systems from a finite set of systems based on multiple stochastic objectives. We characterize the asymptotically optimal sample allocation that maximizes the rate of decay of the probability of misclassification, and we provide a multi-objective SCORE (MO-SCORE) allocation for use when the number of non-Pareto systems is large relative to the number of Pareto systems. The MO-SCORE allocation exploits phantom Pareto systems in high dimensions, which we find using a dimension-sweep algorithm.

#### 2 - Effort Allocation and Statistical Inference for Multistart Stochastic Gradient Descent

Saul Toscano, Cornell University, Peter Frazier

Multistart stochastic gradient descent methods are widely used for gradient-based stochastic global optimization. However these methods seem to waste computational resources: when several starts are run to convergence at the same local optimum, all but one fail to produce useful information; when a start converges to a local optimum worse than an incumbent solution, it fails to produce useful information. We propose a rule for allocating computational effort across starts, which allocates more resources to the most promising starts. This allocation rule is based on a new statistical model, which agrees with known convergence rates for SGD. Numerical results show the effectiveness of our rule.

#### 3 - Online Quantification of Input Uncertainty for Parametric Models

Enlu Zhou, Georgia Institute of Technology, 755 Ferst Drive NW, Atlanta, GA, 30332-0205, United States, Tianyi Liu

It has become increasingly important to assimilate “online data that arrive sequentially in time for real-time decision. Input uncertainty quantification in stochastic simulation has been developed extensively for batch data that are available all at once, but little has been studied for online data. We propose a computationally efficient method to incorporate online data in real time for input uncertainty quantification of parametric models. We show finite-sample bounds and asymptotic convergence for the proposed method, and demonstrate its performance on a simple numerical example.

#### 4 - Efficient Simulation Design for Risk Management of Large Variable Annuity Portfolios

Ben Feng, University of Waterloo, 217 Holbeach Cres, Waterloo, ON, N2J 4Y3, Canada

Variable Annuities (VAs) are popular insurance products in practice. Monte Carlo simulation is usually required to value VA contracts due to their complexities. However, computations required for valuation of every contract in a large VA portfolio via standard MC could be prohibitively expensive. We develop and examine experiment designs that can significantly improve the efficiency of simulation experiments for large VA portfolios. We also identify pitfalls in some of the existing methods and propose corresponding improvements. We show that the proposed simulation procedure has both higher accuracy and lower computational requirement than the state-of-art procedures.

### Practice – Modeling and Optimization for Decision Making I

Contributed Session

Chair: Bjarni Kristjansson, Maximal Software Inc., Arlington, VA, 22201, United States

#### 1 - Optimize Urban Agriculture to Address Food Deserts in Semi-arid Areas

Daoqin Tong, Associate Professor, Arizona State University, School of Geographical Sciences and Urban Planning, 975 S. Myrtle Ave., Tempe, AZ, 85287, United States, Qing Zhong, Courtney Crosson

Accessing to healthy, affordable food remains a great challenge in many neighborhoods, leading to the existence of food deserts. Recently, urban agriculture has been identified as an important strategy to help address urban food deserts. However, producing food in the urban setting can be challenging due to limited land availability and high water cost. This paper develops a spatial optimization model to integrate rainwater harvesting, urban municipal land

availability (including soil capacity) and local nutritional needs to evaluate the potential impact of urban food systems in the growing urban Southwest.

#### 2 - Long-term Production Planning Under Demand Uncertainty

Joost T. de Kruijff, Eindhoven University of Technology, Den Dolech 2, Eindhoven, 5600 MB, Netherlands, Nico P. Dellaert, Cor A. Hurkens, Ton de Kok

We focus on long-term production planning. Where mid-term production planning coordinates the release of materials and capacity aiming to minimize the costs of inventory and backlog given the demand, long-term planning focusses on decisions regarding investments in resources and materials to support long-term sales. Taking into account the uncertainty in the long-term sales, we make a tradeoff between revenue creation and investments in capacity and/or inventory. These investments do not take effect immediately; we explicitly take into account the possibility to change plans when we learn more about the future. We base our modelling on practices in the high-tech low-volume industry.

#### 3 - Nonconvex Discrete Optimization Approach for Highdimensional Regression

Yuji Nakagawa, Professor, Kansai University, Department of Informatics, 2-1-1 Ryozanji-Cho, Takatsuki-City, 569-1095, Japan, Yoshiko Hanada, Youichi Takenaka, Youichi Takenaka, Chanaka Edirisinghe

In high-dimensional regression, where the number of explanatory variables is much larger than the sample size, a statistical problem known as the ‘curse of dimensionality’ arises. The strategy of performing all possible regressions is computationally-impractical. We model using non-convex discrete optimization to minimize MSE. We describe an application involving a large number of SNPs in genomic studies for cancer detection.

#### 4 - Using Json and Nosql Databases to Deliver Data for Deploying Optimization Models on the Cloud

Bjarni Kristjansson, Maximal Software Inc., 2111 Wilson Boulevard, Suite 700, Arlington, VA, 22201, United States

When preparing optimization models for deployment, it is often not the formulation of the model or the solving that is the most difficult part, but rather how to organize and deliver the data efficiently to the model. Using modeling languages, this problem can be alleviated by importing data directly from SQL databases and spreadsheets, but this is still not easy enough. In this presentation, we will demonstrate how using the JSON data format can be particularly well suited for organizing optimization data. Furthermore, using NoSQL databases such as MongoDB and CouchDB, which are very efficient at storing dynamic data, give the model developer new opportunities for deploying optimization on the cloud.

#### 1 - Technology Adoption in a Declining Market

Maria Lavrutich, Norwegian University of Science and Technology, Trondheim, Norway

Rapid technological developments are inducing the shift in consumer demand from existing products towards new alternatives. When operating in a declining market, the profitability of incumbent firms is largely dependent on the ability to correctly time the introduction of product innovations. This paper considers the optimal innovation investment in the context of the declining market. We study the problem of a firm that has an option to undertake the innovation investment and thereby either to add a new product to its portfolio or to replace the established product by the new one. We are able to quantify the value of the option to adopt a new technology, as well as the optimal timing to exercise it.

#### 2 - Integrated Scenario based Robust Planning Approach for Foresight in Blockchain Technology

Leili Soltanisehat, The University of Oklahoma, 815 Russell Circle, E. Brooks St, Norman, OK, 73071, United States, Reza Alizadeh

Blockchain faces major future challenges related to technological, economic, social, and probably political aspects. Here we present a scenario-building framework based on the Global Business Network method to help blockchain to develop more resilient conservation policies when it faces unpredictable and external uncertainties. The approach combines several foresight methods such as Delphi, Political, Economic, Social, and Technological analysis, and Cross-Impact Analysis.

### 3 - The Impact of Product Recall on Advertising in a Duopoly Market

Arka Mukherjee, PhD Candidate, Concordia University, Montreal, QC, H3H 0A1, Canada, Satyaveer S. Chauhan

Product recalls negatively affect the brand image of a responsible firm. Brand image is positively influenced by advertising. We study the optimal advertising strategies of firms in a duopoly environment with an impending product recall. We find that the optimal advertisements for both the firms are dependent on several parameters like initial brand value, pre-crisis and post-crisis profit margin, advertising effectiveness, damage effect of the recall and the recall probability.

### 4 - Modeling the Value of Agents in Supply Chains of Malaria Rapid Diagnostic Test Kits with Decision Analysis

Gilberto Montibeller, Professor of Management Science, Loughborough University, School of Business & Economics, Loughborough, LE11 3TU, United Kingdom

Malaria poses one of the greatest global health challenges. Accurate malaria diagnosis, with rapid diagnostic tests (RDTs), is critical for treating the disease. In this project we developed and deployed a multi-attribute value model for agents along the RDT kit supply chain (manufacturers, first line buyers, and retailers) in Uganda. The model represents the different priorities, incentives, and preferences of each agent in the supply chain and supported the design of high value bundles for RDT kits. The decision analysis provided a systematic evaluation of alternatives and enabled reflection and learning among the stakeholder.

### Queueing Models

Contributed Session

Chair: Iqra Ejaz, Texas A&M University, Bryan, TX, 77801, United States

#### 1 - Determining the Size of Oscillations in Queues with Customer Choice and Delayed Information

Sophia Novitzky, Cornell University, 136 Hoy Road, Ithaca, NY, 14850, United States

With the advancement of online technologies, it is common for the service systems to provide waiting time or queue length information to customers. This information allows the customers to determine whether to remain in line or in the case of multiple lines, which line to join. However, there is usually a delay associated with the waiting time information: either the information is not provided in real time or it takes the customers travel time to join the service after having received the information. Previous work shows that if these delays are large enough, unwanted oscillations in the queue lengths can occur. In this paper, we develop two methods for approximating the amplitude of these oscillations.

#### 2 - Dynamically Scheduling and Maintaining a Flexible Server

Jefferson Huang, Assistant Professor, Naval Postgraduate School, Monterey, CA, United States, Douglas Down, Mark E. Lewis, Cheng-Hung Wu

Advances in sensing technologies have made condition-based maintenance (CBM) in flexible manufacturing systems more economically feasible. We consider the problem of jointly making CBM and scheduling decisions for a server in such a system. In the context of a queueing model of this problem, we show that a natural scheduling heuristic can be extremely suboptimal. We also provide conditions under which one can restrict the search for an optimal policy to policies that (1) schedule according to a static priority rule, and (2) exhibit a certain monotonicity property with respect to the maintenance decisions.

#### 3 - Three-moment Approximation for the Mean Queue Time of a GI/G/1 Queue

Kan Wu, Nanyang Technological University, School of MAE, 50 Nanyang Ave, Singapore, 639798, Singapore, Sandeep Srivathsan, Yichi Shen

The approximation of a GI/G/1 queue plays a key role in the performance evaluation of queueing systems. To improve the conventional two-moment approximations, we propose a three-moment approximation for the mean queue time of a GI/G/1 queue based on the exact results of the H2/M/1 queue. The model is validated over a wide range of numerical experiments. Based on the paired t-tests, our three-moment approximation outperforms the two moment ones especially when both service time and inter-arrival time variabilities are greater than one.

#### 4 - Optimization of Nursing Teams with Patient Assignment Using a Queueing Theory Approach

Parisa Eimanzadeh, Wichita State University, Wichita, KS, 67220, United States, Ehsan Salari

Inpatient units are typically staffed with nursing teams that consist of nurses at different skill levels providing care to patients. This research aims at developing staffing models to determine appropriate staff levels and skill mix for the nursing teams by explicitly incorporating the patient assignment decision. In particular, queueing theory and multi-criteria optimization are combined to find the optimal skill-mix configurations of the nursing teams and the corresponding patient

assignments that minimize staffing costs and nurse burnout while ensuring timely delivery of nursing care.

### 5 - An Efficient Algorithm for Non Markovian Two-node Cyclic Network

Muhammad El-Taha, Professor, University of Southern Maine, Department of Mathematics and Statistics, 96 Falmouth Street, Portland, ME, 04104-9300, United States, Bacer Maddah

Computing the steady state probability distribution of a non-Markovian two-node closed queueing cyclic network is known to be computationally challenging. In this talk, we propose a new efficient convolution method that is significantly more efficient than existing algorithms.

### 6 - Condition-based Maintenance of Queues with Degrading Servers for Stochastic Service Times

Iqra Ejaz, Texas A&M University, College Station, TX, 77843, United States, Michelle M. Alvarado, Natarajan Gautam, Nagi Gebräel, Mark Lawley

We derive an analytical model for condition monitoring of a single server queue with Markovian degradation, Poisson arrivals, and general service and repair times. Stability conditions and performance measures (e.g., average queue length, average degradation.) are derived through steady state analysis. An optimal repair decision model is presented that minimizes an objective function with four costs: repair, catastrophic failure, quality and holding. We develop and verify a simulation model, perform a sensitivity analysis, and show insights learned from relaxing underlying assumptions.

### Stochastic Optimization I

Contributed Session

Chair: Itir Z. Karaesmen, American University, Kogod School of Business, Room 212, Washington, DC, 20016, United States

#### 1 - Two-stage Bond Portfolio Optimization under Different Scenarios

Nasser Alreshidi, PhD Student, Florida Institute of Technology, 150 W. University Blvd, Melbourne, FL, 32901, United States, Ersoy Subasi, Munevver Mine Subasi, Andras Daniel Prekopa

Following Hodges and Schaefer's (1977) deterministic bond portfolio model, where the objective is to minimize the cost of bond portfolio, the bond portfolio optimization has become one of the attractive areas of research in finance literature. In this work we propose a new bond portfolio model as a two-stage stochastic programming problem, where a decision maker may optimize the cost of bond portfolio, while deciding which bonds to sell, which bonds to hold, and which bonds to purchase from the marketplace based upon present market conditions under different scenarios. We present the application of our model on real-world datasets.

#### 2 - Production and Capacity Utilization Strategies in Supply Chains for Complex Engineered Products

Ashesh Sinha, Kansas State University, Manhattan, KS, United States, Ananth Krishnamurthy

We analyze a multi-product manufacturing systems where individual products can be made either at a shared in-house manufacturing facility or at dedicated facilities of external subcontractors. Using Markov decision process models, we determine the optimal policy and derive the set of conditions that partitions the state space into regions and analytically characterize optimal policies and value function in each region.

#### 3 - A Game-theoretic Two-stage Stochastic Programming Model to Protect Cyber Physical Systems Against Attacks

Clara Novoa, Associate Professor, Texas State University, 601 University Dr, San Marcos, TX, 78666, United States, Khan Sidiqqe, Mina Guirguis, Alireza Tahsini

We present two-stage stochastic programming models that determine the check blocks to assign to measurement signals and controls to secure a cyber physical system (CPS). The models incorporate uncertainty on the number of signals to be protected over the horizon considered and on the effectiveness of the check blocks. We illustrate the superiority of the proposed approach by computing the value of the stochastic solution and by comparing to other assignment strategies. Results are validated with a simulation to emulate a component in the operation of an autonomous vehicle and with experiments on a mini-boiler testbed that operates on a closed loop and interacts with a Matlab-Simulink program.

#### 4 - Integrating Logistics and Bidding Decisions in B2B Markets

Itir Z. Karaesmen, American University, Kogod School of Business, Room 212, Washington, DC, 20016, United States

We build an analytical model for brokers that procure and sell goods in a B2B market. The broker submits bids to procure goods from several suppliers. The outcome of the bids are uncertain. After the goods are procured, they are shipped to meet the customer demand. We show how the optimal bids can be determined and computed.

**Operational and Planning Co-ordination for Natural Gas and Electric Power Systems**Sponsored: Energy, Natural Res & the Environment/Electricity  
Sponsored Session

Chair: Ramteen Sioshansi, The Ohio State University, Columbus, OH, 43210, United States

Co-Chair: Antonio J. Conejo, The Ohio State University, Columbus, OH, 43210, United States

**1 - A Combined Repair Crew Dispatch Problem for Resilient Electric and Natural Gas System Considering Reconfiguration and DG Islanding**Zhengshuo Li, Southern Methodist University, Dallas, TX, USA  
Jianhui Wang, Yanling Lin, Bo Chen, Zhaohong Bie

Resilience is an overarching concept that requires combined efforts from interdependent critical infrastructures to achieve. We present a combined repair crew dispatch problem for interdependent electric and natural gas systems. The repair schedule of the two system is coordinated and co-optimized. Both electric system topology reconfiguration and intentional DG islanding are modeled as operational measures to further improve the resilience of interdependent systems. Case studies validate the effectiveness of the proposed method in reducing load shedding and repair duration, and prove that the interdependence has a significant impact on the repair sequence and crew coordination.

**2 - Equilibrium of Interdependent Gas and Electricity Markets with Marginal Price Based Bilateral Trading**

Wei Zheng, Tsinghua University, Beijing, China

This paper studies the marginal price based bilateral energy trading on the equilibrium of coupled natural gas and electricity distribution markets. Convex relaxation is employed to solve a optimal power flow problem. A successive second-order cone programming (SOCP) approach is utilized to solve a optimal gas flow problem. In both problems, locational marginal energy prices are recovered from the Lagrangian multipliers associated with nodal balancing equations. Furthermore, a best-response decomposition algorithm is developed to identify the equilibrium of the coupled energy markets with bilateral gas and electricity trading, which leverages the computational superiority of SOCPs.

**3 - Expansion Planning of Joint Electricity and Gas Networks**Pascal Van Hentenryck, University of Michigan, 1813 IOE  
Building, 1205 Beal Avenue, Ann Arbor, MI, 48108-2117,  
United States, Russell Bent, Seth Blumsack

Recent trends in gas-fired power plant installation has increased the connections between the electric power and natural gas industries. Despite these dependencies, both industries must meet commercial, political, operational and technical requirements that often force the industries to plan and operate in isolation. As a result, undesired situations may arise, such as those experienced by both systems during the winter of 2013/2014 in the northeastern United States. This paper, we consider the technical challenges and present a combined electricity and gas expansion planning model.

**4 - Unit Commitment of Integrated Electric and Gas Systems with an Enhanced SOC Gas Flow Model**Ramteen Sioshansi, Ohio State University, Integrated Systems  
Engineering, 1971 Neil Avenue, Columbus, OH, 43210,  
United States, Antonio J. Conejo, Sheng Chen

Interdependent electric power and gas systems require a coordinated operation framework. This presentation proposes such framework in a form of a unit commitment (UC) model. A second-order cone (SOC) dynamic gas flow model is employed within an UC model, which results in a mixed-integer SOC programming problem. This model is enhanced by using convex envelopes of bilinear terms to tighten the UC solution. Numerical results from two test systems validate the advantages of the proposed enhanced SOC methodology in terms of solution quality and computational efficiency.

**Practice – Environment, Energy, and Natural Resources**

Contributed Session

Chair: Chang Liu, Dongbei University of Finance and Economics, No 217 Jianshan St., Shahekou District, Dalian Liaoning, 116025, China

**1 - The Problem of Information: Moral Hazard and Adverse Selection in Illegal Waste Disposal**Sytske Wijnsma, University of Cambridge, Cambridge,  
United Kingdom, Dominique Lauga

The illegal dumping and trafficking of waste is one of the fastest growing areas of organised crime, mainly due to imperfect monitoring driven by incomplete information. In the presence of imperfect monitoring, waste can be misclassified to hide its true nature or it can be illegally dumped to avoid expensive treatment cost. This paper examines firms' behaviour and non-compliance when they operate under incomplete information with respect to the other agents in the chain. Further, we underscore how increased monitoring of trade bans whilst ignoring the impact of incomplete information on firms' behaviour can have unintended consequences on the export of waste the ban was not even intended for.

**2 - The Effective Mobile Phone Producers Green Supply Chain Management Practices in Reducing Co2 Emissions**Yazan Migdadi, Associate Professor, Qatar University, Doha,  
2713, Qatar

The purpose of this study is reporting the effective mobile phone producers green supply chain management practices to reduce CO2 emissions. Quantitative case study methodology was adopted. This study identified a combination of high impact actions in reducing CO2 emissions related to green purchasing, green production, green distribution, green customers' practices, green business travels, green facilities and offices design actions

**3 - The Influences of Public Environmentalism on Air Pollutant Emissions: A Multilevel Analysis across Chinese Prefecture-level Cities**Chang Liu, Professor, Dongbei University of Finance and  
Economics, No 217 Jianshan St., Shahekou District,  
Dalian Liaoning, 116025, China

Public environmentalism is an effective pollution supervision regulation to moderate pollution emissions, especially when the government has deployed accountability for environmental performance. To what extent will public environmentalism attenuate the effects of economic factors on environmental pollution? We estimate the role of public concern on pollution across 285 Chinese cities over 2004 to 2015 based on the hierarchical structure. The empirical results indicate an inverse U relationship, and public concern over environment can make the cities reach the turning points at a low GDP level. This result has important policy implicates to moderate pollution emissions.

**Optimal Design and Dispatch of Alternative Energy Systems**Sponsored: Energy, Natural Res & the Environment/Energy  
Sponsored SessionChair: Alexandra M. Newman, Colorado School of Mines, Golden, CO,  
80401, United States**1 - Sub-hourly Dispatch Optimization of Photovoltaic and Concentrating Solar Power Hybrid Systems**William T. Hamilton, MS, Colorado School of Mines, Golden, CO,  
80401, United States, Alexandra M. Newman, Robert Braun

Concentrating solar power (CSP) technologies capture thermal radiation from the sun utilizing a field of solar-tracking heliostats. When paired with inexpensive thermal energy storage (TES), CSP technologies can dispatch electricity during peak-market-priced hours. The hybridization of photovoltaic (PV) and CSP with TES systems has the potential to provide continuous energy production at a lower cost than a PV or CSP system alone. To evaluate a PV-CSP hybrid design, we develop a profit-maximizing mixed-integer linear program that determines a dispatch schedule. We present preliminary results from such model with an emphasis on parametric analysis of system design decisions.

## 2 - Integrating Optimized Dispatch with a Concentrated Solar Power Maintenance Simulation Model

Jesse Wales, Colorado School of Mines, Golden, CO, 80401,  
United States, Alexander Zolan, William Hamilton, Alexandra M.  
Newman, Robert Braun

Concentrating Solar Power (CSP) is an emerging large-scale renewable technology that uses sunlight to heat molten salt, which is stored and can be converted to power using heat exchangers and turbines. We describe a maintenance, failure and repair simulation model that interfaces with an optimization dispatch model for a CSP production plant. We optimize an energy dispatch strategy to maximize profit. We simulate planned and unplanned downtimes based on dispatch decisions from the optimization model to quantify the wear-and-tear impacts from operations.

## 3 - Stochastic Optimization Formulations for Wind Turbine Power Maximization and Extreme Load Mitigation

Yankai Cao, University of Wisconsin-Madison, 2009 Engineering  
Hall, 1415 Engineering Drive, Madison, WI, United States,  
Victor Zavala

We propose stochastic programming formulations to enforce mechanical load requirements in wind turbine controller design procedures. The formulations use a probabilistic constraint that captures the long-term probability of exceeding an extreme load threshold. We use the formulations to find design parameters for pitch angle and torque controllers that maximize power output while constraining long-term extreme loads. The proposed formulations can be cast as large-scale (but structured) nonlinear programming problems (NLPs) that contain up to 7.5 million variables and constraints, and can be solved in less than 1.5 hours on a multi-core computer using existing optimization tools.

## 4 - Real-time Optimization of Chillers with Thermal Energy Storage and Variable Electricity Rates

Landen Blackburn, University of Utah, Salt lake City, UT,  
United States, John Hedengren, Kody M. Powell

As more renewable energy is integrated into the power grid, it is increasingly important to exploit variable electricity pricing structures to minimize commercial utility costs. Using data from one of the University of Utah's chiller plants, equipped with a thermal energy storage tank, a novel technique is proposed to optimize this system in real time, formulated as a Mixed-integer Quadratic Programming problem. Future demand is predicted with reasonable accuracy using historic data and current weather forecasts, and the optimized result can easily be calculated in real time. The approach for solving this optimization problem proves very successful when compared to other standard algorithms.

## Sustainable Operations & Development

Contributed Session

Chair: Feiyi Yan, Northwestern Polytechnical University,  
127 West Youyi Road, Xi'an, O, China

### 1 - Eco-investments: Eco-efficiency versus Eco-innovation

Arda Yenipazarli, Associate Professor of Operations Management,  
Georgia Southern University, 2224 College Of Business,  
Department of Logistics & Supply Chain Mgmt, Statesboro, GA,  
30460, United States

We examine environmental investment efforts and whether they should be channeled towards cutting production costs through gains in process-oriented resource productivity (eco-efficiency) or product-oriented eco-differentiation that lowers customers' water/energy/fuel use and related costs (eco-innovation), benefits that justify price premiums, and drive increased market share. While eco-efficiency is easy to pursue with little expertise and capital investment, eco-innovation requires the firm to deal with challenges of managing technology and time-to-market uncertainty.

### 2 - The Impact of Autonomous Vehicles on Traffic Congestion: Is Pooling the Solution to Avoiding Traffic Gridlock?

Sergey Naumov, MIT, Cambridge, MA, 02142, United States

We study the impact of autonomous vehicles (AVs) and ride sharing on traffic volume and road congestion. We develop a dynamic model of travel demand and demonstrate that in the absence of other regulations, the more effective AVs and pooling are at reducing congestion, the stronger is the demand response, offsetting or possibly overwhelming the assumed benefits of AVs. We show that for policies to address the negative externalities of driving effectively, they need to reduce, not increase, the relative attractiveness of driving. Our results have important implications for the design of urban transportation policies.

## 3 - Time Value of Different Information Dimensions on Environmental Technology Adoption

Shadi Goodarzi, Assistant Professor of Operations Management,  
California State University Fullerton, 800 N. State College Blvd,  
Fullerton, CA, 92618, United States, Sam Aflaki, Andrea Masini

We empirically examine the time-dependent impact of different types and channels of information on both the intention to adopt an environmental technology system and the actual adoption decision. The findings have important implications for both policy-making and for technology manufacturing companies that need to optimize their marketing strategy and distribution.

## 4 - Managing Funds in Non-profits: Advertisements, Fundraising and Program Expenses

Nazli Turken, Assistant Professor, Cleveland State University,  
Cleveland, OH, 44107, United States, Janice E. Carrillo,  
Anand Paul

In this paper, we study how non-profits allocate their funds to advertisements, fundraising activities and program expenses to maximize their return on investment. We evaluate the direct and indirect impact of spending on a non-profit's reputation and donations, respectively.

## 5 - An Improved Aggregation Method for Evaluating the Performance of Serial Lines with Unreliable Machines and Finite Buffers

Fei-Yi Yan, Northwestern Polytechnical University,  
127 West Youyi Road, Xi'an, China, Jun-Qiang Wang

Many analytical methods have been developed to evaluate performance of serial lines with unreliable machines and finite buffers. However, these methods cannot perform well in some cases where the machine efficiency is not uniform allocation. To solve this problem, an improved aggregation method that can perform well even in those cases is proposed. First, we demonstrate that the existence of sub-optimal machines causes the lower accuracy of the previous aggregation method. Then, an improved aggregation method is proposed by eliminating the deteriorating effect of sub-optimal machines. This method will help production managers to scientifically evaluate serial lines with higher accuracy.

## Joint Session, ENRE/DM: Sustainability Topics in Urban Environments

Sponsored: Energy, Natural Res & the Environment Environment &  
Sustainability

Sponsored Session

Chair: Victoria C. P. Chen, The University of Texas at Arlington,  
Arlington, TX, 76019-0017, United States

### 1 - Project-level Air Quality Assessment for Active Infrastructure

Stephen Mattingly, Associate Professor, University of Texas at  
Arlington, Box 19308, Arlington, TX, 76019-0308, United States,  
Ziaur Rahman, Colleen Casey

Motor vehicle exhaust emissions represent the single largest source of regional air pollution in urban areas. Outdoor physical activity near heavy-traffic is associated with symptoms of respiratory dysfunction, cardiopulmonary disease and even mortality from stroke. At present, project-level air pollution concentration standards do not exist, so the development of air quality performance measures and standards for physical activity will help decide future activity paths and infrastructure priorities. This research creates performance measures for evaluating the relationship between air quality and the physical characteristics of walking and cycling routes.

### 2 - Modeling and Stochastic Bounds on Multi-agent Demand Response

Alireza Fallahi, TX, United States, Jay Michael Rosenberger,  
Victoria C.P. Chen, Wei-Jen Lee

The renewable energy revolution will substantially alter the future energy. With increasing penetration of stochastic renewable energies, the power distributors must respond to an extremely dynamic, complex, and challenging real-time supply-demand balancing problem, which lead to a dramatically different energy market, both operationally and fundamentally in the near future. This research is designed to bridge the knowledge gap. The mathematical model is proposed and bounds of the optimal operational cost are evaluated.

### 3 - Optimization Based Method for Seismic Rehabilitation of Water Pipe Networks

Azam Boskabadi, PhD Candidate, University of Texas at Arlington, Arlington, TX, United States, Jay Michael Rosenberger, Mohsen Shahandashti, Binaya Pudasaini

We introduce a stochastic programming model for water pipe rehabilitation problem with a recourse flow function to maximize the output flow in the subgraph after earthquake. The stochastic programming model starts with an initial rehabilitation policy in water pipes which shows the decision of rehabilitating water pipes before earthquake, then it considers several random scenarios for the broken pipes after earthquake. We use Benders Decomposition in our study, the master problem finds the best X or rehabilitation policy before the earthquake that maximizes the expected SSL, while each recourse problem assigns maximum output flow in the created subgraph.

### 4 - Sustainability Assessment for Green Building

Shirish Rao, University of Texas-Arlington, Arlington, TX, 76019, United States, Victoria C. P. Chen, Jay Michael Rosenberger, Atefe Makhmalbaf, Takuma Mitani

Building structures have significant impact on environment and energy consumption. Buildings can be designed so that their energy consumption is reduced by using energy efficient materials. The “cradle-to-grave” cycle is a criterion for the environmental effects of materials and minimizing this effect along with energy consumption is of great interest. The goal of the research is to compare different experimental designs and statistical modeling methods to help inform our approach for a multivariate, multi-response green building framework. The results of the experiments are studied by using Treed regression and Multi Adaptive Regression Splines techniques to find influential factors.

### Energy Policy and Planning II

Contributed Session

Chair: Erin Mayfield, Carnegie Mellon University, 5000 Forbes Avenue, Pittsburgh, PA, 15213, United States

#### 1 - Corporate Responses to Public Pressures and Price during an Electric Power Interruption

Shigeharu Okajima, Associate Professor, Osaka University of Economics, 2-2-8 Osumi, Higashiyodogawa-ku, Osaka, 533-8533, Japan

This study investigates corporate electricity consumption behaviors during a power interruption in a natural field experiment. It is found that in general, firms reduce electricity consumption in response to public pressures, but not electricity price increases, and that increasing electricity price is yet effective to reduce electricity consumption of such firms that do not react to public pressures.

#### 2 - Finding Multiple Equilibria in a Dynamic Energy Bilateral Contract Scheduling

Javier Contreras, Universidad Castilla La Mancha, Ciudad Real, Spain, Reinaldo Crispiniano Garcia, Matheus Barbosa, Barbara Macedo, Daniel Monteiro

In the deregulated electricity markets the involved parties, the buyers and the sellers, aim to deliver electricity in time intervals during the contract period to obtain the highest possible profits. This paper implements a model where the parties by a compromise approach achieve a possible equilibria including the Nash and the Raiffa-Kalai-Smorodinski (RKS) ones. An approach in prices and quantities is applied transforming the nonlinear and nonconvex set of the inequalities into a mixed integer linear problem (MILP). A procedure to find all Nash and RKS equilibria is developed by generating “holes added as linear constraints to the feasibility region showing the feasibility of the approach.

#### 3 - A Robust Contingency Constrained Unit Commitment with an N-AK Security Criterion

Jaehee Jeong, Korea Advanced Institute of Science & Technology, Dept. of Industrial and Systems Eng., KAIST, 291 Daehak-Ro, Yuseong-Gu, Daejeon, 305-701, Korea, Republic of, Sungsoo Park

In the power grid systems, the N-k contingency-constrained unit commitment (CCUC) model has been adopted to guarantee the system's reliability. One of the drawbacks of N-k CCUC model is that its robust solution is too conservative. To mitigate this drawback, we propose N-ak CCUC model which excludes some extreme cases with low probability. An economic and reliable robust solution can be achieved by a proper criterion setting. Our model is solved by a Benders' decomposition type algorithm with maximum feasible subsystem cuts. Numerical results on a modified IEEE 118-bus system are reported.

### 4 - Recent Advances in MILP Formulations for the Unit Commitment Problem

Bernard Knueven, Sandia National Laboratories, P.O. Box 5800, MS 1326, Albuquerque, NM, 87185-1326, United States, Jim Ostrowski, Jean-Paul Watson

This paper presents recent work on MILP formulations for the unit commitment problem (UC). UC is that of deciding which power generators to schedule to meet anticipated energy demand, and is of critical importance in the operation of power systems. We review existing MILP formulations along with novel formulations made by combining various ideas from the literature and present a comprehensive computational study of said formulations. In addition, we provide reference implementations of the reviewed formulations in the Pyomo modeling language, along with a library of UC test instances.

### 5 - A Multiobjective Model of Environmental and Labor Market Impacts of Natural Gas Development Decisions in Appalachia

Erin Mayfield, Carnegie Mellon University, Pittsburgh, PA, United States, Jared L. Cohon, Allen Robinson

With the advancement of drilling and fracturing technology and the resulting rapid acceleration of natural gas production, there have been corresponding human health, climate, ecosystem, and labor market impacts. We focus our analysis on Appalachia, a region with a long history of both resource extraction and poverty, as well as, the current location of the highest producing natural gas reservoir in the US. A multiobjective optimization model is formulated in which we optimize spatially-explicit environmental and labor market impacts with respect to decisions regarding the magnitude and timing of natural gas activity. We also incorporate distributive and temporal equity constraints.

North Bldg 231A

### Decision Making

Contributed Session

Chair: Gary R. Waissi, Arizona State University, Cave Creek, AZ, 85331, United States

#### 1 - Using Social Media to Advocate and Enable Knowledge Sharing Within Agile Teams

Deepa Umakanth, Arizona State University, Backus Mall, Mesa, AZ, 85128, United States, Gary R. Waissi (adviser)

This paper discusses a case study of using social media to advocate and enable knowledge sharing within agile teams. Knowledge sharing involves sharing of knowledge with employees, within teams and organizations. Social media aide in the sharing and exchange of knowledge. With a good implementation of Agile framework, tools and online processes to share knowledge effectively, a company can grow effectively and will be able to face the competition. The results indicate that knowledge sharing using online tools is easy, fast and is the current trend with Agile frameworks.

#### 2 - Finding a High Quality Initial Solution for the Traveling Salesman Problem (TSP)

Pragya Kaushal, Arizona State University, Tempe, AZ, United States, Gary Waissi

We propose an efficient algorithm to preprocess the fully dense symmetric network to find a good, feasible, solution for the TSP. The algorithm generates a sequence of spanning trees, and using those constructs a “layered network”. This layered network will include a feasible solution for the TSP. This solution can serve as the starting solution, for example, for the TABU search. We hypothesize, that the quality of the initial solution provided by the proposed algorithm will improve the performance of the TABU search in terms of number of iterations required to reach a high level TSP solution.

#### 3 - A Novel Matrix Technique for Finding an Efficient Solution for the Traveling Salesman Problem (TSP)

Gary R. Waissi, Arizona State University, Cave Creek, AZ, 85331, United States

We propose a polynomial algorithm to process the fully dense symmetric network to find a good, feasible, solution for the TSP. The algorithm processes the cost matrix representing the network to generate a feasible TSP tour. One iteration includes making an assignment in a selected row or column, then omitting that row or column from further consideration, declaring the column or row opposite to the first assignment as “tabu”, and thereby reducing the problem size. The matrix reduction and “tabu assignment assure that the process will result into a complete tour.

#### 4 - Determining Catastrophe Insurance Subsidies under Social Network Influence

Shenming Song, Tsinghua University, Beijing, China,  
Chen (Mavis) Wang

Catastrophe insurance is regarded as an effective financial mechanism that transfers post-disaster losses to proactive preparedness investments, despite many practical challenges. We consider a sequential game with three types of players, the government, a private insurer, and a community of networked policy holders, with which we examine the tradeoffs between government subsidies for insurance premiums and post-event subsidies under different characteristics of social network influence. We also explore the benefits of a multi-year insurance contract over consecutive single-year contracts.

North Bldg 231C

### Practice - Nonlinear and Dynamic Programming for Applications

Contributed Session

Chair: Luca Bertazzi, University of Brescia, Brescia, 25122, Italy

#### 1 - A One-phase Interior Point Method for Nonconvex Optimization

Oliver Hinder, Stanford, Stanford, CA, 94305, United States,  
Yinyu Ye

The work of Wachter and Biegler suggests that infeasible-start interior point methods (IPMs) developed for linear programming cannot be adapted to nonlinear optimization without significant modification, i.e., using a two-phase or penalty method. We propose an IPM that, by careful initialization and updates of the slack variables, is guaranteed to find a first-order certificate of local infeasibility, local optimality, or unboundedness of the (shifted) feasible region. Our algorithm with closely resembles successful algorithms from linear programming. Experiments also indicate superior robustness and infeasibility detection compared with IPOPT.

#### 2 - Power System Optimization through Joint Placement of Phasor and Flow Measurements

Vahidhossein Khiabani, Assistant Professor, Middle Tennessee State University, Murfreesboro, TN, 37132, United States

We proposed a mathematical method for joint optimal placement of phasor and conventional flow measurements considering the conflicting objectives of Phasor Measurement Units (PMU's) deployment cost, and system reliability. The model places PMUs on a network with a pre-existing conventional measurements, considering zero injection measurements with the goal of complete observability of the system. The proposed approach is tested on IEEE standard bus systems and compared with some models in literature.

#### 3 - Algorithm for Evolutionarily Stable Strategies against Pure Mutations

Sam Ganzfried, Ganzfried Research, Miami Beach, FL, 33139, United States

Evolutionarily stable strategy (ESS) is an important solution concept in game theory which has been applied frequently to biology and even cancer. Finding such a strategy has been shown to be difficult from a theoretical complexity perspective. Informally an ESS is a strategy that if followed by the population cannot be taken over by a mutation strategy. We present an algorithm for the case where mutations are restricted to pure strategies. This is the first positive result for computation of ESS, as all prior results are computational hardness and no prior algorithms have been presented.

#### 4 - Optimization Tools for the Management of Electric Vehicles in Electrical Networks

Rafael Zarate-Minano, Associate Professor, University of Castilla-La Mancha, EIMIA, Plaza Manuel Meca 1, Almaden, 13400, Spain,  
Alberto Flores, Miguel Carrion, Ruth Dominguez

The generalized use of the electric vehicle in industrialized countries could become a reality during the next decade. In this context, it is necessary to carefully analyze different aspects of the interaction between these vehicles and electrical networks. This work explores the combined application of optimization methods and homotopy techniques for the modeling of such interaction. The ability of this combination of techniques to study aspects such as the adequacy and the operation of the existing transmission and distribution networks in a context of large-scale integration of the electric vehicle is discussed.

#### 5 - Dynamic Task Allocation with Learning and Forgetting

Thomas Vossen, University of Colorado-Boulder, Leeds School of Business, UCB419, Boulder, CO, 80309, United States, Peter Letmathe

We consider a setting where tasks arrive randomly over time for possible processing. Incoming tasks can be allocated to (human) resources, whose productivity depends on the number of tasks processed by the resource before (learning) and is impacted by changes in the workforce over time (forgetting). We formulate the task allocation problem as a weakly coupled stochastic dynamic

programming problem, and use a Lagrangian Relaxation approach to derive heuristic allocation policies. We evaluate the flexibility and resilience that emerge from these policies, and analyze how various environmental factors impact performance.

#### 6 - Dynamic Project Expediting in Stochastic Networks

Luca Bertazzi, University of Brescia, Brescia, 25122, Italy,  
Riccardo Mogre

A project manager is in charge of a project. At each time, she needs to decide the effort level to invest in the project. The progress made on the project is random, constituting disruptions or efficiency problems. We formulate a stochastic discrete dynamic programming model for this problem and design an exact algorithm to find an optimal policy. Computational results show that this algorithm is more efficient than the classical exact algorithms Value iteration, Policy iteration and Linear programming.

### Joint Session AMD/Practice Curated: Auctions and Mechanism Design Applications

Sponsored: Auction and Marketing Design

Sponsored Session

Chair: Michael O. Ball, University of Maryland-College Park, College Park, MD, 20742-1815, United States

#### 1 - Quantity-contingent Auctions and Allocation of Airport Slots

Yulin Liu, University of California-Berkeley, 107D McLaughlin Hall, Berkeley, CA, 94720, United States, Michael O. Ball, Alexander Estes, Mark M. Hansen

We define and investigate quantity-contingent auctions, which can be used when there exist multiple units of a single product and the value of a set of units depends on the total quantity sold. A quantity-contingent auction determines both the number of items sold and an allocation of items to bidders. We focus on auctions that allocate airport arrival and departure slots. We propose a continuous model and an integer programming model for the associated winner determination problem. Using these models, we perform computational experiments that lend insights into the properties of the quantity-contingent auction.

#### 2 - Strategic Timing and Pricing in On-demand Platforms

Mustafa Dogan, Carnegie Mellon University, 5000 Forbes Avenue, Pittsburgh, PA, 15213, United States, Alexandre Jacquillat, Vibhanshu Abhishek

We design a dynamic pricing and allocation mechanism for service provision in an on-demand platform facing demand stochasticity, heterogeneity across price-sensitive and time-sensitive customers, and information asymmetry. Time is a strategic device to dynamically manage the demand-capacity imbalances; and to provide discriminated service levels. Results suggest that the optimal mechanism depends on the strength of customer heterogeneity and the time preferences of price-sensitive customers. The proposed mechanism increases platform profits as compared to surge pricing policies, and can even provide a Pareto improvement. We also show that higher demand may trigger lower price.

#### 3 - How Efficient is CTOP?

Alexander Estes, University of Maryland, Beltsville, MD, 20705, United States, Farzad Daneshgar, Michael O. Ball

The Federal Aviation Administration sometimes issues traffic management initiatives that restrict the amount of traffic allowed to enter some region of airspace. The Collaborative Trajectory Options Program allows flight operators to specify alternative routes for their flights. The FAA uses the options to more efficiently implement the traffic management initiative. In this work, we compare the efficiency of the current CTOP allocation process and that of a theoretical system-optimal allocation process.

#### 4 - Randomized Mechanism to Coordinate Carriers in Retail Logistics

Paul Karaenke, Technical University of Munich, Department of Informatics (I18), Boltzmannstr 3, Munich, 85748, Germany, Martin Bichler, Stefan Minner

We consider the problem of slot booking by independent carriers at several warehouses and investigate recent developments in the design of electronic market mechanisms promising to address both computational and strategic complexity. Relax-and-round mechanisms describe a class of approximation mechanisms that is truthful in expectation and runs in polynomial time. While the solution quality of these mechanisms is low, we introduce a variant able to solve real-world problem sizes with high solution quality while still being incentive-compatible. We compare these mechanisms to core-selecting auctions, which are not incentive-compatible, but provide stable outcomes with respect to the bids.

### BOM Session

Sponsored: Behavioral Operations Management

Sponsored Session

Chair: Xiaobo Zhao, Tsinghua University, Beijing, 100084, China

Co-Chair: Wanshan Zhu, Tsinghua University, Beijing, 100084, China

#### 1 - Forecast Information Sharing with Multiple Suppliers: Trust & Coordination

Meng Li, Rutgers University, Camden, NJ, United States,  
Yang Zhang, Yue Li

The retailer in a complementary goods supply chain considers whether to share its private demand forecast with its suppliers. According to the theoretical benchmark, share or not share does not make any difference, regardless of how many suppliers involved. However our experiment finds that, sharing the forecast may impede the profit of retailer as well as the performance of suppliers, because the heterogeneity in the agents' trust results in a coordination failure. As a result, the retailer may prefer not to share the forecast when facing multiple suppliers.

#### 2 - Impact of Market Information on Buying Decisions: A Behavioral Study

Diana (Yan) Wu, University of Kansas, 1300 Sunnyside Avenue,  
Summerfield Hall Room 345, Lawrence, KS, 66045-7585,  
United States, Kay-Yut Chen

We study how market information influences purchase behavior. Experiments are conducted in which buyers evaluate trade-offs between value uncertainties, likelihood of out-of-stock and price adjustments. We find decisions can be swayed by market information and develop a model to explain behaviors.

#### 3 - Value of High-Quality Logistics: Evidence from a Clash between SF Express and Alibaba

Ruomeng Cui, Emory University, Atlanta, GA, USA, Meng Li,  
Qiang Li.

Consumers regard product delivery as an important service component that influences their shopping decisions on online retail platforms. Failing to ship products to customers in a timely and reliable manner will diminish customer experience and companies' profitability. In this research, we explore how much customers value a high-quality delivery experience when shopping online. Our identification strategy exploits a natural experiment: a clash between SF Express — the largest private logistics service provider with the highest reputation in both speed and reliability in China — and Alibaba - the largest online retail platform in China.

#### 4 - Decision Bias of Strategic Customers with Private Product-value Information: An Experimental Study

Song Yanan, Tsinghua University, Beijing, China, Xiaobo Zhao,  
Wanshan Zhu

We consider strategic customers who compete for limited stock of a product due to rationing. We conduct a laboratory experiment to study the customers' decisions, and find that, less customers wait for discount than predicted when stock quantity is high; but slightly more customers wait when stock quantity is low. Behavior models reveal that this result is caused by the decision biases of bounded rationality and risk aversion. These findings imply that retailers should discreetly use rationing because the decision biases of strategic customers benefit retailers under light rationing, but hurt them under heavy rationing.

### Joint Session HAS/Practice Curated: Data Science in Health Care Operations Research

Sponsored: Health Applications

Sponsored Session

Chair: Jay Michael Rosenberger, University of Texas-Arlington, Arlington, TX, 76019, United States

#### 1 - Parameter Adjustment for Pain Management Treatment Optimization

Amith Viswanatha, The University of Texas at Arlington,  
Arlington, TX, 76013, United States

Mixed Integer Programming (MIP) solvers like CPLEX have several parameters and finding the right parameter settings for a given problem formulation is a challenging task. In this research, we use the design of experiments (DOE) approach to study the influence of CPLEX parameters on the computation time of the pain management optimization model. The orthogonal array design is used to initially screen the significant parameters and a full factorial design is later employed for a detailed investigation on the influence of the selected parameters.

#### 2 - Data-driven Modeling of a Dynamic and Heterogeneous Contact Network for Understanding the Transmission Behavior of Infectious Diseases

Yuan Zhou, University of Texas at Arlington, Arlington, TX,  
United States

Contacts are fundamentally linked to the propagation behavior of human-to-human transmitted diseases. Although several well-known structures of social network have been widely applied in the literature for establishing contacts, such as small-world and scale-free networks, an argument arises concerning the adequacy of such a network in capturing the public contacts that often take place in between individuals who are not socially affiliated. We develop a two-layer network framework for representing both social and public contacts. We will utilize both simulated demographical data that obtained from public data sources and synthetic data that generated for representing human mobility.

#### 3 - A Multi-column Generation Approach for Radiation Therapy Treatment Planning

Gazi Md Daud Iqbal, University of Maryland School of Medicine,  
Baltimore, MD, United States, Jay Michael Rosenberger,  
Hao Howard Zhang

Both intensity modulated radiation therapy (IMRT) and volumetric modulated arc therapy (VMAT) delivery use multileaf collimator to shape the radiation beam in order to achieve modulation. Column Generation approaches have been proposed to generate these shapes (called apertures) to deliver the radiation therapy treatment. Due to large number of candidate columns (feasible apertures), column-generation-based algorithm is computationally expensive, which affects the achievable solution quality within a clinically acceptable time frame. Instead of adding columns one at a time, this research uses a multi-column generation approach to obtain deliverable apertures for both IMRT and VMAT.

#### 4 - Adjusting for Time Varying Confounding with Multiple Treatment Variables

Aera Leboulluec, University of Texas-Arlington, Arlington, TX,  
76013, United States, Nilabh Ohol, Victoria C. P. Chen,  
Jay Michael Rosenberger

Time varying confounding plays a critical role in longitudinal studies. In medical research, estimating an effect of treatment on an outcome of interest is biased due to presence of time varying confounders. This bias results in inconsistent treatment estimates. Most of literature on handling time varying confounding demonstrates the implementation of methods such as inverse probability of treatment weighting to estimate consistent estimates of a single treatment. This presentation extends this approach to multiple treatments and considers both uncorrelated and correlated treatments.

### Optimizing Health Policy and Medical Decision Making to Account for Patient Heterogeneity

Sponsored: Health Applications

Sponsored Session

Chair: Diana Maria Negoescu, University of Minnesota, Minneapolis, MN, 55455, United States

#### 1 - Better Infectious Disease Control through Patient Incentive Programs

Sze-chuan Suen, University of Southern California, Los Angeles,  
CA, 90089-0193, United States, Diana Maria Negoescu, Joel Goh

To reduce the number of patients failing to complete long antibiotic regimens, public health departments may offer patients financial incentives to remain on treatment. However, it is unclear how incentive programs should be structured for the greatest societal benefit when resources are scarce. We design an optimal incentive schedule in the context of disease transmission, patient incentive compatibility, and resource constraints. We then demonstrate its application to the case of tuberculosis treatment, where a complete treatment regimen can take over 6 months.

#### 2 - Optimal Decision Making in a Markov Model with Parameter Uncertainty: The Case of Chronic Kidney Disease

M. Reza Skandari, Imperial College Business School, South  
Kensington Campus, Ayrton Rd, Kensington, London, SW7 2AZ,  
United Kingdom, Steven Shechter

We investigate a Markov decision process whose unknown transition parameters are revealed partially through state observation. Decisions are made as the state evolves. We use the model to study the optimal time to start preparing a type of vascular access for chronic kidney disease patients who will need dialysis.

**3 - Optimization-based Subclassification for Causal Inference**

Shasha Han, NUS Business School, National University of Singapore, NUS Business School, Biz 2 Building B1, 1 Business Link, Singapore, Singapore, Joel Goh

We are interested in estimating the individualized and population treatment effects of several drugs respectively. To obtain unbiased estimates, one often need to classify the entire population to several subclasses, such that the covariates between the contrasted treatments are distributed as similar as possible. For the purpose, the study propose an optimal subclassification method.

**4 - Optimal Stopping of Response-adaptive Clinical Trials**

Amir Ali Nasrollahzadeh, Research Assistant, Clemson University, 278 Freeman Hall, Clemson University, Clemson, SC, 29634, United States, Amin Khademi

One advantage of response-adaptive clinical trials is the ability to modify its key elements such as allocation policy, sample size, or stopping decisions while the trial is still in progress. In this study, we consider optimal stopping of Phase-II clinical trials where the objective is to find a "target dose" in a safe dosage range. Response-adaptivity of the design suggests that the decision maker must choose between continuation of the trial with more sampling, termination and moving to a confirmatory phase, and abandoning the trial whenever new observations of patients' responses become available.

West Bldg 101C

**Health Care System Optimization**

Sponsored: Health Applications

Sponsored Session

Chair: Naoru Koizumi, George Mason University, Arlington, VA, 22201, United States

**1 - Optimal Pooling Strategies for Nucleic Acid Testing of Donated Blood Considering Viralload Growth Curves and Donor Characteristics**

Hadi El-Amine, George Mason University, Fairfax, VA, 22030, United States, Ebru Korular Bish, Douglas R. Bish

Blood product safety, in terms of being free of transfusion-transmittable infections (TTIs), is crucial. Nucleic Acid Testing (NAT) technology enables earlier detection of infections but is more expensive, hence, most blood centers administer NAT to pools of blood samples from multiple donors. Since some donor characteristics are uncertain, we develop a chance-constrained model that determines the optimal NAT pool sizes for various TTIs, considering both non-universal (where first-time donors undergo more extensive screening), and universal (i.e., common testing for all donors) strategies, so as to minimize the TTI risk, while remaining within the testing budget with a high probability.

**2 - Interactive Maps for UNOS Data Visualization**

Monica Gentili, University of Louisville, J.B. Speed School of Engineering, Louisville, KY, 40292, United States, Naoru Koizumi, Andrew Rivard

In this talk we will show a web application to visualize UNOS data on heart transplants by means of interactive maps. The available maps will allow the user to visualize different statistics related to the data for different geographic granularity level (transplant center, Organ Procurement Organization, and UNOS region). The statistics will include (but are not limited to) (i) the likelihood of receiving a quality donor heart, (ii) the rate of donor heart offers which were declined (iii) pre- and post-transplant mortality rate. Further developments of the website will be discussed.

**3 - Simulating the Outcome of Blood Incompatible Deceased Donor Kidney Transplantation - Time to Remove the Barrier**

Mehdi Nayeypour, George Mason University, Founders Hall, Fairfax Dr, Arlington, VA, 22201, United States, Keith Melancon, Naoru Koizumi, Karthika Mahendran

ABO incompatible kidney transplantation could be accomplished with good outcomes. Most ABO-i kidney transplants have been accomplished using live donors after preparing recipients weeks before transplantation. We report the first case of successful directed deceased donor ABO-i kidney transplantation other than A2 to B. We desensitized the patient within 24 hours of receiving the organ offer and before performing the transplantation. If our current allocation system could allow for deceased donor ABO-i transplantation, we could significantly curtail kidney discards. We simulated this policy by using KPSAM and witnessed lower wait times and better outcomes.

Co-Chair: Zlatana Dobrilova Nenova, University of Denver, Englewood, CO, 80113, United States

**1 - Assessing Multi-modality Breast Cancer Screening Strategies for High-risk Populations**

Caglar Caglayan, PhD Candidate, Georgia Institute of Technology, 755 Ferst Drive NW, ISyE Main Building #321, Atlanta, GA, 30332, United States, Turgay Ayer, Donatus U. Ekwueme

Women with BRCA 1/2 gene mutations and family history of breast or ovarian cancer are at higher risk for breast cancer. For these women, the use of ultrasound (US) and MRI might address some of the limitations of mammography, the standard modality for average-risk women. Currently, there is no consensus on the optimal use of these technologies. We propose a population-dynamics based optimization approach for the multi-modality breast cancer screening problem for the high-risk population. We develop a Markov model to capture the disease progression in high-risk women, and formulate a mixed integer linear program to identify optimal structured strategies that are practical for implementation.

**2 - Approximate Dynamic Programming for a Dynamic Appointment Scheduling Problem**

Zlatana Dobrilova Nenova, University of Denver, Denver, CO, 80113, United States, Dan Zhang, Manuel Laguna

We consider a dynamic appointment scheduling problem. There are multiple patient classes with associated arrival rates, cancellation rates, and no-show probabilities. Patients arrive and make appointment requests over time. The provider can either assign the patient to an appointment slot or reject patients. Overbooking is allowed. The objective is to balance patients' rejection and waiting costs, and the doctor's idle- and overtime costs. Patients may cancel appointments or no-show. The problem is formulated as a finite-horizon Markov decision process and solved using an approximate policy iteration algorithm. We test the solution method on problem instances constructed from clinic data.

**3 - Matching Emergency Physicians and Apps to Meet Patient Demand: Quasi Real-time Scheduling for Improved Patient Satisfaction and Resource Deployment**

Krista Foster, University of Pittsburgh, Pittsburgh, PA, 15217, United States, Jennifer S. Shang

We study the current roles of advanced practice providers in emergency departments throughout a large multi-facility network and identify conditions under which the addition of advanced practice providers would benefit hospitals (reduce costs) and patients (reduce length of stay). We propose a model to optimally staff hospitals with emergency physicians and advanced practice providers to meet patient demand.

**4 - A Spatial Model of the Opioid Epidemic in California**

Sema Nur Kaynar Keles, UCLA Anderson School of Management, Los Angeles, CA, United States, Elisa Frances Long

With more than 67,000 overdose deaths in 2017 in the United States including nearly 5,000 deaths in California, additional efforts to mitigate the opioid crisis are urgently needed. We propose a spatial "epidemic model of opioid use to forecast new opioid prescription rates, opioid addiction, cessation, and overdose death rates in California. Such a model could be used to prioritize key populations and allocate limited resources (eg, naloxone) most efficiently.

### Dynamic Resource Allocation Problems in Healthcare

Sponsored: Health Applications

Sponsored Session

Chair: Shan Liu, University of Washington, Seattle, WA, 98195-2650, United States

#### 1 - Resource Allocation for Hepatitis C Elimination

Qiushi Chen, PhD, Penn State, University Park, PA, United States, Turgay Ayer, Jagpreet Chhatwal

More than 70 million people are chronically infected with hepatitis C virus (HCV) globally. With the recent availability of new treatments, the World Health Organization (WHO) set an ambitious target to eliminate HCV by 2030. However, high treatment cost and unawareness of infection remain major barriers to elimination. In this study, we develop an HCV transmission model that aids in optimal allocation of resources to scale-up HCV screening and treatment that can lead to HCV elimination. We present the optimal allocation policies in different health care settings and target population profiles.

#### 2 - Optimal Control of an Infectious Disease with Drug Resistance

Naveed Chehraz, McCombs School of Business, 2110 Speedway, Stop B6000, Austin, TX, 78712, United States, Lauren Cipriano, Eva A. Enns

We study the optimal treatment policy for an SIS-type infectious disease with drug resistance. We prove that the optimal policy is bang-bang with a single switching time and the optimal value function may not be Lipschitz continuous. Using numerical analysis, we demonstrate that the optimal policy changes form when the disease transmission rate is a function of disease prevalence (e.g., as a result of social distancing). Our solution approach can be generalized to other control problems.

#### 3 - Prevention of Seasonal Influenza Outbreak via Healthcare Insurance

TingYu Ho, University of Washington, Seattle, WA, 98125, United States, Zelda B. Zabinsky, Paul A. Fishman, Shan Liu

To prevent the outbreak of seasonal influenza, we develop an integrated insurance mechanism, including vaccination incentives and cost-sharing policies, and formulate the dynamic interaction between a single insurer and multiple insureds as a Stackelberg vaccination game. We implement agent-based simulation modeling with active learning and simulation optimization to determine the interventions that control the spread of flu. Results indicate that incentives and cost-sharing can effectively improve vaccination uptake and maintain low incident rate even with a highly contagious flu.

#### 4 - Allocating Resources for Outreach Programs in Infectious Disease Systems with Information Propagation

Sze-chuan Suen, University of Southern California, Los Angeles, CA, 90089-0193, United States, Brian Wilder, Milind Tambe

Outreach programs play an integral role in infectious disease control by increasing disease awareness, screening rates, and treatment uptake. Outreach campaigns may rely on information propagation through word of mouth and social media (viral marketing), which can exponentially expand the reach of the original outreach message to preferentially reach targeted groups. We study the optimal allocation of limited outreach resources in the context of tuberculosis in the context of a heterogeneous population with such information spread.

#### 1 - Coherence of Demand Forecasting: Application to Tompkins International Company

Sajjad Taghiyeh, North Carolina State University, Raleigh, NC, 27606, United States, David Lengacher, Robert Handfield

We intend to develop a robust multi-tier multi-phase forecasting model for a third-party logistics company. Demands can be represented as the volume of individual Stock Keeping Units (SKUs), and the total volume of SKUs in each distribution center (DC). We aim to use these forecasts and find the aggregation of them to provide a more accurate demand forecasting framework.

#### 2 - A Bi Objective Production Planning and Scheduling Model Dealing with Reworking the Perishable Items in a Parallel Machine System

Elham Taghizadeh, PhD candidate, Wayne State University, Detroit, MI, 48202, United States, Farshid EvazAbadian, Setareh Torabzadeh, Abdollah Mohammadi

Production systems could always struggle with defective products which can be due to human error, machine break-down, and imperfect production system. Rework is one of the strategies to deal with this issue; rework planning involves the production planning and scheduling of the defected items along the master production planning. This paper presents a multi-objective mathematical model to determine how the work and rework must be scheduled in a parallel machine system for a perishable product. The model objective functions are the minimization of cost and makespan. A linear model is developed and numerical experiments are done based on a case study from the literature, which concerns a biopharmaceutical industry. To find out the importance of each parameter, a sensitivity analysis of the results on varying model parameters is presented as well.

#### 3 - Dynamic Capacity Planning and Matching: A Distributionally Robust Approach

Zhaowei Hao, National University of Singapore, Singapore, 119245, Singapore, Long He, Zhenyu Hu, Jun Jiang

In this paper, we develop a distributionally robust model to study how a firm makes initial capacity and allocation decisions with upgrading in a multi-product multi-period setting. Using the enhanced linear decision rule (ELDR), we derive a tractable approximation, and develop a theoretical performance guarantee in solving the robust model. Finally, our numerical study shows the performance and computational efficiency of the ELDR solution in benchmark with the solution from dynamic programming.

#### 1 - Predicting Post Operative Survivability of Lung Cancer Patients a Machine Learning Approach

Alireza Fazli Khalaf, Student, Binghamton University, Vestal, NY, 13905, United States, Yong Wang

Thoracic surgery is one of the treatment options for lung cancer. Risk measurement of such surgery is critical to choose the operation or not. In this paper, one-year survivability of lung cancer patients after a thoracic surgery is investigated using machine learning techniques. As the study deals with imbalance dataset, synthetic minority over-sampling technique is used to resolve the problem. Next, the performance of five classification methods, namely naive Bayes, radial basis function network, support vector machine, logistic regression and random forest, on predicting the survivability are compared. Results show that Random forest outperforms other classifiers.

#### 2 - Automated Surgical Term Clustering Used in Unstructured Surgery Descriptions

Tannaz Khaleghi, Graduate Teaching Assistant, Wayne State University, 4815 4th Street, Suite 1067, Detroit, MI, 48201, United States, Alper E. Murat

Text mining tools provide us a unique opportunity to extract information from textual data. The information therefore can be useful when predicting procedure code and surgery room duration for different surgical cases as text can provide important details about the procedure while other common features might not target them. In this study the goal is to find most informative text feature from unstructured principal procedure and some physician notes by heuristic integrated text mining method which best organize medical text feature set and sets up feature dimensionality reduction efficiently. The output improves surgery code prediction accuracy and produce more reliable surgery duration.

### 3 - Patient - Demographic and Health Factors Influencing the Length of Stay in Hospital

Surya Ayyalasomayajula, Oklahoma State University, Stillwater, OK, 74074, United States, Ankita Srivastava, Dursun Delen

This study explores the question of what are the demographic and general health factors that predict the length of stay (LOS) of a patient in a hospital. It conceptualizes that general health condition has a major impact on the LOS followed by demographics. The paper then studies the hospital factors that influence the average length of stay (ALOS) or Hospital Length of Stay (HLOS). Data from 22 hospitals and 5553 patients strongly support the proposed idea of LOS is determined by general health and demographics. The results do not support the idea that ALOS is dependent on hospital factors.

### 4 - A DEA Evaluation of States' Infant Mortality Rate in the U.S.

Negar Darabi, PhD Student, Virginia Tech, Blacksburg, VA, 24060-4913, United States, Alireza Ebrahimi, Niyousha Hosseinichimeh, Konstantinos P. Triantis

States vary in terms of their infant mortality rates (IMR). Here, we build a state-level database to compare 50 states' performance with respect to three major variables including IMR, preterm birth, and low birth weight. We use a Data Envelopment Analysis (DEA) approach to test different factors associated with high performance in infant survival by benchmarking states. Prior studies, examined IMR of neighboring states rather than using a mathematical model for choosing their peers. DEA finds the best practices for states that suffer from poor outcomes (i.e., high rate of infant mortality). The results of this analysis would be beneficial for policymakers to implement effective interventions.

### 5 - Evaluation of Alternative Diagnostic Test Intervals and Thresholds for Lung Cancer Screening

Mehrad Bastani, Postdoctoral Scholar, Stanford University, 305 Campus Drive, Palo Alto, CA, 94305, United States, Sylvia Plevritis, Iakovos Tournazis, Ann Leung

U.S. Preventive Services Task Force recently recommended a low-dose computed tomography (LDCT) lung screening for high-risk current and former smokers based on the National Lung Screening Trial (NLST). In response to the high rates of false-positive observed in NLST (27.3%), the American College of Radiology developed Lung-RADS, a standardized system for reporting and following-up LDCT findings. Several studies have shown reduction in false-positive rate when Lung-RADS is applied to NLST. To complement these studies, we evaluate the effect of alternative diagnostic testing intervals and actionable nodule size thresholds of Lung-RADS on the mortality reduction associated with LC screening.

#### 1 - Designing Early Detection and Intervention Techniques via Predictive Models for Bottleneck Business Courses

Sinjini Mitra, Associate Professor, California State University-Fullerton, 800 N. State College Boulevard, ISDS Department, Fullerton, CA, 92831, United States, Zvi Goldstein

We present a study of factors affecting student success in two bottleneck Business courses, and use subsets of them to build predictive models of student success. They can be utilized to detect at-risk students early on for implementing suitable intervention techniques to improve their odds of completing the courses successfully. The results that show that students who receive the intervention and take advantage of it, have significantly improved performance at the end of each course compared to those who do not. We conclude by briefly discussing Supplemental Instruction as an academic support program that benefits such at-risk students greatly.

#### 2 - Should Low Rated Items be Recommended? An Empirical Analysis

Sanjog Ray, Indian Institute of Management-Indore, Rau Pithampur Road, Faculty Block A-202, Indore, 453331, India

Collaborative filtering is the most popular approach used in recommender systems for recommending items like movies, books etc. Items that a user will most likely rate high are recommended as a result low rated items are never recommended. This paper questions the approach of ignoring low rated items by the recommender systems algorithms. Based on our analysis of two large datasets on movies and books, we show that low rated movies should not be ignored in the final list of recommendations. We also provide suggestions on how low rated movies can be recommended.

### 3 - Post-traumatic Stress Disorder (PTSD) Diagnosis & Prediction: A Bayesian Network Model

Yi Tan, University of Kansas School of Business, 1654 Naismith Drive, Lawrence, KS, 66045, United States, Prakash P. Shenoy, Catherine Shenoy, Mary Oehlert

In this study, we first propose a Bayesian network model for post-traumatic stress disorder (PTSD) prediction. By using Veteran Administration patient data between 2000 and 2015, the model is constructed based on patients' demographic information, military history, other accompanied mental disorders, and various psychological tests. Psychological tests are usually required to diagnose/confirm PTSD. To aid the diagnosis, we are also working on a decision support technique that psychiatrists can use to decide which psychological tests, and in what sequence, that a new patient should take. The technique will identify the most informative tests based on information theory.

### 4 - Predicting and Understanding Freshmen Student Retention-Development of a Bayesian Belief Network-based DSS

Kazim Topuz, Assistant Professor, PhD, University of Tulsa, 1826 23rd Avenue SE, Norman, OK, 73071-1065, United States, Dursun Delen

Student attrition is an administratively important, and yet practically challenging problem for decision makers and researchers. This study aims to find the prominent variables and their conditional dependencies/interrelations that effect student attrition in college settings. Specifically, using a large and feature-rich dataset, proposed methodology successfully captures the probabilistic interactions between attrition and related factors to reveal the underlying, nonlinear relationships.

### Joint Session DM/Practice Curated: Data Science and Robust Optimization

Sponsored: Data Mining

Sponsored Session

Chair: Hari Bandi, MIT, Cambridge, MA, 02139, United States

#### 1 - Practical Robust Optimization for Least-squares Problems

Long Zhao, UT McCombs Business School, 2110 Speedway Stop B6500, CBA 5.334 Q, Austin, TX, 78712-1277, United States, Deepayan Chakrabarti, Kumar Muthuraman

Solution to Robust optimization formulations is sometimes too conservative because of the worst-case performance objective. For the least-squares problem, we describe a way to overcome this by combining its Robust version with the classical formulation. The talk describes the method and how it leverages on a deeper understanding of estimation errors to help improve out of sample performance. For more than 50 different real-world scenarios, the method consistently outperforms other methods that ignore such space-level information and outperforms both ridge and lasso regression most of the time.

#### 2 - Bootstrap Robust Prescriptive Analytics

Bart Paul Gerard Van Parys, MIT, Room E40-154, 77 Massachusetts Avenue, Cambridge, MA, 02139, United States, Dimitris Bertsimas

We discuss prescribing optimal decisions in a framework where the cost depends on uncertain problem parameters that need to be learned from data. Proper prescriptive methods exploit additional observed contextual information on a large number of covariates. Naive use of training data may lead to gullible decisions over-calibrated to one particular data set. We use robust optimization and the bootstrap to propose two novel prescriptive methods. Both resulting robust prescriptive methods reduce to tractable convex optimization problems and enjoy a limited disappointment on bootstrap data.

#### 3 - Learning a Mixture of Gaussians via Mixed Integer Optimization

Hari Bandi, MIT, Cambridge, MA, 02139, United States

We consider the problem of estimating the parameters of a Gaussian mixture model (GMM) given access to  $n$  samples  $x_1, x_2, \dots, x_n \in \mathbb{R}^d$  that are believed to have come from a mixture of multiple subpopulations. We present here a novel MIO formulation that optimally recovers the parameters of the GMM by minimizing a discrepancy measure between the empirical distribution function and the distribution function of the GMM. We show that the MIO approaches are practically solvable for datasets with  $n$  in the tens of thousands in minutes and achieve an average improvement of 60-70% and 50-60% on MAPE in estimating the means and the covariance matrices, respectively over the EM algorithm independent of the sample size.

**1 - Fatigue Management System for Manufacturing Occupations**

Zahra Sedighi, Auburn University, Auburn, AL, 36830, United States

From a firm's perspective, managing fatigued workers is an important issue with ethical, operational and financial considerations. We propose and delineate a framework for using wearable sensors to manage worker fatigue in manufacturing environments. A framework is proposed instead of a model to allow for the detection/diagnosis of multiple fatigue modes. The proposed framework is made of four phases: (a) detection, (b) identification, (c) diagnosis, and (d) recovery. We present the capability of our proposed framework in two case studies.

**2 - Identifying Long Term Organizational Well Being**

Hamidreza Ahady Dolatsara, Auburn University, 227 Lowder Hall, 405 West Magnolia Ave., Auburn, AL, 36830, United States, Ashish Gupta, David Paradice

This study uses machine learning approaches to understand the concept of long term organizational well-being, i.e., organizational health (OH). A composite OH index is developed based on long term financial performance. Time series of financial indicators are driven from sequential financial data over the past several years. Multivariate time series classification models are then developed for grouping companies into clusters based on their composite OH index.

**3 - How Enterprises Can Emulate Those Better Than Themselves**

Liao Wei-Chih, Doctorial Student, National Chung-Hsing University, Taichung, Taiwan, Lin Chin-Shien, Chang Ruei-Yuan

This paper aims to explore how enterprises can find appropriate strategic learning objects and what they shall pay attention to while choosing such objects. This study fitted the hierarchical linear models to test the hypotheses. The results show that company-level strategic fit has a significant impact on performance and the cross-level group variables and industrial variables have significant moderating effects. Therefore, when choosing a learning object, enterprises must confirm that the homogeneity of the strategic group is enough and understand the content of the ideal configuration. We need to pay more attention to the content of the ideal configuration to obtain better performance.

**4 - Implications of Renegotiation on Testing Time for Software Outsourcing Contract Choice**

Hongyan Xu, Chongqing University, School of Economics &amp; Business Admin, Chongqing, 400030, China, He Huang, Minhui Hu

We examine two commonly used software outsourcing contracts with renegotiation on testing time, i.e., fixed-price and time-and-material contracts, and investigate the impacts of renegotiation on contract choice.

**5 - Preventative Maintenance Forecast for Powertrain Capacity Planning**

Amir Abolhassani, Analytics Scientist, Ford Motor Company, Dearborn, MI, 48120, United States, Rajeev Kalamdani

The current method of estimating planned preventative maintenance consists of adding 10% excess capacity (16.8 hours/week). This method may be over-estimating and leading to over capacity for a required production volume. An algorithm was developed to predict weekly downtime and labor impact of preventative, predictive, and autonomous maintenance based on line configuration and different available operations on seven bill of process (BoPs).

**1 - Understanding Continuous Citizen Participation in a Green Commuting Platform: The Roles of Public Value and Private Value**

Luning Liu, PhD, Harbin Institute of Technology, Harbin, 150001, China, Jingrui Ju, Yuqiang Feng

E-participation platforms encourage citizens to create public value for public affairs. Prior literature mostly focused on the role of participation in facilitating socially public value creation, with less attention paid to individual private value acquisition. However, the provision of private incentives can promote the production of public goods. Thus, this study develops a model according to theories of citizen participation and incentives to examine what antecedents respectively affect participation in creating public value and acquiring private value and the roles of the two values on continuous participation by using a field survey data.

**2 - Impacts of the Platform-based Sharing Economy on the U.S. Labor Market: Evidence from Uber Entry**

Ziru Li, Arizona State University, Tempe, AZ, United States, Yili Hong, Zhongju Zhang

We study how brand impacts consumer demand in the context of museum memberships in a metropolitan city in the United States. Over the course of our sample, one major museum with a highly recognized brand closed. During the closure, it sequentially co-branded with two established local museums. The closure and co-branding events combined with individual panel data on museum memberships allow us to measure how these changes in brand affect demand. Co-branding with the closed museum lifts demand for the partner museum, however this aggregate increase masks two counter-acting forces. First, customers with no history of buying membership from either museum enter the market, consistent with the prominent brand providing a signal of vertical quality. Second, a sub-group of customers who previously purchased from either or both of the museums display decreased demand. This is consistent with a model of brand providing information about horizontal match value, with decreasing demand from the broadening of brand being an example of brand dilution. The magnitude of these offsetting forces varies between co-branding events. These results have implications for the treatment of brand intercepts in counterfactuals when studying consumer demand.

**3 - Everyone Can Be a Star: Quantifying Grassroots Online Sellers' Live Streaming Effects on Product Sales**

Cheng Chen, University of Illinois at Chicago, Chicago, IL, 60607, United States, Yuheng Hu, Yili Hong, Yingda Lu

The emergence of live streaming services provides online sellers a new channel to sell products. In this paper, we examine the effect of sellers' adoption of live streaming on their online product sales. We found that the adoption of live streaming strategy significantly boosts sellers' online product sales.

**4 - Skill-Biased Technological Change Again? The Impacts of Matching Platforms on Local Labor Markets**

Zhi (Aaron) Cheng, Temple University, Philadelphia, PA, 19130, United States, Xue Guo, Paul Pavlou

Do online matching platforms affect offline labor markets? To answer this question, we exploit a quasi-experiment setting, where a large internet-based matching platform, TaskRabbit, has gradually entered different U.S. cities since 2008. Our difference-in-differences estimation shows that the introduction of TaskRabbit is associated with a decrease in the number of local full-time workers in the traditional housekeeping industry. Moreover, the negative effect is mainly driven by a significant decrease in the number of cognitive routine workers (e.g., first line managers) after the TaskRabbit entry, given a non-significant change in that of manual non-routine workers (e.g., janitors).

**5 - Why Gender Wage Gap does not Necessarily Mean Gender Bias?**

Chen Liang, Arizona State University, Tempe, AZ, United States, Yili Hong, Bin Gu

We explore whether there exists gender wage gap in the gig economy and examine to what degree gender differences in job application strategy could account for the gap. With a large-scale dataset from a leading online labor market, we show that females only earn 81.4% of the hourly wage of males and explore three main aspects of job application strategy, namely, bid timing, choice of jobs based on hourly wage, and avoidance of monitoring. We find that females tend to bid later, prefer jobs with a lower hourly wage budget, and have a higher willingness to pay (WTP) for the avoidance of monitoring. Overall, our study underscores the importance of gender differences in job application strategy on gender wage gap.

**1 - Statistical Transfer Learning for Profile Monitoring**

Ziyue Li, The Hong Kong University of Science and Technology, Kowloon, Hong Kong, Fuguee Tsung, Ke Zhang

In the practical manufacturing process, there exist quite amounts of similar procedures or stages. When a new task comes, data in new task is too limited to get an accurate parameter estimation. Transfer learning outperforms by joint estimation with Gaussian Graphical Model. Some profiles are observed with sparse anomaly. To deal with it, we propose a new method to capture the relatedness across multiple profiles and detect their anomalies efficiently. Profile is decomposed into smooth background, sparse anomaly and random noise. Smooth background is treated with transfer learning model and group-lasso is introduced for anomaly. Coordinate Descent is adapted to solve the optimization problem.

**2 - A Multitask Learning Based Decomposition Approach for Modeling Distributed Machines**

Hao Yan, Tempe, AZ, 85281, United States, Yifu Li, Ran Jin

Quality prediction is traditionally conducted on the system within a single machine. In this work, we consider the data are collected from multiple machines with different input variables. The machines share similarity but may not be identical. We decompose the variation patterns of multiple machines into explainable variation patterns by input variable, latent variation patterns shared by multiple machines, and noise. Furthermore, we utilize multi-task learning to model the explainable variation patterns. This decomposition can be used for quality prediction and process monitoring. Simulation and case study are conducted to demonstrate the advantage of the proposed algorithm.

**3 - A Physics-specific Change Point Detection Method Using Torque Signals in Pipe Tightening Processes**

Juan Du, Xi Zhang, Jianjun Shi

In pipe tightening processes, the torque signals presents with various quasi-periodic profiles, introducing a bunch of false change points while using existing change point detection methods for condition monitoring. To address this issue, this presentation proposes to consider the profile generating mechanism to improve the detection performance.

**4 - Personalized Recommendation for Information Visualization**

Xiaoyu Chen, Virginia Tech, 302 Heartwood Xing, Blacksburg, VA, 24060, United States, Ran Jin

Information visualization help acquire insights of complex datasets in system engineering. However, a uniform visualization format may be ineffective to bring the insights to different users at different contexts. In this research, a personalized recommendation approach is proposed to dynamically adjust visualization with respect to different tasks and contexts for different users. It can automatically select the significant features from unobtrusive measures to support further diagnostics of the visualization designs.

**5 - Clustering-based Data Filtering for Manufacturing Big Data System**

Yifu Li, Virginia Tech, 302 Heartwood Crossing, Blacksburg, VA, 24061, United States, Xinwei Deng, Ran Jin, Shan Ba, William Myers

As the sensing technology advances in manufacturing, various sensors enable real-time modeling and monitoring of in situ covariates. However, sensors collect massive data, which cause high computational load and excessive data storage in manufacturing. To address these issues, we proposed an unsupervised data filtering method based on index-segmented and clustered datasets. Furthermore, a filtering information criterion is proposed to automatically determine the proportion of data filtered for further data analysis, which effectively balances the trade-off between the sample size of the filtered datasets and information preserved.

**1 - Cardiac Surface Potential Prediction Based on Gaussian Process and Partial Differential Equation**

Zhiyong Hu, Texas Tech University, 2500 Broadway, Room 240, Lubbock, TX, 79415, United States, Dongping Du

Reconstructing the surface potential in cardiac chambers plays an essential role for precise diagnosis and treatment planning. Gaussian Process (GP) is a popular method that learns the spatial temporal correlations of available data for surface mapping. However, GP kernel functions cannot capture the physiological correlation among cardiac tissue. In this study, we integrate GP with physical models of heart to characterize the covariance structure of surface potential recordings. The resulting model enables an accurate surface prediction, thus providing more insight into cardiac disorders.

**2 - Fault Diagnosis in Multistage Manufacturing Processes Based on Bayesian Linear Random Effects Model with Sparse Variance Components Prior**

Jaesung Lee, University of Wisconsin, 3255, Mechanical Engineering Building, 1513 University Ave, Madison, WI, 53706, United States, Junbo Son, Shiyu Zhou

We present a Bayesian linear random effects model for the fault diagnosis in the multistage manufacturing processes with a prior for the sparse variance components. A modified horseshoe+ prior is used to tackle the low sample size and high dimensional problems with sparse faults. Furthermore, we introduce the informed-horseshoe+ that incorporates the positional fault likelihood information. To estimate the faults from the horseshoe+ prior, Gibbs sampler was developed. In simulation and numerical experiments, the horseshoe+ outperformed the inverse gamma prior in sparse fault cases and the informed-horseshoe+ achieved advantages given additional information on process faults.

**3 - When are Markets out of Control? Monitoring Financial Networks with Online Hurdle Models**

Mostafa Reisi Gahrooei, Georgia Tech, Atlanta, GA, 30318, United States, Samaneh Ebrahimi, Shawn Mankad, Kamran Paynabar

The interconnectedness of financial institutions can function as a mechanism for the propagation and amplification of shocks throughout the economy, thus contributing to financial crises. As such, network analysis has become a critical tool to assess interconnectedness and systemic risk levels. In this paper we create a formal monitoring system to detect changes within a sequence of sparse networks constructed from an interbank lending market in the European Union.

**4 - Transfer Learning of Structures of Ordered Block Graphical Models Using Informative Priors**

Chao Wang, University of Wisconsin Madison, Rm. 3255, ME building 1513 University Ave., Madison, WI, 53706, United States, Shiyu Zhou

We focus on the structure learning of ordered block model (OBM) based on data-driven informative prior. A novel informative structure prior distribution is represented by a categorical random variable. In this way, the informative prior distribution construction is equivalent to the parameter estimation of the graph random variable distribution using historical data. The sample space inconsistency between historical and new OBMs is addressed by adding pseudo nodes with probability normalization, then removing extra nodes through marginalization. The simulation and real case study show the effectiveness of the proposed method, especially when the data from the new OBM is small.

### Reliability II

Contributed Session

Chair: Oluseye Fafiolu, Lamar University, Beaumont, TX, Texas, United States

#### 1 - Statistical Inference on Remaining Useful Life in a Two-phase Degradation Model Under Gamma Process

Hon Keung Tony Ng, Professor, Southern Methodist University, 3225 Daniel Avenue, Department of Statistical Science, Dallas, TX, 75275-0332, United States, Man Ho Ling, Kwok-Leung Tsui

Due to physical and chemical changes that take place with usage and with age, a significant degradation rate change of a product usually exists. To accurately predict the remaining useful life prediction for products with two-phase degradation, we incorporate a probability distribution of the time of rate change into the gamma degradation model. A Bayesian approach and a frequentist approach are proposed for statistical inference of the remaining useful life. A simulation study is used to evaluate the performance of the developed methodologies and a real data set on light emitting diodes is presented to illustrate the application of the proposed model.

#### 2 - Condition-based Maintenance and Production for Systems with Overcapacity

Michiel uit het Broek, MSc, University of Groningen, Groningen, Netherlands, Ruud Teunter, Bram de Jonge, Jasper Veldman

Many multi-unit systems face significant economic dependencies for performing maintenance, e.g., expensive vessels are needed to perform maintenance at offshore wind farms. Therefore, it is often cost efficient to cluster maintenance for several units in the system. However, when maintenance for units with different degradations levels is clustered, then maintenance is performed too early for the low deteriorated ones or too late for the highly deteriorated ones. In such situations, an interesting question is whether it can be profitable to adjust the production rates in order to synchronize the deterioration processes for the different units.

#### 3 - Joint Optimization of Job Scheduling and Condition-based Maintenance

Bram de Jonge, University of Groningen, P.O. Box 800, Groningen, 9700 AV, Netherlands

We consider a production facility that processes incoming jobs of various lengths and that requires maintenance due to deterioration and ultimately failure. We present an approach to determine whether the system has a steady state. Based on maintenance costs and total weighted flow time costs we formulate a Markov decision process to determine optimal maintenance and job scheduling policies. We provide insights on how job scheduling and maintenance planning interact.

#### 4 - Physics-of-failure Based Reliability Prediction Model for Rail Track Geometry

Oluseye Fafiolu, Lamar University, 4400 Mlk Pkwy, Beaumont, TX, 77701, United States, Jaeyoung Cho, Maryam Hamidi

We propose a rail track geometry reliability prediction model based on physics-of-failure approach. The failure mechanisms that causes rail track geometry degradation are incorporated into the model. We expect that the reliability model predicts accurately the optimum working hours under normal operating conditions of the rail track geometry prior to maintenance actions being required.

#### 1 - Linear Programming Based Sparse Solutions Revisited

John W. Chinneck, Carleton University, Systems and Computer Engineering, 1125 Colonel By Drive, Ottawa, ON, K1S 5B6, Canada

Finding sparse solutions for underdetermined linear systems is the key step in compressive sensing and a number of other important problems. One category of solutions uses linear programming, e.g. Basis Pursuit. However there are other ways to formulate the LP which have not been explored and which lead to different algorithms with different characteristics. The talk presents a variety of new LP-based formulations and associated algorithms, along with numerical evaluation and comparisons.

#### 2 - Optimization Modeling in Matlab

Aurele Turnes, MathWorks, Natick, MA, 01760, United States, Steve Grikschat, Paul Kerr-Delworth, Adam Hug

The problem-based workflow for optimization has made it much easier to model and solve an optimization problem in MATLAB. First, optimization variables are identified and defined. They can be N dimensional and can be indexed similar to standard MATLAB arrays. Next, familiar MATLAB operators can be used to define the objective and constraints as expressions of the optimization variables. Finally, the optimization solver is automatically selected based on the type of objective and constraints. Large and complex optimization problems expressed in this way are more compact and readable. We will review the problem-based workflow and demonstrate new capabilities with examples.

#### 3 - Constraint-based Sequential Pattern Mining Using Multi-valued Decision Diagrams

Amin Hosseininasab, Tepper School of Business, Carnegie Mellon University, 5000 Forbes Avenue, Pittsburgh, PA, 15213, United States, Willem van Hoeve, Andre Augusto Cire

Constraint-based sequential pattern mining (SPM) has gained recent attention as it aims to find patterns interesting to the user, rather than an arbitrary set of frequent patterns. We propose a general framework for imposing non-monotone constraints into SPM. Such constraints impose restrictions on different item attributes, and are challenging or impossible for current mining algorithms. We use multi-valued decision diagrams to compactly model the database, and use it to store critical information required to impose all constraints. We compare our algorithm to specialized SPM algorithms in the literature, and present a number of novel insights from a real-world database.

#### 1 - Impact of Shorttermism on Capacity Investment in Competitive Markets

Xiaoyan Liu, PhD Student, Cornell University, Sage Hall, Ithaca, NY, 14853, United States, William Schmidt

We study how a firm's short-term interest in its capital market valuation will affect its capacity decision and long-term profits in the presence of a competitive entrant. We show that the firm with private demand information prefers to signal a high (low) demand when short-termism is high (low). Moreover, pooling equilibria can occur with either low or high levels of short-termism, and both firm types will under-invest in a pooling outcome when short-termism is sufficiently low. We find that the impact of short-termism on long-term profits changes with the firm type and the equilibrium type.

#### 2 - A Wholesale Supply Contract with a Secondary Price Commitment

Ayhan Aydin, George Mason University School of Business, 4400 University Drive, MS 5F4, Fairfax, VA, 22030, United States, John R. Birge, Izak Duenyas

In procurement from low-cost but less flexible supply options, especially of products with highly variable demand and of seasonal nature, advanced auctions and non-linear compensation schedules can be used to correct inefficiencies due to double marginalization, information asymmetry, and demand uncertainty. We introduce an alternative simple-to-administer contracting scheme that requires minimal effort to implement, which can be used especially when the suppliers do not offer revenue sharing, buy-back, or real option contracts. We study how it allows the buyer to benefit further from low-cost distant supply options. We show that a truly low-cost supplier can also benefit from such a scheme.

#### 3 - Quality Control Strategies in Two-sided Market

Lyu Gaoyan, Peking University, No.5 Yiheyuan Street, Beijing, 100871, China, Lihua Chen

Consumers focus on product quality increasingly. We design two quality control strategies to help two-sided platform improve its product quality. Using Stankburg method, we compare the optimal profits with two quality control methods. The result shows that taking any strategy is better than taking no action. Moreover, taking both strategies will bring higher social welfare.

**4 - A Framework for Analyzing the U. S. Coin Supply Chain**

Yiwei Huang, Assistant Professor, Pennsylvania State University - Shenango, 173 Broadstone Drive, Mars, PA, 16046, United States, Subodha Kumar, Bala Shetty, Chelliah Sriskandarajah, Yunxia Zhu

We analyze the supply side of the U.S. Coin Supply Chain with the objective of providing a near-optimal or an optimal operating policy that minimizes the total cost of producing, supplying, and managing coin inventory in the U.S. Coin Supply Chain. We develop efficient algorithms to solve various versions of the coin-management problem and perform an extensive analysis to answer several managerially relevant questions in the context of improving the efficiency of the U.S. Coin Supply Chain.

**1 - Exact Penalization for Generalized Nash Equilibrium Problem**

Qin Ba, University of Southern California, Los Angeles, CA, United States, Jong-Shi Pang

The Generalized Nash Equilibrium Problem (GNEP) extends the classical Nash Equilibrium Problem (NEP) by allowing individual players' constraints, in addition to objectives, to depend on rivals' decisions. It is an important model actively used in many different fields. However, solution algorithms are extremely scarce due to the presence of coupling constraints. This paper studies penalty methods which penalize violation of individual players' coupling constraints and transform a GNEP into a single NEP. Several sufficient conditions are provided which guarantee exact penalization, i.e., the penalized NEP has identical solution sets as the original GNEP for finite penalty parameter.

**2 - Underestimate Sequences via Quadratic Averaging**

Chenxin Ma, JD.com, Mountain View, CA, United States, Naga Venkata C. Gudapati, Majid Jahani, Rachael Tappenden, Martin Takác

In this work we introduce the concept of an Underestimate Sequence. Our definition of a UES utilizes three sequences, one of which is a lower bound (or under-estimator) of the objective function. We propose several first order methods for minimizing strongly convex functions in both the smooth and composite cases. The algorithm have natural stopping conditions, which provides the user with a certificate of optimality. Convergence of all algorithms is guaranteed through the UES framework, and we show that all presented algorithms converge linearly, with the accelerated variants enjoying the optimal linear rate of convergence.

**3 - Optimizing Schedule of Trains in Context of a Large Railway Network**

Srinivasa Prasanna, IIIT Bangalore, 26/C, Hosur Road, Electronics City, Opposite Infosys Technologies, Bangalore, 560100, India, Sanat Ramesh, Tarun Dutt, Anushka Chandrababu, Abhilasha Aswal

We present two heuristics based on MILP formulations to optimize utilization for train timetabling problems for portions of one of the largest railway networks. These methods (extending state-of-art solvers) provide flexibility in scheduling additional trains while respecting a large number of constraints. We present methods to validate the deterministic schedule over global correlated variations in travel times without making any probabilistic assumptions.

**4 - A Branch and Bound Algorithm for Two-machine No-wait Flow Shop Scheduling with Truncated Learning Function**

Vahid Azizi, Iowa State University, Ames, IA, United States, Guiping Hu

There have been increasing interests in production scheduling considering learning effects. However, this problem has not been studied in a no-wait flow shop scheduling setting. This paper addresses a two-machine no-wait flow shop with the effect of the truncated learning function. With the truncated learning function, processing times of the jobs depend on their positions in the sequence and the learning parameter. A branch and bound algorithm is designed to minimize the makespan. A lower bound and two dominance properties are proposed which increase computational efficiency for the branch and bound algorithm.

**5 - Global Non-probabilistic Validation of Schedules**

GN Srinivasa Prasanna, International Institute of Information Technology Bangalore (IIITB), Bengaluru, 560100, India, Anushka Chandrababu, Abhilasha Aswal, Sanat R, Tarun Dutt

Deterministic optimization problems for train timetabling over even small portions of one of the world's largest railway networks become intractable when uncertainty is introduced. We present methods based on linear programming to validate nominal schedules over global correlated variations in travel times (satisfying linear constraints) without making any probabilistic assumptions.

**6 - A Hybrid Bat Algorithm for a Risk Averse Two Stage Stochastic Replenishment Problem with Transportation Costs**

Elham Taghizadeh, Wayne State University, Detroit, MI, 48202, United States, Saravanan Venkatachalam, Ratna Babu Chinnam

Integrating inventory and transportation decisions can provide significant gains in the supply chain management. In this talk, we present a two-stage risk-averse stochastic programming model with Conditional-Value-at-Risk (CVaR) as risk-measure for a multi-item replenishment problem with transportation cost and demand uncertainty. To circumvent computational complexity, we develop a Hybrid Bat algorithm to solve the large-scale instances. Computational results based on sample average approximation approach will be presented.

**1 - Using Data Analytics on Stakeholder Requirements Data to Inform Research Innovation**

Christina Rinaudo, USACE Engineer Research and Development Center, 3909 Halls Ferry Road, Vicksburg, MS, 39180-6199, United States, Niki C. Goerger, Simon Goerger

A recent stakeholder workshop to identify and discover challenges generated an initial data set of potential stakeholder requirements. Leveraging text and data analysis tools such as Tableau and R to analyze the stakeholder requirements data, areas for R&D efforts are illuminated to inform research innovation.

**2 - Developing an Analytical Tool to Assess Stakeholder Engagements**

Janice P. Buchanan, USACE - ERDC, 3909 Halls Ferry Road, Vicksburg, MS, 39180, United States, Randy K. Buchanan, Simon Goerger, John R. Burt

Identifying key stakeholders and tracking meeting results for a complex organization can be a daunting task. This presentation reviews the methodologies behind and development of StEAM - Stakeholder Engagement and Assessment Tool. StEAM is a prototype tool developed and used by the US Army Research and Development Center to help schedule stakeholder meetings, identify goals, and record accomplishments of senior leader engagements.

**3 - Shared Vision Planning for Water Security – A Stakeholder Analysis Framework**

James Schreiner, U.S. Military Academy-West Point, Dept. of Systems Eng, Room 420, Mahan Hall, West Point, NY, 10996, United States

Regional and Global water security represents an increasing risk and can be negatively or positively impacted by quality decisions of water management and infrastructure investment. Balancing watershed attributes of water storage, hydropower yield, risk mitigation, crop yield, and navigation among others becomes a difficult proposition when multi-national stakeholders are involved. This presentation will present a framework developed to use visual tools to capture stakeholder needs, wants, and desires while creating a shared situational awareness of the watershed system. The Tigris-Euphrates watershed provide the case study for this work.

#### 1 - Performance Metrics for Emergency Response Network Design

Alexander Rothkopf, Massachusetts Institute of Technology, Cambridge, MA, 65197, United States, Jason Acimovic, Jarrod D. Goentzel

We use a stochastic linear program to model a US-based emergency response organization's network of warehouses to serve sudden onset disasters. We develop multiple performance measures to characterize the risk portfolio, the supply portfolio and the carrier portfolio to support decision-makers in evaluating the status-quo of their operations and suggest areas of improvement. We show how our model and the measures work with data from our case.

#### 2 - Supply Constrained Location-distribution in Nonprofit Settings

Gemma Berenguer, Purdue University, West Lafayette, IN, 47906, United States, Chong Park

There is a need to design location-distribution problems in not-for-profit settings where limited resources have to be allocated to different demand regions and, thus, a combination of efficiency and equity goals can rightfully be considered. In this paper, we design and solve models that represent this setting. In particular, we propose the use of a well-known fractional efficiency measure and a new inequity measure related to the Gini coefficient that is based on the relative utility obtained by each demand region given a certain supply allocation. Our resolution technique allows us to use fractional objective measures that have not been commonly utilized before due to tractability issues.

#### 3 - Value of Combining Patient and Provider Incentives in Humanitarian Healthcare Service Programs

Karthik Natarajan, University of Minnesota, Minneapolis, MN, 55455, United States, Mili Mehrotra

We analyze the incentive design problem faced by a budget-constrained humanitarian organization managing a healthcare delivery program. Incentives offered to the healthcare provider are aimed at improving the quality and quantity of services offered, and demand-side incentives are used to encourage patients to seek care. In practice, incentives are often targeted at improving the availability of healthcare services. However, our results suggest that by offering the right combination of incentives to the provider and patients, program performance can be improved significantly. Furthermore, using the right incentives is critical to fully realizing the benefits of fundraising efforts.

#### 4 - Donor Funding for Drug Availability

Iva P. Rashkova, Washington University in St Louis, St Louis, MO, United States

Motivated by the Global Fund grant recipients, we study the procurement of health products subject to a donor budget constraint. Donor funding is in the form of lump-sum disbursements or per-unit subsidy agreements, or both. The donor objective is to maximize consumption in the face of demand uncertainty and grant recipients' unobservable procurement costs. We derive the optimal allocation of donor funds, which exhibits a risk-hedging synergy between the two types of funding. Using Global Fund data, we find that implementing the optimal budget allocation includes both types of funding for 60% of grant recipients and could lead to up to 21% increase in total consumption.

#### 1 - Setting up a Liquefied Natural Gas Refueling Infrastructure and Greenhouse Gas Emissions Savings on the Pennsylvania Turnpike

Sang Jin Kweon, Carnegie Mellon University, Pittsburgh, PA, 15213, United States

Recognizing the increased spotlight on liquefied natural gas (LNG) for long-haul fleets, logistics companies are interested in switching their long-haul fleets from diesel to LNG. In this talk, we present a bi-criteria binary linear programming model to locate LNG refueling stations on a directed transportation network with two conflicting objectives; maximizing the annual total vehicle-miles traveled covered by the stations and minimizing the capital cost for building the refueling infrastructure. We applied the proposed model to the Pennsylvania (PA) Turnpike System and estimate the potential reduction of pollutants on the turnpike as a function of the LNG refueling infrastructure cost.

#### 2 - Automated Guideway Transit (AGT) System Control Design with Q-learning Algorithm

Young Jae Jang, KAIST, Daejeon, Korea, Republic of, Ilhweo Hwang

The automated guideway transit (AGT) is a class of transportation system consisting of automated vehicles operating on a network of guideways or specially designed rails. This system is also known as Personal Rapid Transit (PRT) or pod-cars. One of the challenges in commercializing the AGT is the development of a routing algorithm controlling massive number of vehicles. We introduce AI based algorithm, Q-learning routing, which effectively control AGT system which consists of massive number of vehicles. Simulation analyses validate that the proposed algorithm outperforms the conventional DP based algorithms in terms of transit service times.

#### 3 - A Hybrid Heuristic Method for the Zero Emission Vehicles (ZEV) Routing Problem with Fueling Stations

Shichun Hu, University of Southern California, Los Angeles, CA, United States

Recent researches on Vehicle Routing Problem (VRP) have included the effect of greenhouse gas emissions to help alleviate the global climate change. One direction is to incorporate ZEVs into VRP models. Despite their advantages of zero or near-zero emissions, the fact that ZEVs have less mile range per fueling and less fueling stations is likely to offset their benefits thus making it harder to replace diesel trucks. We propose a method that combines Adaptive Large Neighborhood Search with local search to solve the ZEV routing problem considering fueling stations.

#### 4 - Optimal Location Design and Dynamic Pricing of Electric Vehicle Charging Facilities under Uncertain Demand and User Decisions

Leila Hajibabai, Stony Brook University, Department of Civil Engineering, 2433 Computer Science, Stony Brook, NY, 11794, United States, Amir Mirheli

This study develops a methodology that incorporates a dynamic pricing scheme into facility location design for electric vehicle charging infrastructure. The objective is to determine the optimal location and capacity of charging facilities in the transportation network and the optimal pricing based on demand. The problem is formulated as a bi-level optimization program that minimizes the total costs including infrastructure investments and operation costs of facilities under user-equilibrium flows. Numerical experiments confirm that the proposed methodology solves the problem efficiently.

#### Interpretable Machine Learning via Optimization

Sponsored: Optimization/Optimization under Uncertainty

Sponsored Session

Chair: Dimitris Bertsimas, Massachusetts Institute of Technology, Cambridge, MA, 02139, United States

##### 1 - Optimal Prescriptive Trees

Jack Dunn, Massachusetts Institute of Technology, Cambridge, MA, United States, Dimitris Bertsimas, Nishanth Mundru

Most machine learning approaches focus on predictive tasks, but in reality the final goal is actually to make optimal decisions. We present Optimal Prescriptive Trees (OPT), an interpretable approach for making personalized treatment prescriptions that learns from observational data. While constructing the tree, our method simultaneously infers the unknown counterfactuals in the data and learns to make optimal prescriptions, resulting in a decision tree that optimizes both the predictive and prescriptive error. OPT is interpretable, highly scalable, handles multiple treatments, and performs competitively with several state of the art methods.

##### 2 - Optimal Online Impute

Daisy Ying Zhuo, Massachusetts Institute of Technology, Cambridge, MA, United States, Dimitris Bertsimas, Colin F. Pawlowski

Missing data is a common problem in real-world settings and has attracted significant attention in the statistical literature. We have proposed a flexible framework based on formal optimization to impute missing data that readily incorporate various predictive models including K-nearest neighbors, support vector machines, and decision tree based methods. More recently, building on this framework, we have developed a fast and accurate method to impute data in an online fashion, where observations with potential missing data are provided one at a time. In large-scale experiments with real-world data and a range of learning tasks, we demonstrate improved accuracy using this approach.

##### 3 - Optimal Nonlinear Trees

Yuchen Wang, Massachusetts Institute of Technology, Dimitris Bertsimas, Jack W. Dunn

MARS is a greedy method for constructing a decision tree with nonlinear prediction functions in the leaves. We show that we can formulate the process of building such trees as a global optimization problem, which gives rise to our new method, Optimal Nonlinear Trees. We show in a collection of synthetic and real-world datasets that our Optimal Nonlinear Trees improve substantially over MARS, and also perform better than tree-based boosting methods like xgboost on most small to medium size datasets.

##### 4 - Nonparametric Prescriptive Analytics with Continuous, Constrained Decisions

Nishanth Mundru, Massachusetts Institute of Technology, Dimitris Bertsimas

Most real world business analytics problems involve solving optimization problems that depend on uncertain parameters  $Y$ . Given historical data on uncertainties  $Y$  and observed covariates  $X$ , we consider the problem of prescribing optimal data driven decisions. Our work adapts nonparametric methods such as k-nearest neighbors, local kernel regression, trees, and random forests to learn from data in a single step and produce high quality decisions. We demonstrate the effectiveness of our methods by applying them on various problems.

##### 1 - Robust Policy Improvement under Residual Confounding

Angela Zhou, Cornell University ORIE, 206 Rhodes Hall, Ithaca, NY, 14853, United States, Nathan Kallus

We study the problem of learning personalized decision policies from observational data which are robust in view of possible confounding. Unlike previous approaches for policy learning which assume unconfoundedness, that there are no unobserved confounders jointly affecting treatment assignment as

well as outcome response, our framework for robust policy improvement optimizes the minimax regret of a candidate policy against the standard of care, generalizing inverse-propensity weighted estimators. We demonstrate our methods can achieve beneficial out-of-sample performance on synthetic data and construct an evaluation study from a large clinical trial.

##### 2 - Statistics with Set-valued Functions: Applications to Inverse Approximation Optimization

Anil Aswani, UC Berkeley, San Francisco, CA, 94103, United States

Much statistical theory does not directly translate to sets because they do not form a vector space. Building on probability theory for random sets, this paper uses variational analysis to develop operational tools for statistics with set-valued functions. These tools are first applied to kernel regression of set-valued functions. The second application is to the problem of inverse approximate optimization, in which approximate solutions (corrupted by noise) to an optimization problem are observed and then used to estimate the amount of suboptimality of the solutions and the parameters of the optimization problem that generated the solutions.

##### 3 - Detecting Communities in Relational Event Data with Non-negative Tensor Decomposition

Xiaoyue Li, University of California-Davis, Davis, CA, United States

A point-to-point process models timestamped interactions between two entities in their state spaces. This study looked into the NYC Taxi dataset, where there were interactions of taxi trips between locations with their timestamps being the pick-up times. Assuming the temporal pattern of taxi trip intensities can be determined by community labels of pick-up and drop-offs, like neighborhoods, airports and tourist locations, the intensity estimation naturally requires detecting this community structure. To this end, we applied point-to-point models and developed a multiplicative update algorithm to estimate the intensity with a non-negative low-rank tensor reconstruction of the dynamic network.

##### 4 - A Semidefinite Programming-based Kernel Clustering Algorithm for Gaussian Mixture Models in the Presence of Outliers

Prateek Raj Srivastava, University of Texas at Austin, Austin, TX, 78712, United States, Purnamrita Sarkar, Grani Adiweni Hanasusanto

We consider the problem of clustering data points generated from a mixture of Gaussians in the presence of outliers. We propose a semidefinite programming-based algorithm that takes as input a kernel distance matrix to first denoise the original data, followed by spectral clustering to recover the true cluster labels of data points. Using Grothendieck's inequality, we obtain theoretical guarantees on the error rates. Further, we compare the performance of our algorithm with other existing algorithms like k-means++ and vanilla spectral clustering.

#### Practice- Modeling and Optimization for Decision Making II

Contributed Session

Chair: Michele J. Fisher, Northwestern University, Regina, SK, S4S 2H7, Canada

##### 1 - MCDA with Little or No Data

Lawrence D. Phillips, Emeritus Professor, London School of Economics & Political Science, London, NW3 1AH, United Kingdom

Unique decisions involving multiple criteria are often characterised by conflicting or sparse data, or even no data, so we rely on expert judgment. In this talk I explain and illustrate seven best-practice principles, with evidence they lead to reliable and valid results. The principles include impartially facilitating decision conferences of diverse experts, engaging experts' mental models, gaining clarity about the decision context, developing good definitions of criteria, applying proper scoring and weighting techniques, checking consistency, and conducting extensive sensitivity analyses.

##### 2 - Optimization and Scheduling Methodologies to Enable Low Earth Orbit Nano-satellite Communication

Michelle L. Song, University of Washington, Seattle, WA, 98105, United States, Cherry Yu Wakayama, Zelda B. Zabinsky

Communications with low earth orbit nano-satellites (nanosats) are challenging due to short contact time intervals and uncertainty in successful delivery of messages. We present optimization models (with and without energy constraints) to enable timely delivery of messages between gateways and remote users via nanosats. Connections between nanosats and remote users may not be well established; the uncertainty is modeled using a chance constraint. A network flow program is formulated to optimize the scheduling/routing of messages. Decisions are chosen to minimize the delivery time. Although the decisions are binary variables, the models are shown to satisfy the integrality property.

### 3 - An Application of Doubly Stochastic Nonhomogeneous Poisson Process for Detecting Abnormalities

Joonho Bae, Korea Advanced Institute of Science and Technology, 291, Daehak-ro, Yuseong-gu, Daejeon, Korea, Republic of, Seung-hoon Lee, Woojin Cho, Jinkyoo Park

The anomaly detection problem can be considered with a stochastic counting process. The event of interest is firstly defined as an exceedance of a numerical threshold of the data. Log Gaussian Cox Process, a doubly stochastic nonhomogeneous Poisson process is used to fit the occurrence pattern of the events. The probability value for the data realization within a fixed time interval under the trained intensity function, as a normality score, is calculated and checked if it is below a pre-determined criterion, which is regarded as an anomaly. The robustness of the model is also verified for the abrupt change within the data.

### 4 - Using Analytics to Improve Patron Engagement at the Los Angeles Philharmonic

Michele J. Fisher, Northwestern University, Chicago, IL, United States, Shelley de Leon, Erin Po, Scott Kennedy

One hundred years ago, the Los Angeles Philharmonic was founded as L.A.'s first permanent symphony orchestra. A century later, the LA Phil is one of the most dynamic music organizations in the world. It combines a commitment to the future with a fresh eye on the past. The Phil has been using analytics of historical giving data to target future fundraising efforts. Our team analyzed demographics, ticketing, and giving history for patrons and built models to predict the likelihood of a donation and the associated amount. This is helping the organization get ready for the next century.

### Combinatorial Optimization

Sponsored: Optimization/Integer and Discrete Optimization  
Sponsored Session

Chair: Rajan Harish Udawani, Massachusetts Institute of Technology, Cambridge, MA, 02139, United States

#### 1 - Continuous Submodular Maximization and Applications

Rad Niazadeh, Postdoctoral Researcher, Stanford University, 353 Serra Mall, Gate BLDG, Office 484, Stanford, CA, 94305, United States, Tim Roughgarden, Joshua Wang

Submodular optimization has deep roots in various application domains such as machine learning, finance, biology, auctions, or even statistical physics. In this work, we consider the natural generalization of submodularity to continuous domains, termed as Diminishing Return submodularity (DR-SM). We design algorithms with tight approximation guarantees for maximizing such functions over the unit hypercube. We show there exists an algorithm achieving at least  $1/2$  of the value of the optimal point (tight under standard complexity theoretic assumptions). For the special case of strong DR-SM, i.e. with additional coordinate-wise concavity, we develop a fast binary search  $1/2$ -approximation.

#### 2 - Approximating Maximin Fair Allocations

Peter McGlaughlin, University of Illinois Urbana Champaign, Urbana, IL, United States

We study the fair division of indivisible goods between agents with additive valuations. We use the recently introduced maximin share as local measure of fairness of an allocation. A maximin share is the maximum value an agent can guarantee himself if he is allowed to partition the goods into  $N$  bundles (one for each agent), but is allocated his least preferred bundle. We give a simple, greedy algorithm which provides a  $2/3$  maximin share allocation, i.e., an allocation where each agent receives a bundle worth at least  $2/3$  of their maximin share.

#### 3 - Robust Appointment Scheduling

Rajan Udawani, MIT, Cambridge, MA, United States, Andreas S. Schulz

Designing simple appointment systems that try to achieve both high utilization of expensive medical equipment and personnel, and short waiting time for patients, has long been an interesting problem in healthcare. In this work we consider a robust version of the appointment scheduling problem, and give a simple heuristic that achieves the first constant factor approximation. We also show optimal solutions in various special cases that supersede previous work. For the case where order of patients is interchangeable, and under-utilization costs are homogeneous, we show a simple ratio based heuristic that achieves a  $1.06$  approximation, improving the  $2+\epsilon$  approximation in Mittal et al. (2014).

### Recent Software Developments and Benchmarks

Sponsored: Optimization/Computational Optimization and Software  
Sponsored Session

Chair: Hans Mittelmann, Arizona State University, Tempe, AZ, 85287-1804, United States

#### 1 - Latest Benchmark Results

Hans Mittelmann, Arizona State University, Tempe, AZ, United States

We report on the current status of our benchmarking effort for both discrete and continuous, commercial and noncommercial optimization software.

#### 2 - Recent Enhancements to Matlab Optimization Solvers

Mary C. Fenelon, MathWorks, 3 Apple Hill Dr., Natick, MA, 01760-2098, United States

MATLAB has solvers for linear, quadratic, nonlinear, and mixed-integer linear optimization problems. They can solve both analytical and black-box models, including those with multiple objectives. Recent enhancements to these solvers and guidance on selecting a solver will be presented.

#### 3 - Gurobi 8.0 - What's New

Zonghao Gu, Gurobi Optimization, 3733-1 Westheimer Rd Box 1001, Houston, TX, 77027, United States

We will give an overview on new features and improvements in the current Gurobi release. In particular, we focus on the new Cloud and Compute Server enhancements and present our newest performance improvements.

#### 4 - CPLEX Progress in 2018

Andrea Tramontani, IBM Italy, Bologna, 06600, Italy, Xavier Nodet

In this talk, we will present the new features in the upcoming CPLEX version, as well as some of the performance improvements that were obtained.

## WC06

North Bldg 122C

### Global Optimization I

Sponsored: Optimization/Global Optimization  
Sponsored Session

Chair: Logan Michael Mathesen, Arizona State University, 699 S. Mill Ave, Tempe, AZ, 85281, United States

#### 1 - High Dimensional Global Optimization via Optimization of Complimentary Communicating Low Dimensional Subspaces

Logan Michael Mathesen, Arizona State University, 699 S. Mill Ave, Tempe, AZ, 85281, United States, xinsheng li, Kasim Seluck Candan, Giulia Pedrielli

Global optimization suffers the curse of dimensionality. High dimensional search is dominated by the assumption of low effective dimensionality, where few dimensions impact function value, with sophisticated algorithms searching for and exploiting a projection, or creating random embeddings. We avoid assuming low effective dimensionality and high dimensional modeling by optimizing sets of complimentary subspaces (that collectively exhaust the full space). Enabling intelligent information sharing amongst subspace optimizations, guiding one another to new optimal global projection locations.

#### 2 - Trans-dimensional Seismic Inversion by the Hamiltonian Approach

Sen Mrinal, Professor, University of Texas at Austin, 10100 Burnet Road, PRC, Bld 196, Austin, TX, 78758, United States, Reetam Biswas

Seismic reflection data are used for characterization of hydrocarbon reservoirs. We have developed a trans-dimension full waveform inversion technique in which the number of subsurface parameters is also treated as a variable to be solved for. The problem is set up in a Bayesian framework which draws samples from the posterior probability distribution. We make use of the sensitivity information to take large jumps in our model search using the Hamiltonian framework and thus we are able to draw several models from the most significant parts of the posterior distribution quickly. These are then used to estimate uncertainty which can be further used in decision making.

### 3 - Combining Exact Global Optimization and Nature-inspired Meta-heuristics: Revealing Robust Black-box Optimization Problem Solving Characteristics

Logan Mathesen, Research Assistant, Arizona State University, 699 S. Mill Ave, Tempe, AZ, 85281, United States, Giulia Pedrielli

Stochastic Optimization with Adaptive Restart (SOAR), recently proposed by the authors, mixes local and global search through controlled restarts. Despite good empirical performance SOAR is difficult to effectively parallelize. In this work we treat SOAR as an agent, parallelizing, we mix explorative (L vy) agents with exploitative SOAR agents. Meta-models blend information of each agent type, improving SOAR agent search. The distributed SOAR (dSOAR) algorithm results; experimentation investigates relationships between agent types, revealing robust cost effective dSOAR optimization behavior.

### Stochastic Optimization Methods and Approximation Theory in Machine Learning II

Sponsored: Optimization/Nonlinear Programming

Sponsored Session

Chair: Aritra Dutta, Thuwal, 23955-6900, Saudi Arabia

Chair: El houcine Bergou, INRA-KAUST, Jeddah, Saudi Arabia

#### 1 - Random Direct Search Method for Minimizing Nonconvex, Convex and Strongly Convex Functions

El houcine Bergou, INRA-KAUST, King Abdullah University of Science and Techn, Jeddah, Saudi Arabia

In this paper we consider the problem of unconstrained minimization of a smooth function in a setting where only function evaluations are possible. We design a novel randomized direct search (RDS) method and analyze its complexity. At each iteration, RDS generates a random search direction according to a certain fixed probability law. We analyze RDS method under several stepsize selection schemes (fixed, decreasing, estimated through nite differences, etc).

While deterministic direct search depends quadratically on  $n$  ( $n$  is the dimension of the space), our method depends linearly on  $n$ . We also propose a parallel version for RDS, with better iteration complexity bounds.

#### 2 - A Nonconvex Projection Method for Robust PCA

Aritra Dutta, King Abdullah University of Science and Technology, Division of Computer, Electrical and Mathemat, Al Khwarizmi Bldg 1, Thuwal, 23955-6900, Saudi Arabia, Filip Hanzely, Peter Richtarik

Robust principal component analysis (RPCA) is a well-studied problem with the goal of decomposing a matrix into the sum of low-rank and sparse components. In this paper, we propose a nonconvex feasibility reformulation of RPCA problem and apply an alternating projection method to solve it. To the best of our knowledge, we are the first to propose a method that solves RPCA problem without considering any objective function, convex relaxation, or surrogate convex constraints. We demonstrate through extensive numerical experiments on a variety of applications, including shadow removal, background estimation, face detection, and galaxy evolution, that our approach matches and often significantly outperforms current state-of-the-art in various ways.

#### 3 - An Inexact Regularized Stochastic Newton Method for Nonconvex Optimization

Xi He, Lehigh University, 837 Cedar Hill Drive, Allentown, PA, 18109, United States

We consider the minimization of nonconvex functions that typically arise in machine learning. In this paper, an inexact regularized stochastic Newton method (irSNT) within trust region scheme is purposed and it only requires Hessian-vector product oracle within the subproblem solver. irSNT achieves the best worst-case complexity regarding first-order stationary point convergence in terms of expectation and also has a second-order stationary point convergence guarantee with high probability. The Numerical experiments show that our proposed method can successfully solve optimization problems involving nonconvex objectives.

#### 4 - Improved Shrinkage Prediction under a Spiked Covariance Structure

Trambak Banerjee, University of Southern California, Los Angeles, CA, United States

We develop a novel shrinkage rule for prediction in a high dimensional non-exchangeable hierarchical Gaussian model with an unknown spiked covariance structure. We propose a family of commutative priors which, governed by a power hyper-parameter, ranges from perfect independence to highly dependent scenarios. It induces a wide class of predictors whose evaluation involves

quadratic forms of smooth functions of the unknown covariance. We propose an efficient adaptive prediction procedure which outperforms factor model based plug-in predictors by using uniformly consistent estimators of the quadratic forms involved in the coordinate-wise shrinkage strategies. We further improve our predictor by introducing possible reduction in its variability through a novel coordinate-wise shrinkage policy that only uses covariance level information and can be adaptively tuned using the sample eigen structure of the high dimensional spiked covariance model. Simulation studies are conducted to show that in many settings the proposed method substantially improves the performance of traditional plug-in based shrinkage procedures which first estimate the covariance and thereafter optimize over the hyper-parameters.

### Healthcare Supply Chain

Sponsored: Manufacturing & Service Oper Mgmt

Sponsored Session

Chair: Liu Yang, Purdue University, New Albany, IN, 47150, United States

#### 1 - Service Level Satisfaction during Shortages for Health Networks

Erhun Kundakcioglu, Ozyegin University, Faculty of Engineering, Nisantep mah. Orman sok., Istanbul, 34794, Turkey, Cem Bozkir

In this study, we consider a system of healthcare providers, which face the same uncertain supply disruptions (e.g., nationwide, or worldwide drug shortages). Each hospital observes a stochastic demand and if demanded drug is unavailable, patients leave and receive care in another hospital system. As these unavailabilities hurt the brand value of the hospital system, we propose an inventory sharing mechanism for hospitals to mitigate the effect of uncertain supply disruptions. We explore reactive versus proactive inventory sharing approaches by investigating the effect of inventory related parameters on the service level of the system.

#### 2 - Improving Supply Chain Process Efficiency and Data Transparency Using Blockchain Technology

Raja Jayaraman, Khalifa University, P.O. Box 127788, Abu Dhabi, United Arab Emirates, Mecit Can Emre Simsekler

Supply chain logistics constitutes second largest expense for healthcare providers. The exponential growth, global sourcing of products, and increasing healthcare costs presents a compelling need to adopt innovative technology and real-time information sharing across the supply chain. The current system-wide inefficiencies in healthcare supply chains present an important and timely opportunity to improve the way transactions are recorded, stored and shared amongst stakeholders. In this talk I will present some of the significant challenges in supply chain data management, present several applications of blockchain technology along the product supply chain with potential pitfalls.

#### 3 - Optimizing Medical Supply Spend for GPOs and Healthcare Organizations

Liu Yang, Purdue University, Purdue Research Park, 3000 Technology Avenue, New Albany, IN, 47150, United States

Tier pricing is commonly used by medical suppliers to support corporate sales and market share strategies. Hospitals and GPOs have the opportunity to achieve significant savings in medical supply costs if they can effectively utilize tier pricing, but a major challenge is that tier structures vary by vendors and product categories, and may be based on volume, spend, and/or market share, and could be at a single facility or across facilities. This research presents a modeling framework that addresses the complexity of tiers with the consideration of one-way cross-reference and preference of individual facility. The application enables hospitals to achieve over 15% reduction in supply costs.

#### 4 - A Comparative Analysis of Healthcare and Traditional Supply Chains Using Financial Ratios

Balaraman Rajan, California State University East Bay, 25800 Carlos Bee Blvd, Hayward, CA, 94542, United States, Vishwanath Hegde

We compare and contrast the structure of healthcare and traditional supply chains using publicly available financial data. First, we develop a framework to analyze the healthcare supply chain and use the framework to compare with traditional supply chain. Then, by analyzing financial ratios, we find that companies that operate in different stages of the healthcare supply chain do exhibit different characteristics and differ from the companies that operate in comparable stages of traditional supply chains. We then draw inferences about the structural differences between healthcare supply chain and traditional supply chains based on the observed patterns.

## 5 - Individualized No-show Predictions: Effect on Clinic Overbooking and Appointment Reminders

Yutian Li, University of Science and Technology of China, Sammi Tang, Joseph Johnson, David Lubarsky

In this paper, we develop a Bayesian nested logit model which improves no-show prediction accuracy over the widely-used standard logit model. The accuracy gain arises from the individual patient-level coefficients provided by the Bayesian approach. Comparison of model fit on 12-months of appointment data shows the Bayesian model outperforms the standard logit model. In simulation studies, our results show that applying Bayesian model's prediction to scheduling algorithm can increase clinic's profit, reduce waiting cost when no-show probability is low and reduce overtime cost when no-show probability is high.

North Bldg 125B

### Service Operations Management in the IT Industry

Sponsored: Manufacturing & Service Oper Mgmt

Sponsored Session

Chair: Aly Megahed, IBM, San Jose, CA, United States

#### 1 - Blockchain Technology in Supply Chains: Recent Developments and Future Research

Kaan Unnu, Rensselaer Polytechnic Institute, Center for Industrial Innovation, 110 8th Street, Troy, NY, 12180-3590, United States, Jennifer A. Pazour, Aly Megahed, Pralhad Deshpande, Chandra Narayanaswami

Blockchain technology has the potential to increase supply chain transparency and traceability by creating a robust and trusted decentralized source of information between different supply chain entities. We create a framework to categorize blockchain supply chain use cases based on a supply chain's echelons and scale, as well as information requirements. The presented framework systematically links potential blockchain benefits and use cases to existing supply chain literature and identifies new directions for future ORMS research topics.

#### 2 - Optimal Bidding for Highly-Valued IT Service Contracts: Theoretical Results and Practical Implications

Xiangyu Zhang, Cornell University, Ithaca, NY, United States, Aly Megahed, Peter Frazier

Information technology service providers compete to win highly-valued IT service contracts in a tender process. Prior literature shows that features other than price, including the service provider's relationship with the client, contribute to the client's selection because good relationship increases the provider's chance of winning the deal. Thus, it might be beneficial for the provider to lower their price for improving the client relationship and increasing their potential future contracts profits. In this work, we provide theoretical and numerical results illustrating the optimal price is lower than the myopic price which tries to maximize the expected profit of the current deal.

#### 3 - An Approach to "Predict+optimize" Rather than "Predict Then Optimize" with a Case Study in a Cloud Computing Application

Aly Megahed, IBM Research-Almaden, San Jose, CA, 95123, United States, Yingdong Lu, Mark S. Squillante

In a lot of applications, some uncertain parameters are predicted then fed into an optimization model to optimize for some task. For example, customer demand in a supply chain is predicted and then fed into an optimization model to find the optimal inventory levels. The traditional approach is to do the two tasks separately. We present a novel approach of doing them simultaneously (predict+optimize rather than predict then optimize) and apply it to a real-world service operations management application in cloud computing.

#### 4 - Black Box Combinatorial Optimization with Monotone Structure: Applications in the IT Services Industry

Nam Ho-Nguyen, Carnegie Mellon University, Tepper School of Business, 5000 Forbes Avenue, Pittsburgh, PA, 15213, United States, Giacomo Nannicini, Aly Megahed, Ahmed Nazeem

We consider the NP-hard problem of optimizing a black box function over binary vectors subject to linear constraints, where the black box function satisfies a monotonicity property. We discuss two potential applications for such a problem: automated solution design of IT services contracts, and product selection for retail bundles with uncertain cost. We develop an iterative framework for choosing new binary vectors to query via monotonic polynomial regression, and give a valid optimality criterion for stopping. To scale our approach, we discuss potential heuristics for different steps of our framework.

## WC12

North Bldg 126A

### Marketing II

Contributed Session

Chair: Mehmet Onal, Isik University, Ozyegin University, Istanbul, 34794, Turkey

#### 1 - An Analytical Model of Tier-based Loyalty Programs

Amir Gandomi, Assistant Professor, Hofstra University, 031 Weller Hall, Hempstead, NY, 11549-1340, United States, Mehdi Nourinejad

Loyalty programs are now a prominent market marketing strategy in many industries. They offer users a reward for becoming repeat consumers of a product. A prominent reward structure is the tier-based program that categorizes users according to their consumption intensity. Service providers like to design the tiers to maximize their expected profit. While research in this area is abundant, only a few provide analytical intuition of how the tiers should be set up. This study finds the optimal tier design of loyalty programs.

#### 2 - Benefit Formation and Enhancement

Hyowon Kim, Doctoral Student, Ohio State University, 540A Fisher Hall 2100 Neil Ave, Columbus, OH, 43210, United States, Dong Soo Kim, Greg M. Allenby

The distinction between attributes and benefits is at the heart of product development. Some attributes are benefit enabling in the sense that their presence signals that an offering is responsive to a benefit being sought, while their absence indicates that the product does not provide the benefit. Not all brands, for example, are seen as luxurious and specific brand names may be needed for consumers to consider an offering as providing luxury. Benefit formation hinges on these types of attributes being present, while other attributes only enhance a benefit that has already been formed. We develop a model to identify attributes that are critical to a benefit formation and apply it to conjoint datasets.

#### 3 - The Influence of Consumers' Regulatory Focus and Cultural Dimensions on Intentions to Purchase from Online Stores

Qiuling Li, University of Macau, Room 1048 E22, FBA, University of Macau, Macau, Macao, Chanthika Pornpitakpan

Consumer behavior in a multichannel context has increasingly received attention from academics. More and more people nowadays pursue online shopping. However, little research has examined how consumers' motivations and cultural dimensions affect their shopping channel preferences. Addressing this gap of knowledge, this research examines how consumers' regulatory focus (promotion focus vs. prevention focus) and cultural dimensions (i.e., individualism-collectivism, power distance, uncertainty avoidance, and masculinity-femininity, as identified by Hofstede) influence intentions to purchase from online stores versus physical stores. Several hypotheses are proposed.

#### 4 - A Price Markdown Analysis for Two Vertically Differentiated Items

Mehmet Onal, Ozyegin University, Istanbul, Turkey, Erhun Kundakcioglu

We consider a retail store that sells two vertically differentiated products that can substitute each other. We assume that the two products differ in quality and price, and target two different customer segments. We also assume that items lose their utility linearly with time and may require price adjustments so that cannibalization does not occur, i.e., consumers from one segment never buy items targeted for the other segment. We identify optimal solution properties and propose an efficient solution approach.

## WC13

North Bldg 126B

### Practice- Supply Chain Optimization II

Contributed Session

Chair: Jing Luo, University of Pittsburgh, Pittsburgh, PA, 15260, United States

#### 1 - Supply Chain Design with Multi-modal Shipping and Varying Lead Times

Gang Wang, University of Massachusetts Dartmouth, New Bedford, MA, 02740, United States

This paper considers a multi-echelon supply chain design considering production scheduling, varying lead times, and multiple shipping options. The problem is to determine three types of decisions: a) strategic decision-the location of processing centers; b) tactical decision-the shipping quantities from suppliers to processing centers; and c) operational decisions-order assignment of demand points to processing centers as well as production schedules at both the suppliers and processing centers. We study three scenarios: 1) commit to delivery; 2) nonlinear shipping costs; and 3) complete delivery.

## 2 - Manufacturing Network Design in the Pharmaceutical Industry under Life-cycle Demand

Gregor Blosssey, German Graduate School of Management and Law, Heilbronn, 74076, Germany, Gerd J. Hahn, Achim Koberstein

This research investigates the value of flexibility in manufacturing networks of the pharmaceutical industry. Pharmaceutical companies typically operate under life-cycle demand and are subject to two sources of uncertainty: demand uncertainty and product approval uncertainty. We present a two-stage stochastic programming model to determine the optimal level of capacity flexibility using multiple product allocations and outsourcing to contract manufacturing organizations. A numerical study is conducted with real-life data provided by a global pharmaceutical company.

## 3 - Integrated Order Acceptance, Production Planning, and Distribution Problems

Utku Koc, MEF University, Huzur Mah. Ayazaga Cad No: 4, Maslak-Sariyer-Istanbul, Istanbul, 34396, Turkey

We study a manufacturer's multi-period production planning problem to produce and ship a subset of available orders from a given set, meeting due window constraints, with the maximum profit. Each potential order has a revenue, size, and a due window. The profit is calculated as the revenue minus the transportation and inventory holding costs. The manufacturer can use different type of vehicles varying in their price and availability for outbound transportation. We study three different delivery characteristics: 1) whether orders can be split or not, 2) whether they can be consolidated or not, and 3) whether their sizes are restricted to be in integer multiples of vehicle capacities or not.

## 4 - The Optimal Width Decision for Cardboard Used in On Demand Packaging

Yihuan Yang, Hong Kong University of Science and Technology, Clear Water Bay, Kowloon, Hong Kong, Xiangtong Qi

For packaging problem, if the box could fit the products perfectly, there would be no packing fillers waste and less corrugated cardboard is used. The box-making machine with one long continuous piece of cardboard is used to cut the right-sized box. So the main problem is how to decide the proper width of the cardboard. The framework introduced in this paper can help to make better decisions so that the material waste is minimized. Compared with other naive methods, the policy obtained by our framework has better performance, especially when the penalty of exceeding capacity is high.

## 5 - Learning About a New Market from Supplier Perspective

Jing Luo, University of Pittsburgh, Pittsburgh, PA, 15208, United States

How to learn about a new market? What information and method are important for suppliers?

North Bldg 127A

## Improving Services: Role of Incentives and Simple Policies

Sponsored: Manufacturing & Service Oper Mgmt/Service Operations

Sponsored Session

Chair: Ramandeep Randhawa, University of Southern California, Los Angeles, CA, 90089, United States

Chair: Achal Bassamboo

## 1 - Tipping for Fast Service: The Role of a Social Norm

Ran Snitkovsky, Tel Aviv University, Tel Aviv, Israel, Laurens G. Debo

We discuss how tipping for fast services emerges as a norm in a congested environment when after the joining and consumption phase, customers meet in a social market place where they compare each others' tips and incur disutility when these tips differ from each other.

## 2 - Managing Supply in the On-demand Economy: Flexible Workers or Full-time Employees

Jing Dong, Columbia University, Uris Hall 413, 3022 Broadway, New York, NY, 10027, United States, Rouba Ibrahim

We study the optimal staffing problem with a blended workforce. The goal is to strike a balance between staffing cost and service quality in presence of time-varying demand, supply side flexibility, and supply side uncertainty. We consider a queueing framework, where the number of servers is random due to the supply side uncertainty, and develop appropriate approximations that provide key insights into the staffing problem. We also study the impact of supply side uncertainty on the quality of service.

## 3 - Revenue Loss of Simple Contracts with Price and Delay Differentiated Customers

Abhishek Ghosh, Northwestern University, Evanston, IL, United States, Achal Bassamboo, Ramandeep Randhawa

We analyze a service firm that caters to price and delay sensitive customers by offering a menu of price-delay pairs. We study the gap in revenue for the firm under the worst-case valuation and delay sensitivity parameters. We also characterize the asymptotically optimal contract when the number of customer classes is large and provide the optimality conditions and the associated revenue loss.

## 4 - Dynamic Matching in School Choice: Efficient Seat Reassignment after Late Cancellations

Irene Yuan Lo, Columbia University, New York, NY, United States

When assigning scarce public school seats to students, a key operational issue is how to reassign seats that are vacated after an initial round of assignment. We propose a class of reassignment mechanisms, the Permuted Lottery Deferred Acceptance (PLDA) mechanisms, which generalize the commonly used Deferred Acceptance school choice mechanism and retain its desirable incentive and efficiency properties. We find that under natural conditions on demand all PLDA mechanisms achieve equivalent allocative welfare and the PLDA based on reversing the lottery order minimizes reassignment. Empirical investigations on data from NYC high school admissions support our theoretical findings.

## Tactical Assortment & Inventory Planning

Sponsored: Manufacturing & Service Oper Mgmt/Supply Chain

Sponsored Session

Chair: Shahab Derhami, ISyE Ga Tech, Atlanta, GA, 30332, United States

Co-Chair: Iman Dayarian, Georgia Institute of Technology, Atlanta, GA, 30332, United States

## 1 - Assortment Planning for Retailers of Substitutable High-value Products under Stochastic Demand

Shahab Derhami, Georgia Tech, NW, Atlanta, GA, 30332, United States, Iman Dayarian, Benoit Montreuil

We present challenges that retailers of high-value products face in determining the optimal assortment plan and inventory level decisions under stochastic demand, customer substitution, and long order lead-time constraints. We develop a scenario-based stochastic optimization model to address this problem and demonstrate the simulation results of implementing this model on the network of dealerships of a leading manufacturer of recreational vehicles in North America.

## 2 - Assortment Planning Under Product Substitution, Stochastic Demand, and Dealer Network Exchange

Iman Dayarian, Culverhouse College of Commerce, University of Alabama, Box 870226, Tuscaloosa, AL, 35487, United States, Shahab Derhami, Benoit Montreuil

We consider the context of assortment and inventory level planning of a network of dealers, offering high-value products. If a dealer is not able to meet a customer's demand based on his current inventory, he may offer an exchange to one of the neighboring dealers who possesses a product that satisfies the customer's demand. In such an environment, assortment recommendations to the dealers must take into account scenarios in which dealers attempt to collectively reduce the chance of lost sales in a district. We first formally describe this context, and then propose a centralized decision making procedure, which makes assortment and inventory level recommendations to the dealers within a district.

## 3 - Retail Availability Optimization in High-value Product Retail Networks

Jinyong Yim, Georgia Institute of Technology, Atlanta, GA, United States, Iman Dayarian, Shahab Derhami, Benoit Montreuil

We present a model to maximize product availability under stochastic demand and fast replenishment assumption in a network of hyperconnected dealerships of vehicles. Our model considers possible on-demand inventory transshipment between retail centers to satisfy the demand for an out-of-stock product. We present the results of implementing our model on the distribution network of a manufacturer of recreational vehicles in North America.

**1 - Vertical Expansion a Solution for Future Container Terminals**

Nima Zaerpour, Assistant Professor, California State University-San Marcos, San Marcos, CA, 92096-0001, United States

Container terminals play a major role in the growth of international trade. They need to accommodate the increasing number of containers while their space is limited, particularly close to major cities. One approach, often used in practice, is horizontal expansion through expensive land reclamation projects. In contrast, vertical expansion uses the available land more efficiently by storing containers in high-bay warehouses. In this paper, we study a next generation container terminal consisting of container storage towers. The results show that, compared to a traditional container block, the container tower can increase the annual throughput, while saving on the required footprint.

**2 - A Lagrangean Decomposition Approach for Dynamic Block Stacking Planning Under Deterministic Demand**

Hueon Lee, PhD Candidate, University of Arkansas, 4207 Bell Engineering Center, 1 University of Arkansas, Fayetteville, AR, 72701, United States, Kelly Sullivan, John A. White

In this research, the dynamic block stacking problem of determining which product lots to store in which storage row depths at each time epoch is considered for a block stacking storage system. The problem is formulated as an unsplitable multi-commodity flow problem based on a given layout of the system and known inventory cycles of product lots. To efficiently derive a good feasible solution to a large-scale instance, we propose a heuristics based on Lagrangean decomposition. It provides optimistic bounds of the optimal objective function value of the problem and generates feasible solutions using Lagrangean multipliers in an iterative process solving a Lagrangean dual formulation.

**3 - A Neighborhood Search Heuristic for the P-Median Problem with Continuous Demand**

Shane Auerbach, University of Wisconsin-Madison, Madison, WI, United States, Rebekah Dix

We develop a neighborhood search heuristic for the p-median problem with continuous demand. We discuss challenges to implementing the heuristic, propose solutions, and describe how it can be embedded in hybrid heuristics. We then apply the heuristic to computing optimal spatial allocations of facilities in US cities. In comparing these optimal allocations to the actual ones, we find that allocations of supermarkets do relatively poorly in minimizing transportation costs for consumers.

**4 - Robust Emergency Relief Supply Planning Incorporating Evacuation Side Uncertainty**

Jyotirmoy Dalal, Assistant Professor, Indian Institute of Management Lucknow, Prabandh Nagar, IIM Road, Uttar Pradesh, Lucknow, 226013, India, Halit Uster

We present an emergency response planning problem for foreseen disasters to supply relief by explicitly considering uncertainties in disaster location, intensity, duration, and evacuee-compliance. We present a robust optimization model that provides a decision maker with a choice of considering time-dependent or independent evacuation-related uncertainties. We devise a decomposition-based solution method for large-scale instances and conduct a case study to demonstrate the applicability of our approach.

**5 - An Integrated Sustainable Food Supply Chain Network Design Model for Optimization of Strategic & Tactical Decisions**

Dnyaneshwar G. Mogale, Research Scholar, Indian Institute of Technology, Kharagpur, West Bengal, Kharagpur, 721302, India, Sri Krishna Kumar, Manoj Kumar Tiwari

The developing countries are moving towards the modernized food supply chain system due to the growing population and post-harvest losses of food. In this study, a novel integrated multi-echelon, multi-period and inter-modal mathematical model is formulated to design the sustainable food grain supply chain network. The objective function of the model is to minimize the fixed cost of silo establishment, transportation, inventory and operational costs along with the cost of carbon dioxide emissions. The mathematical model is solved by using the CPLEX solver.

**Joint Session RMP/Practice Curated: Modern Applications of Revenue Management**

Sponsored: Revenue Management &amp; Pricing

Sponsored Session

Chair: Maxime Cohen, NYU Stern, New York, NY, 10012, United States

Co-Chair: Renyu Zhang, New York University Shanghai, Shanghai, 200122, China

**1 - The Value of Personalized Pricing**

Michael Hamilton, Columbia University, New York, NY, United States, Adam Elmachtoub, Vishal Gupta

Increased access to high-quality customer information has fueled interest in personalized pricing strategies, i.e., strategies that predict an individual customer's valuation for a product and then offer them a customized price. While the appeal of personalized pricing is clear, it may also incur costs in the form of market research, investment in information technology, and branding risks. In light of these tradeoffs, in this work, we study the value of personalized pricing over simpler pricing strategies, and provide various closed-form upper bounds on the ratio that depend on simple statistics of the valuation distribution.

**2 - Power of Monotonic Reoptimized Pricing in Revenue Management with Strategic Customers**

Yiwei Chen, University of Cincinnati, Cincinnati, OH, United States, Stefanus Jasin

We study a canonical revenue management problem that a seller sells a single product with finite inventory over a finite horizon. Customers are forward looking who strategize their purchasing times. We propose a simple heuristic policy that requires the seller to repeatedly solve a simple static optimization problem by using the updated sales information. The price process is restricted to be non-decreasing over time. Thus, it incentivizes customers to behave myopically. We show that when the seller's initial inventory and the length of the horizon proportionally grow large (scaled by  $k$ ), the regret of our proposed policy is upper bounded by  $O(\log k)$ .

**3 - Competition and Cooperation for Two-sided Platforms**

Renyu Zhang, New York University Shanghai, 1555 Century Avenue, Shanghai, 200122, China, Maxime Cohen

We study the two-sided competition between online service platforms. We develop a new approach to characterize the existence and uniqueness of equilibrium when platforms compete for both demand and supply. Armed with this result, we then investigate cooperation between different ride-sharing platforms by introducing new joint services. The cooperation between different platforms is through profit sharing contracts. Interestingly, we show that a well-designed profit-sharing contract can will benefit both platforms. In addition, we find that one can design a profit-sharing contract that also benefits riders and drivers.

**4 - Electricity Pricing with Limited Consumer Response**

Saed Alizamir, Yale University, 206 Elm Street, P.O. Box 209052, New Haven, CT, 06520, United States, Shouqiang Wang, Fariba Farajbakhsh

Retail electricity markets are characterized by nuanced features that distinguish them from mainstream retail settings. Specifically, the consumption quantity is influenced by factors not controlled by the consumer (e.g., weather), and consumption decisions can be readjusted on a continuous basis. In this paper, we study a monopolistic utility firm's pricing decision in a retail electricity market. Using a rational inattention framework, we construct a demand model for consumers, whose consumption decisions demonstrate limited response to their ambient environment for a given price. Implications on social welfare and system reliability are drawn.

### Matching Markets

Sponsored: Revenue Management & Pricing

Sponsored Session

Chair: Ozge Sahin, Johns Hopkins University, Brooklyn, NY, 11222, United States

#### 1 - Information Acquisition Costs of Matching Markets

Irene Yuan Lo, Columbia University, New York, NY, 10025-6186, United States

Centralized matching mechanisms are typically designed assuming all participants know their preferences. We study the welfare effects of costly information acquisition in a matching model where school priorities are known, but students learn their preferences at a cost. Traditional matching mechanisms that do not account for costly information acquisition can lead to information deadlocks, where it is strictly optimal for every agent to wait for others to provide information before learning their own preferences. We characterize the optimal omniscient mechanism using an admission cutoff structure and propose mechanisms that learn market information to approximate the optimal outcome.

#### 2 - Bonus Competition in the Gig Economy

Xiaoyan Liu, Cornell University, Sage Hall, Ithaca, NY, 14853, United States, Yao Cui, Li Chen

Unlike traditional firms, service platforms in the gig economy need to compete for both customers and independent service providers. We study how service platforms can offer bonuses to attract service providers in a competitive setting, and investigate the implications of platforms' bonus strategies on the stockholders of the gig economy.

#### 3 - Nonlinear Pricing for Online Matching Markets

Ozge Sahin, Johns Hopkins University, Baltimore, MD, 21231, United States

Online matching platforms such as eHarmony lack a straightforward quality measure, and users' preferences are often fluid and subjective. A large and active user base is a platform's most precious asset. We investigate how pricing mechanisms can help manage user entry, and exit behavior to the matching platform to improve social welfare and firm revenues.

### Innovative Practices in Pricing and Revenue Management

Sponsored: Revenue Management & Pricing

Sponsored Session

Chair: Pelin Pekgun, University of South Carolina, Columbia, SC, 29205, United States

Co-Chair: Ovunc Yilmaz, University of Notre Dame, South Bend, IN, 46617, United States

#### 1 - Inventory Count-down Information

Laura Wagner, NIF 501082522, Lisbon, 1200/830, Portugal, Edu Calvo, Ruomeng Cui

Online retailers provide the scarcity message such as count-down inventory information to alert consumers that there are only a few units left. Collaborating with the leading flash-deal retailer in Spain, which displays the limited-inventory information for the last five inventory units, we explore how it affects consumer purchasing behavior. We use a difference-in-difference approach to examine the impact on sales, returns and net sales. We find that the scarcity message causally attracts more sales, the return rate remains the same and net sales increase. We also investigate the moderating effect of product characteristics, and how the scarcity effect varies across web and mobile channels.

#### 2 - The Effect of Platform Selection and Underreporting Biases on Tripadvisor Ratings

Saram Han, 110 Joanne Dr., Ithaca, NY, 14850, United States  
Cornell SC Johnson College of Business, Ithaca, NY, United States

This study shows how an underreporting bias affects the shape and average of an online satisfaction rating in TripAdvisor in conjunction with a platform selection bias. We show that since expert reviewers' expectations for service quality is hard to meet, most of the properties experience negative platform selection bias. The direction of the underreporting bias is determined by the reporting propensity that depends on how strongly the reviewers are motivated to report their satisfaction, whether to complement or complain. The bounds of the reporting propensity are determined by the reviewers' expertise with the platform.

#### 3 - The Sharing Economy and Housing Affordability: Evidence from Airbnb

Davide Proserpio, University of Southern California, 701 Exposition Blvd, HOH 332, Los Angeles, CA, 90034, United States

We assess the impact of home-sharing on residential house prices and rents. Using a dataset of Airbnb listings from the entire United States and an instrumental variables estimation strategy, we find that a 1% increase in Airbnb listings leads to a 0.018% increase in rents and a 0.026% increase in house prices at the median owner-occupancy rate zip code. The effect is moderated by the share of owner-occupiers, a result consistent with absentee landlords reallocating their homes from the long-term rental market to the short-term rental market. A simple model rationalizes these findings.

#### 4 - The Effect of User Generated Content on Hotel Demand under a Competitive Framework

Sanghoon Cho, University of South Carolina, 1014 Greene Street, Columbia, SC, United States, Pelin Pekgun, Ram Janakiraman

We investigate the impact of user generated content on hotel performance as captured by actual hotel bookings. We propose and estimate a consumer learning model that focuses on the effect of review sentiment on hotel demand taking into account the effect of competition and hotel prices. Drawing on prospect theory, we cast the competitive perception spillover effects in the form of gains and losses in review sentiment, and find that the relative negative sentiment has more influence on bookings than the relative positive sentiment.

### Practice – Finance Theory & Financial Engineering I

Contributed Session

Chair: Min Dai, National University of Singapore, Dept of Math, Singapore, 119076

#### 1 - Investment and Financing for Cash Flow Discounted With Group Diversity

Zhaojun Yang, Southern University of Science and Technology, 1088 Xueyuan Avenue, Fourth Building of the Faculty Apartment, Shenzhen, 518055, China

We consider a firm's investment and financing decisions made by a group of which each individual may utilize different discount rates to price cash flow generated by the investment project. We show that a higher degree of decreasing impatience or a greater group diversity increases the project value, accelerates investment and postpones default. Both the value of the investment option and the optimal leverage increase with the degree of the decreasing impatience and the group diversity. The inefficiency from asset substitution increases but it from debt overhang decreases with the degree of the decreasing impatience and the group diversity. Our predictions are documented by empirical evidences.

#### 2 - Making the Most Out of Market Forecasts Based on Linear Regression

Hamed Khaledi, PhD Student, Broad Graduate School of Management, 632 Bogue Street, North Business College Complex, Room N203, East Lansing, MI, 48825, United States

This paper presents a mathematical model to make optimal trading decisions using forecasts made by multivariate regression. Given that these results are uncertain, the model maximizes the expected profit from opening and closing trade positions. To this end, a dynamic programming approach is employed. We first find the optimal take profit levels associated with buy and sell positions. Then we decide to buy, sell or wait, based on the maximum expected profit in each case. The approach is applied to find the optimal strategy for trading GBPUSD rate based on a multivariate regression model fitted to the historical daily data in the FOREX Market.

#### 3 - The Design of a Global Supply Chain by Integrating Operational and Financial Strategies

Mengyue Wang, PHD, Tsinghua University, Beijing, China, Hongxuan Huang

In this paper, a scenario-based mixed-integer linear programming model is proposed for designing a flexible capital-constrained global supply chain (CCGSC) in which integrate the applying for loans with operational strategies such as constructing, or leasing facilities and equipments to meet uncertain demands and exchange rates. The research on the CCGSC also indicates that the complementary property holds for both the remaining capital of loans with higher costs and another available loan with a lower cost under certain conditions. A case study is also presented to illustrate effectiveness and efficiency of the scenario-based approach.

#### 4 - Adjusted Portfolio Selection Model Reflecting the End of the Year Effect of Global Economic Growth

Jihye Yang, PhD Student, Yonsei University, 50 Yonsei-ro, Seodaemun-gu, Seoul, 03722, Korea, Republic of, Hongseon Kim, Seongmoon Kim

This study suggests improved investment strategy based on adjusted portfolio selection model reflecting The End of the Year Effect, a strong negative relation between end of the year global economic growth and average stock returns (Stig V.2016). We can adjust the proportion of capital invested in risk assets and risk-free assets on the rebalancing date according to end of the year global economic growth. Specifically, if end of the year global economic growth is high, we decrease the proportion of capital invested in risk assets and increase risk-free assets in order to avoid risk. Thus, we can expect superior performance using the proposed investment strategy reflecting The End of the Year Effect.

#### 5 - Optimal Control of an Individual Savings Account in a Defined Contribution Pension System

Luis Chavez-Bedoya, Professor, Universidad Esan, Nestor Bermudez 191, Chorrillos, Lima, LIMA 9, Peru, Ranu Castaneda

In this article, we examine the optimal investment strategy of a particular utility-maximizer participant in a defined contribution pension fund under the system of individual accounts; but, we assume deterministic functions for the fees paid to the pension fund administrator and for the contribution rate of the participant. Finally, we perform a thorough comparison between the two different types of fees (on balance and on flow) and we apply our results to the Peruvian Private Pension System in order to determine equivalent fees on balance and flow.

#### 6 - A Dynamic Mean Variance Analysis with Application to Robo Advising

Min Dai, National University of Singapore, 10 Lower Kent Ridge Road, Dept of Math, Singapore, 119076, Singapore, Hanqing Jin, Steven Kou, Yuhong Xu

In asset allocation for robo-advising, it is desirable to elicit investors' risk profile via several simple online questions and to provide advice consistent with conventional investment wisdom (e.g. rich people should invest more money in risky assets, and for long-term investment people should not short sell major stock indices whose returns are higher than the risk-free rate). We propose a dynamic portfolio choice model with the mean-variance criterion for portfolio log-returns that meets the two challenges. The model yields analytical and time-consistent optimal portfolio policies.

### Optimal Stopping and Stochastic Control for Financial and Engineering Applications

Sponsored: Finance

Sponsored Session

Chair: Philip Ernst, Rice University, Houston, TX, 8, United States

#### 1 - When is it Best to Follow the Leader

Quan Zhou, Rice University, 6100 Main St. Duncan Hall 2076, Houston, TX, 77005, United States, Philip Ernst, L. C. G. Rogers

We study a classical continuous-time optimal scanning problem with  $N$  boxes. An object is hidden in one box according to a given prior distribution. The goal is to determine which box contains the object. When we search a box, we get a signal evolving as a Brownian motion with a constant drift if the box contains the object, or as a Brownian motion with drift zero otherwise. This problem was first studied by Posner and Rumsey (1966), who conjectured that the optimal policy is to always observe the box with the largest posterior. However, we prove that this is not true in general and give counterexamples for some specific prior distributions. It remains unclear whether this policy is optimal for the uniform prior.

#### 2 - The Value of Foresight

Philip Ernst, 6100 Main St, Houston, TX, 77005, United States, L.C.G. Rogers, Quan Zhou

Suppose you have one unit of stock, currently worth 1, which you must sell before time  $T$ . The Optional Sampling Theorem tells us that whatever stopping time we choose to sell, the expected discounted value we get when we sell will be 1. Suppose however that we are able to see  $\$a$  units of time into the future, and base our stopping rule on that; we should be able to do better than expected value 1. But how much better can we do? And how would we exploit the additional information? The optimal solution to this problem will never be found, but in this paper we establish remarkably close bounds on the value of the problem, and we derive a fairly simple exercise rule that manages to extract most of the value of foresight.

#### 3 - Optimal Allocation of Retirement Portfolios

Stan Uryasev, University of Florida-Gainesville, AOD, 303 Weilhall, Gainesville, FL, 32611, United States, Giorgi Pertalia, Morton Lane, Matthew Murphy

Without a pension the function of the savings is to provide post-employment income to a retiree. At the same time, most retirees will want to leave an estate to their heirs. Guaranteed income can be acquired by investing in an annuity. However, that decision necessarily takes funds away from investment alternatives that might grow the estate. The decision is made even more complicated because one does not know how long one will live. This paper presents a stochastic programming model of an optimal portfolio for the retiree.

#### 4 - Non-linear Risk Parity Portfolios

Nathan Lassance, Universit  Catholique de Louvain, Louvain-la-Neuve, Belgium, Victor DeMiguel, Fr d ric Vins

Factor risk parity portfolios are defined such that the portfolio risk is projected homogeneously on the basis of uncorrelated principal components. This basis is however arbitrary: it is one basis of uncorrelated factors out of infinitely many others, each yielding different optimal solutions. Instead, looking for a basis of independent factors is more meaningful for non-Gaussian assets, and removes this arbitrariness. This basis is found by independent component analysis (ICA), a non-linear higher-order extension of PCA. ICA also provides a simplified setting to deal with higher-order risk parity. The proposed portfolios exhibit solid performances in terms of Sharpe ratio and downside risk.

## WC24

North Bldg 131B

### Practice- Programming and Applications I

Contributed Session

Chair: Frank Muldoon, Applied Materials, Piedmont, SC, 29673, United States

#### 1 - Revised Adaptive Linear Programming Algorithm

Lin Guo, University of Oklahoma, Norman, OK, 73071, United States

We revise Adaptive Linear Programming (ALP) to have fewer heuristics in determining the value of critical parameters, using the insight that we get through post-solution analysis. ALP is a second-order derivative linearization algorithm. The algorithm has limitations: 1) the value of critical parameters are determined with heuristics; 2) we use the critical parameters to control the approximation accuracy as well as convergence efficiency, but little knowledge of their tradeoffs has been used to make rules of the parameters setting and updating. To fill in these gaps, we revise the ALP algorithm to self-update the critical parameters using the knowledge from the post-solution analysis.

#### 2 - Managing Navigation Channel Traffic and Anchorage Area Utilization of a Container Port

Shuai Jia, The Hong Kong Polytechnic University, Kowloon, Hong Kong, Chung-Lun Li, Zhou Xu

Navigation channels are fairways for vessels to travel in and out of a container terminal basin. The capacity and availability of a navigation channel is restricted by the traffic lanes and tides. When the navigation channels run out of capacity, the anchorage areas can serve as a buffer. This paper aims to simultaneously optimize the navigation channel traffic and anchorage area utilization of a container port. We provide a mixed integer program of the problem, analyze its complexity, and propose a Lagrangian relaxation heuristic for solving the problem. Computational performance of the heuristic is evaluated on problem instances generated based on the operational data of a port in Shanghai.

#### 3 - On Sensitivity Analysis of Linear Integer Program: The Case of Stochastic Programming and Non-linearity in Parameters

CY (Chor-yiu) Sin, National Tsing Hua University, Kuang-Fu Road, Hsinchu, 30013, Taiwan

A stochastic programming with  $P$  states can well be formulated as a deterministic programming with  $P-1$  probabilities. In this and the case with non-linearity in parameters, when one parameter changes the others may also change. Consequently the existing sensitivity analysis in the linear integer program may not be applicable, as it confines the attention to one-parameter change. This paper considers a special type of Lagrangian dual function which renders strong duality. Using this Lagrangian dual function, we first generalize the result in Shapiro (1977) to multi-parameter cases. Further, we show with synthetic data that our analyses save a lot of computer time in large-scale optimization.

**4 - Data-driven Quickest Detection of Customer Churn**

Roozbeh Yousefi, Queen's University, Kingston, ON, K7M9H1, Canada, Jue Wang

In many service industries, customers may stop returning for service without informing the service provider. It is important for the service provider to detect such soft churn as quickly as possible, so that appropriate retention can be made. We develop a churn detection model based on partially observable Markov decision processes in which both transition and observation probabilities are unknown. The optimal policy must balance churn detection with parameter learning. We characterize the structure of the optimal policy and show that the infinite-dimensional belief space can be collapsed to two-dimension, making the optimal policy computationally feasible.

**5 - Sales & Operations Planning Linear Programming Model Used by Semiconductor Manufactures**

Frank Muldoon, Operations Research Application Engineer, Applied Materials, 5225 W. Wiley Post Way, Suite 275, Salt Lake City, UT, 84116, United States

In today's competitive environment, semiconductor manufacturers face the unending challenge of planning for ever-changing customer demands. Factory managers must plan for new orders within existing demands in order to avoid capacity shortfalls of available resources. We propose a linear programming formulation that models this capacity planning challenge in Applied Material's Advanced Productivity Family software. The result of this optimization identifies demands that cannot be satisfied and resource capacity deficits week, months, or even years in advance giving planners time to adjust. We discuss the implementation of our system within a semi-conductor assembly and test facility.

**System Design for Emergency Medical Services**

Sponsored: Service Science

Sponsored Session

Chair: Ozgur M. Araz, University of Nebraska, Lincoln, NE, 68588-0491, United States

**1 - Emergency Service Network Design with Constraint Relaxation**

Adrian Ramirez Nafarrate, Professor, Universidad Panamericana, Zapopan, Mexico, Ozgur M. Araz, John W. Fowler

Some emergency scenarios require deploying a limited amount of resources to deliver service within a target time. However, the available resources in large-scale scenarios may make the location-allocation problem infeasible. We propose a modeling approach that represents this situation and present a set of algorithms to relax capacity at each service site and/or time to complete the service operations. The results show how decision makers can incentivize using one type of resource and when is better to balance adding more capacity or service time. In addition, we analyze how the resource allocation strategy interacts with the number of open sites.

**2 - Bed Forecasting System in the Emergency Healthcare Network**

Shao-Jen Weng, Tunghai University, Taichung City, Taiwan

Because of high complexity in Emergency Departments, the ability to analyze the present and future status of resource availability is difficult. The goal of this research is to use simulation to create a cloud-based forecasting system called an available bed forecasting system (ABFS) in a regional hospital network in Taiwan in order to provide near-contemporaneous information to Emergency Department personnel and to EMTs in an effort to efficiently predict the optimal hospital to which patients should be transported based on bed and resource availability.

**3 - Forecasting Influenza for Emergency Planning**

Zeynep Ertem, University of Texas at Austin, Austin, TX, 78723, United States

Timely and accurate estimates of influenza prevalence, particularly of severe cases requiring hospitalization, can improve control measures to deal with medical emergencies. Our framework uses multi-linear regression to combine forecasts from multiple data sources and optimization with forward selection to choose the most predictive combinations of data sources. We show that the systematic integration of complementary data sources can improve forecast accuracy over single data sources. The optimal combination of predictors includes public health surveillance data and commercially available electronic medical records, but neither search engine nor social media data.

Chair: Fengmei Gong, University of La Verne, La Verne, CA, 91750, United States

**1 - Do Organizational Controls Influence the Effectiveness of Waste Management Green IT Systems?**

Xue Ning, University of Colorado Denver, 1475 Lawrence Street, Denver, CO, 80202, United States, Dobin Yim, Jiban Khuntia

This study explores how organizational controls influence the effectiveness of life cycle assessment systems (LCAS) for waste management in hotels. Effectiveness is measured through total waste generated by hotels and waste management cost reduction. Analysis of secondary data for 1,277 hotels of a large multinational hotel chain is used to find evidence for hypotheses. Study informs to green information technology and business value streams of research.

**2 - Can Individuals Benefit from the Wisdom of Crowds?**

Joshua Becker, PhD Candidate, University of Pennsylvania, 3620 Walnut Street, Suite 200, Philadelphia, PA, 19104, United States, Damon Centola

Groups can form remarkably accurate beliefs even when group members are wildly inaccurate, an empirical phenomenon known as the "wisdom of crowds." This accuracy gain, however, offers no direct benefit to individual group members. Moreover, theoretical accounts argue that individuals must be independent to preserve group accuracy, preventing social learning. We test an alternative theory predicting that structured information exchange networks allow social learning while preserving group accuracy. Experimental subjects made financial forecasts before and after learning the beliefs of peers. Information exchange produced a 25% decrease in error without harming the wisdom of the crowd.

**3 - Timely Production of Crowdsourced Answers in Stack Overflow**

Orcun Temizkan, Ozyegin University, Cekmekoy Kampusu, AB2 324, Nisantepe Mah. Orman Sok. No: 34-36, Istanbul, 34794, Turkey, Ram Kumar

Question answering websites that involve volunteer participants such as Stack Overflow are becoming increasingly popular. They represent a crowdsourced knowledge creation process, and thus are large repositories of knowledge. In addition to the quality of answers, a process that results in high quality answers in a relatively short time frame is also important. Therefore, we focus on the generation of high quality answers in a timely manner. We present a survival analysis model of generating high quality answers. We also discuss research and managerial implications.

**4 - Are Online Ratings Relative in Competitive Markets?****A Mean-field Estimation Approach**

Mingwen Yang, University of Texas at Dallas, Richardson, TX, 75080, United States, Vijay S. Mookerjee, Eric Zheng, Hongyu Chen

We study user ratings in China's tourism market, where different tours compete with one another for business. The focus is on how user ratings affect the sales of competing tours and how the ratings of these tours are optimally managed over time. We estimate the joint evolution of tour ratings and sales assuming that tour managers act rationally to maximize profit over time. The data for the study comes from sales and review information collected over time for tours listed on Ctrip.com, the largest travel aggregator in China. Our estimation approach uses controlled diffusion processes to jointly estimate two stochastic processes for each tour: sales and review ratings.

**5 - The Limitation of Current Digital Gamification Systems and the Alternative Strategy for Sustainable User Engagement**

Jaewan Lim, PhD Student, University of Maryland, Baltimore County, 1000 Hilltop Cir, Baltimore, MD, 21250, United States

In a large number of studies, it has been demonstrated that digital gamification strategy improves the engagement of customer. However, some gamification systems expose short life cycle pattern, resulting in the decrease of the system effectiveness. There is a paucity of literature on this problem. In this regard, the focus of this research is to identify the limitation of current digital gamification systems and propose the model for increasing the retention rate and sustainable user engagement.

**6 - The Impact of Information Technology on Technical Efficiency Evidence from Industry**

Fengmei Gong, University of La Verne, 1950 Third Street, La Verne, CA, 91750, United States, Tong Zeng, Yingxia Cao

This study intends to examine the impact of Information Technology (IT) investment on technical efficiency across different industries in the U.S. economy. Previous related studies are mostly based on firm level and country-level evidence, this study adds to the literature by providing industry-level evidence.

**1 - Layout Optimization of Business Outlets for Railway Scattered Goods Express**

Yongxiang Zhang, Southwest Jiaotong University, Chengdu, 610031, China, Qingwei Zhong, Qiyuan Peng, Wenxin Li

Due to the characteristics of scattered goods, how to optimize the layout of business outlets for railway scattered goods express in transportation network has become a worth researching problem. In this paper, firstly, portraying the railway scattered goods express network as a two-level single assignment network composed of three-layer logistics nodes. Then, based on the construction of the assignment network, a mixed integer programming model is established to minimize the total cost of the railway scattered goods express network. Finally, a real-world case of Chengdu is used to verify the effectiveness of the proposed method.

**2 - The Access Management Application for Improving Performance of a Signalized Intersection**

Maxim A. Dulebenets, Florida A&M University-Florida State University, Tallahassee, FL, 32311, United States, Amir Masoud Rahimi, Arash Mazaheri, Junayed Pasha, Masoud Kavoosi

Different access management techniques have been widely used to improve the traffic flow conditions in large metropolitan areas. This study aims to assess the effects of replacing the direct left turn with the right-turn U-turn maneuver at the signalized intersection performance. The SimTraffic and AIMSUM simulation models are developed to estimate the major intersection and network performance indicators. The computational experiments are conducted for one of the busiest intersections in Tehran metropolitan area (Iran) and demonstrate advantages from the proposed access management treatment.

**3 - Optimizing Intermodal Terminal Operations Base Model through Simulation Modeling: A Comparison on Different Settings**

Fatemeh Rezaeifar, PhD Candidate, University of Texas at Arlington, Arlington, TX, 76010, United States, Mohammad Najafi, Brian L. Huff

Increasing demand in terminals will raise the risk of terminal congestion due to the increase in system bottlenecks. This research develops a framework for optimizing the capacity of intermodal Underground Freight Transportation (UFT) terminals. To test the variations of performance indicators a discrete event simulation model is used for two scenarios (with and without a stack-yard). The findings confirm that the percentage of bottlenecks in both scenarios significantly decreased and Scenario No. 1 and No. 2 ship respectively 34% and 59% more than the annual expected shipped containers. Also, Scenario No. 2 can handle 25% more containers per year.

**4 - A Near Real-time Algorithm for System Optimal Dynamic Traffic Assignment with Multiple Origins and Destinations**

Mehrzad Mehrabipour, Washington State University, 1630 NE Valley Road, Apt B204, Pullman, WA, 99164, United States, Ali Hajbabaie

This study introduces an efficient algorithm to find near-optimal solutions to the System Optimal Dynamic Traffic Assignment Problem (SODTA) with multiple origins and destinations in real-time. The proposed Distributed Optimization and Coordination Algorithm decomposes the network-level traffic assignment problem into several intersection-level subproblems that can be solved individually. The complexity of the problem is significantly reduced, and the solutions can be found in real-time. The results in a case study of 20 intersections are compared with the global optimal solution and the maximum observed optimality gap was 5%.

**5 - Air Traffic Noise Monitoring with ADS-B Signal, GIS, and BIM in UAE**

Young-Ji Byon, Associate Professor, Khalifa University of Science and Technology, Abu Dhabi, 127788, United Arab Emirates, Tadahi Kishida

It is essential to monitor and assess air traffic noise levels in the vicinity of airports for impacts on residential and commercial zones in UAE. Recently, commercial airlines have started equipping their planes with ADS-B signal emitters. A GIS layer in a raster format can accumulate the noise in a quantifiable unit of decibels in associated cells for various tempo-spatial analyses of air traffic noises. In order to accurately account for the noise on the ground surface, digital elevation model integrated with building information modeling can provide noise projection on buildings.

**System and Operation Issues in Wireless Charging Electric Vehicles and Electrified Road Infrastructure**

Sponsored: TSL/Urban Transportation

Sponsored Session

Chair: Young Jae Jang, KAIST, Daejeon, 34141, Korea, Republic of

**1 - Dynamic Charging Infrastructure Deployment for Plug-in Hybrid Electric Trucks**

Ziqi Song, Utah State University, 4110 Old Main Hill, Logan, UT, 84322-4110, United States, Zhaocai Liu

Inspired by the rapid development of charging-while-driving (CWD) technology, plans are ongoing in government agencies worldwide for the development of electrified road freight transportation systems through the deployment of dynamic charging lanes. This en route method for the charging of plug-in hybrid electric trucks is expected to supplement the more conventional charging technique, thus enabling significant reduction in fossil fuel consumption and pollutant emission from road freight transportation. In this study, we investigated the optimal deployment of dynamic charging lanes for plug-in hybrid electric trucks.

**2 - V2V Wireless Power Transfer between Electric Automated Vehicles**

Mojtaba Abdolmaleki, University of Michigan, Ann, MI, 48109, United States, Neda Masoud

To date, three major concerns have hindered widespread adoption of electric vehicles (EVs): the high cost of batteries, a lack of sufficient charging infrastructure, and the limited driving range of EVs. This proposal tackles all three challenges by introducing a new concept of vehicle-to-vehicle (V2V) tethered power transfer (TPT) between EVs to facilitate frequent, real-time, and on-demand charging. We quantify the impact of adopting this technology in terms of reductions in infrastructure investments that would otherwise be required, and energy savings.

**3 - The State of the Art in Operation and System Study on Wireless Charging Electric Vehicle Systems**

Young Jae Jang, KAIST, Department of Industrial and Systems Engineer, Yuseong-Gu, Daejeon, 34141, Korea, Republic of

The state-of-the-art in operations and systems-related studies of wireless charging electric vehicles (EVs) is presented. The wireless charging EV is one of emerging transportation systems in which the EV's battery is charged via wireless power transfer (WPT) technology. The system makes use of charging infrastructure embedded under the surface of the road that transfers electric power to the vehicle while it is in transit. The goal of the presentation is to provide researchers and practitioners with an overview of research trends and to provide a guide to promising future research directions.

**4 - The Impact of Charging Infrastructure on Electrified Shared Mobility Systems**

Zhengtian Xu, University of Michigan, Ann Arbor, MI, 48105-2540, United States, Zhibin Chen, Daniel Vignon, Yafeng Yin

In the foreseeable future, electric vehicles (EVs) will largely permeate the shared-mobility market. Considering EVs' scant battery size, the long charging time, and the scarce distribution of charging facilities at the early stage, a suitable deployment of charging infrastructure can significantly advantage the movements and reduce the charging delay of shared EVs, thereby benefiting the system operations. With such a quest, this study investigates the impacts of different types of charging infrastructure, including charging stations, swapping stations, and charging lanes, on the performance of shared mobility systems.

**Warehousing**

Sponsored: TSL/Facility Logistics

Sponsored Session

Chair: Reem Khir, Georgia Institute of Technology, Atlanta, GA, United States

**1 - An Integrated Cluster-based Storage Assignment Policy**Yafeng YinB.M. De Koster, Erasmus University-Rotterdam,  
Planciusdreef 47, Bergschenhoek, 2661 RK, Netherlands,  
Masoud Mirzaei, Nima Zaerpour

As ecommerce is growing, companies need more efficient warehouses. Amazon for example, allocates multiple correlated products on the same pod to reduce retrieval time. Turnover-based storage policies, only consider the frequency at which each product has been requested and ignore the frequency at which products are ordered jointly. To consider both information, we propose an integrated cluster allocation storage assignment model which minimizes the total retrieval time. Compared to full turnover-based policy, the proposed model can save up to 22%, in total retrieval time in an automated storage and retrieval system. However, it is data intensive and benefits depend largely on the order pattern.

**2 - Dynamic Wireless Charging Lane Location Optimization in a Congested Warehouse**Liu Su, University of South Florida, ENG 302, Tampa, FL, 33620,  
United States, Sung Hoon Chung, Kibaek Kim, Changhyun Kwon

Forklifts with batteries are often used for material handling in a warehouse. With dynamic wireless charging, forklifts can be charged without work interruption. The optimal locations of dynamic wireless charging lanes are selected under the workflow congestion in a warehouse facility. Considering the uncertainty of demands, we formulate the wireless charging lane location problem as a two-stage stochastic programming model and propose a numerical method.

**3 - Optimization of Sorting Center Operations in Express Parcel Delivery Network**Reem Khir, Georgia Institute of Technology, Atlanta, GA,  
United States, Alan Erera, Alejandro Toriello

We model a two-stage sorting process as a mixed-integer program to enable making decisions related to parcels' routing and scheduling, and resource management and planning. The objective is to find a path for each parcel from the time it enters the sorting center to the time it leaves it such that each parcel finishes its sorting requirements no later than its cut-off time while the operational cost is minimized. Since finding optimal solutions of this problem is difficult for large-scale instances that are commonly found in practice, we investigate various ways to solve the problem using local search mechanisms.

**Reverse Logistics & Supply Chains**

Contributed Session

Chair: Xianghui (Richard) Peng, Eastern Washington University, 668 N. Riverpoint Blvd., Room 360, Spokane, WA, 99202-1677, United States

**1 - Cross-training Policies in Repairable Spare Part Supply Systems**Andrei Sleptchenko, Assistant Professor, Khalifa University, P.O.  
Box 127788, Abu Dhabi, United Arab Emirates, Hasan Turan

In this talk, several results on the usage of Cross-Training Policies in Supply Systems for Repairable Spare Parts will be summarized. The presented results comprise simulation-based evolutionary heuristics for total cost optimization, as well as simple and scalable heuristics based on pooling of different parts into clusters by exploiting similarities of the repairable parts. The obtained results demonstrate that the optimal cross-training policies, or skill-server assignments, can help to improve the utilization of the repair servers and reduce the total system cost.

**2 - Determining the Optimal Collection Policy for Returned Products in the Reverse Supply Chain**Moulik Kapadia, Northeastern University, Boston, MA,  
United States, Nizar Zaarour, Emanuel Melachrinoudis

A growing number of firms are facing the challenge of driving down costs in their reverse logistics network while maintaining a strategic competitive advantage through great customer service. This work focuses on the comparison of different collection policies that reduce the impact of product returns on a firm's operational costs by leveraging economies of scale and optimizing the collection period across multiple initial collection points (ICPs) in a network before transshipping the returned products to a centralized return center (CRC).

**3 - Coordination, Information Sharing, and Return Variabilities in Closed-loop Supply Chains**Juan Pedro Sepulveda-Rojas, Associate Professor, University of  
Santiago of Chile, Avda Ecuador 3769, Santiago de Chile, Chile

We analyze quantitatively coordination, information sharing and return variabilities in a closed-loop supply chain context. We evaluate the value of coordination for operational decisions (in the context of inventory management decisions). One of the more important characteristics of the closed-loop supply chain context is the addition of uncertainties about returns.

Thus, this work is focused on coordination problems imposed by the flows of returned products. In particular, we want to analyze if the gains expressed in the literature remains, decrease or increase in presence of coordination, return variability and information sharing among the actors of the supply chain.

**4 - Product Recovery Decision-making in the Context of Internet of Things: A Review and Generic Roadmap to End-of-life Product Management**Xianghui (Richard) Peng, Penn State Erie, The Behrend College,  
Erie, PA, United States, Kai Meng, Ying Cao, Victor R. Prybutok

This research provides a state of the art review on End-of-Life (EOL) product recovery decision-making in the context of Internet of Things. We contextualize and apply an implementation framework to enable sustainable EOL product management based on enriched information. We also propose a generic roadmap for model and methodology selection to assist practitioners in making smart decisions.

**Transportation-Operations**

Contributed Session

Chair: Yanshuo Sun, Florida State University, 2005 Levy Ave, Rm. 241  
MRB, Tallahassee, FL, 32310, United States**1 - Mothership and Drone Routing Problem with Obstacles**Stefan Poikonen, Assistant Professor, University of Colorado  
Denver, 1475 Lawrence Street, Denver, CO, 80202, United States,  
Bruce L. Golden

The Mothership and Drone Routing Problem with Obstacles extends previous work on the mothership and drone routing problem, which considers a tandem between a ship and a drone. The drone is required to visit each of a set of targets. However, the drone has finite battery life and, thus, must coordinate with the ship. In previous work, we utilized second order cone programming as an embedded procedure. However, the addition of obstacles (dry land, political boundaries, etc.) which the mothership is not allowed to penetrate creates non-convexity in the problem. We propose a solution method which forms an initial solution than iteratively improves it using sequential second order cone programming.

**2 - A Real-time Dynamic Model for Vehicle Routing Problem with Safety Criteria**Qiong Hu, Auburn, Auburn, AL, 36832, United States,  
Alexander Vinel

Driver's safety is an important issue in the transportation, especially for long-haul truck industrial. We consider vehicle routing problem to enable safety constraint in decision making. We developed a dynamic model based on the statistical result of estimating risk under real-time driving conditions such as weather and traffic. Our model is based on real-life data collected by combining different sources. As a first step, value iteration and breath-first-search have been applied in our model to provide the best policy for a driver to schedule stop during route to minimize risk.

**3 - Automatically Generating Shunting Operation Plan for District Local Train Based on Dynamic Programming**Li Li, Southwest Jiaotong University, Chengdu, China,  
Gongyuan Lu, Bojian Zhang

An LP model is proposed to describe the process of flat shunting operation and optimize the shunting operation plan for district local train, considering the initial and terminal status of cars on hand in the classification yard as the input variable. On the premise of ensuring the minimum number of coupling hooks, considering the use of shunting lines, the requirements of locomotive energy consumption, and the number of sliding hooks, to improve the marshaling efficiency and realize the operation plan's auto-generation for the station sequence marshaling mode district local train.

#### 4 - A Branch-and-price Algorithm for the Hitchcock-Koopmans Problem with Reusable Transportation Assets

Tulay Flamand, Assistant Professor, Colorado School of Mines, Division of Economics and Business, Engineering Hall 816 15th Street, Room 313, Golden, CO, 80401, United States, Mohamed Haouari, Ghaith Rabadi

We address a new variant of the Hitchcock-Koopmans problem that arises in commercial logistics where a given set of commodities must be transported from multiple supply nodes to multiple demand nodes using different types of transportation modes. Each transportation asset has a finite capacity and can be used for multiple consecutive rotations (i.e. round-trips). The problem requires delivering all commodities within a specified deadline while minimizing the total transportation cost. We describe an exact branch-and-price algorithm and present some preliminary computational experiments.

#### 5 - Nudging Commuters' Travel Choices with Dynamic and Personalized Incentives for Transportation Network Efficiency

Yanshuo Sun, Florida State University, Tallahassee, FL, United States, Lei Zhang

This paper explores an emerging strategy of transportation demand management, where dynamic and personalized incentives are transferred to travelers to influence their travel choices toward a more socially desirable state. A day-to-day traffic dynamics model is adopted, where commuters update their perceived travel time through trying and learning, based on which choices are made. A mathematical programming model is proposed for the system operator to design individually customized incentives daily. Through numerical analyses, we identify a paradox that increasing incentive limits do not necessarily improve the system efficiency due to probabilistic responses of travelers.

Chair: Wei Wei, Waterloo University, Waterloo, ON, Canada

#### 1 - Differentiable Linear Tracing Procedures for Selecting Nash Equilibrium and its Refinements

Chuangyin Dang, Professor & Acting Head, City University of Hong Kong, 83 Tat Chee Avenue, Kowloon, Hong Kong

The selection of a unique Nash equilibrium and its refinements has always been a concern in game theory. Nevertheless, Harsanyi's linear tracing procedure can only select a unique Nash equilibrium for generic games. With the introduction of a differentiable quadratic function of an extra variable, this paper develops differentiable linear tracing procedures by incorporating concave quadratic terms into payoff functions. It is shown that the procedures are able to select, for every game, a unique Nash equilibrium, perfect equilibrium, proper equilibrium and perfect d-proper equilibrium, respectively. Numerical results further confirm the effectiveness and efficiency of the procedures.

#### 2 - A Game Theory Model for Resource Allocation in Large Systems Design

Soodabeh Yazdani, George Mason University, Takoma Park, MD, 20912, United States, Edward Huang

Engineering design is a concurrent process with multiple engineers designing different components of a system simultaneously under the supervision of a project manager. Project manager allocates limited resources needed for the design process among the different engineers trying to optimize the overall value of the whole system. However, each team has its private information about the characteristics of the component being designed and the goal of each team is usually misaligned to the objective of the project manager. The goal of this paper is to develop an efficient mechanism for allocating resources in large systems design.

#### 3 - Dynamic Decision Making with Asymmetric Information and Dependent States

Deepanshu Vasal, University of Texas, Austin, TX, United States

We consider finite horizon dynamic game with asymmetric information with  $N$  cooperative and selfish players where there exists an underlying state of the system that is a controlled Markov process, controlled by players' actions. In each period, a player makes a common observation of the state and a private observation, and gets an instantaneous reward which is a function of the state and everyone's actions. We present a sequential decomposition methodology to compute structured perfect Bayesian equilibria (SPBE) of this game, which computes SPBE in linear time. These equilibria exhibit signaling i.e. players' actions reveal part of their private information that is payoff relevant to other players.

#### 4 - Modeling a Biofuel Supply Chain as an Equilibrium Problem with Equilibrium Constraints (EPEC): A Policy Analysis

Saman Hamzeh, PhD Candidate, University of Wisconsin-Milwaukee, 3200 N. Cramer, Milwaukee, WI, 53211, United States

We consider a biofuel supply chain problem in which a farmer supplies downstream refineries with non-identical crops. The problem has been modeled as a multi-leader-single-follower game to derive the farmer's (follower) decisions on land use as well as refineries' (leaders) proposed prices to the farmer. We join the leaders' problem using EPEC formulation to find the NE. Parametric analyses are used to study the effect of subsidies on the profit of the players and the total social welfare of the supply chain. We observe that a government's expenditure can be offset by the increase of the social welfare under certain circumstances.

#### 5 - On the Smooth Pasting Principle and the Non-existence of Equilibrium Stopping Rules in Time Inconsistent Problems

Wei Wei, Postdoctoral Fellow, Waterloo University, Waterloo, ON, Canada, Xunyu Zhou, Ken Seng Tan

This paper considers a time inconsistent stopping problem. We show that properties of standard optimal stopping models may not be inherited when time consistency is lost. First, we focus on smooth pasting (SP). We find that the SP principle solves the time inconsistent problem within the intra-personal game theoretic framework if and only if a certain inequality is satisfied. Second, we formally show that the time inconsistent stopping problem does not admit any intra-personal equilibrium whenever the SP principle fails. The non-existence result and the failure of the SP principle caution blindly applying the SP principle to optimal stopping problems that are time inconsistent.

#### 1 - Application of Random Utility Models for Airline Preference Estimation in Complex Operational Environment

Ivan Tereshchenko, University of California, Berkeley, CA, United States

Random utility models can be successfully applied to analyze decision-making strategies in settings when all decisions are made independently of each other. However, in air transportation, this is rarely the case. For example, aircraft operators make decisions about individual aircraft based on decisions made about all flights at their disposal. We use simulated schedules and optimization-based decision-making strategies to assess how well the random utility models can estimate parameters of airline objective functions in the realistic operational environment.

#### 2 - Two-stage Optimized Recommendation Model: An Empirical Study of Airline Marketing on Website Visits

Chen Zhang, UNSW, Sydney, Australia

Traditional recommendation system utilises users' historical purchases or browsing data to recommend products based on the similarity analysis, ignoring individual characteristics of the user and dynamic characteristics of the market. In this paper, we propose a new two-stage recommendation model using optimisation theory. The first stage uses AI algorithm to extract each individual user's preference feature. The second phase dynamically identifies users online intentions, dynamically adjusts recommended content, and provides personalised and optimised recommendations. The proposed model works better than the traditional recommendation model in the experiment.

#### 3 - A Data-Driven Analysis of Equilibrium in the U.S. Airline Market

Soheil Sibdari, University of Massachusetts, Brighton, MA, 02135, United States, Farbod Farhadi, David F. Pyke

When multiple firms exist in a market, game theory can be used to analytically model their interactions. In such analysis, the optimal solution is replaced by an equilibrium. In this paper, we address an equilibrium analysis in the U.S. airline market using a large transactional data set. We also characterize the equilibrium outcome of the game and address its existence and uniqueness using the data set. We provide conditions under which multiple equilibria can be achieved.

Chair: Stefan Minner, Technische Universitaat München, Munich, 80333, Germany

**1 - A Supply Planning and Inventory Management Problem for a Single Item with Random Demand and Substitutable Components**

Zehra Melis Teksan, Assistant Professor, Ozyegin University, Cekmekoy Kampusu Nisantepe Mah Orman Sk, Cekmekoy, Istanbul, 34794, Turkey, Joseph Geunes

We consider a supply planning and inventory management problem for an item within a single planning period with random demand. The production of the end-item requires a particular component whose supply availability depends on the price the producer offers to suppliers. The amount of supply and the production capacity are determined by the response of suppliers to the producer's price offer. The goal is to determine optimal supply pricing and production decisions when the component has a number of potential substitutes with different supply availabilities. We analyze the optimal supply-pricing policy with various pricing options, as well as policies when supplier-specific fixed charges exist.

**2 - An Inventory System with Reserved Stock**

Arnab Bisi, Johns Hopkins Carey Business School, 100 International Drive, Baltimore, MD, 21202, United States, Yanyi Xu, Maqbool Dada

We consider an infinite horizon periodic-review base stock inventory system with partial backorders and lost sales. For the long-run average cost problem, we determine structural properties of a proposed  $(k, R)$  policy and discuss how to find the optimal base stock  $R$  and reservation or holdback stock  $k$ . We also describe how two supply modes, of the type due to Barankin (1961), can be incorporated into our model by using a  $(k, Z, R)$  policy while generating further insights into the policy structure.

**3 - The Joint Replenishment Problem under Cycle Time Constraints**

Yu-Liang Lin, North Carolina State University, Raleigh, NC, 27606, United States, Chi-Yi Chen

The Joint Replenishment Problem (JRP) is to determine the replenishment cycle times of a group of items in single facility system over an infinite horizon. We investigated the JRP with cycle time constraints that are popular in inventory systems with restrictions such as max/min order quantity and storage capacity, etc. Based on the optimality structures, we categorize the items into four types and propose an efficient algorithm for solving this constrained JRP. Our random experiments demonstrate the proposed algorithm is effective as compared with the existing approaches in the literature.

**4 - Integrated Location-inventory Optimization in Slow Moving Spare Parts Networks Using Benders Decomposition**

Stefan Minner, Technical University of Munich, Munich, 80333, Germany, Patrick Zech, Zuo-Jun Max Shen

Virtual inventory sharing is an effective method to pool inventories in spare parts networks. We propose a novel location-inventory model which integrates strategic facility choice, tactical base-stock level setting and operational sourcing decisions. The mixed integer linear program combines a set-covering problem and a semi-Markov decision process. The model's special structure suggests Benders decomposition as an effective method to solve the problem. Numerical experiments confirm the efficiency of Benders decomposition and emphasize the value of an integrated model compared to a sequential location first, inventory and sourcing second approach.

**1 - An Asymptotically Optimal Index Policy for the Finite Horizon Restless Bandit**

Peter Frazier, Cornell, Weici Hu

We consider the restless bandit, a generalization of the multi-armed bandit in which arms may change state when they are not pulled. In the stochastic infinite-horizon setting, Whittle proposed the Whittle index policy and conjectured the per-arm optimality gap vanishes as the number of arms grows to infinity while holding fixed the fraction of arms that can be pulled per period. Weber and Weiss showed this conjecture is true when arms have only 3 states, or when the fluid limit has a globally stable equilibrium point. We propose a novel but related index policy for the finite-horizon setting, and show it is asymptotically optimal in the same sense without restrictions on the fluid limit.

**2 - Weighted Stochastic Approximation for Large-scale Network Computation**

Jingchen Liu, Columbia University, Department of Statistics, 1255 Amsterdam Avenue, New York, NY, 10027, United States, Xueying Tang, Zhi Wang

We consider the parameter estimation and computation via stochastic approximation for large-scale multi-relational network and propose a weighted sampling scheme biased towards observations with more information regarding the parameters. It is shown to be computationally more efficient if the weights are properly chosen. Besides the computational efficiency, the biased scheme is observed to contribute to the estimation quality and substantially improves the out of sample prediction performance.

**3 - Credit Risk: Closed Form Approximate Maximum Likelihood Estimation and Fast Simulation**

Anand Deo, Tata Institute of Fundamental Research, Homi Bhabha Road, Navy Nagar, Colaba, Mumbai, India, Sandeep Juneja

We consider discrete default intensity based and logit type reduced form models for conditional default probabilities for corporate loans where we develop simple closed form approximations to the maximum likelihood estimator (MLE) when the underlying covariates follow a stationary Gaussian process. In a practically reasonable asymptotic regime where the default probabilities are small, the number of firms and the time period of data available is reasonably large, show that the proposed estimator behaves similarly to the MLE. We also derive large deviations asymptotics for large losses. These have interesting geometric properties, which we exploit to develop efficient simulation techniques.

**4 - Efficient Rare-event Probability Computation of Functional Exceedance**

Raghu Pasupathy, Purdue University, West Lafayette, IN, 47907, United States

We present methods for efficiently calculating the probability of the function  $f$  of an elliptical random vector  $X$  exceeding a given threshold. Elliptical random vectors are general in that they subsume a variety of random vectors that are commonly in use, e.g. multivariate normal, multivariate  $T$ , and multivariate logistic. The proposed method uses importance sampling and actively exploits the local structure of  $f$  to construct estimators that exhibit bounded relative error. We discuss extensions to functions of appropriate stochastic processes.

**1 - Client Selection for a Risk-sensitive Commodity Options Underwriter with Poisson Demand**

Belleh Fontem, University of Mary Washington, Fredericksburg, VA, 22407, United States, Megan Price

We consider a maximization problem for a risk-sensitive underwriter of an option contract on a commodity with geometric Brownian motion spot price trajectories. Firms hoping to enter into service agreement with the underwriter each face Poisson demands that are the underwriter's responsibility to satisfy. While considering payoff risk, the underwriter aims to select the optimal combination of client firms to privilege with its option contract. Using payoff variance as our risk measure, we derive for a special case, the optimal solution algorithm for the variance-constrained maximization problem. Results from the special case analysis inspire the design of two heuristics for the general case.

**2 - An Evolutionary Approach to Constrained Many-objective Combinatorial Optimization**

Hayrullah Mert Sahinkoc, Bogazici University, Istanbul, Turkey, Umit Bilge

Many-objective optimization tries to characterize and overcome the challenges posed by the high number of objectives. Most of the existing studies work on well-defined continuous mathematical functions with designed Pareto front characteristics whereas combinatorial and constrained problems are rarely addressed. Many-objective 0-1 knapsack problem with multiple constraints is chosen in our study and our proposed algorithm combines the effective features of the existing many-objective approaches with several other prominent evolutionary strategies in an innovative fashion. Numerical results show the success of the proposed algorithm compared to some existing approaches.

### 3 - Time Space Combinatorial Optimization Problems and Applications

Hadi Farhangi, Visiting Assistant Professor, Savannah State University, 204, 3219 College Street, 3219 College Street, Savannah, GA, 31404, United States

This work presents a time extension of some of the combinatorial optimization problems. Particularly, the variables are redefined to include time into the problem. The resulting models are disjoint combinatorial problems that can be connected using coupling constraints. The properties of these problems and appropriate solution methods are presented in this work. Finally, some applications of the time space combinatorial problems are discussed.

#### 1 - GPU Supported Large Scale Simulation Models for Influenza Pandemic Outbreaks

Shalome Hanisha Anand Tatapudi, University of South Florida, 4202 E. Fowler Avenue, ENB 118, Tampa, FL, 33620-5350, United States, Zhila Nouri, Tapas K. Das

Influenza pandemics are a serious concern and researchers are trying to understand its patterns. One such tool to effectively understand the disease characteristics is through an agent-based (AB) simulation model, which is versatile, yet has computational limitations when it comes to simulating larger populations. This study integrates the flexibility of AB simulation with computational efficiency of a graphical processing unit (GPU) to create models for pandemic outbreaks in large areas comprising of hundreds of millions of people.

#### 2 - Comparison of MRSA Infection Control Policies in ED Patients

Karthick Srinivasan, Rochester Institute of Technology, Rochester, NY, 14623, United States, Vignesh Krishnan Rajkumar, Levi Toweh, Nasibeh Azadeh Fard

Methicillin-Resistant *Staphylococcus Aureus* (MRSA) is a major cause of preventable nosocomial infections in ED. The changes made in admission policies of patients with MRSA can affect patient throughput in hospitals. In this research, we study the impact of admission policy change for MRSA patients in an ED of a large hospital in upstate NY using discrete-event simulation modeling.

#### 3 - An Agent-based Model of Subsidized Flooding Insurance

Valerie Washington, University of Michigan, Ann Arbor, MI, 48109, United States

Flood insurance is one strategy for addressing the economic impact of floods to both homeowners and their community. In this paper, I use agent-based modelling to explore how income-based subsidies influence mitigation strategies employed by agents, and whether that includes large-scale abandonment. I investigate the effect of subsidized and unsubsidized flood insurance on community mitigation decisions, damages incurred, and vacancy and move out rates. Damages are evaluated from the perspective of individual homeowners and the community at large.

#### 4 - Review and Analysis of Airplane Boarding Strategies Based on Discrete Events Simulation

Alejandro Garcia del Valle, Professor, University of A. Coruna, Escuela Politecnica Superior, C/ Mendizabal S/N - Esteiro, A. Coruna, 15403, Spain, Roi Sanchez-Tutor, Diego Crespo-Pereira, Javier Faulin

Airport taxes are one of the most critical economic factors for an airline due to the time the plane stays on the airport while turn-around. Boarding is a key part of turn-around for both customer satisfaction and airline profitability. This is the reason why so many strategies have been designed in order to reduce boarding times. By using Discrete Event Simulation, different boarding strategies are analyzed to determine which one is more efficient in Boeing 737-800 according to different scenarios considering plane occupation, delays and 2-door boarding.

#### 5 - What Not to Expect When You're Expecting:

##### Perils of Sampling and Estimating for Lognormal Distributions

Matthew J. Saltzman, Associate Professor, Clemson University, Dept of Mathematical Sciences, Martin Hall Box 340975, Clemson, SC, 29634-0975, United States, William C. Bridges, Neil J. Calkin

Lognormal distributions can be problematic when the variance of the underlying normal distribution is other than very small. We illustrate these problems in terms of sampling issues, interval estimation of the mean, and comparison of lognormal and logbinomial distributions with similar means and variances.

### NREL Session

Emerging Topic: Energy and Climate

Emerging Topic Session

Chair: Brady Stoll, National Renewable Energy Laboratory, CO, United States

#### 1 - Modeling Challenges of High Photovoltaic Penetrations in Future Electric Grids

Brady Stoll, NREL, 15013 Denver West Parkway, Golden, CO, 80401, United States, Elaine Thompson Hale, Jennie Jorgenson

As states and utilities incentivize low carbon electricity and the cost of solar photovoltaics (PV) drop, it is likely PV penetrations will continue to increase. We utilized a capacity expansion model, the Resource Planning Model, to study the impacts of high solar penetrations in the western United States through 2035. We here describe the creation of high solar penetration scenarios and operational improvements needed to accurately model these scenarios, including updated operating reserve requirements and curtailment requirements. Additionally, we present our findings on the increased operability of the system in 2035 when these modeling improvements were included.

#### 2 - Late-century Electric Sector Climate Impacts Using a High-resolution Capacity Expansion Model

Stuart Cohen, National Renewable Energy Laboratory, 15013 Denver West Parkway, RSF 300, Golden, CO, 80401, United States

Climate impacts on the electric sector will vary in space and time while also being influenced by market and policy evolution. I'll discuss how the National Renewable Energy Laboratory's ReEDS model of U.S. electric sector expansion is being used to examine climate impacts on load, system performance, and water resources while accounting for regional, diurnal, and seasonal differences; technology-specific responses; and market-policy developments. ReEDS has recently been modified to solve through the year 2100, enabling this presentation to explore climate impacts in the mid-to-late century within the context of highly uncertain human and natural system development.

#### 3 - Deep Reinforcement Learning for Urban Energy Management and Demand Response

Jose Vazquez Canteli, University of Texas at Austin, Austin, TX, United States

The increasing amount of sensor data from buildings can help improve the energy management in urban settings. Reinforcement learning (RL) is a self-tuning and model-free controller that learns from real-time and historical data. RL is scalable and attractive for demand response in residential buildings. We developed CityLearn, a simulation environment based on CitySim, an urban energy simulator, and TensorFlow, a library that allows implementations of machine learning algorithms. We applied CityLearn in a case study with multiple buildings, controlled by RL, that compete against each other to reduce their cost of electricity, which increases when they consume electricity simultaneously.

### Models and Optimization Methods for Future Electricity Markets

Sponsored: Energy, Natural Res & the Environment/Electricity

Sponsored Session

Chair: Mahnoosh Alizadeh

#### 1 - Competitive Market with Renewable Power Producers Achieves Asymptotic Social Efficiency

Yue Zhao, Stony Brook University, 127 Light Engineering, Stony Brook, NY, 11794, United States

A price-making two-settlement power market in which both conventional generators and renewable power producers (RPPs) participate is studied. It is proved that the Nash Equilibrium (NE) of the market converges to the social optimum as the number of RPPs increases. As a result, social efficiency is asymptotically achieved with a simple market mechanism for integrating RPPs, without the need for an independent system operator to perform a centralized stochastic optimization. The analytical derivation of the NE offers an elegant characterization of the market power of the competitive RPPs. The market outcomes predicted by the developed theoretical results are demonstrated by simulation studies.

**2 - Renewable Scenario Generation using Adversarial Networks**

Baosen Zhang, University of Washington, Yize Chen, Wang Yishen, Daniel Kirschen

Scenario generation is an important step in the operation and planning of power systems. In this talk, we present a data-driven approach for scenario generation using the popular generative adversarial networks, where deep neural networks are used in tandem. Compared with existing methods that are often hard to scale or sample from, our method is easy to train, robust, and captures both spatial and temporal patterns in renewable generation. In addition, we show that different conditional information can be embedded in the framework. Because of the feedforward nature of the neural networks, scenarios can be generated extremely efficiently.

**3 - Pricing Differentiated Services in Electric Vehicle Public Charging Station Networks**

Mahnoosh Alizadeh, University of California-Santa Barbara, Santa Barbara, CA, United States, Ahmadrza Moradipari

We study the pricing problem of an electric vehicle charging network operator (CNO) offering differentiated access plans to its stations. We consider a scheme where users cannot directly choose which station to use when charging their vehicles. Instead, they are routed by the CNO to different stations with heterogeneous wait times and amenities based on their service plan. We design incentive compatible pricing-routing policies that take into account the heterogeneous energy needs of users, their value of time, travel plans, as well as locationally-variant prices of electricity and station capacities.

**4 - Dynamic Power Distribution System Management with a Locally Connected Communication Network**

Hao Zhu, The University of Texas at Austin, 2501 Speedway, Austin, TX, 78712, United States, Kaiqing Zhang, Wei Shi

Coordinated optimization of distributed energy resources (DERs) is a key distribution system management (DSM) problem. Two challenges exist therein: i) the possibly disconnected communication network; and ii) the system dynamics from the variable DERs/loads and measurement error. This talk will present the modeling and algorithm design for DSM by addressing these two concerns. First, a game-theoretic characterization is proposed to account for a locally connected communication network with Nash equilibrium analysis. Second, a projected-gradient based asynchronous DSM algorithm is developed for distributed equilibrium learning, with its convergence speed and tracking error analyzed.

**5 - Car and Ride Sharing Platforms with Electric Vehicle Fleets**

Subhmesh Bose, University of Illinois-Urbana Champaign, 306 N. Wright Street, 4058 ECE Building, Urbana, IL, 61801, United States

Shared usage and electrification in urban transit systems are on the rise. Motivated by that trend, we analyze the business model of car sharing services such as Autolib' and ride sharing services such as Uber with an electrified car fleet. Electric vehicles (EVs) impact the operation of such platforms in two ways. First, battery charging considerations affect waiting times for customers, driver's willingness to accept rides, etc., and influence the revenues from transit services. Second, plugged-in EVs can garner revenues by utilizing their batteries to provide grid services. We employ a queueing theoretic framework to study the impact of these factors on pricing policies of such platforms.

**1 - Using Python to Decompose Reduced Costs for a Capacity Expansion Model of the Electric Power Sector**

Kelly Eurek, National Renewable Energy Laboratory, 15013 Denver W. Pkwy, Golden, CO, 80401, United States

The Regional Energy Deployment System (ReEDS) is a capacity expansion model that identifies least-cost solutions to build and operate the US electric power grid. ReEDS is formulated as a linear program and written in GAMS. To understand the decision making in ReEDS, we designed a Python tool to harvest data from the MPS and GAMS solution files to reconstruct the reduced costs of the decision variables. Examining reduced costs allows us to calculate the cost and value streams of supply-side technologies and compare which options recover costs versus those that do not. This Python tool helps to identify errors in the model, provides solution transparency, and can be applied to other models written in GAMS.

**2 - Implement Real Time Pricing with Multiarmed Bandit Games**

Andrew Lu Liu, Associate Professor, Purdue University, 315 North Grant Street, School of Industrial Engineering, West Lafayette, IN, 47907, United States, Zibo Zhao

The situation where price-responsive consumers determine what to do in the near future (such as when to charge their PEVs) forms a dynamic and incomplete-information game, in which the consumers' collective actions will impact electricity prices, which in turn affect their payoffs. We propose a multiarmed bandit (MAB) game framework in which each consumer plays an MAB problem to minimize the cumulative regret, as opposed to naively responding to day-ahead prices. Numerical results show very fast convergence to a steady-state of the MAB game with much reduced price volatility and lower transmission congestion costs than the naive-response case.

**3 - Market Design and Competition in Short Term Electricity Markets - Lessons Learned from a Stochastic Multistage Energy System Model**

Frieder Borggrefe, German Aerospace Center (DLR), Pfaffenwald Ring 38-40, Stuttgart, 70563, Germany

This paper provides results from an integrated model for short-term electricity markets, including day-ahead, intraday and balancing markets. Coping with volatile renewable feed-in is a key challenge to the future European electricity system. The paper shows first results from a stochastic linear commitment and dispatch model. Aim of the model is to analyze how trading in the short-term markets will change with increasing shares of renewable energies. The model results are part of the BEAM-ME project: This project develops speed-up methods and applies models to high performance computing (HPC). The paper discusses the next steps to expand the model and challenges when applying the model to HPC.

**4 - Community Market Design for Unlocking Congested Distributed Energy Operations**

Jesus Nieto-Martin, Senior Research Fellow, London Business School, Sussex Place, Regent's Park, London, NW1 4SA, United Kingdom, Derek W. Bunn

This study is motivated by the Orkney Archipelago in Scotland, which presents a substantial amount of renewables connected to undersized infrastructure and is only linked to the Scottish mainland by two 33kV submarine cables. Currently, there is a curtailment mechanism based on the Last-In-First-Out (LIFO) principle. This study provides a market-based alternative to improve current operations by decreasing the curtailment of wind generators. This is achieved through participation into a Blockchain-based Community Local balancing market among islands, unlocking demand side response actions among them and increasing their trading opportunities.

**5 - Handling Optimization in Large Scale Energy Management with Hierarchical Approach**

Srinivasa Prasanna GN, Professor, IIITB, Bangalore, India, Sunil K. Vuppala

We present optimization methods of energy management in large scale smart grid systems. We handle violated coupling constraints in a hierarchical approach.

We present three cases covering different possibilities of feasibility in the hierarchical approach and techniques to handle the infeasibility. We compare our results with non-hierarchical and a proposed All-or-None heuristic.

North Bldg 228B

**Sustainable Development of Food, Water, and Energy Resources**

Sponsored: Energy, Natural Res & the Environment/Energy

Sponsored Session

Chair: Yao Zhao, Rutgers University, Newark, NJ, 07102-1895, United States

Co-Chair: Kwon Gi Mun, Fairleigh Dickinson University, Teaneck, NJ, United States

**1 - Designing Wastewater Supply Chains for Riparian Developing States**

Jiyong Eom, KAIST College of Business, 85 Hoegi-ro, Dongdaemun-gu, Seoul, 130-722, Korea, Republic of, Kwon Gi Mun, Yao Zhao

Designing wastewater supply chains for riparian states has become a highly controversial policy issue because of their asymmetric externality relationships and vulnerability positions. The problem is particularly pronounced in low-income countries facing tight public budgets and development uncertainties. We develop the concept of wastewater management for riparian states by proposing a spatially, temporally, and technologically explicit optimization model. A policy guidance for designing wastewater supply chains is provided for the case of Ganga river management in India.

## 2 - Designing Hydro Supply Chains for Energy, Food, and Flood

Kwon Gi Mun, Ph.D, Fairleigh Dickinson University, Teaneck, NJ, United States, Yao Zhao, Raza Ali Rafique

The interconnected issues such as Water, Food, Energy and Flood are among the most formidable challenges faced by developing countries. In this paper, we apply SCM concepts to water resource development and provide the end-to-end and dynamic perspectives. We found that the development of hydropower has the potential to address all these issues simultaneously. Our results demonstrate the value of the SCM perspective on hydro network expansion, and provide insights on the optimal development strategies regarding location, sequence and mix of hydro projects.

## 3 - Fiscal Policy in the Natural Gas Sector: An Optimization Approach

Ekaterina Dukhanina, MINES ParisTech, 60 Boulevard Saint Michel, Paris, 75006, France, Olivier MASSOL, Daria Kirova

In this paper we analyze the results of introduction of a new formula for mineral resource extraction tax in the biggest and the most complex domestic natural gas market. We build an economic equilibrium model involving strategic interaction between major natural gas producers and government subject to operational, political and market constraints, specific for the Russian gas industry. We show that the new tax is neither an optimal policy for the tax revenue maximization nor a socially optimal solution, as the possibility of sequential optimization distorted initial results of the tax reform.

### Practice- Sustainable Operations

Contributed Session

Chair: Qiangfei Chai, Xi'an Jiaotong University, Xi'an, 2, China

#### 1 - A Performance Measurement System for Green Supply Chain Performance Evaluation

Nima Kazemi, Massachusetts Institute of Technology, Cambridge, MA, 02140, United States, S. Maryam Masoumikh

In this paper, a fuzzy-rule based performance measurement system is developed to evaluate the performance measures for both Green supply chain management practices implementation and performance outcomes. To construct the performance measurement system, a comprehensive literature review was conducted to investigate various green supply chain initiatives. Structural equation modeling is used to categorize measures and then a fuzzy membership function is designed for evaluation purpose. The applicability of the developed performance measurement system is evaluated by using a real case study in Malaysian manufacturing industry.

#### 2 - An Analysis of Sustainability in Small Businesses in New York

John Vongas, Ithaca College, Ithaca, NY, United States, Narges Kasiri, Hormoz Movassaghi, Daniel Ruthman

Small and Medium-sized Enterprises (SMEs) are responsible for most of the pollution generated by businesses on earth; they are collectively generate approximately 60% of total carbon dioxide emissions and an alarming 70% of total pollution. Regulations, social and competitor trends, education and businesses' self-motivation are among the major factors behind the small businesses' decision on implementing sustainability in their operations. We examine the data collected from hundreds of SMEs in NY State to identify the motivators and obstacles to the adoption of sustainable solutions by SMEs in NY State.

#### 3 - Optimal Carbon Abatement Strategy Under Cap-and-trade

Qiangfei Chai, Xi'an Jiaotong University, Xi'an, China, Zhongdong Xiao

The importance of carbon abatement has been frequently emphasized around the world. This paper attempts to explore the appropriate carbon abatement strategy for firms who are regulated by cap-and-trade by taking into account the unique advantages of remanufacturing for both the monopolistic environment and the competitive environment. Our results indicate that involving in investment and remanufacturing collectively strategy is the optimal strategy in the monopolistic environment. However, this strategy is no longer optimal for the manufacturer in the competitive environment. We provide some decision guidance for the firms in the competitive environment.

### Environment, Energy, and Natural Resources

Contributed Session

Chair: Kenneth Bruninx, KU Leuven, Celestijnenlaan 300, Leuven, B3001, Belgium

#### 1 - On the Interaction between Aggregators, Electricity Markets and Residential Demand Response Providers

Kenneth Bruninx, Postdoctoral Researcher, KU Leuven, Celestijnenlaan 300, P.O. Box 2421, Leuven, B3001, Belgium, Hrvoje Pandzic, Helene Le Cadre, Erik Delarue

The flexibility of thermostatically controlled loads may be monetized by aggregators, acting as mediators between consumers and the electricity market. We study the strategic interactions between an aggregator, its consumers and the wholesale market using a bilevel optimization model. The aggregator-consumer interaction is captured as a Stackelberg or a Nash Bargaining Game. The aggregator takes strategic positions in the day-ahead electricity market, represented as a stochastic Stackelberg Game. The presented methodology may be used to assess the value of DR in a deregulated power system.

#### 2 - Failure of Green Technology Adoption and the Decision to Offshore Production

Wenqing Zhang, University of Minnesota Duluth, 1318 Kirby Drive, Labovitz School of Business and Economics, Duluth, MN, 55812, United States, Prasad Padmanabhan, Chia-Hsing Huang

Strong environmental pollution regulations in host countries (for example, through carbon taxes, focus on the triple bottom line, incentives to select green technology investment options) have forced multinational corporations (MNCs) to change their operations practices. In this study, an optimization model is presented where a domestic firms' propensity to offshore is shown to be function of the failure of green technology adoption. The findings suggest that a domestic firms' propensity to offshore pollution via production in pollution friendly host countries is directly related to the possibility of failure of the adopted green technology.

#### 3 - Scenario Selection and Weighting Algorithm for Large Scale Stochastic Mixed-integer Programs and Application to Stochastic Transmission Planning

Jesse Bukenberger, Pennsylvania State University, 310 Leonhard Building, University Park, PA, 16802, United States, Mort David Webster, Uday Shanbhag

Stochastic programs with many scenarios and complex recourse decisions can exceed computational memory and time resources. Often, the recourse costs of state-action pairs are not completely independent and exhibit a relationship that can be exploited with data compression techniques. We present an algorithm to select and weight a small subset of the original scenario space and feasible solution space to provide an efficient approximation of the costs of other state-action pairs. We demonstrate substantial computational savings in the context of stochastic transmission expansion planning.

#### 4 - Emission Reduction at Ports by Integrating Tax and Incentive Policies and Green Infrastructure Development

Anahita Molavi, University of Houston, 4722 Calhoun Rd, Houston, TX, 77204-4007, United States, Gino J. Lim

Air pollution due to port activities and development has a high impact on climate change and human health. However, ports are reluctant to implement emission abatement solutions due to associated barriers and costs. We analyze the process in which government defines incentive and tax policies and motivates ports to initiate green efforts. We develop a multi-objective bi-level programming model to find the optimal incentive and tax policies for the government in the upper level, and the optimal choice of green technologies for the multiple ports in the lower level.

#### 5 - A Bilevel Optimization Approach to Co-operative Dispatch of Transmission-level Renewables with Microgrids

Jialin Liu, 325 Riley Robb Hall, Ithaca, United States, Lindsay Anderson

As energy systems evolve to a sustainable and decentralized structure with a high penetration of renewable energy and distributed generation, microgrids (MG) will play a critical role, featuring distributed local generation, energy storage, and demand response. With the possibility of numerous MGs connected to and exchanging power with the transmission system (TS), new operational paradigms are required. Co-optimization of these systems will provide maximal benefits to the complete system. In this work, a bi-level optimization framework is used to model co-operative dispatch of TS and MG, and analyze the impacts on renewable penetration level, and the operation cost of both systems.

**Energy Policy and Planning III**

Contributed Session

Chair: Cristiana L. Lara, Carnegie Mellon University, 238 46th Street, Pittsburgh, PA, 15201, United States

### 1 - Joint Benefit of Transmission Switching, Siting, and Sizing of Energy Storages in Power Systems

Meltem Peker, Research Fellow, Bilkent University, Department of Industrial Eng, Ankara, Turkey, Ayse Selin Kocaman, Bahar Kara

This study discusses the joint benefits of transmission switching and other control mechanisms such as energy storage systems, demand side management and renewable energy curtailment for using clean sources in electricity generation without endangering the system. We analyze the effect of transmission switching on the total investment and operational costs, siting and sizing decisions of energy storage systems, and changes in the load-shedding and renewable energy curtailment amounts by using an extensive computational study.

### 2 - Undetectable Cyber Physical Attacks on Power Grids under the AC Model

Mauro Escobar, Columbia University, New York, NY, 10027, United States, Daniel Bienstock

We describe an algorithm for computing undetectable cyber-physical attacks on power grids under the AC power flow model. An adversary attacks a small set of nodes of the network: it can modify their demands as well as hide the signals that are measured (voltage and current). These actions are calculated so as to hide the underlying truth, which includes severe equipment overloads, while remaining consistent (i.e. not noticed) from the perspective of the control center of the system. On a second stage, we provide a mechanism to detect the attacked zone. We provide an algorithm and run experiments on large grids.

### 3 - Triple-bottom-line Approach to Optimizing Electricity Demand Response Schemes Using Smart Meter Data

Amir-Behzad Samii, Professor, Vlerick Business School, Bolwerklaan 21, Brussels, 1210, Belgium, Olga Varganova

Electricity Demand Response (DR) schemes impact people, planet, and profit. They can help low income consumers benefit from low cost of tariffs during the off-peak hours; reduce CO2 emissions by shifting the load to hours that solar and wind contribute more to power generation; and elongate the life of electricity distribution assets by reducing the peak-hour shocks. We use a three-objective optimization model to estimate the optimum relocation of consumption loads during off-peak/shoulder/peak hours. We analyze smart meter data supplied by Eandis-Belgium to estimate model parameters and provide decision makers with Pareto-efficient solutions utilized in power distribution command centers.

### 4 - Policy Making for Microgrid Planning to Reduce Emission

Aida Khayatian, University of Houston, Houston, TX, United States, Masoud Barati, Gino J. Lim

Integrated resource planning is intended to appraise new energy resources that examine a full spectrum of alternatives to enhance power system. The competitiveness of power investors, environmental issues, and reliability are challenges faced by power system planners. Future load growth, power output, and power outage in the face of uncertainty are other obstacles. This study integrates microgrid (MG) designing and expansion planning with generation and transmission planning to study the potential advantages of MG. Some performance indices are proposed to establish policy. The case studies illustrate the application of proposed model and policy.

### 5 - Stochastic Dual Dynamic Integer Programming for Electric Power Infrastructure Planning

Cristiana L. Lara, Carnegie Mellon University, Pittsburgh, PA, 15213, United States, Benjamin Omell, David Miller, Ignacio E. Grossmann

We address the long-term planning of electric power infrastructure under uncertainty. We propose a multi-stage stochastic integer programming formulation that optimizes the generation expansion to meet the projected electricity demand over few decades while considering detailed operational constraints, intermittency of renewable generation, power flow between regions, and load demand uncertainty. To solve the large-scale model, we decompose the problem using Stochastic Dual Dynamic Integer Programming (SDDIP), incorporate scenario sampling, and solve in parallel nodes within the same stage. We report results for the region managed by the Electric Reliability Council of Texas.

North Bldg 231A

**Retail Management**

Contributed Session

Chair: Armagan Bayram, University of Michigan Dearborn, Livonia, MI, 48152, United States

### 1 - Channel Transparency and Omnichannel Retailing: The Impact of Sharing Retail Store Inventory Availability with Online Shoppers

Xinyi Ren, University of Maryland, 3330 Van Munching Hall, College Park, MD, 20742, United States, Philip Evers

This paper empirically examines the effects of sharing retail store inventory availability with online shoppers at both the marketing and reverse logistics interfaces. Specifically, industry data is collected from a leading North American retailer to answer the following research questions 1. How does sharing brick-and-mortar inventory availability affect customer purchasing decisions at online and offline channels? 2. How does this policy affect customer conversion rates at the online and offline channels and the operational costs associated with product returns? Furthermore, the implications of these findings on inventory management are discussed.

### 2 - Food Waste in Online versus Offline Grocery Shopping

Alwin Dsouza, Arizona State University, 6459 S. Essex, Mesa, AZ, 85212, United States, Lauren Chenarides, Timothy Richards

U.S. households are responsible for a significant portion of food waste, which results when shoppers are unable to match purchases to expected consumption. Using multichannel store scanner data, this study investigates how the amount of food waste varies across online, offline and mixed shoppers. While online shoppers are more inclined to follow a shopping list, online shoppers are often required to pay a delivery fee and follow a minimum basket size. We use a model of consumer learning and inventory behavior to explore these two opposing effects and their impact on household-level food waste.

### 3 - A Model for Fresh Produce to Jointly Optimize Shelf Space Allocation, Inventory, and Pricing Decisions

Hasmukh Gajjar, Associate Professor, Indian Institute of Management Indore, Faculty Office #C-208, IIM Indore, Prabhindh Shikhar, Rau-Pithampur Road, Indore, India, Bhavin J. Shah

Fresh produce's demand primarily depends on its displayed stock, freshness and price. We present a model to jointly arrive at shelf space allocation, inventory and pricing decisions. Numerical results and sensitivity analysis are carried out to test the usefulness of the model.

### 4 - Direct and Wholesale Price Optimization in Omnichannel Environment Using Bilevel Optimization Model

Vishal Gupta, Indian Institute of Technology-Kharagpur, Department of Industrial & Systems Enggn., I. I T. Kharagpur, Kharagpur, 721302, India, Shrinath Dakare, Manoj Kumar Tiwari

We considered multi-period price optimization problem for a manufacturer (leader), also having a direct channel, and a multi-location multi-channel retailer (follower). Both manufacturer and retailer try to maximize their profits; moreover, manufacturer tries to increase the market share of their product. Assuming price and delivery lead time dependent attraction function, location-based holding and fulfillment costs, we propose a bilevel model that has a multi-objective upper level and single objective lower level. In the resulting omnichannel environment, we demonstrate how the model is effective in setting wholesale and direct channel prices using intelligent search heuristic.

### 5 - Dynamic Pricing Under Customer Review Effect

Ruizhi Shi, University of Minnesota, 1400 S. 2nd St, Minneapolis, MN, 55454, United States

In this talk, we consider a monopolist selling a single product to a sequence of customers. Each customer will make a purchase decision base on the current review and the price. If a customer purchases the product, he will post a review, which is drawn from a normal distribution centered at the true quality  $q$ . Only the seller knows the true quality therefore the customers have to use the review as an estimation of the true quality. We derive the optimal policy on how the seller should adjust the price to maximize the expected revenue. We also derive upper bounds on the best performance of any policy.

### 6 - Order Fulfillment Policies for Ship from Store Implementation in Omni Channel Retailing

Armagan Bayram, Assistant Professor, University of Michigan-Dearborn, 4901 Evergreen Road, Dearborn, MI, 48128, United States, Bahriye Cesaret

We consider an omni-channel retailer having both online and store operations and implementing ship-from-store fulfillment model. In this model, store orders are fulfilled from store inventories, but for an online order, the retailer can ship it either from the online distribution center or from any store location that maximizes its overall profit. We investigate dynamic fulfillment decisions: from which location to fulfill an online order when it arrives. We incorporate the uncertainty both in demand and in the cost of shipment to individual customers. We develop a stochastic dynamic framework and present our analytical and numerical findings on optimal fulfillment strategies.

### Practice-Scheduling

Contributed Session

Chair: Leonardo Bedoya-Valencia, Colorado State University-Pueblo, 4702 Desert Candle Drive, Pueblo, CO, 81001, United States

#### 1 - A New Extension of the MSRCPS in a Resource Reallocation Context

Zhentao Hu, Huazhong University of Science & Technology, School of Management, HUST, Hongshan District, Wuhan City, Wuhan, 430074, China, Nanfang Cui

In this research, we proposed a new strategy to optimize MSRCPS, which expands the problem into a new one named RP-MSRCPS. For solving the new problem, a heuristic, which is a PSS procedure consisting of activity priority rule, dynamic weight-based resource priority rule, Hungarian method and 0-1 programming, is developed. The results of experiment on 1440 instances show that the new strategy is effective and the heuristic is efficient and robust in solving both the new and the previous scheduling problems.

#### 2 - Aircraft Maintenance Planning: Moving A-check Tasks to Line Maintenance

Qichen Deng, PhD Student, Delft University of Technology, Kluyverweg 1, Delft, 2629 HS, Netherlands, Bruno F. Santos, Daniel Coolen

In this study, we present a two-stage optimization model to minimize the total delay of maintenance tasks. It is for the first time to propose to move the A-check tasks from hangar to line maintenance. The model of first-stage is task planning, which groups the A-check tasks into packages and shifts them to line maintenance. The model of second-stage is task scheduling. It minimizes the total amount of delay given a task package. The proposed model is evaluated on a fleet of 30 aircraft. The results show that by task planning and scheduling, it can save up to 18% of aircraft downtime per A-check. Allowing performing tasks 4-14 days earlier than the desired dates can reduce the total delay of tasks up to 66%.

#### 3 - Stochastic Single-machine Scheduling with Learning

Haitao Li, Associate Professor, Univ. of Missouri-St Louis, College of Business Administration, 208 Express Script Hall, St Louis, MO, 63121-4400, United States

Learning is ubiquitous in the modern scheduling environment. While deterministic scheduling with known processing time and learning rate have been extensively studied, limited work exists to address the problems with both learning effect and uncertainty. In this talk, I introduce the single-machine scheduling problem with random nominal processing time and/or random job-based learning rate with both theoretical and computational results.

#### 4 - A Sequential Stochastic Mixed Integer Programming Model for Tactical Master Surgery Scheduling

Ashwani Kumar, PhD Candidate, The University of Melbourne, Peter Hall Building, Parkville Campus, Melbourne, 3010, Australia, Alysso M. Costa, Mark Fackrell, Peter G. Taylor

In this talk, we present a MIP model to optimise master surgery schedule (MSS) under downstream capacity constraints. We optimised the process over several scheduling periods, and we used various scenario realisations to model the uncertainty. Our model had novelty that it used scenarios in chronologically sequential manner, not parallel. We positioned patients randomly in a queue and constrained the model to schedule patients in queuing order. This simple approach enhanced the model's non-anticipative feature. Finally, we developed robust MSSs to maximise throughput while keeping cancellations within limits. The simulation results indicated that the schedules obtained were promising.

#### 5 - Truck Driver Friendly Scheduling Problem a Constraint Programming Approach

Fereydoun Adbesh, J.B. Hunt Transport Inc, 615 J. B. Hunt Corporate Dr, Lowell, AR, 72745, United States, Brain Moore, Douglas Mettenburg

As a transportation company, development of quality work schedules is critical to the retention of drivers. Feasible driver schedules must strictly adhere to delivery appointments and Department of Transportation rules, while also considering soft constraints, such as schedules that start at roughly the same time each day. Several commercial software packages address the former but neglect important human factors. A constraint programming approach is developed to minimize the number of total drivers while increasing the driver-friendliness of the solution. The performance of the model is compared with results from a commercially available routing software over a set of real-world problems.

#### 6 - Developing Dispatching Rules for a Flexible Flow Shop Scheduling Environment at a Wind Mill Tower Assembly Facility

Leonardo Bedoya-Valencia, Colorado State University-Pueblo, 4702 Desert Candle Drive, Pueblo, CO, 81001, United States, Micah Mitchell

This research work proposes the developing of a simulation model used to evaluate different dispatching rules in a multi-stage flexible flow shop scheduling

environment (FFSSE). The process analyzed in this research is the rolling, welding and assembling of steel sheets required to manufacture the four sections of a wind mill tower. In this process, the utilization of the welding workstations is the most important measure of performance while keeping the throughput above a lower limit defined by the management of the company. Computational experiments were performed in order to define the group of best dispatching rules that maximizes the resources utilization.

### Practice- Transportation Freight 1

Contributed Session

Chair: Juvvala Rambabur, Indian Institute of Technology Kharagpur, Kharagpur, India

#### 1 - Intermodal Freight Network Design Problem: Consideration of the Product Perishability

Maxim A. Dulebenets, Florida A&M University-Florida State University, Tallahassee, FL, 32311, United States, Eren Erman Ozguven, Ren Moses, Thobias Sando, Mehmet Ulak

A significant amount of products, transported via the existing freight transportation networks, are perishable in their nature. This study presents an optimization model for design of freight transportation networks with perishable products, aiming to minimize the total transportation cost, including the cost associated with decay of perishable products. A set of piecewise functions are adopted to linearize the original model. The linearized model is solved using CPLEX. Numerical experiments are performed for the seafood perishable products to draw a number of important managerial insights.

#### 2 - Recovery Optimization for Truckload Freight: Evidence from Practice

Roger D. Lederman, Amazon, Seattle, WA, United States

Our network of truckload freight carriers is critical to the promise of fast and reliable delivery. To achieve high standards of customer service, the network must respond efficiently to both internal and external disruptions. The talk will discuss our work in recovery optimization, which optimally allocates available trucks to maintain service, while minimizing the cost of disruption. Our solution is forward-looking, including proactive mechanisms to keep supply and demand in balance. The tools have improved network performance in the form of lower cancellation rates and decreased reliance on costly spot market capacity.

#### 3 - Investigating the Waiting Time & Carbon Emission Reduction Potential of the Urban Consolidation Centre

Juvvala Rambabu, Research Scholar, Indian Institute of Technology Kharagpur, ND 105 VSRC IIT Kharagpur, 721302, India, S. P. Sarmah

The purpose of this study is to examine the feasibility of the Urban Consolidation Centre (UCC) as a measure to minimize the negative impacts of freight transportation in the city such as congestion and carbon emission. We have employed the established meta-heuristic technique to the NP-hard nature of the mathematical model formulation

## ■ WC53

### Behavioral Operations I

Contributed Session

Chair: Samuel Nathan Kirshner, UNSW Business School, Level 2, West Wing, Quadrangle Building, Sydney, 2052, Australia

#### 1 - Social Stress and the Newsvendor Problem

George Kurian, The University of Texas at Arlington, Arlington, TX, 76013, United States

This paper investigates the effect of social stress on individual performances in the newsvendor problem. From our experiments and analyses, we did not find sufficient evidence for the impact of social stress on performance. However, subjects showed less demand chasing and better learning under social stress. The results show that not all types of stress are detrimental.

#### 2 - An Experimental Study: Does the Influence of Leaderboard and Dynamic Ranking on Performance Depend Upon Task Type?

Sina Zare, University of Texas-Arlington, Arlington, TX, 76013, United States, Kay-Yut Chen, Sridhar P. Nerur

We investigated the effect of Leaderboard and dynamic ranking on the decision makers' performance in two different contest games. The first experiment is a Newsvendor task which requires subjects' cognitive skills to perform well in the experiment. In the second experiment, subjects are engaged in a real effort task where we study how their level of effort and efficiency change upon cost setting.

### 3 - The Impact of Service Level on Inventory Decisions

Jaime Andres Castañeda, Universidad del Rosario, Bogota, Colombia, Sebastian Villa

This study analyzes how a service level concern impacts inventory decisions. We experimentally manipulate decision makers' mindset through priming techniques to (unconsciously) activate a service level mindset aligned with profit maximization. We also explicitly model a service level target in the Newsvendor problem, providing the analytical solution, model insights and suggestions for a behavioral test of this (consciously) activated service level mindset.

### 4 - Impact of Behavioral Factors on Performance of Multi-server Queuing Systems

Marilyn T. Lucas, University of Vermont, School of Business Management, 202 Kalkin Hall 55 Colchester Avenue, Burlington, VT, 05405-0157, United States, Hung Do, Masha Shunko, David Novak

Recent studies have shown that employees in service-based queuing systems respond to the design and congestion level of the queuing system in which they operate. In this paper, we incorporate two behavioral effects into multi-server analytical queuing models: server speedup due to increased workload and server slowdown due to social loafing when multiple workers share the workload. We evaluate how these factors affect the performance of both the multi-server, single-queue (or SQ) system and the multi-server, parallel-queue (or PQ) system. We also consider strategic routing and its impact on the performance of PQ systems.

### 5 - Construal Level Theory and the Newsvendor Problem

Samuel Nathan Kirshner, UNSW Business School, Level 2, West Wing, Quadrangle Building, UNSW, Sydney, 2052, Australia, Chun-Tang Pai

Experimental studies on the newsvendor problem has robustly observed that subjects choose order quantities that systematically deviate from the profit maximizing order quantity. Construal Level Theory (CLT) shows that people can be subconsciously primed by their environment to think more abstractly (high construal) or concretely (low construal), which in turn, can predictably influence decision-making. This talk investigates the potential impacts of CLT on demand chasing in the newsvendor problem.

### Behavioral Operations Management Session

Sponsored: Behavioral Operations Management

Sponsored Session

Chair: Xiaobo Zhao, Tsinghua University, Beijing, 100084, China

Co-Chair: Wanshan Zhu, Tsinghua University, Beijing, 100084, China

#### 1 - What Can We Learn from Brain Imaging Newsvendors?

Kay-Yut Chen, University of Texas at Arlington, 511 Pine Island Circle, Mansfield, TX, 76063, United States

The current literature on newsvendor behavior relies on "guessing the underlying cognitive mechanisms from observations, without direct physical evidence. Functional near infrared spectroscopy allows researchers to examine brain functions by measuring hemodynamic responses. In this paper, we show that newsvendor performances are correlated with neural activations, which can be interpreted as cognitive efforts.

#### 2 - Full Credit or Full Quantity? A Behavioral Investigation of Buyback Contracts

Yinghao Zhang, Assistant Professor, University of Cincinnati, 614A Carl H. Lindner Hall, 2925 Campus Green Dr., Cincinnati, OH, 45221, United States, Peiwen Yu, Tianjun Feng, Stephanie N. Eckerd

This paper investigates two forms of buyback contracts: full quantity and full credit contracts. Standard theory suggests that the retailer should order the same amount of inventory under these two options. Lab experiments, however, reveal different ordering patterns. We propose a behavioral model to explain these experimental observations.

#### 3 - How to Provide Information for Management Decisions

Jaime Andres Castañeda, Universidad del Rosario, Bogotá, Colombia, Yingshuai Zhao

This work experimentally studies several ways of providing information in a newsvendor task to pinpoint decision-making improvement interventions. Based on sunk-cost effects arguments, we manipulate (i) whether decision makers obtain supporting information for free or at a cost, and based on instrumental information arguments, we manipulate (ii) the feedback information provided. Results show (i) performance improvements when participants have to pay for supporting information and (ii) less order variability when they are provided with instrumental information.

### 4 - On Difference between Direct-response and Strategy Procedures in Decision Making: Neural Evidence in a Reward-punishment Game

Niannian Sun, Tsinghua University, Beijing, China, Xiaobo Zhao, Lihong Wang, Yukun Zhao, Xue Xiao

In decision making, the evidence of whether direct-response procedure and strategy procedure lead to similar outcome is mixed. We conduct an fMRI experiment of a game setting with reward and punishment decisions under both procedures. The results show that, in reward decision, the direct-response procedure prompts stronger neural unwillingness and lower reward rate than the strategy procedure. In punishment decision, the strategy procedure induces stronger neural negative emotions and higher punishment rate than the direct-response procedure. Moreover, subjects prefer not to choose reward when facing favorable states but tend to choose punishment when facing unfavorable states.

### Product and Project Development and Management 1

Contributed Session

Chair: Barbaros Yet, Hacettepe University, Ankara, Turkey

#### 1 - Factors Affecting Labor Productivity in Turnaround Maintenance Projects: Case of the Oil and Gas Sector in Qatar

Omar Ben-Ayed, Professor of Management, Qatar University, College of Business and Economics, Department of Management and Marketing, Doha, Qatar, Abdulhadi Nasser Al-Marri, Salem Nechi

The aim of this study is to define the factors affecting labor productivity in Turnaround Maintenance (TAM) projects in the oil and gas sector in Qatar and to propose solutions to improve it. We use the Analytic Hierarchy Process method to determine the importance of the factors identified and to select the most appropriate managerial alternative for improvement. The target participants are mostly from the management level of TAM companies. The results show that the top five factors are labor skills, extent of supervision, communication skills, safety related issues, and on-site labor transportation. The study suggests improving the estimation of activity time and resources.

#### 2 - Coordination between Iterations and Design Rate in Serial Product Development Process

Maoqi Liu, PhD Candidate, Tsinghua University, Beijing, 100084, China, Li Zheng, Changchun Liu

Product Development (PD) plays an important role in winning market competition. As complexity and uncertainty increasing in PD process, iteration becomes more and more significant in this process. Lead time is a key indicator to measure the performance of PD process. Many techniques like CPM and PERT are applied to non-iterative process but few of them can be applied in iterative one. In this research, a model is proposed to achieve best coordination between faster and fewer iteration with the object of minimizing lead time of PD process. The results in small scale shows that task with higher risk tends to design slowly to reduce iterations and therefore, shorten PD lead time.

#### 3 - Probabilistic Earned Value Management using Bayesian Networks

Barbaros Yet, Dr., Hacettepe University, Ankara, Turkey, Yasemin S

Accurate project control is challenging due to uncertainty regarding the completion percentage of ongoing activities and uncertainty of the project plan. Our aim is to develop a probabilistic project control tool based on Earned Value Management (EVM). We use Hybrid Bayesian Networks (HBN) to model the causal relations between project risk factors and progress, and to reflect parameter uncertainty in EVM. The proposed tool is illustrated using a case study of a construction project.

### Mathematical Modeling and Optimization for Cancer Therapy

Sponsored: Health Applications

Sponsored Session

Chair: Ehsan Salari, Wichita State University, Wichita, KS, 67260, United States

#### 1 - Dose Mimicking with Inverse Optimization

Aaron Babier, University of Toronto, Toronto, ON, M5S 2K6, Canada, Andrea McNiven, Timothy Chan

There are many instances in radiotherapy (e.g., knowledge-based planning) where we know what a desirable dose distribution looks like, but we do not know how to deliver it to a patient. In these cases, dose mimicking methods are used to optimize the beamlets that best deliver the plan in question. We propose an inverse optimization (IO) pipeline as an improvement over conventional dose mimicking methods. After testing both approaches on clinical plans and predictions from a random forest, we found that our IO approach can mimic plans better than a conventional method. These results were consistent across a large cohort of 217 patients, and suggest that IO is a viable tool for dose mimicking.

#### 2 - Effects of Spatial Structure on the Speed of Evolution

Nathaniel Witte, University of Minnesota, Minneapolis, MN, United States, Kevin Leder

Spatially structured and spatially homogeneous models are both commonly used to model cancer growth. In this work, we consider two stochastic models of tumor evolution: a logistic branching process and an interacting particle systems. In particular, we are interested in how the average population fitness changes versus time in the two models. We also investigate how spatial structure affects tumor response to therapy.

#### 3 - Optimizing Spatiotemporally Fractionated Radiotherapy Plans

Ali Adibi, Wichita State University, Wichita, KS, 67220, United States, Ehsan Salari

Several studies have recently shown the potential therapeutic gain that may be achieved from delivering spatiotemporally fractionated radiotherapy plans. However, solving the corresponding treatment planning problem to a small optimality gap remains computationally challenging for 3D clinical cases due to the large-scale and non-convex nature of the problem. This research aims at developing a customized solution approach to spatiotemporal fractionation.

#### 4 - Organ Motion Prediction in MRI Guided Radiotherapy

Seyed Ali Mirzapour, Wichita State University, Wichita, KS, 67220-2982, United States, Thomas Mazur, Gregory Sharp, Ehsan Salari

Internal organ motion during radiation therapy (RT) is a major concern in the treatment of lung and abdominal cancers. If unaccounted for, the anatomical motion may lead to the underdosing of the target volume or overdosing of organs at risk. A new generation of RT systems are equipped with onboard magnetic-resonance imaging (MRI) scanners, providing a real-time view of the anatomical motion during RT delivery. This research aims at employing the online stream of MRI images to predict the motion trajectory using Markov processes.

### Resource Allocation in Health Care

Sponsored: Health Applications

Sponsored Session

Chair: Jackie Griffin, Northeastern University, Boston, MA, 02115, United States

#### 1 - Approximate Dynamic Programming for the Aeromedical Evacuation Dispatching Problem: Value Function Approximation Using Multiple Level Aggregation

Nathaniel D. Bastian, Assistant Professor, Department of Systems Engineering, U.S. Military Academy, West Point, NY, 10996, United States, Matthew Robbins, Phillip Jenkins, Brian Lunday

Sequential resource allocation decision-making for the military medical evacuation of wartime casualties consists of identifying which available aeromedical evacuation (MEDEVAC) assets to dispatch in response to each casualty event. These sequential decisions are complicated due to uncertainty in casualty demand and service times. In this research, we present a Markov decision process model solved using a hierarchical aggregation value function approximation scheme within an approximate policy iteration algorithmic framework. The model seeks to optimize this sequential resource allocation decision under uncertainty of how to best dispatch MEDEVAC assets to calls for service.

#### 2 - Resource Allocation for Medical Fraud Assessment

Tahir Ekin, Texas State University, San Marcos, TX, 78666, United States, Rasim Musal

It is estimated that up to 10 percent of annual health care spending is lost to fraudulent transactions, which makes medical audits paramount. The resource allocation decisions for the medical audits are challenging because of the heterogeneity of the claims. A number of frameworks are utilized to help auditors address the trade-offs between efficiency and cost while having valid overpayment amount estimates. We present resource allocation designs to help the auditors assess the trade-off between the initial and additional numbers of samples within a multistage sampling framework.

#### 3 - Productivity-driven Physician Scheduling in Emergency Departments

Nadia Lahrichi, Ecole Polytechnique de Montreal, Cp6079 Succ. Centre-Ville, Montreal, QC, H3C3A7, Canada, Dina Bentayeb, Louis-Martin Rousseau

Reducing the congestion in EDs is a major challenge for improving access to care. Our approach to deal with this problem is to offer an innovative approach to scheduling emergency physicians. Currently, departments define a covering constraint that fixes the number of required physicians per shift/day. We observe two main issues: 1) the variation in demand in terms of number of patients is not considered when designing the schedule; 2) all physicians are considered equivalent in terms of the number of patients they see in a shift. These two aspects lead to a mismatch between offer and demand. In this project, we will address these two issues to better align the schedule of physicians to patients demand.

#### 4 - Patient Prioritization in an Ambulatory Care Clinic Using Markov Chain Models

Vahab Vahdatzad, Northeastern University, Boston, MA, 02114, United States, Jacqueline Griffin, Ann Suhaimi

In outpatient centers, physicians regularly visit patients with different characteristics. Furthermore, physicians may visit each patient multiple times during one visit. An example of multiple visit is in orthopedic centers that physician visit the patient before and after radiology tests. In this research, prioritizing patients are examined using Queueing Network and Markov chain models and showed how altering prioritization based on patient characteristics can improve timeliness of care for all patients.

### Operational Decisions in Healthcare

Sponsored: Health Applications

Sponsored Session

Chair: Zhankun Sun, City University of Hong Kong, Kowloon, 1, Hong Kong

#### 1 - Design of Specialist Response Policies to Reduce Waiting Time in Emergency Departments

Cheng Zhu, McGill University, 701-801 Sherbrooke Est, Montreal, QC, H2L 0B7, Canada, Beste Kucukyazici

We design a framework of systematic response policies for specialists based on their clinical demands. After identifying a class of patients who are more likely to require specialist consultation based on their clinical information available at the triage stage through statistical analysis, we analyze several alternative policies for specialists' responses to consultation requests using queueing models. Specifically, we analytically calibrate a specialist's optimal arrival in a cycle based on the non-homogenous Poisson distributed demand. The simulation suggests this policy can be effectively adopted in different types of hospitals with varied patient volumes.

#### 2 - Bed Allocation to Reduce Overflow

Jingui Xie, University of Science and Technology of China, School of Management, 96 Jinzhai Road, Hefei, 230026, China, Marcus Teck Meng Ang, Mabel Chou, David D. Yao

To address the overflow issue, we build an analytical model and propose two easy-to-compute bed allocation policies. We use the real data from the only university hospital in Singapore and a simulation model to evaluate the effectiveness of our proposed policies against the base case provided by the empirical study of the hospital. Through the simulation study, we show that the proposed policies can reduce the overflow rate from 18.91% to about 4-5% without sacrificing other performance measures. More surprisingly, our simulation studies suggest that the existing capacity actually can accommodate 50% more elective patients while keeping the overflow rate at a level of less than 10%.

### 3 - Dialysis Facilities: Does Location, Staffing, and Mode Impact Access to Care?

Michael G. Klein, San Jose State University, One Washington Square, San Jose, CA, 95192-0069, United States

Kidney failure is treated with dialysis until transplant or death. Regardless of the travel burden, many patients always opt to go to a facility, while some always opt for home dialysis. For others, the choice varies depending on the location of available facilities. Existing patients also switch dialysis modes (e.g. from facility-based dialysis to home dialysis) bringing different requirements for providers over time. I propose a new model to determine the best network of dialysis facilities from an access to care perspective. Through a California case study, I propose to illustrate the model and help identify areas for improvement.

### 4 - Readmission Reduction Programme for COPD Exacerbation: From Predictive to Prescriptive Analytics

Shaochong Lin, City University of Hong Kong, 5022, AC2, Kowloon Tong, Hong Kong, Frank Y. Chen

Chronic Obstructive Pulmonary Disease (COPD) is a chronic, non-reversible lung disease. Based on a predictive model, we can early identify high-risk subpopulation with high accuracy for further follow-up interventions. This work aims to use the predictive model to guide allocation of limited health care resources to balance efficiency - readmission reduction and health outcomes.

### Supply Chain Optimization II

Contributed Session

Chair: Anurag Agarwal, University of South Florida, Information Systems and Decision Sciences, Coll of Business, Sarasota, FL, 34243, United States

#### 1 - Optimal Decision of Supply Chain with Consumer Returns in Electronic Commerce

Wenjuan Wang, Dongbei University of Finance and Economics, Dalian, China

The impacts of the customer's behaviors can damage the profits of supply chain with customer returns. Some related knowledge of consumer return in supply chain is summarized. We estimate customer demand through a choice model, which incorporates reference price, utility function and customer loss aversion. We analyze the optimal and equilibrium strategies for a seller operating. Our system can improve the efficiency of decision making and provide better customer service for the enterprise's operation.

#### 2 - Matching and Revenue-risk Sharing Contract with Heterogeneous Risk Averse Supplier and Retailer

Hewen Liu, University of Miami, Miami, FL, United States

The following analysis covers a decentralized matching model with a bilateral supply chain including risk averse suppliers and retailers. I characterize the stable matchings with endogenous production plan and revenue sharing contract. Depending on the trade-off between the expected revenue and demand uncertainty, both positive assortative matching (PAM) and negative assortative matching (NAM) can occur at a stable matching equilibrium. These results shed light on the role of the endogenous production plan in coordination supply chain allocation and inventory management.

#### 3 - Evaluating the Tradeoff between the Delivery Cost and Customer Lead Time in Last Mile Delivery

Sanam Azadiamin, PhD Candidate, Ohio University, Athens, OH, 45701, United States, Dale Masel

In supply chain, the purpose of last mile delivery is to deliver items to customers in manageable cost and time. For this purpose, vehicle routing problem has been used to solve the problem considering both delivery cost and customer lead time factors by examining the impact of driver's batch size on both factors. The travel area's largeness has also been considered in finding the optimal solution.

#### 4 - Heuristics versus Exact Method Comparison of a Supply Chain Scheduling Problem with Penalties

Anurag Agarwal, University of South Florida, Information Systems and Decision Sciences, Coll of Business, Sarasota, FL, 34243, United States, Ramakrishna Govindu

Given the complexity of supply chain scheduling problems, they are solved by applying heuristics (using due times and other improvisations) and metaheuristics to find good solutions quickly. Better formulations can help reduce the time for exact solutions. We investigate the performance comparisons between multiple heuristics and an exact method on a supply chain scheduling problem.

### Joint Session DM/Practice Curated: Data Science in Health Care III

Sponsored: Data Mining

Sponsored Session

Chair: Maryam Soltanpour Gharibdousti, Binghamton University, 1120 Murray Hill Road, Vestal, NY, 13850, United States

#### 1 - Studying Impact of Physical Activity on Human Learning Propensity and Emotional Response Modulation using EEG Data

Klim Drobnyh, Arizona State University, Tempe, AZ, 85281, United States, Ghazal Shams, Robert Atkinson, George Runger

The goal of our study was to investigate the impact of acute and chronic physical activity on learning propensity and emotional response modulation. Two groups of participants with high and low levels of exercise were instrumented with EEGs and tested for cognitive load, and furthermore different stimuli were presented. This generated high-volume, rich datasets, and several analytical tasks were completed to handle this high-volume data.

#### 2 - Hospital Length of Stay Prediction Model for Neurosurgery Inpatients Applying Various Data Mining Techniques

Sahar Khamsehi, SUNY Binghamton, 4400 Vestal Pkwy E, Binghamton, NY, 13850, United States

Prolonged length of stay (LOS) at hospitals have been controversial topic that leads to extra cost for hospitals. Consequently, it increases patients' turnaround time. The purpose of this study is to determine non-clinical factors that may prolong length of stay and develop predictor models using contributing factors. The results from three prediction techniques of Artificial Neural Network (ANN), Logistic Regression (LR) and Support Vector Machine (SVM) obtained from neurosurgery database for a period of 2 consecutive years inclusive of 14 non-clinical factors, are statistically compared. Conclusively, logistic regression has the highest accuracy among all data mining techniques.

#### 3 - Survival Rate Prediction in Cardiac Patients with Heart Transplant or Assisted Devices

Maryam Soltanpour Gharibdousti, PhD Candidate, Binghamton University, 4400 Vestal Pkwy E, Binghamton, NY 13902, Vestal, NY, 13902, United States, Mohammad Khasawneh

The survival rate prediction for the organ transplant surgery patients can help to classify patients risk levels and potential post-surgical complications. The research used the data for cardiac patients with either medical assist devices such as Impella and Left Ventricular Assist Devices (LAVD) or heart transplant patients. The significant factors such as demographic information, baseline patient characteristics, baseline hemodynamics, laboratory values, and in-hospital complications can predict the survival rate after the transplant surgery. The data from one of the Organ Procurement Organizations (OPO) in New York State is analyzed using several machine learning algorithms.

Sponsored: Data Mining

Sponsored Session

Chair: Yanqing Kuang, University of South Florida, Tampa, FL, United States

#### 1 - Data-driven Consumer Debt Collection via Machine Learning and Approximate Dynamic Programming

Qingchen Wang, Amsterdam Business School, Amsterdam, Netherlands, Ruben van de Geer, Sandjai Bhulai

This paper presents a novel data-driven framework for the optimization of the consumer debt collection process. We consider the problem of scheduling outbound calls made by debt collectors to a portfolio of debtors with heterogeneous and dynamic repayment behavior. We model this problem as a Markov decision process and approximate the value function based on predictions of individual debtors' repayment probabilities by leveraging historical data and using a state-of-the-art machine learning technique. A controlled field experiment with an industry partner showed an increase in collected cases at a significant decrease in calling efforts compared to their current collection policy.

## 2 - Optimal Return Policy in the Presence of Social Networks

Ehsan Salimi, University of Florida, 376 Weil hall, Gainesville, FL, 32603, United States, Sina Ansari

When a firm allows the return of purchased item, it provides customers with the option of keeping or returning the item. While the option to return item leads to an increase in gross revenue, it may also create additional costs including the social costs associated with returns. In this paper, we study the optimal return policy considering customers' returns behavior in the presence of social networks. Our findings have important implications for the coordination of marketing and operations decisions.

## 3 - An Anatomy-adjusted Quality Control Tool for Cancer Radiotherapy Plan Evaluation

Arkajyoti Roy, The University of Texas at San Antonio, San Antonio, TX, United States  
Arkajyoti Roy, Bowling Green State University, Bowling Green, OH, United States, Dan Cutright, Mahesh Gopalakrishnan, Arthur Yeh, Bharat B. Mittal

A quality control tool is proposed that allows clinicians to evaluate and directly compare cancer radiation treatment quality of a large set of patients, after accounting for variations in patients' anatomies. The effect of the inter-patient variations is accounted for through the use of anatomy-adjusted I-Charts. 69 head-and-neck cancer cases are used for the evaluation of the proposed tool.

## 4 - Statistical Monitoring of Inhomogeneous Continuous Time Markov Chains

Yanqing Kuang, University of South Florida, Tampa, FL, United States, Devashish Das, Jianguo Wu, Mustafa Y. Sir

In this presentation, we propose a nonparametric scheme for monitoring inhomogeneous continuous time Markov chains with a large state space. The proposed framework is used to monitor the timeliness of the healthcare delivery process using time-stamped clinical event sequences.

## 1 - Detecting Crash Severity in Passenger Vehicle a Machine Learning Study

Rupesh Agrawal, Research Assistant, Oklahoma State University, 700 N. Greenwood Ave, Tulsa, OK, 74106, United States, Robert Fritts, Dursun Delen

In 2016, National Highway Traffic Safety Administration reported nearly a trillion-dollar impact from the loss of productivity, loss of life, and other consequences related to automobile crashes. This study seeks to enhance the current body of knowledge in discovering variables impacting the level of injury severity in passenger vehicle accidents using variable selection and data balancing techniques (i.e., oversampling and undersampling) using multidimensional, feature-rich, and highly-structured data with Machine Learning algorithms.

## 2 - Conditional Monitoring of Wheel Wears for High-speed Trains: A Data-driven Approach

Peiwen Xu, PHD Candidate, City University of Hong Kong, 88 Tat Chee Avenue, AC1, Hong Kong, Hong Kong, Weiran Yao, Yang Zhao, CAI YI, Lishuai Li, Jianhui Lin, Kwok-Leung Tsui

The rapid expansion of high-speed railway network is placing increased emphasis on the optimization of the maintenance process to enhance the availability and efficiency of the train system with a high standard of safety and reliability. A data-driven method is proposed to monitor wheel wears in a high-speed railway system. The result can provide an early warning of a component degradation, enabling the switch from fixed interval maintenance to condition-based maintenance. The proposed method combines signal processing and statistical methods to extract relevant information from vibration data and then predict wheel wears. The accuracy of this method is tested by real operational data in China.

## 3 - Incremental Learning for Nonstationary Traffic Control in Automated Vehicle Systems

Sang Min Lee, Korea University, 221 New Engineering Building, Korea Univ., 145 Anam-ro, Seongbuk-gu, Seoul, Korea, Republic of, Sung Ho Park, Seoung Bum Kim

We introduce an incremental learning method for adaptive traffic control in a large-scale automated vehicle system. We present a change-aware learning method that combines a change detector with adaptation algorithms. To demonstrate the effectiveness of the proposed method, we conducted an experimental study to evaluate the predictive performance using the high-fidelity simulator.

## WC66

## 1 - Assessing a Maintenance Outsourcing Production System under Presence of Cyber Threats and Channel Coordination

Anh Ta, University of North Texas, Denton, TX, 76205, United States, Hakan Tarakci, Shailesh S. Kulkarni, Victor R. Prybutok

Outsourcing of maintenance is desirable in many production systems. The Internet of Things (IoT) enabled "smart manufacturing systems but the resulting connected format makes these systems potential targets for cyber-attacks. This study assesses maintenance outsourcing for potential cyber threats as well as channel coordination cost subsidization. We provide guidelines and quantify the effect of various monetary, reliability and cyber-attack parameters.

## 2 - Production Control to Reduce Waste Productions in a Two-machine-one-buffer Bernoulli Serial Line

Penghao Cui, Northwestern Polytechnical University, NO.127, West Youyi Road, Xi'an, Xi'an, 710072, China, Junqiang Wang

We study production control problems in a two-machine-one-buffer Bernoulli serial line including waste production. In such a system, the second machine produces a certain number of non-standard quality productions each time it restarts after a stop either a failure or a starvation. Using a Markov model, an optimal control policy is developed to restore the buffer to a predefined threshold each time it gets empty for reducing starvation frequency of the second machine. Closed-form expressions of performance measures are derived and the effect of the policy is carried out by comparing with a serial line without it.

## 3 - Reliability-redundancy Optimization for Continuous-state Series-parallel System with Degrading Components

Yuan Chen, Ohio University, Athens, OH, 45701, United States, Tao Yuan

This presentation discusses a reliability-redundancy optimization problem for continuous-state series-parallel systems consisting of degrading components. A structure function is introduced to describe the relationship between the state of the system and the states of the components over time. An optimization model that maximizes the reliability of the system subject to a cost constraint is proposed to find the optimal redundancy design. A battery pack system for electric vehicle applications is employed to illustrate the proposed methodology.

## 1 - Can Your Facebook Page Likes Predict Your Dating Behavior?

Behnaz Ghahestani Bojd, University of Washington, Seattle, WA, 98105, United States, Yong Tan

Many existing dating apps require users to login with their social media accounts. For example, apps like Tinder require a Facebook login to use its service. This grants the apps access to select Facebook data, which speeds up the process of creating dating profiles. It also helps companies detect fake profiles. In this study, using data from an online dating app, we study the relationship between users' Facebook page likes and their dating preferences, and app usage. Although users do not observe each other's Facebook page likes, their interests affect their dating judgments.

## 2 - Linking Clicks to Bricks: Spillover Benefits of Online Advertising

Mi Zhou, Carnegie Mellon University, Pittsburgh, PA, 15217, United States, Vibhanshu Abhishek, Edward Kennedy, Kannan Srinivasan, Ritwik Sinha

Businesses have widely used email ads to send promotional information to consumers. While email ads serve as a convenient channel to target consumers online, are they effective in increasing offline revenues for firms that predominantly sell in physical stores? Is the effect heterogeneous across different consumer segments? If so, on which consumers is the effect highest? We address these questions using a big dataset from a large domestic retailer. Using a doubly robust estimator that incorporates machine learning methods for causal estimation, we find email ads can increase a consumer's spending in physical stores by \$11.8, and the effect is highest among those with fewer interactions recently.

### 3 - Driver Retention in Ride-sharing Services: An Empirical Study

Kyungsun (Melissa) Rhee, University of Washington, Seattle, WA, 98105, United States, Jinyang Zheng, Yong Tan, Fei Ren

With the growing popularity of global sharing economy market, on-demand ride-sharing services have become an important transportation channel. However, there is a rising concern on retaining drivers in ride-sharing platforms; they do not necessarily earn a significant amount of profit due to an increasing competition between the drivers and frequent order cancellations. By leveraging data from Chinese leading on-demand ride-sharing platform, we examine how spatial and temporal characteristics of passengers' trips affect drivers' behaviors of using ride-sharing apps. We extend the investigation to find out how drivers such behaviors affect their decision on staying/leaving the platform.

#### 1 - Spatial-temporal Modeling for the Additive Manufacturing Process of Ti-6Al-4V

Weihong Guo, Rutgers, The State University of New Jersey, 96 Frelinghuysen Rd, CoRE Rm 220, Piscataway, NJ, 08854, United States, Shenghan Guo, Linkan Bian

This study focuses on modeling the data indicating temperature and heat transfer within the melt pool and heat affected zone atop a thin-walled structure of Ti-6Al-4V during its additive manufacture. A spatial-temporal model is developed to quantify the temperature, heat transfer, and laser-induced, powder-fed melt pool characteristics. The proposed method is integrated with Bayesian inferences for online adaptive modeling and monitoring. A novel control chart is developed to monitor the model parameters to support decision making. The performances of several spatial-temporal models are compared using experimental data.

#### 2 - Customized Modeling for Multi-stage Additive Manufacturing Systems

Hongyue Sun, University at Buffalo, 319 Bell Hall, Industrial and Systems Engineering, Buffalo, NY, 14260, United States, Ramanarayanan Purnanandam, Chi Zhou

Most existing works on additive manufacturing (AM) focus on the single-stage printing at a local 3D printer, and fail to analytically quantify the effect of material preparation and post-processing stages on the printed part quality. To fully investigate AM, multiple stages (both AM and its up-stream and down-stream processes) need to work synergistically. However, the complex functional variable relationships among multiple stages pose challenges for conventional data analytics models. In this work, we propose customized models to address the problem. Both simulation and a constrained-surface stereolithography (SLA) process are used to demonstrate the proposed method.

#### 3 - Online Monitoring for Additive Manufacturing Processes Based on Image Sequence Analysis

Wenmeng Tian, Mississippi State University, P.O. Box 9542, Mississippi State, MS, 39762, United States, Mehrnaz Esfahani, Linkan Bian

The melt pools in thermal images are regarded as the most informative process signature in metal-based additive manufacturing (AM) processes, and thus can be used for real-time process monitoring. However, how to effectively extract features from a series of melt pools for anomaly detection in each fabricated layer is still an open question. In this work, we propose a novel feature extraction approach by formulating the melt pool contours of one entire layer as a 3D space-time object. Low dimensional features can be extracted to characterize the shape variability in the 3D object. A case study based on a thin wall fabrication process is used to validate the proposed approach.

Co-Chair: Qingyu Yang, Wayne State University, Detroit, MI, 48202, United States

#### 1 - A General Repair Model with Dynamic Covariate Information and Application in Optimal Maintenance Planning

Wujun Si, Wichita State University, Wichita, KS, 67206, United States, Qingyu Yang

We propose a novel general repair model when dynamic covariate information is presented. Based on the repair model, we develop an optimal maintenance planning strategy subject to dynamic covariates. A maximum likelihood estimation method is developed to estimate the model parameters. A simulation study is implemented to illustrate the developed methods, and a real world case study is conducted to demonstrate the proposed model.

#### 2 - Event Prediction for Individual Unit Based on Time-to-event Data Collected in Teleservice Systems

Akash Deep, University of Wisconsin Madison, Madison, WI, United States, Dharmaraj Veeramani, Shiyu Zhou

We present a semi-parametric method to predict the event occurrence for an individual unit in real-time using time-to-event data. The units we consider are prone to experience the event multiple times during their usage lifetime, and these events are critical to overall performance of the system. The hazard of event-occurrence is modeled using Cox PH model and the distinction of units is achieved using a frailty parameter. The method features an on-line updating scheme, therefore, it can provide real-time prediction of the occurrence of next event. We demonstrate the efficacy of frailty and the updating scheme through comprehensive numerical experiments and a case study based on real-world data.

#### 3 - Analysis of Large Repairable System Reliability Data with Static System Attributes and Dynamic Sensor Measurement

Xiao Liu, University of Arkansas

Leveraging modern statistical learning and conventional repairable system reliability analysis methods, this work investigates a statistical analysis approach which integrates the Random Forests algorithm and the classical statistical reliability data analysis methods.

#### 4 - Optimal Maintenance Policies for Multi-level Preventive Maintenance with Complex Effects

Yisha Xiang, Lamar University, Yue Shi

Existing maintenance literature mainly focus on a single type of preventive maintenance action and often make simple assumptions regarding the effects of maintenance activities. Many important maintenance effects are overlooked in these models, e.g., deterioration rate reduction and random duration of a maintenance effective period. In this research, we consider joint planning for multiple levels of preventive maintenance with complex effects, and formulate the problem as a Markov decision process. Structural properties of the optimal policies are investigated by minimizing the total expected discounted costs. Numerical examples are conducted to validate our proposed model.

### Practice- Quality & Reliability Engineering I

Contributed Session

Chair: Mejdal Alqahtni, Rutgers Univ., Bound Brook, NJ, 08805, United States

#### 1 - Power Systems Reliability Assessment with Variance Reduction and Markov Chain Monte Carlo

Daniela B. Almeida, PSR, Centro Empresarial Rio, Praia de Botafogo 228 / 1701-A Rio de Janeiro, RJ, Rio de Janeiro, 22250-145, Brazil, Carmen L. Borges, Gerson C. Oliveira

The methodology combining Variance Reduction and Markov Chain Monte Carlo significantly reduces the computation time and number of samples required for reliability studies compared to the standard Monte Carlo simulation. Some results from a study with real power systems are presented to highlight the effectiveness of the proposed method.

## 2 - Condition-based Maintenance (CBM) Optimization for a Two-component System through State Discretization and Proportional Hazard Model (PHM)

Mengkai Xu, Northeastern University, Boston, MA, 02115,  
United States, Noor E. Alam, Sagar S. Kamarthi, Xiaoning Jin

CBM of mechanical systems with stochastic dependence among their components has drawn much attention recently. Researchers commonly assume the independence of degradation and failure of multiple components to keep the models simple. However, the existence of degradation and failure interactions diminishes the accuracy of the models. To address this issue, the state-rate dependence denoting interaction between degradation states and hazard rates is proposed. A state discretization technique integrated with PHM aimed at capturing the effect of state-rate dependence for maintenance optimization is presented.

## 3 - Stochastic Modeling of Corrosion Growth

Changxi Wang, Ph.D Student, Rutgers University, Piscataway, NJ, 08854, United States

Corrosion growth modeling is important in industry. Existing methods model corrosion pits depth growth and estimate reliability accordingly. However, volume loss may also lead to failures such as rupture even if corrosion pits depth is small, which usually cannot be captured by such models. We develop a degradation model that captures corrosion volume growth, as well as corrosion depth growth. The influence of stresses on corrosion growth is considered. The distribution of volume loss increments and failure probability in the next time increment is obtained.

## 4 - Study on Travel Reliability of Urban Rail Transit Network Using Automatic Fare Collection Data

Yong Yin, Southwest Jiaotong University, Chengdu, China  
Yong Yin, National United Engineering Laboratory of Integrated and Intelligent Transportation, Chengdu, China, Jie Liu,  
Qiyuan Peng, Xu Yan, Anjun Li

It is important to study the travel reliability of Urban Rail Transit network to ensure people travel through Urban Rail Transit. The OD matrix and travel time between stations are obtained through Automatic Fare Collection data. Three reliability indicators that considering tolerable index are constructed from the aspects of network connectivity, travel time and transport capability. Taking Chengdu Urban Rail Transit as an example, five workday data of Urban Rail Transit are analyzed. The results show that the multi-state model is more effective than single model to fit the travel time distribution and tolerable index has a huge influence of the travel reliability of Urban Rail Transit network.

## 5 - Process Monitoring Of Three-dimensional Topographic Surfaces

Mejdal A. Alqahtni, Rutgers University, New Brunswick, NJ, 08901-8554, United States, Elsayed A. Elsayed, Myong K. Jeong

This paper develops a real-time monitoring approach for assessing the quality of 3D topographic surfaces. The approach initially improves the representation of 3D surface features by slicing the 3D surface topography into several layers. The functional spatial randomness (FSR) profile is then suggested for surface characterization in which the spatial randomness of topographic values is computed at each layer. By utilizing the functional principal component analysis (FPCA), an anomaly detection approach based on FSR profile is proposed. The developed approach reveals outstanding performance compared to the existing approaches in identifying various forms of surface defects.

## Decision Diagrams and Optimization

Sponsored: Computing

Sponsored Session

Chair: Willem van Hoeve, Carnegie Mellon University, Pittsburgh, PA, 15213, United States

## 1 - An MDD-based Formulation for Scheduling Clinical Rotations

Tallys Yunes, University of Miami, Coral Gables, FL, United States,  
Andre Augusto Cire, Adam Diamant

We study the scheduling problem of a medical school that must assign a cohort of students to a set of clinical rotations, subject to operational and QoS constraints. Students become eligible for clerkship throughout the year and complete rotations at hospitals in different regions. Each hospital offers a subset of the rotations, with different start dates, capacities, and cost rates. We propose a network-flow formulation based on MDDs that is computationally superior to an MILP model and provides useful managerial insights. Using a real-life dataset, we run a discrete-event simulation of the assignment process. Compared to current practice, we achieve an average cost reduction of 25%.

## 2 - Integer Programming Postoptimality Analysis Using Decision Diagrams

John Hooker, Carnegie Mellon University, Tepper School of Business, Pittsburgh, PA, 15213, United States, Thiago Serra

We show how a decision diagram can compactly represent all solutions of an integer programming problem that are within a given tolerance of the optimal value. The structure of the diagram facilitates rapid processing of a wide range of queries about the near-optimal solution space. "Sound decision diagrams can more compactly represent near-optimal solutions by innocuously admitting some spurious solutions. In fact, repeated application of a simple "sound reduction operation yields a smallest possible sound diagram for a given problem instance. Computational tests show that it is typically far smaller than a tree representing the same set of solutions.

## 3 - Solving Multi-follower Bilevel Mixed-integer Programs via a Generalized Value Function

Onur Tavaslioglu, University of Pittsburgh, Houston, TX, 77025, United States, Oleg A. Prokopyev, Andrew J. Schaefer

We introduce a generalized value function of a mixed-integer program, which is simultaneously parameterized by its objective and right-hand side. We describe its fundamental properties, which we exploit through three algorithms to calculate it. We then show how this generalized value function can be used to reformulate multi-follower bilevel mixed-integer programming problems. We present the solution of instances that are significantly larger than those solved in the literature in terms of the total number of variables, and the number of followers. We compare our approach with an open source solver, MibS.

## 4 - Exact Multiple Sequence Alignment by Synchronized Multi-valued Decision Diagrams

Willem-Jan Van Hoeve, Carnegie Mellon University, Tepper School of Business, 5000 Forbes Avenue, Pittsburgh, PA, 15213, United States, Amin Hosseiniinasab

Sequence alignment problems appear in the context of bioinformatics, natural language processing, and financial applications, and aim to identify regions of similarity in sequences of data. While pairwise sequence alignment is tractable, optimal multiple sequence alignment is challenging in theory as well as practice. We present a new exact method that first represents all pairwise sequence alignments using multi-valued decision diagrams. These are then synchronized with an integer programming model, which we solve using a logic-based Benders decomposition. Our approach can improve state-of-the-art heuristic solvers, and outperforms the best exact methods from the literature.

## Practice- Operations Management IV

Contributed Session

Chair: Fang Fang, California State University, Los Angeles, CA, 91801, United States

## 1 - Forward-reserve Warehouses: Why a Dynamic Selection of Items is Necessary

Rakesh Venkatasubramony, Assistant Professor, Indian Institute of Management Lucknow, IIM Road, Prabandh Nagar, Lucknow, 226013, India

Forward-Reserve warehouses are popular when small number of Stock Keeping Units (SKU) account for large number of picks. Most studies that approach the design and allocation of SKUs to forward area have static decisions. In this simulation based article, I argue for dynamic selection of SKUs to the Forward area of the warehouse, when individual demands are seasonal.

## 2 - Competition in Two-sided Market with Quality Control Strategies

Lyu Gaoyan, Peking University, No.5 Yiheyuan, Beijing, 100871, China, Lihua Chen

There are many two-sided markets with similar products. We design mechanism to explore how to cooperate and compete with competitors at the same time. Meanwhile, how to improve their product quality to attract consumers is another important factor in this mechanism. We set cooperate parameter and compete parameter to measure the degree of market competition. The result shows that, with low degree competition, both markets get less profit.

### 3 - Dynamic Return and Resale Policies for Heterogeneous Strategic Customers with Uncertain Valuations

Lan Lu, Hong Kong University of Science and Technology,  
Clear Water Bay, Kowloon, Hong Kong, Hong Kong, Qian Liu

This paper develops a model of return and resale policies with heterogeneous strategic customers who have uncertain valuations prior to purchase. The seller faces a two-period selling season, where the returned products in the first period can be resold in the second period. We characterize the seller's optimal return policies in both periods and compare two resale policies: differentiate the returned products with new products or not. We demonstrate that the seller tends to differentiate the returned products when customers are highly differentiated. Moreover, we find that the seller does not always benefit from the increase of customer valuation.

### 4 - Robust Optimization Approach to Process Flexibility Designs with Price Differentials

Shixin Wang, New York University, New York, NY, 10012,  
United States, Xuan Wang, Jiawei Zhang

We study process flexibility designs when products exhibit price differentials. We introduce the Profit Plant Cover Index (PPCI) and prove that a general class of robust measures can be expressed as functions of a design's PPCIs and the given uncertainty set, which leads to a method to compare the worst-case performance of different designs. Applying these results, we prove that under a broad class of uncertainty sets and robust measures, the alternate long chain is optimal among all long chains with an equal number of high-profit products and low-profit products. Finally, we develop a heuristic based on the PPCIs to generate effective flexibility designs when products exhibit price differentials.

### 5 - In-house vs. Outsourcing: The Effect of Volume-based Learning on Quality Competition

Yanni Ping, Drexel University, 3220 Market Street, Philadelphia,  
PA, 19104, United States, Seung-Lae Kim

This paper considers an original equipment manufacturer (OEM) who outsources finished products to a contract manufacturer (CM), where the CM, by adopting existing technology, achieves cost reduction and quality improvement through learning-by-doing. Besides the role of upstream partner, the CM also acts like a downstream competitor. We study the OEM's outsourcing strategy dynamically from both cases when competition exists and does not exist by constructing a two-period model and explore the interplay of learning, quality and cost.

### 6 - Block Ownership in Vertical Relationships in the Presence of Downstream Competition

Fang Fang, Assistant Professor, California State University,  
Los Angeles, CA, 90032, United States, Baojun Jiang, Jiong Sun

Block ownership (i.e., partial ownership) plays an important role in aligning the incentives of firms involved in vertical relationships. This paper examines the impacts of block ownership on pricing decisions, firm profitability, as well as consumer and social surplus. We show that such impacts may depend on the nature of downstream competition.

Chair: Jonathan David Lonski, Clemson University, Clemson, SC,  
29631, United States

#### 1 - Robust Portfolio Optimization Based on Stochastic Dominance and Empirical Likelihood

Peng Xu, Aalto University School of Business, Runeberginkatu  
22-24, Helsinki, FIN-00100, Finland

Identifying Second-order Stochastic Dominance (SSD)-efficient portfolios is of great interest to finance research where investors are routinely assumed to be rationally risk-averse in financial decision making. This paper seeks to (i) evaluate some most recent SSD optimization approaches and their out-of-sample performance, and (ii) examine if robust optimization based on SSD and Empirical Likelihood (EL) improves out-of-sample performance of these approaches. We report the results from an empirical application analyzing how robust diversification among industry portfolios using SSD and EL increases the likelihood of obtaining out-of-sample dominance over a given benchmark portfolio

#### 2 - Robust Multi-criteria Decision Making for Hesitant Behavior

Gevorg Stepanyan, PhD Candidate, University of Michigan -  
Dearborn, Dearborn, MI, United States, Jian Hu

We presents a robust multi-criteria decision making model for hesitant behavior.

### 3 - Robust Repositioning for Vehicle Sharing

Long He, National University of Singapore, Mochtar Riady  
Building, BIZ1 8-73, 15 Kent Ridge Drive, Singapore, 119245,  
Singapore, Zhenyu Hu, Meilin Zhang

Our paper discusses the operational decision of dynamic fleet repositioning for vehicle sharing. We first formulate the problem as a stochastic dynamic program to minimize the expected total repositioning cost and lost sales penalty. To solve for a multi-region system, we deploy the distributionally robust approach that can incorporate demand temporal dependence, motivated by observations from real trip data. In a real-world case study, we quantify the "value of repositioning" and compare with several benchmarks to demonstrate that the proposed solutions are computationally scalable and in general result in lower cost with less frequent repositioning.

### 4 - Mitigating Disaster-induced Transportation System Losses via Robust Optimization

Jonathan David Lonski, Clemson University, Clemson, SC, 29631,  
United States, Scott J. Mason

Recent natural disasters like Hurricane Sandy (2012) and Tropical Storm Harvey (2017) have caused \$20B+ in economic losses and necessitated \$35B+ in restoration efforts. During such disasters, it is often too late for decision makers to spend time and effort analyzing information, and weighing potential outcomes. We present our research into developing robust plans for minimizing the total cost of economic losses and reparations incurred by transportation systems during natural or human-caused disasters. We seek to improve transportation system plan resiliency via robust optimization techniques and establishing an improved, cloud-based method of data collection for use in our models.

### Joint Session MCDM/Practice Curated: Theory and Application of the ANP

Sponsored: Multiple Criteria Decision Making

Sponsored Session

Chair: Orrin Cooper, University of Memphis, Memphis, TN, 38152,  
United States

#### 1 - An AHP Consensus Reaching Model with Both Individual and Aggregated Opinions

Qingxing Dong, Central China Normal University, Wuhan, China,  
Qi Sheng, Gaohui Cao

The Analytic Hierarchy Process (AHP) is an effective tool and has been widely used in group decision making. In this paper a new consensus reaching model based on the AHP is proposed, which considers both individual and aggregated opinions. The compatibility index can be used to determine both the individual consensus level (ICI) and the central consensus level (CCI). Then this model provides feedback suggestions to the most incompatible decision makers so they can adjust their opinions adaptively depending on their ICI and CCI in each round. The integrated adaptive consensus reaching model is constructed. Finally, a numerical example is given to verify the feasibility and effectiveness of the model.

#### 2 - Coherency and Reducing Comparisons in the ANP

Orrin Cooper, University of Memphis, Memphis, TN, 38152,  
United States

One of the perceived challenges of using the ANP is number of comparisons that need to be made to ensure the model will converge without absorbing states. There are also data quality checks that one can use to increase the confidence she has in the decision. Coherency testing can be balanced to not only test for coherency but also reduce the number of needed comparisons in an ANP model.

#### 3 - The Added Value of a Team-based Model in Preventive Healthcare Services

M Gabriela Sava, Clemson University, College of Business,  
145 Sirrine Hall, Clemson, SC, 29634, United States, Luis Vargas,  
Jerrold H. May, Jennifer Shang, James Dolan

The role and importance of preventive healthcare services has increased significantly due to the health benefits to the patient. The design of such services becomes a challenge due to the increased number of patients that would like to get more involved in the preventive decision-making process, but they don't possess all the necessary information. We propose a team-based model for designing the process of choosing the most appropriate colorectal cancer screening option. The value-added in the model is the result of the contribution of the healthcare provider to achieve beneficial patient outcomes.

#### 4 - Analogical Evaluation of the Urban Function Combination Mode of the Integrated Transportation Hub Based on AHP Fuzzy Comprehensive Evaluation Method

SiYu Tao, School of Transportation and Logistics, Southwest Jiaotong University, Chengdu, China, Feng Tao, Xinmei Chen, anjun li, Lisha Wang

This paper adopts a AHP fuzzy comprehensive evaluation for the different forms of the integrated transportation hub, the AHP model is used to establish & quantify the assessed level indicators of the urban function combination modes of the integrated transportation hub, & an index evaluation system is established to evaluate the advantages & disadvantages of different combination modes accurately. Suggestions are proposed for optimization & improvement on the evaluation results, & scientific guidance are provided for the development, construction & investment operation of the urban function of the integrated transportation hub.

#### Online Optimization I

Contributed Session

Chair: Wenda Zhang, University of Illinois at Urbana-Champaign, Urbana, IL, 61801, United States

##### 1 - Dispatch: An Optimal Algorithm for Online Perfect Bipartite Matching with I.I.D. Arrivals

Quico Spaen, University of California, Berkeley, CA, 94709, United States, Minjun Chang, Dorit Simona Hochbaum, Mark Velednitsky

We introduce DISPATCH, a 0.5-competitive, randomized algorithm for the problem of weighted online perfect bipartite matching with i.i.d. arrivals. We prove that 0.5 is the best-possible competitive ratio. In this problem, we are given a known set of workers, a distribution over job types, and non-negative utility weights for each worker, job type pair. At each time step, a job is drawn i.i.d. from the distribution over job types. Upon arrival, the job must be irrevocably assigned to a worker. The goal is to maximize the expected sum of utilities after all jobs are assigned. Our work is motivated by the application of ride-hailing, where jobs represent passengers and workers represent drivers.

##### 2 - Online Linear Programming with Production Costs

Michael Fairley, PhD Candidate, Stanford University, Stanford, CA, 94305, United States, Yinyu Ye

We consider a sequential decision making problem where a sequence of orders arrive and we must decide to accept or decline the order before the next order is revealed. If an order is accepted then we create a production plan to supply the products by selecting suppliers to provide each product. The offline problem is a linear program and the online problem is an online linear program where the objective coefficient and constraint matrix are revealed over time. We present an online algorithm, which learns the dual prices from the columns of the previous periods and uses the dual prices to make a decision in the current period. We present simulation results that indicate that our algorithm is near optimal.

##### 3 - Model-based Sensor-selection Submodular Optimization: Performance Trade-offs

Orlando Romero, Rensselaer Polytechnic Institute, Troy, NY, 12180, United States, Sergio Pequito

Submodularity is an increasingly popular tool to address NP-hard problems defined on matroid-constrained subset cost/utility functions. Within this framework, polynomial-time approximation algorithms (such as greedy algorithms) can be implemented with theoretical worst-case guarantees. This work is motivated by sensor and actuator selection problems in the context of large-scale dynamical systems, where we show that under certain problem formulations within this context, the more well-known submodular-based bounds can be proved to be overly conservative since they fail to fully leverage the structure of the problem.

##### 4 - A Branch-and-bound Algorithm for the One-machine Problem and Delayed Precedence Constraints Variation

Wenda Zhang, University of Illinois, Urbana, IL, 61802, United States, Jason Sauppe, Sheldon H. Jacobson

The one-machine scheduling problem with release and delivery times with the minimum makespan objective often arises as a subproblem for the general job shop scheduling problem. A branch-and-bound algorithm solves the problem and its variation, which allows the presence of constraints that require a delay between the completion of one job and the start of another. This paper analyzes key components of this branch-and-bound algorithm and proposes a new heuristic and a different search strategy. Computational experiments show the modified algorithm to have substantial improvement in running time and number of iterations on instances both with and without delayed precedence constraints.

#### Finance – Risk Management

Contributed Session

Chair: Shaofang Li, Southeast University, Jiangning District, Nanjing, 211189, China

##### 1 - Computation of Optimal Conditional Expected Drawdown Portfolios

Alex Papanicolaou, University of California-Berkeley, Mountain View, CA, 94041, United States, Lisa R. Goldberg, Ola Mahmoud

We introduce a partial differential equation approach to computing and minimizing the risk measure of Conditional Expected Drawdown (CED) of Goldberg and Mahmoud (2016). We derive a methodology that allow ones to perform function and gradient evaluation for a first-order optimization routine to a convex portfolio optimization problem for computing minimum CED portfolios. We apply this to a log-normal pricing model and show how under this framework, minimum drawdown portfolios relate to minimum variance and minimum shortfall portfolios.

##### 2 - Merging for Stabilizing Financial Networks

Aein Khabazian, University of Houston, 4796 Cullen Blvd, Houston, TX, 77004, United States, Markku Kallio, Jiming Peng

We analyze the possibility of the mergers of solvent and in-solvent banks to stabilize a financial network based on the extended Eisenberg-Noe's model where the liquidation cost is considered and the liabilities have different seniorities. We develop a model to identify the best match in the system such that the total gain obtained through the merger is maximized. A subsidized merger where the social planner provides some bail-outs to cover part of the liabilities of the insolvent bank is also considered. We use a network of major European banks to evaluate the performance of the pure merger and subsidized merger in the system.

##### 3 - Banking Sector Reform, Competition, and Bank Stability

Shaofang Li, Southeast University, No.70, Suyuan Avenue, Jiangning District, Nanjing, 211189, China, Wenping Wang

This study tests the impact of banking sector reform and competition on bank stability in 14 transition countries in 1998-2016. The results find negative relationship between the market power and bank stability, but positive relationship for bank reform. The results also suggest that the positive relationship between bank competition and stability is more pronounced if banking sector experienced higher financial development and has better financial information transparency. The effect of competition in reducing bank risk is less pronounced if the banks are exposed to higher activity restrictions and grater stringency on capital requirements, particularly in more competitive markets.

#### Machine Learning via a Modern Optimization Lens

Sponsored: Optimization/Optimization under Uncertainty

Sponsored Session

Chair: Dimitris Bertsimas, Massachusetts Institute of Technology, Cambridge, MA, 02139, United States

##### 1 - Optimal Clustering Trees

Agni Orfanoudaki, MIT, 77 Massachusetts Avenue, Cambridge, MA, United States, Holly Mika Wiberg, Dimitris Bertsimas

State-of-the-art clustering algorithms use heuristics to partition the feature vectors while providing little insight regarding the interpretability of each cluster. We present a new Optimal Clustering Trees algorithm that leverages mixed-integer optimization (MIO) techniques to generate interpretable and globally optimal clustering tree models. We demonstrate that our method achieves superior performance on both synthetic and real-world datasets and scales even when the number of observations is high.

##### 2 - Optimal Survival Trees

Emma Gibson, Massachusetts Institute of Technology, Dimitris Bertsimas, Jack W. Dunn, Agni Orfanoudaki

Tree-based models are increasingly popular due to their ability to identify complex relationships that are beyond the scope of parametric models. Survival tree methods adapt these models to allow for the analysis of censored outcomes, which often appear in medical data. We present a new Optimal Survival Trees algorithm that leverages mixed-integer optimization (MIO) and local search techniques to generate globally optimal survival tree models. We demonstrate that the OST algorithm improves on the accuracy of existing survival tree methods, particularly in large datasets.

##### 3 - Missing Data Imputation for Clinical Covariates with Time Series

Colin Pawlowski, Massachusetts Institute of Technology, Cambridge, MA, United States, Dimitris Bertsimas, Agni Orfanoudaki, Ying Zhuo

Missing data is a common problem in healthcare applications where researchers use EMR, claims data, and results of observational studies to apply analytics methods. We propose a family of optimization-based methods for imputation of data sets consisting of clinical covariates of patients observed over time. We derive first-order methods that find high quality solutions in minutes for data sets with 10,000s of patients and 100s of clinical covariates. We demonstrate that our method med.impute outperforms state-of-the-art methods in imputation accuracy and out-of-sample performance on downstream tasks on healthcare data sets with real and synthetic missing patterns.

##### 4 - Optimal Classification Trees with Hyperplanes are as Powerful as Classification Neural Networks

Matthew Sobieski, Massachusetts Institute of Technology, Dimitris Bertsimas, Rahul Mazumder

We investigate the modeling power of neural networks in comparison with optimal classification trees with hyperplanes (OCT-Hs). We prove that a variety of neural networks can be transformed to decision trees with hyperplanes, showing that OCT-Hs are at least as powerful as neural networks. Conversely, we show that a given classification OCT-H can be transformed to a classification neural network with the perceptron activation function, showing that these neural networks are at least as powerful as OCT-Hs, that is, OCT-Hs and these neural networks are equivalent in terms of modeling power.

##### 1 - Energy Optimization of a Plug in Electric Vehicle Along a Fixed Path

Bilgenur Guru, Middle East Technical University, Industrial Engineering, No: 326. Cankaya, Ankara, 06800, Turkey, Mustafa Kemal Tural, Arsham Atashi Khoei

Given an origin-destination pair and a fixed path between them, we consider the problem of determining the speed of a plug-in electric vehicle on each road segment along the path, the charging stations the vehicle will stop by, and how much to recharge at each stop so as to minimize the total amount energy consumption of the vehicle. We assume that there is a speedlimit on each road

segment which cannot be violated by the vehicle. Moreover, it is assumed that the vehicle has to arrive at the destination on or before a given time-limit. We propose a mixed-integer second order cone programming formulation for the problem and evaluate its performance. Effects of some valid inequalities are also investigated.

##### 2 - Isolation Branching: A Branch and Bound Algorithm for the K-terminal Cut Problem

Mark Velednitsky, University of California-Berkeley, Berkeley, CA, United States

The k-terminal cut problem is: Given an edge-weighted graph with k terminals, remove a minimum weight collection of edges such that there is no path between any pair of terminals. The problem is NP-hard. Although it has multiple applications, no optimization algorithms have been devised specifically for the problem. We present the first branch-and-bound optimization algorithm customized for k-terminal cut. The performance of our algorithm is demonstrated to be practical for a number of real-world instances. As a by-product, we prove that the complexity of Isolation Branching is fixed-parameter tractable with respect to the size of the optimal solution.

##### 3 - Learner Demand-driven School Timetabling

Ayşe Aslan, University of Groningen, Nettelbosje 2, Groningen, 9747 AE, Netherlands

Personalized learning in secondary schools in Netherlands offers flexibility for learners to create their own learning paths by choosing which learning activities they want every week. This leads to the emergence of demand-driven timetables in schools. We propose an integrated IP model to produce weekly demand-driven timetables for learners and teachers simultaneously.

#### Joint Session OPT/Practice Curated: SCIP Optimization Suite: Recent Developments and Applications

Sponsored: Optimization/Computational Optimization and Software  
Sponsored Session

Chair: Ambros Gleixner, Zuse Institute Berlin, Berlin, 14195, Germany

Co-Chair: Benjamin Mueller, Zuse Institute Berlin, Berlin, 12161, Germany

##### 1 - Reinforcement Learning of Branching Strategies

Maxime Gasse, Polytechnique Montr al, Montr al, QC, Canada, Andrea Lodi

Branching decisions arguably take a central place in traditional branch-and-bound solvers. We formulate the branching problem as a 1-player game, whose ending is triggered once the instance has been solved, and where the goal is to minimize the final tree size. Under this formalism, one can use reinforcement learning to find good branching strategies, e.g. using a mix of Monte-Carlo Tree Search and deep learning (the AlphaGo approach). We will present some preliminary results on MIPLIB instances, based on an implementation that combines the SCIP and PyTorch libraries.

##### 2 - Digging for Variable Holes in MINLPs

Benjamin Mueller, Zuse Institute Berlin, Berlin, 12161, Germany, Andrea Lodi, Gonzalo Munoz

Due to the presence of nonconvex constraints in mixed-integer nonlinear programs (MINLPs), the set of feasible assignments can be disconnected even for continuous variables. The resulting forbidden regions for variables are called "holes", which can be viewed as a generalization of integrality conditions in MILP. This allows us to conceive methods for continuous variables that so far have been mainly developed for integer variables.

We study the concept of holes and their importance in a spatial branch-and-bound framework. Additionally, we show that a branching rule driven by the knowledge of holes in a nonconvex problem can have a significant impact on the performance of the MINLP solver SCIP.

##### 3 - A Branch and Price Approach for an Inventory and Routing Problem to Address the Replenishment of a Network of Automated Teller Machines

Cristian Eduardo Cortes, Universidad de Chile, Blanco Encalada 2002, Santiago, Chile, Daniel Herl, Pablo Andres Rey, Alejandro Cataldo, Leandro C. Coelho

The main goal of this study is to develop a Branch and Price method for the inventory-routing problem arising from the replenishment of an automated teller machines (ATM) network. One interesting feature of the problem is the existence of out of stocks in the inventory of the ATMs. Moreover, one additional difficulty in our pricing subproblem is the existence of column dependent rows, which means that we are forced to dynamically generate columns and rows simultaneously. We implement our B&P algorithm on the SCIP framework, obtaining promising results for selected real instances in Santiago, Chile.

**4 - Progress in the Branch-price-and-cut Solver GCG**

Marco Luebbecke, RWTH Aachen University, Operations Research,  
Kackertstr. 7, Aachen, D-52072, Germany, Michael Bastubbe,  
Christian Puchert, Jonas Witt

GCG is a solver for mixed-integer linear programs. It implements a Dantzig-Wolfe (or similar) reformulation and a full-featured branch-price-and-cut algorithm. Information on how the reformulation should be performed can be given by the user in various ways. However, GCG can and usually does detect a model structure suited for reformulation all by itself. We report on recent developments that lead to the upcoming release 3.0. This includes a completely re-designed structure detection, new cutting planes, and experimental features like deciding whether a reformulation should be applied at all and a Benders decomposition extension. We show experiments and some use cases in which we applied GCG.

**1 - Global Optimization Algorithm to Solve the Equilibrium-constrained Program for Estimating Random-coefficient Demand Function**

Yu-Ching Lee, National Tsing Hua University, No 101, Section 2,  
Kuang-Fu Road, Engineering Building I, Hsinchu, Taiwan,  
Cy (Chor-yiu) Sin

Recently, estimation problem of random-coefficient demand function using aggregate market level observations has been formulated as an equilibrium-constrained optimization program. This modeling technique successfully bridges the advance of nonlinear programming (NLP) solvers with important class of problem in demand estimation. NLP solvers are convenient and efficient in terms of implementation and computation for estimating demand. Nevertheless, a guarantee of global optimality is missing. In the talk we will discuss the importance of global optimality for this class of problem. Then, a global optimization algorithm will be presented to solve for a global optimal estimator.

**2 - Bilevel Optimization Problem for Preferred Boarding Groups**

Viacheslav V. Kalashnikov, Tecnológico de Monterrey, (ITESM),  
Campus Monterrey, Ave Eugenio Garza Sada 2501 Sur, Monterrey,  
Nuevo Leon, 64849, Mexico

We consider a bilevel optimization problem, in which the upper-level decisions are made by the airline's management governing the proportion of preferred boarding passes (PBP) to be available, as well as the price of the latter. The economy class passengers find Nash equilibrium at the lower level by trying to minimize their flight cost, where the individual cost function has two components: the PBP price and the expected waiting time in the line to the check-in counters. As the optimality at the lower level provides the percentage of PBPs sold to have the minimum deviation from its value in the future sales, the Markov chain stable state technique is used to solve the problem. The model has a practical value.

**3 - A Customized Branch and Bound Approach for Circle Packing**

Akang Wang, Carnegie Mellon University, 5000 Forbes Avenue,  
Pittsburgh, PA, 15213, United States, Chrysanthos Gounaris

We present a custom-built linear relaxation and an associated branch-and-bound approach for solving circle packing problems to global optimality. We utilize a novel branching scheme based on circle-circle non-overlapping constraints, and we also employ concave envelopes to tighten the feasible domain. Extensive computational studies are performed on benchmark instances and the preliminary results demonstrate our approach's superiority over the state-of-the-art general-purpose global solvers.

**4 - New Underestimator and Branching Scheme for the Global Optimization of General Nonconvex Problems**

Ishan Bajaj, Texas A&M University, 3122 TAMU, College Station,  
TX, 77843, United States, Faruque Hasan

The selection of the underestimator and branching scheme are central to the effectiveness of a branch-and-bound (B&B) algorithm. We propose to exploit a new class of edge-concave underestimators, constructed by subtracting a positive quadratic expression that overpowers all non-edge-concavities in the original function. We also propose a novel branching technique based on a univariate projection of the original multi-dimensional space into a single auxiliary space such that a function exists on this map whose global minima is the same as that of the original function. We will show the efficacy of the proposed relaxation and branching schemes with other methods in the literature.

**1 - Local Optimality and Generalization Guarantees for the Langevin Algorithm via Empirical Metastability**

Belinda Tzen, University of Illinois at Urbana-Champaign, Urbana,  
IL, United States

We study the path-wise behavior of the discrete-time Langevin algorithm for non-convex ERM via metastability. For a given local optimum of the empirical risk, we show that w.h.p., the path either ends up outside an  $\epsilon$ -neighborhood of this optimum by a short recurrence time; or it enters by then and stays until an exponentially-long escape time. This aligns with existing literature. Firstly, recurrence time is dimension independent, like convergence of deterministic gradient descent. Secondly, escape time is consistent with the Eyring-Kramers law; i.e., the Langevin scheme visits all local minima, with exponentially-long transit time. We use this to examine local generalization and optimality.

**2 - Convergence Rate of Block-coordinate Maximization Burer-Monteiro Method for Solving Large SDPs**

Nuri Denizcan Vanli, Massachusetts Institute of Technology,  
22 Palermo Street, Cambridge, MA, 02141, United States

Semidefinite programming (SDP) with equality constraints arise in many optimization and learning problems, such as max-cut, community detection and robust PCA. Although SDPs can be solved to arbitrary precision in polynomial time, generic solvers do not scale well with the dimension of the problem. To address this issue, Burer and Monteiro proposed to reduce the dimension of the problem by imposing a low rank factorization and solve the resulting nonconvex problem. To solve this nonconvex problem, we propose a first-order method based on block coordinate ascent with exact line search. We provide convergence rate guarantees and computational results on large-scale problems.

**3 - Momentum-Based Acceleration for Non-convex Stochastic Optimization**

Mert Gurbuzbalaban, Massachusetts Institute of Technology,  
77 Massachusetts Avenue, Building 32 / Room D632, Cambridge,  
MA, 02139, United States

We consider stochastic non-convex optimization problems that arise in several applications including machine learning and the stochastic gradient Hamiltonian Monte Carlo (SGHMC) algorithm to solve them. We obtain the first finite-time global convergence guarantees for SGHMC in the context of both empirical and population risk minimization. Our results show SGHMC can achieve acceleration on a class of non-convex problems compared to overdamped Langevin MCMC approaches such as the stochastic gradient Langevin dynamics. This is joint work with Xuefeng Gao and Lingjiong Zhu.

**1 - Market Failure in Kidney Exchange**

Itai Ashlagi, Stanford University, Huang Engineering Center,  
475 Via Ortega, Stanford, CA, 94305, United States

We find that kidney exchange markets suffer from traditional market failure that reduce transplants by over 25%. We document that the market is highly fragmented and inefficient. We propose a model to illustrate two sources of inefficiency: hospitals do not internalize their patients' benefits and current mechanisms provide sub-optimal rewards to hospitals. Eliminating this inefficiency requires a combined approach that uses mechanisms and solves agency problems.

## 2 - Fairness Metrics in Facility Location Problems

Gireja Ranade, UC Berkeley, Atlanta, GA, Swati Gupta, Akhil Jalan, Helen Yang, Simon Zhuang

We consider the NP-hard facility location problem: given a set of facilities and a set of consumers to serve, determine a subset of  $k$ -facilities that minimizes the sum of distances from each consumer to the nearest facility. For public facilities such as hospitals, playgrounds and waste collection facilities, it is important to take equity across groups into consideration. Various equity metrics have been proposed in the literature and our work explores the tradeoffs between them.

## 3 - Fairness in Prediction Models Used by Public Service Agencies

Maria De-Arteaga, Carnegie Mellon University

The use of machine learning to assist public service agencies is both promising and concerning, with problems ranging from child welfare to criminal justice and preventive health. While at first sight many of these may appear to be traditional prediction problems, the characteristics of available data and deployment contexts give rise to several challenges that have not been sufficiently addressed in the machine learning literature. Issues include presence of unobservables, selective labels, and omitted payoff biases. This talk discusses some of these challenges and presents novel methodologies to tackle them.

## 4 - Finding Equitable Start Times for Boston Public Schools

Arthur J. Delarue, Massachusetts Institute of Technology, 77 Massachusetts Ave, Cambridge, MA, 02139, United States, Dimitris Bertsimas, Sebastien Martin

Over 80% of high schools across the U.S. begin school before 8:30AM, even though early start times have been linked to serious health issues for teenagers. Because districts cannot estimate the impact of bell time changes on the cost of their complex bus schedules, change is often impossible under a fixed budget. We present a new optimization approach for the bell time assignment problem, which takes into account transportation costs as well as the complex needs of school districts. We discuss the application of our methodology as part of our collaboration with Boston Public Schools, which led to the unanimous approval of the first new start time policy in almost thirty years by the Boston School Committee.

### 1 - Design of Remote Diagnostic Networks for Semiconductor Equipment Suppliers

John W. Fowler, Arizona State University, P.O. Box 874706, Supply Chain Management, Tempe, AZ, 85287-4706, United States, Giulia Pedrielli, Esma S. Gel

With advances in information technology, service activities for expensive equipment used in semiconductor manufacturing can be performed from a remote location. This is called remote diagnostics (RD). RD has the potential to reduce maintenance and capital costs and improve productivity. We develop a queueing-location model to analyze the capacity and location problem of after sales service providers, considering the effects of RD technology. Our model optimizes the location, capacity and the type of service centers while taking congestion effects into consideration. We solve this model using a simulation optimization approach in which we use a genetic algorithm to search the solution space.

### 2 - The Importance and Trends in Central Planning – Illusion of Control

Kenneth J. Fordyce, Arkieva, 5460 Fairmont Drive, Wilmington, DE, 19808, United States

Most organizations can be viewed as an ongoing sequence of loosely coupled decisions where current and future assets are matched with current and future demand across the demand-supply network at different levels of granularity. Since the middle 1990s, enterprise-wide supply, master or central planning, whose purpose is to create a projected supply linked to detailed exit demand and synchronize the activities of the enterprise, has become a key member of this “decision suite within the Kempf-Sullivan Decision Grid. This presentation provides an overview of key trends such as increased granularity and diffusion and why it is important - even if it just creates the Illusion of control.

## 3 - Improving Intel's Supply Planning Performance Using a Proprietary Enterprise Optimization Solution Suite

Shamin Shirodkar, Intel Corp, Chandler, AZ, United States, Zhenying Zhao

As Intel has transitioned from High-Volume Low-Mix (HVLN) to High-Volume High-Mix (HVHM) manufacturing, supply planning has become much more complex & effective supply planning translates to a clear competitive advantage. In this presentation we will be sharing an enterprise suite of proprietary well integrated optimization solutions which support supply planning at Intel & in the process various advanced generic modeling concepts, innovative formulations and solving techniques will be introduced.

### 1 - The Role of Consumer Waste in Food Retail

Ekaterina Astashkina, INSEAD, Boulevard de Constance, Fontainebleau, 77305, France, Elena Belavina, Simone Marinesi

We investigate how addition of consumer food waste changes the inventory dynamics and emissions of the upstream actors. We find that consumer food waste (unlike transportation emissions) generates spillover effects on upstream tiers: higher consumer food waste prompts higher retail sales and emissions. Hence, practices that cut consumer food waste are particularly efficient in contrast to other instruments that aim to benefit the environment. Further, we find that interventions targeted to reduce travel in the attempt to lower market emissions may in fact achieve the opposite result and increase market emissions, on account of higher consumer food waste.

### 2 - Revenue Management in Parking Systems under Competition and Information Asymmetries

Xin Wang, University of Wisconsin, WI, United States, Qiao-Chu He, Yuguang Wu

We consider oligopoly pricing game in parking systems under incomplete information. Each agent (garage) has some information (forecast) about the incoming parking demand for some of the garages. They charge a price for their own garage to maximize their profit. We consider the equilibrium wherein each agent's action depends linearly on known forecasts and forms Bayes' estimator for unknown forecasts. Based on the equilibrium strategy, we further investigate the agents' incentive to share their information with others in order to get larger expected payoff.

### 3 - Peer-to-peer Crowdsourcing as an Omnichannel Retail Strategy

Ho-Yin Mak, University of Oxford, Park End Street, Oxford, OX1 1HP, United Kingdom

We study a peer-to-peer crowdsourcing strategy for an omnichannel retailer, who enlists in-store shoppers to deliver online orders in their vicinity. Using an analytical model, we investigate the effect of the crowdsourcing model on the retailer's profit and consumer surplus. We find that the favorability of crowdsourcing heavily depends on the choice of reimbursement scheme and product characteristics.

### 1 - Optimal Bundling Strategy for a Retail Platform under Agency Selling

Shengming Zheng, University of Science & Technology of China, 96 Jinzhai Road, School of Management, Hefei, 230026, China, Yugang Yu, Fuqiang Zhang, Xiaolong Guo

Bundling strategy has been widely adopted by online retail platforms under agency selling. We study the optimal bundling strategy for a retail platform through which two independent manufacturers distribute their products. The manufacturers first set their product prices and then the platform decides whether to offer the bundled product or not and the price for the bundled product if it offers a bundle. By analyzing this two-stage Stackelberg game, we find that the platform will adopt the bundling strategy only when the manufacturer's product prices are above a threshold. Additionally, the manufacturers will set high prices to induce the platform to offer bundled products.

## 2 - Mental Accounting in Consumer Inventory Problem with Uncertain Benefit

Haonan He, University of Science and Technology of China, Hefei, 61820, China

Newsvendor problems describe a situation in which the vendor needs to predict the demand by a buyer when a fixed unit profit is predetermined. But sometimes, the vendor can effectively affect the demand, that is, when he is also the buyer. This paper first considers how a consumer's mental accounting behavior affects whether consumer reaches a theoretically prespecified optimal inventory level when the unit profit is not fixed and how to exacerbate and mitigate potential judgment inaccuracies. The result shows that changes to the benefits affect inventory more strongly and lead to more deviation than to the cost. Besides, inventory could increase even when the volatility of demand increases.

## 3 - Double Auctions for Truthful Information Sharing in Sales and Operations Planning

Frank Hage, Technical University of Munich, Production and Supply Chain Management, Munich, 80333, Germany, Martin Grunow

We study a sales and operations planning problem. Operations persons are responsible for production sites and have private information on production costs. Sales persons are responsible for customer markets and have private information on customer demand. Due to function-oriented bonus schemes, both parties have conflicting interests: While operations persons aim to minimize production and inventory costs, sales persons aim to maximize turnover. Both parties have an incentive to misrepresent their private information, which leads to inefficient capacity allocation and lower profitability. To address this problem, we develop an iterative double auction for capacity allocation.

#### 1 - Who is Next: An Empirical Study of Patient Prioritization in an Emergency Department

Zhankun Sun, City University of Hong Kong, Kowloon, Hong Kong, Jeff Hong, Li Wenhao

In the emergency department (ED), priority scores are assigned to patients at triage based on their acuity levels. However, using operational data from more than 150,000 patient visits, we find that doctors may deviate from this priority sequence, and within each priority class, patients may not be served in a first-come-first-serve manner. Our analysis shows that when selecting the next patient to treat, doctors prioritize patients who are more likely to be discharged after treatment at ED when many ED beds are occupied by boarding patients, in an effort to avoid further access block to the ED.

#### 2 - How to Manage Doctor Appointments with a Shared Medical Appointment Option

Nazli Sonmez, London Business School, Regent's Park, London, NW1SN, United Kingdom, Kamalini Ramdas, Sarang Deo

Shared medical appointments are an alternative to traditional one-on-one appointments for routine care of chronic diseases that offer an innovative, interactive approach to healthcare delivery. They are not widely used even though there is a high potential. To adopt this new healthcare delivery method, the service providers must make an upfront decision on how to allocate service capacity. We develop a model that will incorporate what we learn about how patients make trade-offs while choosing an appointment, when offered two different appointment types using the data from a healthcare provider. This model will provide insight into how many appointments from each type need to be scheduled.

#### 3 - Equilibrium Behavior of Patients Served by a Dual Practice Physician

Lerzan E. Ormeci, Koc University, Dept of Industrial Engineering, Rumeli Feneri Yolu, Istanbul, 34450, Turkey, Dimitrios Andritsos, Yiannis Dimitrakopoulos

We consider a physician who has a dual practice in public and private sectors. We model this system as two M/M/1 queues with a coupled server. The server alternates between the queues with exponential rates. The system has three levels of decisions: First, government provides the main rules for having a dual practice, which may limit the time she spends in her public and private offices and regulate the private service fee. Second, the physician decides on how much time she will

spend in each practice and the private fee to maximize her revenue. Finally, patients decide on the office to visit to maximize their utility which is a function of their waiting time, value of service and private fee.

#### 4 - Modelling the Use of Patient Activation Measure (PAM) in Chronic Care Management

Evrin D. Gunes, Koc University, Rumeli Feneri Yolu, Sariyer, Istanbul, 34450, Turkey, Lerzan E. Ormeci, Odysseas Kanavetas, Christos Vasilakis

We develop a Markov Decision Process framework to manage care for individual patients with multiple chronic conditions through a complex care hub. Complex care provision influences the evolution of Patient Activation Measure (PAM), an indicator for healthy behavior, which affects the evolution of health state of patients. We define a general model where the transition probabilities and the rewards are time dependent parameters. Then, we explore optimal and heuristic policies which maximise the welfare for static parameters. Through numerical experiments we explore the performance of alternative policies that focus on managing more complex patients or improving activation of all patients.

### New Topics in Demand Learning and Assortment Planning

Sponsored: Manufacturing & Service Oper Mgmt/Service Operations

Sponsored Session

Chair: Victor Araman, American University of Beirut, Beirut, Lebanon

Co-Chair: Rene A. Caldentey, The University of Chicago, Chicago, IL, 60637, United States

#### 1 - Crowdvoting New Product Introduction

Victor Araman, American University of Beirut, Lebanon, Rene A. Caldentey

Launching new products into the marketplace is a complex and risky endeavor that companies must continuously undertake. In this paper, we consider a seller who has the ability to first test the market and gather demand information before deciding whether or not to launch a new product. In particular, we consider the case in which the seller sets up an online voting system and offers multiple versions of the product - differentiated through their quality levels and prices - for potential customers to vote on. We investigate the optimal design of such a crowdvoting system in order for it to provide an effective demand forecast and allow the seller to identify which versions if any to commercialize.

#### 2 - Reputation Formation in Social Networks

Mohamed Mostagir, University of Michigan, Ann Arbor, MI, 48109, United States, Asuman Ozdaglar, James Siderius

Reputation is one of the main drivers that sustains relationships between consumers and firms. This work generalizes the reputation literature—which typically assumes sequential arrivals of agents—to a network setting. We show how a firm can manipulate the learning process of agents in a network so that they never learn the true state of the world (for example, that the firm intentionally provides low quality service or that a news outlet provides false news). We then characterize those societies that are immune to manipulation and those that are not, and suggest potential remedies for the latter.

#### 3 - Dynamic Assortment Planning under Nested Logit Models

Xi Chen, New York University, 44 W. 4th St, NYU KMC Room 8-50, New York, NY, 10012, United States, Yining Wang, Yuan Zhou

We study a stylized dynamic assortment planning problem, where for each arriving customer, the seller offers an assortment of substitutable products and customer makes the purchase among offered products according to a nested logit model. The goal of the seller is to maximize the expected revenue, or equivalently, to minimize the worst-case expected regret. We propose a lower and upper confidence bound algorithm with an aggregated estimation and establish the corresponding regret bound. One advantage of our policy is that our regret does not depend on the number of products.

#### 4 - Learning Customer Preferences from Personalized Assortments

Yifan Feng, University of Chicago, 5807 South Woodlawn Avenue, Chicago, IL, 60637, United States, Rene A. Caldentey, Christopher Ryan

A company wishes to commercialize the best version of a product out of a menu of available alternatives. The company does not know customers' preferences over the set of alternatives and relies on a voting system that allows potential buyers to vote for their preferred version. Under a general ranking-based choice model framework, we study how to dynamically customize each individual voter's choice set, so as to identify the top-ranked alternative with a fixed probabilistic confidence level, while using a minimal number of votes.

**1 - A Spatial Model of Ride Hailing**

Cemil Selcuk, Cardiff University, Aberconway Building, Colu, Cardiff, CF10 3EU, United Kingdom

We build a spatial model to study the selection and performance of price and commission policies for a ride-sharing platform. We show that a flexible commission policy is more effective in matching demand and supply than a flexible price policy, especially if the platform does not have many cars at its disposal. Without flexible commissions, the platform resorts to price hikes to prevent excess demand; however such interventions not only distort the unconstrained demand and lower profits, but also do a poor job in spreading drivers across the city. In contrast, with a flexible commission policy the platform can spread the cars around without distorting the demand and running into any bottlenecks.

**2 - A Marketplace for Data: An Algorithmic Solution**

Anish Agarwal, Massachusetts Institute of Technology, Cambridge, MA, United States, Munther Dahleh, Tuhin Sarkar

We aim to create a data marketplace; a robust matching mechanism to efficiently buy and sell data while optimizing social welfare and maximizing revenue. Data is a unique asset: it is replicated at zero marginal cost; value is inherently combinatorial i.e. value of a dataset depends on what other data is available; value for data vary widely between firms; authenticity of data cannot be verified a priori. Hence, setting prices for a collection of datasets with correlated signals is non-trivial. Our proposed marketplace provides a complete algorithmic solution combining concepts from algorithmic market design and online optimization.

**3 - Strategic Inventories in a Supply Chain with Downstream Cournot Duopoly**

Xiaowei Hu, PhD Student, University of Wisconsin-Milwaukee, Milwaukee, WI, 53212, United States

We present a game-theoretic supply chain model, in which a manufacturer supplies products to a pair of identical Cournot duopolistic retailers. We show that the strategic inventory carried out by the retailers under dynamic contract is Pareto-dominating for the manufacturer, retailers, consumers, the channel, and the society as well. We also find that retailer's strategic inventory can be eliminated when the manufacturer commits wholesale contract or inventory holding cost is too high. In comparing the cases with and without downstream competition, we also show that the downstream Cournot duopoly undermines the profits for the retailers, but benefits all others.

**4 - Engineering Economic Valuation of Blockchain Technology for Petroleum Industry Supply Chain under Uncertainty**

K. Jo Min, Iowa State University, 3004 Black Engineering, Department of Industrial & Ames, IA, 50011-2164, United States, John Jackman, Farshad Niayeshpour

Much interests in blockchain technology applicable to petroleum industry supply chain notwithstanding, there has been little analytical investigation of the critical attributes of the blockchain technology such as the value of immutability, irrefutability, traceability, scalability, and transparency. In this paper, we aim to show how such attributes can be valued, in the context of petroleum industry supply chain, from a perspective of stochastic optimal control. In particular, we will show what the underlying assets may be and how strike prices can be found via real options approach. Illustrative numerical examples based on the fluctuation of the petroleum product prices will be presented.

**1 - An Effective Memetic Algorithm for the Boolean Quadratic Programming Problem with Generalized Upper Bound Constraints**

Daiqiang Yin, Northwestern Polytechnical University, Xi'an, China, Yang Wang, Abraham Punnen

We propose an effective memetic algorithm for solving the NP-hard boolean quadratic programming problem with generalized upper bound constraints. The main ingredients of the proposed algorithm include a reverse learning based population initialization, a uniform combined with greedy rule guided crossover operator, an adaptive tabu search method and a rank based population updating.

Experiments on problem instances with up to 6000 variables demonstrate the effectiveness of the proposed algorithm.

**2 - Genetic Algorithm for Planar Capacitated Single Allocation Hub Location Problem**

Derya Ipek Eroglu, Middle East Technical University, Ankara, 06450, Turkey, Duygu Pamukcu, Cem Iyigun

In this study, Genetic Algorithm (GA) has been implemented to Planar Capacitated Single Allocation p-Hub Location Problem. In this problem, the objective is to locate the hubs and assign the supply and/or demand points to hubs so as to minimize the total of distribution and transfer costs. If Euclidean Distance is used as a distance measure calculating the cost, the problem becomes nonlinear. Therefore, GA has been implemented to the problem. Computational studies have been performed regarding solution quality and runtime, and solutions are compared with these of Discrete Capacitated Single Allocation p-Hub Location Problem.

**3 - A Study on Two-stage Genetic Algorithm for the Mixed-integer Linear Programming with Non-linear Objective Functions**

Kiseok Sung, Gangneung-Wonju National University, 150 NamWon-ro, Wonju, 26403, Korea, Republic of

We propose a genetic algorithm for MILP with nonlinear objective function. This algorithm consists of two stages of a hierarchical evolutionary process. At higher levels, integer variables evolve and linear variables evolve at lower levels, where we use a method that maintains the feasibility of a linear variable according to a linear equation constrained by a given integer chromosome. This method uses null-space projection and bound shift techniques. I have been coding the proposed method in MATLAB and tested the sample problems.

**4 - Revenue Management for Dual Channel Retailer Using Randomized Decomposition Based Evolutionary Algorithm**

Shrinath Dakare, Indian Institute of Technology-Kharagpur, Meghnad Saha Hall of Residence, Kharagpur, 721302, India, Vishal Gupta, Manoj Kumar Tiwari

We consider integrated price optimization, inventory replenishment and demand fulfillment problem for a dual channel retailer who has adopted cross channel fulfillment strategy. Demand function is modeled using MNL model with price dependent attraction function. The problem so formulated is non-linear and non-convex that we solved using Randomized Decomposition based Evolutionary Algorithm. We compare the results obtained with that of recently proposed Randomized Decomposition based Neighborhood Search. We also demonstrate that price optimization problem could efficiently be solved using intelligent search heuristics, technique which has largely been ignored for such problems.

**5 - A Heuristic Approach to Passenger-oriented High-speed Train Schedule Model**

Jiemin Xie, The University of Hong Kong, Hong Kong, China, Shuguang Zhan, S.C. Wong, S.M. Lo

A better railway timetable for high-speed railway, HSR, can provide a more convenient service to passengers, which may attract more consumers transferring from domestic air flights and cars. In this study, a schedule model, which minimizes the total path cost of passengers and is subjected to both standard train schedule and passenger path choice constraints, is proposed to generate conflict-free and convenient schedule plan. A heuristic HSR scheduling algorithm is proposed to solve our model. This heuristic algorithm is based on the decomposition approach and the iterative approach. The South China HSR network is used to test the optimality, efficiency, and applicability.

Chair: Joline Uichanco, University of Michigan, Ross School of Business, Ann Arbor, MI, 48109-1234, United States

**1 - Price Markdowns to Induce Customers to Opt Out of Free Returns**

Sajjad Najafi, Ross School of Business, University of Michigan, 701 Tappan Ave, Ann Arbor, MI, 48109, United States, Izak Duenyas

In this paper, we consider a firm offering a product to a set of consumers who can return it over a grace period of time. The firm aims at finding the optimal return policy to improve its total expected revenue.

**2 - Life Cycle Pricing of Multiple Differentiated Products**

Hongmin Li, Arizona State University, WP Carey School of Business, Dept of Supply Chain Management, Tempe, AZ, 85287, United States

This paper considers the centralized pricing problem of a firm managing multiple substitute or differentiated products. Demands of these products undergo a diffusion process and customers choose among the products, with the choice probability of each product given by the logit model. We examine the firm's optimal pricing problem in this context.

**3 - Dynamic Pricing and Replenishment for Seasonal and Regular Products**

Oben Ceryan, LeBow College of Business, Drexel University, Philadelphia, PA, 19103, United States

We consider a firm that offers two substitutable products that differ in how their inventories are managed, a seasonal product with a fixed initial quantity that allows dynamic price adjustments but no replenishments, and a regular product with a static price that can be periodically replenished. We study the impact of these asymmetries on optimal dynamic pricing and replenishment decisions and utilize the insights gained to develop a simple-to-implement and effective heuristic policy.

**4 - Competitive Revenue Management with Sequential Bargaining**

Yuanchen Li, Purdue University, 2192 Tortuga Lane, West Lafayette, IN, 47906, United States, Qi Feng, J. George Shanthikumar

We study the role of bargaining in competitive revenue management. The seller firms each have some fixed initial stocks and compete to sell to a random arrive stream of potential buyers who are heterogeneous in product valuation. We fully characterize the equilibrium outcome, which depends on the length of the selling season and the initial stock levels. When the selling season is up to three periods, the seller with a lower stock level is weakly preferred by an incoming buyer. When the selling season is longer than three periods, the seller with a higher stock level may win the competition.

**1 - Managing Opportunistic Consumer in Retail Operations**

Tolga Aydinliyim, Associate Professor, Baruch College, One Bernard Baruch Way, Department of Management, New York, NY, 10010-5585, United States, Mehmet Sekip Altug, Aditya Jain

Considering "honest-customers versus "renters, we assess the merits "targeted-refunds and "menu-of-refunds proposals retailers use to mitigate opportunistic consumer returns. Relative to benchmarks with "no-renters (Su, 2009) and "uniform-refunds, we find that the menu-of-refunds proposal with a low restocking-fee can separate customer types when leftover/returned units must be significantly marked down.

**2 - The Effect of Internet Bots on Dynamic Pricing of Perishable Products**

Kimitoshi Sato, Kanagawa University, Yokohama, Kanagawa, Japan

We study the problem of a firm that sells perishable products with a dynamic pricing scheme in the presence of internet bots. The bots automatically check for changes in price every few seconds and hold the price during short period (e.g. 24 hours). Reservations by the bots does not generate revenue for the firm if payments are not completed and will temporarily increase the selling price. In this research, we formulate a dynamic pricing model in presence of the bots and derive an optimal pricing policy. Then we show how does the behavior of bots affect the firm's expected revenue as well as the optimal price trend.

**Practice- E-Business/Commerce I**

Contributed Session

Chair: Roger William Baugher, TrAnalytics, LLC, Johns Creek, GA, 30097, United States

**1 - The Moderating Effect of Reputation and Presentation on Trust Transfer of Trusted Third Party**

Cong Cao, University of Wollongong, Wollongong, NSW 2522, Australia, Jun Yan, Mengxiang Li

Based on experimental data, this paper not only shows the significant influence of trusted third party (TTP) on consumers' behavior, but further explains its trust transfer function in the online shopping environment. Moreover, it also reveals moderator variables of the trust transfer, namely the reputation and presentation of TTP. The research results show that the certification service provided by TTP with high reputation can significantly improve the degree of consumer trust in enterprises. The concrete and detailed description and presentation of TTP services can effectively enhance consumers' cognition of TTP services and therefore influence their behavioral intention.

**2 - End-to-end Inventory Replenishment Model**

Yuanyuan Shi, University of Washington, 6319 65th Avenue NE, Seattle, WA, 98115, United States, Di Wu, Meng Qi, Rong Yuan, Yuhui Shi, Max Shen

Traditional inventory models often assume a predict-then-optimize paradigm. A prediction model which depicts the demand uncertainty is built then an optimization model is applied to solve for optimal inventory decisions based on the forecasting. However, the criteria by which we train the prediction model often differs from the ultimate criteria on which we evaluate them. In this research, we focus on building an end-to-end inventory replenishment model which simultaneously learns the probabilistic info of multiple uncertainty sources such as demand, lead time, while making replenishment decisions that directly capture the cost-based objective.

**3 - Competitive Intelligence Analysis from Customer Online Concerns of Series Products for Engineering Design**

Jian Jin, Beijing Normal University, No. 19, Xijiekouwai street, Beijing, 100875, China, Qian Geng, Ping Ji

Online concerns inform valuable messages to customers, dealers and product designers. Conventional studies mainly focus on the sentiment analysis of online opinions and few explore their capacities on comparison of series products. In this study, a framework is presented to highlight shared pros and cons of series products by mining online concerns. Customer opinions of specific features across series products are initially extracted and clustered to identify similar concerns. Then, an optimization problem is formulated to sample a few representative sentences for designers. This study aims to integrate big consumer data for competitive intelligence analysis in market driven product design.

**4 - Current State of Railroad Yard Technology**

Roger William Baugher, President, TrAnalytics, LLC, Johns Creek, GA, 30097, United States

Given the high cost of improvements to a rail yard's infrastructure, railroads are investigating and implementing new control technology and enhanced information systems to improve performance and reduce costs. These efforts will be discussed and a summary presented.

Sponsored Session

Chair: Qi Wu, The Chinese University of Hong Kong, Hong Kong

Co-Chair: Lingfei Li, Chinese University of Hong Kong, Shatin, N. T, Hong Kong

**1 - A Multidimensional Hilbert Transform Approach for Barrier Option Pricing and Survival Probability Calculation**

Jie Chen, Chinese University of Hong Kong, Shatin, N. T, Hong Kong, Liaoyuan Fan, Lingfei Li

We propose a novel approach for pricing discretely monitored multi-asset barrier options and computing joint survival probability in multivariate exponential Levy asset price models using multidimensional Hilbert transform. Our method features exponential decay in the discretization parameter and various numerical examples are provided to demonstrate its efficiency in both 2D and 3D cases.

**2 - Parsimonious Learning of Tail Dynamics**

Qi Wu, City University of Hong Kong, Kowloon, Hong Kong, Xing Yan

We propose a semi-parametric machine learning approach to study the serial dependence of conditional distribution in asset returns, motivated by the problem of tail risk forecast. This approach combines the merits of a novel parameterization of conditional quantile function with the Long short-term memory (LSTM) sequential neural network. Comprehensive empirical study shows that the dynamics of return distribution is not always auto-regressive in nature; further, drivers of higher moments' serial dependencies could contain risk factors that are independent of those responsible for volatility clustering. These findings should have important implications for financial risk management.

### 3 - Robust Bounds of Default Probabilities in Financial Networks

Dohyun Ahn, The Chinese University of Hong Kong, Shatin,  
N. T., Hong Kong

We focus on firm-specific default probabilities in the Eisenberg-Noe network model with random shocks. In particular, we are interested in finding their robust bounds when financial networks are not fully observed. We first identify shock amplification caused by the network structure, which allows us to define the firm-specific default probabilities in financial networks. Using mixed-integer linear programming, we then obtain two kinds of robust bounds: one from a specific bank's perspective and the other from regulators' perspective. Also, we address asymptotic behaviors of those bounds when the shock size decreases. The applicability of those results is illustrated via numerical examples.

### 4 - Dynamic Programming, Progressive Hedging Algorithm and Machine Learning

Xin Huang, PhD Student, The Chinese University of Hong Kong,  
Shatin, Hong Kong, Duan Li

Dynamic programming often fails due to unavailability of analytical cost-to-go functions. In this research, we first solve the primary problem approximately by applying progressive hedging algorithm to associated scenario trees. Next we adopt neural networks to find mappings from states to values as approximated cost-to-go functions. We then update these approximated cost-to-go functions backward for all successive two stages by minimizing the gap between the prediction from preceding approximated function and that from the principle of optimality. This process iterates until achieving desired precision.

### Practice- Productivity Improvement in Manufacturing

Contributed Session

Chair: Douglas Thomas, NIST, 100 Bureau Drive, Gaithersburg, MD,  
20899-8603, United States

#### 1 - The Direction of Causality between Personnel Management Practices and Productivity

Juha Eskelinen, Researcher, Aalto University, Runeberginkatu  
22-24, Helsinki, 00100, Finland, Ossi Aura, Guy Ahonen, Timo  
Kuosmanen

Causal relationship between personnel management practices and productivity remains ambiguous. This longitudinal study combines survey data from Finnish small and medium size enterprises in manufacturing with productivity indicators for years 2008-2016 (17100 observations). Controlling for firm specific factors such as capital intensity, we find that measures regarding management development, work environment and content are associated with increase in future productivity. In contrast, measures like increasing non-financial employee benefits follow high productivity and do not precede it.

#### 2 - The Impact of Patents on Manufacturing Productivity

Anand Kandaswamy, Economist, NIST, Washington, DC, 20008,  
United States

The traditional economics models in manufacturing usually look at factors like plant and equipment spending, worker education, and research and development funding to measure changes in productivity levels. What they tend to ignore is the role of innovation in driving productivity. Patents have traditionally been recognized as an excellent proxy for levels of innovation. Using data from 2004 to 2014, the author focused on six key manufacturing industries and created a model in R Studio that tries to determine the relative importance of innovation (as represented by patent activity) with respect to the more traditionally accepted components of economic productivity.

#### 3 - The Effect of Flow Time on Productivity and Production

Douglas Thomas, Economist, NIST, Gaithersburg, MD, 20899-  
8603, United States

Operations management strategies incorporate flow time and inventory turns as a metric for tracking and improving performance; however, there is limited understanding regarding the impact of reducing flow time. This paper examines the impact that flow time has on productivity and production, measured using the multifactor productivity index and manufacturing value added. A total of 6 models are presented and two simulations. The results suggest that flow time reflects and impacts productivity and production both within an industry and between industries. Moreover, the results are consistent with using flow time as a metric to identify industry level bottlenecks and improve productivity.

#### 4 - Experimental Investigation of Stratasys J750 Polyjet Printer: Effects of Printing Parameters on Bending Strength

Xingjian Wei, Graduate Student, Texas A&M University, College  
Station, TX, 77843, United States, Abhinav Bhardwaj, Zhijian Pei,  
Bruce Tai

Additive Manufacturing (AM) has found significant applications in the engineering of prototypes as well as functional parts. These advances have resulted in the origination of high-resolution, multi-material printers such as the Stratasys J750: world's first full-color, multi-material 3D printer. In this research,

we analyze the effects of printing parameters on the bending strength of samples printed by the Stratasys J750 printer. The results from this study would be valuable to research institutions and businesses leading high-resolution, multi-material 3D printing of polymers.

#### 5 - The Motivation of Capital-giving in Crowdfunding Market: A Self-determination Theory Perspective

Xiang Yuan, Tongji University, Shanghai, China, Hongwei Wang,  
Yuan Meng

How to promote crowd-funding results successfully are crucial to crowdfunding projects. The results of crowd-funding projects are determined by investors' subjective behavior, which is triggered by some certain motivations. Through identifying different motivation modes mainly influenced by the project description, it will be beneficial to identify the investment intention of each investor. In this paper, based on the self-determination theory, we first create the corpus targeting different motives by means of the text mining method. Then, we classify the project description and project investment options. Last, we conduct an econometric model to examine the effect of investor's motives.

#### 1 - Applying Time Buffer Management to Lean Service Design

Xiaofeng Zhao, University of Mary Washington, Fredericksburg,  
VA, 22406-7272, United States

Theory of constraint-based buffer management is widely used to protect the system's output from disruptions. The research employs queuing methods to calculate the time buffer size in lean service operation. It discusses computable expressions for the mean and the variation of waiting time. The approach can be implemented to conduct what-if analysis.

#### 2 - Research on Supplier Evaluation in Service Procurement Based on Fuzzy Soft Set

Jie Xu, Pittsburgh, PA, 15213, United States

The use of fuzzy soft sets can flexibly deal with multiple projects, different indicators, and uncertain service procurement items. Considering the experts' case evaluation of the supplier's various indicators, and based on the deterministic evaluation when considering the expert rating, the supplier's negative (risk) factors and hesitation factors in each index are considered. Combining the expert's affirmative scoring, negative and hesitant scores on supplier indicators, using triangular fuzzy numbers to represent the experts' determination and negation of suppliers, and establishing an improved triangular fuzzy soft-package service procurement supplier evaluation model.

#### 3 - Optimal Inventory and Redesign Strategies in Resolving Part Obsolescence

Zhenyang Shi, Student, Shanghai Jiao Tong University, 1954  
Huanshan Road, Shanghai, 200030, China, Shaoxuan Liu

We study the joint part inventory and product redesign decisions for a manufacturer facing part obsolescence problem. Product redesign, and inventory control approaches such as last time buy, are two focal strategies in obsolescence resolution. We establish an optimal stopping model with additional decisions to investigate when should product redesign be initiated and how should part procurement and inventory be managed, during product life cycle after obsolescence. We show the optimality of a threshold policy for redesign choice and well-structured policies including the target interval policy for inventory control.

#### 4 - Understanding Service Innovation Introduction and Diffusion through the Lens of the Economic Order Quantity Model

Seongkyoon Jeong, Arizona State University, Tempe, AZ,  
United States, Adegoke Oke

Unlike tangible manufactured products, services have unique characteristics, which motivate the need to understand how service innovations are introduced and how they diffuse or percolate targeted markets. Using novel data of daily usage of online game services in South Korea, we find that service innovations in such online game industry appear to follow the saw-tooth patterns typically observed in the traditional inventory profile model of economic order quantity. We address what types of service products or innovations experience this phenomenon and what determines this type of introduction and diffusion profile.

### Design and Operation of Interdependent Critical Infrastructure Systems

Sponsored: Service Science

Sponsored Session

Chair: Ann Suhaimi, Northeastern University, Somerville, MA, 02145, United States

Co-Chair: Jacqueline Griffin, Northeastern University, Boston, MA, 02115, United States

#### 1 - Design and Control of Resilient Interdependent Infrastructures

Hana Khamfroush, University of Kentucky

In this talk I explain a general analytic model that captures multiple types of interdependency among nodes of interdependent infrastructures. Given an initial failure this model allows us to analyze the impact of different network topologies, different types of coupling, different failure/attack models, and different ways of choosing initial spreaders on the propagation of failures in such networks. Based on our observations, we propose design guidelines for resiliency of interdependent infrastructures. We also propose a new metric of centrality designed for interdependent networks. We will compare the preciseness of the proposed metric with the standard centrality metrics.

#### 2 - Cyber-physical Attacks Recovery in Interdependent Power and Communication Systems

Wei Sun, Assistant Professor, University of Central Florida, Orlando, FL, 32816, United States

The increasing threats from natural disasters and cyber attacks on cyber and physical systems (CPS) could trigger catastrophic events and cause tremendous damage to physical systems. The interdependency between CPS drastically increase the complexity of enhancing CPS security and resiliency. This talk will introduce the adaptive and resilient restoration strategies that coordinate the recovery efforts between power and communication systems. Challenges and recommendations will be discussed on building a secure and resilient nation, ultimately self-healing from cyber-physical attacks.

#### 3 - Examining the Joint Role of Load Shedding and Emergency Services Effectiveness during Critical Events

Ann Suhaimi, Northeastern University, Somerville, MA, 02145, United States, Jacqueline Griffin

Load shedding refers to power outages that occur by design by the utility companies to ensure that certain areas will not experience disruption in power especially during natural disaster. While load shedding commonly addressed in many studies, the effects of load shedding, especially on the greater population is still absent. This study aims to estimate the stress on EMS deployment that occurs after power is lost due to load shedding using Vehicle Routing Problem that is the core of EMS fleet deployment. We develop a model accounting for human cost to understand the relationship between power loss, load shedding, and EMS response time.

#### 4 - System of Systems Modeling for Incentive Policy Design in Promoting Electric Vehicle Transport

Chao Lei, University of Illinois at Urbana-Champaign, Liqun Lu, Yanfeng Ouyang

Encouraging travels with electric vehicles (EVs) has been recognized as an effective and economical approach to reducing greenhouse gas emissions. Economic concerns and travel conveniences are two crucial factors affecting EV ownership and usage. We propose a system of systems (SOS) model to help the government decide the optimal EV purchase incentivization and charging infrastructure deployment while considering the interdependency among the transportation, power, and environment systems and the EV market. Charging infrastructure deployment is modeled as a bi-level problem accounting for users' travel choices. An iterative-based algorithm is developed to solve the proposed model.

#### 1 - The Impact of Platform Levers on Ecosystem Development: The Case of Twitter Hashtags

Sameer Borwankar, PhD Student, Purdue University, West Lafayette, IN, United States

Social media platforms generate revenue through advertising or transaction based charges. Hence, growing and managing the active users is at the core of the

platform management. In our study, we focus on the impact of platform features on attracting new users. Our empirical context is the hashtags used on Twitter to discover and contribute to user-generated content around a specific theme. In that context, we ask following questions 1. Do hashtags play a role in attracting new users? 2. Do different types of hashtags have a different impact on attracting new users? 3. Do these users continue to use the platform? We analyze more than 13 million tweets generated in 2016 and 2017 to address these questions.

#### 2 - A Reputation and Credit-based Retrieval System for Hybrid Wireless Networks

Yung-Ting Chuang, National Chung Cheng University, Min-Hsiung Township, Chia-Yi County, Taiwan

Currently, trust in information accessed via the Internet depends on its unbiased centralized systems to ensure high efficiency and low cost, but we cannot guarantee such centralized systems to remain unbiased forever. As mobile devices are becoming the primary devices for communications, the network has shifted to hybrid wireless network (HWN). Thus, I propose a system for HWN which: 1) resolves the censorship issues; 2) addresses forwarding attacks; 3) encourages cooperation incentives; 4) ensuring low overhead and high retrieval rates. After implementing this system, I plan to measure my system against other existing retrieval systems, and confirm its effectiveness.

#### 3 - Data Breach Disclosure Laws and Digital Security Conscientiousness

Raviv Murciano-Goroff, Graduate Student, Stanford University, 579 Serra Mall, Stanford, CA, 94305, United States

In 2002, California enacted a law requiring that companies publicly disclose data breaches. To evaluate the impact of data breach notification laws, I collected data on the decisions of 2,185 public companies regarding when to update their web server software and apply security patches during the two years before and after the California legislation was signed. Using a difference-in-difference strategy, I find that the data breach notification law in California caused firms based there to use web server software that was 12.06% newer.

#### 4 - A Clustering Based Decision Tree Approach for Risk Assessment of Information Security in Smart Cities

Yana Yuan, PhD Candidate, Northwestern Polytechnical University, Xi'an, 710129, China, Huaqi Chai

The emergence of new information technologies poses challenges to information security in smart cities. Risk is the most prominent challenge. In this paper, we analyze the impact factors of information security in smart cities and evaluate the risks that these factors bring to information security. We aim at establishing a new evaluation index system and building a risk assessment model based on Ward's method and decision tree. Then we present an empirical study on risk assessment of information security in 15 smart cities. We provide a data-based and intelligent method to assess the risks of information security, and give solutions to address the challenges for information security in smart cities.

#### 5 - A Game-theoretic Model of Protecting Interdependent Systems with Incomplete Information

Fei He, Texas A&M University - Kingsville, MSC 191, MEIE Dept., 700 University Blvd., Kingsville, TX, 78363, United States

Securing a complex system in the face of adversary attacks is challenging because of many factors, such as the coupling between constituent systems, the adaptiveness of attackers, and uncertainty of both systems and attackers. We propose a new game-theoretic model of protecting interdependent systems with incomplete information. By analytically and numerically solving the model, we analyze the effects of system interdependency pattern, and the uncertainty of attacker's attack preference to defense strategies at Nash equilibria. The research provides new insights for system design, and optimal defense strategy for infrastructures such as telecommunication networks, and power grids.

#### 6 - The Effect of Prefunding on Crowdfunding Success

Xiahua Wei, University of Washington, Bothell, 18115 Campus Way NE, Box 358584, Bothell, WA, 98011, United States, Weijia You, Ming Fan, Yong Tan

We investigate the effect of prefunding on the success of crowdfunding. Using a daily panel dataset from a large online crowdfunding platform, we examine the dynamic effects of prefunding on fund raised and different types of backers, and find that prefunding attracts lottery backers and non-lottery backers differently. We also use counterfactual decomposition to distinguish the prefunding effect and the effect of project characteristics on funding outcomes, which helps us uncover the kind of projects that succeed through prefunding.

**Practice- Transportation-Operations IV**

Contributed Session

Chair: Zhen Tan, Cornell University, Ithaca, NY, 14850, United States

**1 - Multi-methodological Approach for Risk Mitigation Strategy Selection in the Trucking Industry: A Truck Drivers Perspective**

Krishna Kumar Dadsena, Indian Institute of Technology Kharagpur, Kharagpur, Vs Hall, B. 243, IIT Kharagpur, Kharagpur, 721302, India, Sarada Prasad Sarmah, V. N. A. Naikan

This study aims to identify the operational risks induced by the truck drivers' job satisfaction criteria, and to select the most suitable risk mitigation strategy on managing the operational efficiency of the trucking industry. The approach based on the systematic application of survey-based analysis and fuzzy theory is used to develop a novel algorithm to support the strategy selection process.

**2 - Dynamic Subsidy-pricing Models for Multi-modal Transportation Integration: The One Belt-one Road Strategic Context**

Tanmoy Kundu, National Taiwan University, Taipei, Taiwan, Jiuh-Bing Sheu

One Belt-One Road (OBOR) is a regional/international developmental initiative recently initiated by the Chinese government. One of the challenges being faced in the OBOR operations is the ineffective utilization of the multiple modes of transportation. Huge subsidy to one mode of transportation is leading to the cannibalization of the other. Hence, this work offers various dynamic subsidy-pricing models associated with the dynamic multimodal transportation networks along the OBOR corridors.

**3 - An Efficient Iterative Algorithm for the Integrated Optimization of Train Timetabling and Maintenance Task Scheduling**

Yongxiang Zhang, Southwest Jiaotong University, Chengdu, 610031, China, Qiyuan Peng, Andrea D'Ariano, Bisheng He

Track maintenance tasks need to be scheduled to retain the railway tracks in an appropriate state. However, the planning of track maintenance activities is interrelated with the train timetabling process. In this work, train timetabling is optimized together with maintenance task scheduling to solve potential planning conflicts and to allocate the available railway capacity more efficiently to the scheduled services. A new mixed integer linear programming model is formulated and an efficient iterative algorithm is proposed to find near-optimal solutions within a short computation time. The experimental results show that the proposed algorithm outperforms previously proposed approaches.

**4 - The Pareto-improving Hybrid Fare Scheme with Heterogeneity in Commuter's Scheduling Flexibility**

Yili Tang, Hong Kong University of Science and Technology, Academic Building, Room 3595, Hong Kong, China, Hai Yang

This paper proposes a hybrid fare scheme (HFS) combining a fare-reward scheme (H-FRS) and a uniform fare scheme (H-UFS) by considering the heterogeneous commuter's scheduling flexibility in transit bottleneck model. It aims at reducing peak-hour congestions with alternative options catered for various commuters. In H-FRS, a commuter is rewarded with a free ride during shoulder periods after taking a number of paid rides during the central period in peak hours. The H-UFS determines a uniform fare. The preliminary results demonstrate that the HFS is not only revenue-preserving but also Pareto-improving. An optimally designed hybrid scheme can achieve a reduction in total time costs by at least 25%.

**5 - Effect of Information Delay on Real-time Routing and a Potential Remedy**

Zhen Tan, Nottingham University Business School (China), Ningbo, 14850, China, Jamol Pender, H. Oliver Gao, Xiaoning Zhang

In dynamic routing, travel time information is often delayed and hence inaccurate because of challenges in data collection and sensor working principal. This inaccuracy can misguide motorists and result in unstable traffic patterns that exacerbate congestion. To alleviate this negative effect, we analyzed the potential of providing drivers with real-time en-route air pollution information (in addition to travel time) using a new queueing model. Results of our theoretical and numerical analysis indicate that provision of real-time air pollution information can help stabilize traffic. We verified this benefit by traffic simulation of the George Washington Bridge based on real-world data.

**Urban Public Transport**

Sponsored: TSL/Urban Transportation

Sponsored Session

Chair: Yanshuo Sun, Florida State University, Tallahassee, FL, 20742, United States

**1 - Multi-period Line Planning in Urban Public Transportation**

Guven Sahin, Sabanci University, Faculty of Engineering and Natural Sciences, Istanbul, 34956, Turkey, Amin Ahmadi, Ralf Borndörfer, Malte Ranken, Thomas Schlechte

Line planning in urban transportation is involved with determining the number and routes of the lines along with their frequencies given an underlying physical transportation network. In traditional line planning, demand is considered as static while fleet-related constraints are secondary. We solve a multi-period line planning problem with integer programming formulations that consider dynamicity of the demand. Multi-period solutions outweigh the single-period solutions with respect to system-wide service levels. Indeed, single period solutions when combined with each other may not even be feasible due to suboptimal allocations of vehicles among lines.

**2 - Regulation of Public Transit Monopoly under Asymmetric Information**

Yanshuo Sun, Florida State University, Tallahassee, FL, 20742, United States, Qianwen Guo

Contrary to the dominant assumption, we study how to regulate a monopolistic transit operator with unknown cost parameters. A benchmark model which assumes complete cost information is proposed and solved analytically. Then government's decisions based on prior estimates of cost parameters are evaluated and the welfare loss due to the incomplete information is thus identified. Next, an incentive-compatibility regulatory policy which induces the operator to report its true parameter is proposed. Finally, the derivation of the optimal policy is provided and its properties are analyzed. Thus, this study provides an effective tool for designing regulatory policies and evaluating practices.

**3 - Uncertainty Quantification of Dynamic Urban Transit System State Estimates in Big Data Applications: An Information Space Projection Approach**

Jiangtao Liu, Arizona State University, Tempe, AZ, 85282, United States, Xuesong Zhou

This talk aims at a modeling framework to systemically account for the multi-source sensor information in urban transit systems to quantify the estimated state uncertainty. By developing a system of linear equations and inequalities, the information space is generated based on the available heterogeneous sensor data. Then, a number of projection functions are introduced to match the relation between the unique information space and different system states of interest. Finally, different state estimate uncertainties are quantified by calculating its maximum state range.

**4 - Passenger Trajectory Generation and Characterization using Modern Datasets**

Xiaoyan Xie, Cole des Ponts ParisTech, Champs-sur-Marne, France, Fabien Leurent

Passenger trajectory generation and characterization along a line on a Public Transport (PT) network was still a difficult task, as it must capture not only the complexity of trip building and route choice on the network; but also the heterogeneity in walking and waiting behaviors related to individual characteristics and the topological complexity of each station. Fortunately, over the last decade, the emerging modern data from automatic observation systems improved this task. However, traditional data modeling approaches were challenged. Based on the state-of-the-art review about passenger trajectory rebuilding and characterizing approaches, this paper proposed an approach to generate passenger trajectory based on smartcard data on a PT network. It is applied to a real case study in Paris. Passenger trajectory is characterized using the model output. Passenger in-station and on-network value of times (VoT) are appraised.

**5 - A Cumulative Service State Representation for the Pickup and Delivery Problem with Synchronized Transfers**

Monirehalsadat Mahmoudi, Arizona State University, Tempe, AZ, United States, Tie Shi, Yongxiang Zhang, Xuesong Zhou

In this research, in order to solve the pickup and delivery problem with time windows and synchronized transfers, we construct multi-dimensional state-space-time networks and apply a dynamic programming to solve a shortest path problem on the constructed networks. In order to handle a large set of passengers, we develop the traditional cluster-first, route-second approach. We also develop a continuous time approximation approach using cumulative arrival, departure, and on-board count diagrams to effectively assess the dynamic system performance and guide the search.

### Practice – Shipping & Transportation Operations & Management I

Contributed Session

Chair: Qingcheng Zeng, Dalian Maritime University, School of Transportation Management, Dalian, 116026, China

#### 1 - Revenue Management in Ocean Shipping

Andres Iroume, Revenue Analytics, Atlanta, GA, United States,  
Michael Seelhorst

Container shipping companies face many of the same issues addressed by traditional revenue management (RM): perishable inventory, demand uncertainty and customers with different price sensitivities, among others. Historically, operations research based decision support systems have been implemented in this industry, including empty container repositioning, terminal operations, disruption management and others. Today, some of the first revenue management systems are being implemented. We discuss nuances and similarities with previous applications of RM.

#### 2 - Bi-level Optimization Method to Minimize Externalities by Means of Eco-transfer Staging Areas in Urban Cores

Mario E. Arrieta-Prieto, Graduate Research Assistant, Rensselaer Polytechnic Institute, Troy, NY, 12180, United States,  
Abdelrahman Ismael, Carlos Rivera-González, John E. Mitchell

Changes in urban population combined with the rise of e-commerce have had tremendous impacts on sustainable supply chains at urban cores. This paper proposes a methodology to decide optimal location of on-street staging areas in urban cores. By using a bi-level optimization problem the authors were able to capture how the agents involved in the decision pursue different objectives. In freight systems the public sector aims to maximize social welfare while the private sector looks for maximizing profit. The result of the research exhibits a formulation and a case study scenario in Manhattan that allows the evaluation of on-street staging areas from both the private and the public sector perspective.

#### 3 - Modelling the AGV and ALV System in Automated Container Terminals

Qingcheng Zeng, Dean, Dalian Maritime University,  
Linghai Road 1, Dalian, Dalian, 116026, China

This paper addresses the impact of the number of operations on the terminal efficiency based on AGV and ALV transport systems. Performance indicators of AGV and ALV transport system is obtained by queuing models, where AGV transport system is modelled by a closed queuing network and ALV transport system is modelled by a mixed queuing network. We also developed a cost model to investigate the present values of total cost of AGVs and ALVs, including operation cost, capital cost and labour cost. Numerical experiments indicate that the efficiency of ALVs and AGVs. Sensitive analysis shows the impact of the number of buffers and vehicle travelling speed on terminal efficiency.

### Practice- Rail Transportation I

Contributed Session

Chair: Manuel Fuentes, Universidad Rey Juan Carlos, Camino del Molino, 5, Fuenlabrada, 28943, Spain

#### 1 - A Capacity Estimation System for High-speed Railway: An Integrated Approach Considering Railway Traffic and Rolling Stock Utilization

Haiying Li, Prof., Beijing Jiaotong University, Shangyuan Cun No 3, Beijing, 100044, China, Zhengwen Liao, Ying Wang, Xinyi Li

A capacity estimation approach considering both the passing capacity of railway open track segments and stations, as well as the holding and the circulation of rolling stocks is introduced in the presentation. A MIP model which jointly optimizes the timetabling, track assignment and rolling stock circulation problems is proposed to generate a saturated integrated plan. For solving the MIP model, a pressure testing method is embedded in a time-rolling algorithm framework for generating a whole-day train timetable. Based on the algorithm, a decision support system with the user interface is developed and applied in a case study on Beijing-Tianjin intercity railway.

#### 2 - Research on the Risk Fuzzy Evaluation and Control Measures of China's Rail Transportation Projects Based on Economic Sensitivity

Xu Yan, Southwest Jiaotong University, Chengdu, China  
National United Engineering Laboratory of Integrated and Intelligent Transportation, Chengdu, China, Qiyuan Peng, Jie Liu, Yong Yin, Yongxiang Zhang

This paper construct a multi-level risk evaluation system based on the sources of

risk analyses in China's rail transportation projects. Then an improved fuzzy comprehensive risk evaluation model is established in order to evaluate the risks of projects from the perspective of economy and efficiency, which combining economical sensitivity analysis method with expert scoring method to determine the weight of each level's index. Then the model verification is carried out with two examples of China's rail transportation projects. The results from multiple angles is consistent with the actual situation and the risk control measures are put forward according to it.

#### 3 - Railway Crew Scheduling with Semi-flexible Timetables

Ulrich Thonemann, Universität zu Köln, Wirtschafts und Sozialwissenschaftliche Fakultät Albertus Magnus Platz, Köln, D-50923, Germany, Christian Raehlmann

We investigate the impact of coordinating the timetable and the crew schedule in an operational freight railway system. Usually both problems are solved sequentially - resulting in suboptimal schedules with long idle times for the train drivers. We coordinate the timetable and the crew schedule by adding flexibility to the timetable. We introduce small time windows, that allow to shift entire trains forwards and backwards by discrete time periods. We solve our model with a column generation heuristic and test it on three real datasets. Our results show large reductions in idle time and cost.

#### 4 - Integrated Crew Scheduling & Crew Rostering Model for Rapid Transit Networks

Manuel Fuentes, Universidad Rey Juan Carlos, Camino del Molino, 5, Fuenlabrada, 28943, Spain, Luis Cadarso

Solving Crew Planning Problem sequentially, by tackling first the Crew Scheduling and then the Crew Rostering problems independently, usually leads to suboptimal solutions. Instead, facing the problem without splitting it into two may improve the global solution. However, this is often impractical when using exact methods, due to the complexity of the problem. We propose a heuristic approach for solving the integrated crew planning problem for rapid transit networks, where the schedules are usually daily repeated and the crews are sequenced in rotating rosters.

### Transportation-Freight

Contributed Session

Chair: Peng Sun, K hne Logistics University, Gro er Grasbrook 17, Hamburg, 20457, Germany

#### 1 - Freight Demand Synthesis with Mode Choice: Combined Estimation Procedure

Lokesh Kumar Kalahasthi, Graduate Student, Rensselaer Polytechnic Institute, Troy, NY, 12180, United States,  
Jose Holguin-Veras, John E. Mitchell

Freight Demand Synthesis (FDS) is the process of estimating freight demand from the available data such as traffic counts, cost matrix, productions, and attractions; bypassing the need for an extensive data collection efforts. This research develops a combined model for FDS that incorporates the estimation of modal split between rail and truck. A gravity model is adopted for the estimation of trip distribution; a binary logit model for modal split between rail and truck; and Noortman and van E's model is used for empty trips. This research serves as a potential tool for transportation planners in evaluating various policy outcomes.

#### 2 - Stochastic Drayage Scheduling Problem with Time Windows

Samaneh Shiri, UPS, Baltimore, MD, United States,  
Nathan Huynh, ManWo Ng

This work studies the drayage problem which involves transporting containers in the hinterland of an intermodal terminal. It relaxes the assumption of the deterministic duration of activities in drayage operation. Two chance-constrained programming models were developed with the following assumption: 1) only the mean and variance of activities are available, and 2) the mean as well as the lower and upper bounds of activities are available. To keep the problem tractable, the chance constraints are converted to their deterministic equivalents using Cantelli's and Hoeffding's inequalities. The models were solved using optimization software CPLEX and reactive tabu search algorithm.

#### 3 - The Impact of Mass Transport on the Design of Multimodal Two-tier City Logistics Systems

Pirmin Fontaine, Technical University of Munich, Arcisstrasse 21, LST Minner, Munich, 80333, Germany, Teodor Gabriel Crainic, Ola Jabali, Walter Rei

We build on the service network design problem of a two-tier city logistics system where the goods are transported from distribution centers at the city border to satellites in the city from where the final distribution is done. Additionally, to classical trucks, we focus on the impact of mass transportation (e.g., trams) in such a system. We use a service-based integer programming formulation for the resulting multi-mode service network design problem with resource management. Decomposition techniques are used to solve the problem efficiently. The numerical results give insights on the advantages and disadvantages of the different transportation modes and what influences on the fleet structure.

#### 4 - Optimization Problem of Parcel Delivery Coordinating a Truck with Drones

Xin Wang, Tsinghua University, Shenzhen, 518055, China,  
Mingyao Qi

With the emergence of technologies, a new distribution method of deploying the unmanned aerial vehicles or drones to support the parcel delivery gradually exerts its advantages. A new idea of using a drone in conjunction with a traditional delivery truck to distribute parcels is discussed in earlier literatures. Different from the existing work, we propose a new distribution mode of a truck with several drones and provide a mathematical programming model aiming to find the optimal routing and scheduling of the multiple vehicles.

#### 5 - An Adaptive Large Neighborhood Search Heuristic for the Time Dependent Profitable Pickup and Delivery Problems with Time Windows

Peng Sun, Kuhne Logistics University, Grosser Grasbrook 17,  
Hamburg, 20457, Germany, Lucas P. Veelenturf, Mike Hewitt,  
Tom van Woensel

In this paper, we study the time-dependent profitable pickup and delivery problem with time windows. In this problem, each request consists of a pickup and delivery location, a profit is collected from the visit to its pickup. A limited amount of vehicles with a capacity limit are available. The profit of a request can be collected at most once. Time-dependent travel times are considered to capture road congestion. The objective is to determine a set of tours that maximize the difference between the collected profits and the total traveling cost. An adaptive large neighborhood search is proposed. Results show its effectiveness in finding good-quality solutions on the instances with up to 75 requests.

North Bldg 223

#### Game Theory III

Contributed Session

Chair: Timothy Murray, University of Illinois, Champaign, IL, 61820, United States

##### 1 - Schrodinger Nim

Mark J. van den Bergh, Leiden University, Ravenhorst 59, Leiden,  
2317AG, Netherlands

In the field of combinatorial game theory, many beautiful results are known for two-player, deterministic, perfect information games, of which Nim is a prime example. In this talk, we will discuss a non-perfect information variant of Nim. Employing results from non-cooperative game theory, we assess the probability of the starting player being the winner for various sizes of piles, and compare the results to the classic version of Nim.

##### 2 - What if Hotelling Firms Can Mass Customize

Alireza Yazdani, University of Oregon, 1208 University Street,  
Eugene, OR, 97403, United States, Eren Basar Cil,  
Michael Pangburn

We study product-design and price competition between two mass-customizing firms that serve consumers with varying tastes and finite reservation prices on a Hotelling linear city. By comparing equilibrium results in settings with and without mass customization, we show that mass customizers prefer markets exhibiting extreme (high or low) levels of consumers' fit sensitivity, whereas traditional firms are better off when facing moderate fit sensitivity. We also establish that competition with mass customization may lead to lower profits and consumer surplus, suggesting that regulators should closely evaluate whether to facilitate industry investments in customization technologies.

##### 3 - Effects of Limited Trust on the Price of Anarchy of Random Repeated Games

Timothy Murray, University Illinois at Urbana-Champaign,  
Champaign, IL, 61820, United States, Jugal Garg, Rakesh Nagi

We examine Leader-Follower Repeated Games of 2 players on payoff matrices randomly generated from arbitrary. We explore three concepts of Limited Trust (rather than altruism) and their effects on the Price of Anarchy, both theoretical and empirical.

### ■ WD35

North Bldg 224A

#### Data-driven Analysis for Air Transport

Sponsored: Aviation Applications

Sponsored Session

Chair: Yulin Liu, University of California-Berkeley, 107 McLaughlin Hall, Berkeley, CA, 94709, United States

##### 1 - Predicting Actual Aircraft Trajectory with Deep Mixture Density Recurrent Neural Networks

Yulin Liu, University of California-Berkeley, 107 McLaughlin Hall,  
Berkeley, CA, 94709, United States, Mark M. Hansen,  
Michael O. Ball, David J. Lovell

Reliable aircraft trajectory prediction, whether in a real-time setting or for analysis of counterfactuals, is important to the efficiency of the aviation community. We propose an end-to-end deep learning framework that consists of a Long Short-Term Memory (LSTM) encoder and a mixture density LSTM decoder to predict aircraft trajectories based on last filed flight plans, wind conditions, and convective weather. The encoder network extracts features from the flight plans, and the decoder network learns the joint distribution of the state of an aircraft from meteorological conditions. Beam search and filtering algorithms are used to stabilize the prediction results in the inference phase.

##### 2 - Physics Based Learning for Simulation and Prognostic of Aircraft Dynamical System

Yang Yu, Postdoctoral Research Associate, Arizona State  
University, Tempe, AZ, United States, Houpu Yao, Yongming Liu

This study proposes the concept of physics-based learning, a hybrid approach based on data-driven learning and physical models, as a computationally efficient method for the simulation of aircraft dynamics. The physics-based learning integrates the underlying physics of dynamical systems into learning models such as neural networks to reduce the training and simulation costs. The application of physics-based learning for simulating aircraft dynamics is demonstrated using a recently introduced physics-aware network known as the deep residual recurrent neural network (DR-RNN) on a Boeing 747-100 aircraft.

##### 3 - Denoising and Risk Identification of Bird Strikes in Civil Aviation Based on Complementary Ensemble Empirical Mode Decomposition

Chen Zhang, CASTC, Beijing, China

Bird strikes are considered as one of the important factors threatening to the safety of civil aviation. In this paper, a new application based on complementary ensemble empirical mode decomposition (CEEMD) was introduced. With the data of bird strikes from 2004 to 2013, it was split into a set of intrinsic mode functions (IMFs) and a residue. During the process of CEEMD decomposition, more features had been extracted that bird strikes were prone to influence by intermittent cyclicity. What's notable is that the MHIs always appeared in September. These findings provided a theoretical basis to early warning and better measures taken for bird strikes risk management.

North Bldg 224B

#### Practice- Inventory Management

Contributed Session

Chair: Yixuan Xiao, City University of Hong Kong, 83 Tat Chee Avenue, Kowloon, 1, Hong Kong

##### 1 - Capacity Expansion with a Bundled Supply of Capacity Attributes

Mohammad Ebrahim Arababian, University of Washington, Seattle,  
WA, 98105, United States, Shi Chen, Kamran Moinszadeh

We study the well-known problem of expanding capacity of server attributes in a cloud company where supply of attributes is bundles. We consider a cost minimization problem in a continuous review, finite horizon setting. Furthermore, the best server configurations to be deployed each cycle are studied

##### 2 - Managing Perishable Inventory Systems with Multiple Age-differentiated Demand Classes

Shouchang Chen, Zhejiang University, Hangzhou, China,  
Yanzhi Li, Yi Yang, Weihua Zhou

In this paper, we consider a periodic-review inventory system with perishable products. In the market, there are different demand classes; each can be characterized by its different lost-sale cost and freshness requirement. By establishing some new properties of multimodularity, we partially characterize the structure of the optimal policy. Based on optimality analysis, we design several efficient approximation approaches. Numerical studies show that our heuristic policy outperforms the traditional heuristics proposed by prior literature.

### 3 - Determining Optimal Parameters for an Expediting Policy under a Service Level Constraint

Simon Hoeller, University of Cologne, Albertus-Magnus-Platz, Cologne, 50923, Germany, Raik Oezsen, Ulrich Thonemann

We consider a periodic review inventory system with stochastic demand, deterministic lead times, back-ordering, and the option to move outstanding units forward in the replenishment pipeline. The objective is to minimize inventory holding and expediting costs per period subject to a minimum service level constraint. We consider a generalized base-stock policy where outstanding units are expedited when the inventory level drops below a certain threshold. We develop structural properties and present an efficient procedure to determine optimal policy parameters. In a numerical study, we show that the expediting policy offers substantial savings compared to the classical base-stock policy.

### 4 - An Aggregation-based ADP Approach for the Periodic Review Model with Random Yield

Ulrich Thonemann, Universität zu Köln, Wirtschafts und Sozialwissenschaftliche Fakultät Albertus Magnus Platz, Koeln, D-50923, Germany, Michael Voelkel, Anna-Lena Sachs

A manufacturer places orders periodically for products that are shipped from a supplier. Orders may get damaged with some probability, i.e. the order is subject to random yield. The manufacturer may track its orders to receive information on damages and to place additional orders. We solve this model with stochastic demand, tracking cost and random yield in all periods to optimality. We propose a novel aggregation-based approximate dynamic programming algorithm and provide solutions for larger instances for which it is not feasible to obtain optimal solutions. We analyze the effect of dynamic tracking and develop a heuristic that takes tracking costs into account to solve even larger instances.

### 5 - A Newsvendor Analysis with Carbon Emission Regulations

Sungyong Choi, Assistant Professor, Yonsei University, College of Government and Business, 1 Yoneseidae-gil, Wonju, 26493, Korea, Republic of

This paper aims to provide an optimization model for operational efficiency in individual firms considering various types of carbon emission regulations. More specifically, this study assumes that customer demand is given as a probability distribution. Under this circumstance, I formulate newsvendor models including carbon emission regulations and then derive practical implications for the policymakers in carbon emission regulations. Then, I analyze the models to provide closed-form solutions and conduct a sensitivity analysis for the impacts of model parameters on the optimal solutions through a comparative static analysis. All analytical results are reconfirmed by numerical analysis.

### 6 - Inventory Management under Corporate Income Tax

Yixuan Xiao, City University of Hong Kong, 83 Tat Chee Avenue, Kowloon, Hong Kong, Zhan Pang

Corporate income tax is a significant cost for companies and an important input into many corporate decisions. Corporations use after-tax earnings to reinvest in their core business and pay out dividends. We propose a framework to study a firm's inventory decisions under taxation in multi-accounting periods where each accounting period consists of multiple ordering periods. We show that in the backlog model under a convex tax or in the lost-sales model under a flat-rate tax and mild conditions, a state-dependent base-stock policy is optimal. We also examine the static effect and intertemporal effect of tax on a firm's inventory decisions.

### Applied Probability in Machine Learning and Optimization I

Sponsored: Applied Probability

Sponsored Session

Chair: Chang-Han Rhee, Centrum Wiskunde and Informatica, Amsterdam, 1018 MZ, Netherlands

### 1 - Approximating Data-driven Joint Chance-constrained Programs via Uncertainty Set Construction

Zhiyuan Huang, University of Michigan, Ann Arbor, MI, 48109, United States, Jeff Hong, Henry Lam

We discuss a statistical framework to integrate data into robust optimization, based on prediction set learning and a simple data-splitting validation scheme that achieves finite-sample statistical guarantees on the feasibility of the underlying uncertain constraints. We demonstrate several features of the framework, including a dimension-free sample size requirement for the feasibility guarantees and the capability to self-improve existing solutions in terms of both optimality and feasibility.

### 2 - Offline Multi-action Policy Learning: Generalization and Optimization

Zhengyuan Zhou, 160 Comstock Circle - Unit 106002, Stanford, CA, 94305, United States, Susan Athey, Stefan Wager

The unprecedented growth of easily accessible user-specific data has welcomed the exciting era of personalized decision making, an ubiquitous paradigm that has been revolutionizing many areas of operations research (e.g. health care, Internet advertising, product recommendation, public policies). The central problem in personalized decision making lies in learning from observational data a good policy, which provisions decisions based on each individual's distinct set of characteristics. In this work, we study the general offline policy learning problem and provide a principled framework to learn an effective policy from data.

### 3 - The Nearest Neighbor Information Estimator is Adaptively Near Minimax Rate-optimal

Jiantao Jiao, Stanford University, CA, United States, Weihao Gao, Yanjun Han

We analyze the Kozachenko-Leonenko (KL) nearest neighbor estimator for the differential entropy. We obtain the first uniform upper bound on its performance over Holder balls on a torus without assuming any conditions on how close the density could be from zero. Accompanying a new minimax lower bound over the Holder ball, we show that the KL estimator is achieving the minimax rates up to logarithmic factors without cognizance of the smoothness parameter  $s$  of the  $H_2$ -holder ball for  $s \in (0, 2]$  and arbitrary dimension  $d$ , rendering it the first estimator that provably satisfies this property.

### 4 - Data Driven Distributionally Robust Optimization via Optimal Transport: Algorithms and Applications

Fan Zhang, Stanford University, 450 Serra Mall, Stanford, CA, 94305, United States, Jose Blanchet, Yang Kang, Karthyek Murthy

In this talk, we are going to explain why data-driven distributionally robust optimization (DRO) is an important class of stochastic optimization problems by showing that it encompasses popular estimators in machine learning. We will provide optimal algorithms under general DRO formulations. In particular, we will prove that solving a DRO problem of an affine decision model is not harder than solving its non-robust counterpart. We will also show some estimates of the optimal transport rules. Finally, we will demonstrate empirically that our proposed methodology is able to improve upon popular machine learning estimators.

### Joint Session APS/Opt-Uncert: Robust and Dynamic Stochastic Optimization

Sponsored: Applied Probability

Sponsored Session

Chair: Saumya Sinha, University of Washington, Seattle, WA, 98195, United States

### 1 - A Utility Uncertainty Approach to Multiattribute Bayesian Optimization

Raul Astudillo, Cornell University, Ithaca, NY, 14850, United States

We consider multi-attribute Bayesian optimization, where each feasible design is associated with a vector of attributes that can be evaluated via a time-consuming computer code, and each vector of attributes is assigned a utility according to a decision-maker's implicit utility function.

We propose a sampling policy that maximizes the expected utility of the design chosen by the decision-maker, where her choice is based on the policy's sampling-based attribute vector estimates. In contrast with existing approaches for multi-attribute optimization that focus on estimating a Pareto frontier, our approach leverages prior information about the decision-maker's preferences.

### 2 - A Distributionally Robust Capacity Planning Model for Optimizing Access Delay in Surgical Services under Limited Information

Mohammad Zhalechian, PhD Student, University of Michigan, 1205 Beal Avenue, Ann Arbor, MI, 48109-2117, United States, Mark P. Van Oyen

We develop a capacity allocation framework that reserves OR time slots for different types of surgeries (department, duration, and urgency) in the complex network in our partner hospital. Urgent patients must be scheduled for surgery with much shorter access delay targets than elective ones. Due to the uncertainty in surgical demand, we develop a distributionally robust optimization model that assumes only the moment information of surgical demand.

**3 - Robust Countable-state Markov Decision Processes**

Saumya Sinha, University of Washington, Seattle, WA, 98195,  
United States, Archis Ghatge

Policy iteration is a standard method for solving robust Markov decision processes. For the countable-state case, however, convergence of the algorithm has not been established. Also, an as-is implementation of the method is not possible since it calls for an infinite amount of computation in each iteration. We present an approximate policy iteration algorithm that performs finitely implementable variants of policy evaluation and policy improvement. We prove that the value functions of the sequence of policies produced by this algorithm converge monotonically to the optimal value function. The policies themselves converge subsequentially to an optimal policy.

**4 - Feedback-based Tree Search for Reinforcement Learning**

Emmanuel Ekwedike, Tencent AI Lab, Bellevue, WA, United States  
Emmanuel Ekwedike, Princeton University, Princeton, NJ,  
United States, Daniel Jiang, Han Liu

Inspired by recent successes of Monte-Carlo tree search (MCTS) in a number of artificial intelligence (AI) application domains, we propose a model-based reinforcement learning technique that iteratively applies MCTS on batches of small, finite-horizon versions of the original infinite-horizon Markov decision process. We provide the first sample complexity bounds for a tree search-based reinforcement learning algorithm.

**5 - Analyzing and Provably Improving Fixed Budget Ranking and Selection Algorithms**

Di Wu, Georgia Institute of Technology, 755 Ferst Drive, NW,  
Atlanta, GA, 30309, United States, Enlu Zhou

We study the fixed budget ranking and selection problem, where the goal is to maximize the probability of correct selection (PCS) under a fixed simulation budget. First, we characterize the convergence rate of PCS for several classes of algorithms, and reveal that a constant initial samples size only amounts to a sub-exponential (or even polynomial) convergence rate. Then, we improve two state-of-the-art algorithms: OCBA from simulation optimization and successive rejects (SR) from best-arm identification. Our algorithms are guaranteed to achieve an exponential convergence rate, as is shown by finite-sample bounds on the PCS. Further, the improvement is validated using numerical experiments.

**Practice - Decision Support Systems & Applications I**

Contributed Session

Chair: Juri Yanase, Complete Decisions, LLC, 10517 Springbrook Ave.,  
Baton Rouge, LA, 70810, United States

**1 - A Minimum Cost Consensus Model for Social-network Group Decision-making Problems with Incomplete Linguistic Preference Relations**

Dong Cheng, Xi'an Jiaotong University, Xi'an, 710049, China,  
Zhili Zhou

In this study, we propose a minimum cost consensus framework in social-network group decision-making with incomplete linguistic preference relations. First, a uninorm-based iterative procedure is presented to estimate the missing preference values. Next, we obtain the user weights by analyzing the tie strength and topology structure of their social network. Then, inconsistent users are identified through both the consistency and consensus measures. To help them reach a consensus with the minimum adjustment costs, an optimization-based consensus model is built to provide customized recommendations to them. Finally, the validity of the proposed method is verified by an example.

**2 - Optimal Pricing and Ordering Strategy in a Single Supplier Group Purchasing Problem with a Newsvendor Framework**

Abdollah Mohammadi, UNC Charlotte, 532 Lex Dr., Charlotte, NC,  
28262, United States, Ertunga Ozelkan

Procurement cost account for a significant percentage of the total cost in a business entity. Group purchasing is a procurement strategy that helps companies save in their purchasing cost. In this research we are considering a group purchasing problem where a single supplier offers a quantity discount pricing schedule and retailers should decide about their price and ordering policy to maximize their profit in a single period problem. Through theoretical analysis we find out the optimal result condition and develop a heuristic algorithm to find out the near optimal results for a test problem.

**3 - Blockchain Adoption under Uncertainty of Regulation**

Reza Alizadeh, The University of Oklahoma, 815 Russell Circle, E.  
Brooks St, Norman, OK, 73071, United States, Leili Soltanisehat

Demand for decentralization of the organizational processes is getting strong throughout the world. The entity of the decentralization technology and the governmental regulations may differ among enterprises. We consider a decentralized IT system (Blockchain) inside an enterprise under uncertain governmental regulation and standards when there is a competitive tendency to adopt blockchain in the market.

**4 - Shared Decision Making (SDM) as a Fast Emerging Field in the Interface of OR / MS and Medicine: Its Past, Present, and Likely Future**

Juri Yanase, Complete Decisions, LLC, 10517 Springbrook Ave.,  
Baton Rouge, LA, 70810, United States, Evangelos Triantaphyllou,  
Zaina Qureshi

The rapid evolution of medicine has resulted in multiple treatment options for many chronic conditions. These treatments are associated with different risk-benefit profiles, and preferences by individual patients. SDM provides a unique platform for patients and clinicians to collaboratively determine the best treatment option for individual patients. We review SDM's history, the state-of-the-art and some challenges for the future.

**1 - Data Driven Optimization and Statistical Modeling to Improve Meter Reading for Utility Companies**

Debdatta Sinha Roy, Robert H. Smith School of Business,  
University of Maryland, 7699 Mowatt Lane, 3330 Van Munching  
Hall, College Park, MD, 20742, United States, Christof Defryn,  
Bruce L. Golden, Edward Wasil

Utility companies collect usage data from meters on a regular basis. Each meter has a signal transmitter that is automatically read by a receiver within a specified distance using radio-frequency identification (RFID) technology. In practice, there is uncertainty while reading meters from the planned routes of the vehicles. The RFID signals are discontinuous, and each meter differs with respect to the specified distance. These factors can lead to missed reads. We use data analytics, optimization, and Bayesian statistics to address the uncertainty. Simulation experiments using real data show that a hierarchical Bayesian model performs the best by designing improved routes for the vehicles.

**2 - UNIPOPT: Univariate Projection-based Optimization without Derivatives**

Ishan Bajaj, Texas A&M University, College Station, TX, 77840,  
United States, Faruque Hasan

We present a novel derivative-free framework UNIPOPT (UNivariate Projection-based OPTimization) based on projecting all the samples onto a univariate space defined by summation of the decision variables. We illustrate that a univariate function (defined as lower envelope) exists on this space such that its minima is the same as that of the original function. The UNIPOPT framework identifies the points on the lower envelope and uses these samples to optimize it. UNIPOPT finds solutions within 1% of the global minima for 10-30% more problems compared to other solvers when applied on 485 constrained black-box problems. We also show the convergence of UNIPOPT to first order critical point.

**3 - Design a Power Network for Charging Electronic Vehicles**

Ting Wu, Nanjing University, Department of Mathematics, No 22  
Hankou Road, Nanjing, 210093, China, Cheng Zhu, Yasmina Maizi

Electronic Vehicles contribute to a green environment in a smart city, they, however, raise a challenging problem for an existing power network to accommodate their charging facilities. This study aims to verify an upgraded power network via simulation models, providing managerial insights for adjusting existing power networks given a transportation network.

**4 - Optimal Trade Execution Strategy under Volume and Price Uncertainty**

Julien Vaes, University of Oxford, Andrew Wiles Building,  
Radcliffe Observatory Quarter, Woodstock Road, Oxford, OX2  
6GG, United Kingdom, Julien Vaes, The Alan Turing Institute,  
96 Euston Road, Kings Cross, London, NW1 2DB, United Kingdom

In the seminal paper on optimal execution of portfolio transactions, Almgren and Chriss define the optimal trading strategy to liquidate a fixed volume of a single security under price uncertainty. Yet sometimes, like in the power market, the volume to be traded can only be estimated and becomes more accurate when approaching a specified delivery time. We develop a model that accounts for volume uncertainty and show that a risk-averse trader has benefit in delaying trades. We demonstrate that the optimal strategy is a trade-off between early and late trades to balance risk associated to price and volume respectively.

### Climate Impacts on the Electric Power Sector

Emerging Topic: Energy and Climate

Emerging Topic Session

Chair: Delavane Diaz, Electric Power Research Institute, Washington, DC, 20005, United States

Co-Chair: John Bistline, Electric Power Research Institute, CA, United States

#### 1 - Climate Change Vulnerabilities of New York State's Future Electric System

Delavane Diaz, Electric Power Research Institute, Washington, DC, 20005, United States

This paper estimates potential impacts of future climate conditions on the NY electricity system through 2050 using EPRI's US-REGEN model. Specifically, we evaluate future climate changes as characterized in the NY ClimAID assessment through the following climate impact pathways: temperature impacts on of thermal generation and transmission efficiency, water availability for hydro generation and cooling, and temperature impacts on electricity demand.

#### 2 - An Integrated Approach to Climate Impacts on Power Sector Using GCAM

Mohamad Hejazi, Research Scientist, Joint Global Change Research Institute, Pacific Northwest National Laboratory, College Park, MD, 20740, United States, Zarrar Khan, Gokul Iyer, Marshall Wise, Pralit Patel, Sonny Kim

Energy, water, and land systems are increasingly interconnected. In this study, we use the Global Change Assessment Model (GCAM), where interactions between population, economic growth, energy, land, and water resources interact simultaneously in a dynamically evolving system, to investigate the direct and indirect effects of climate impacts on the electric sector under different scenarios.

#### 3 - Does Water Scarcity Shift the Electricity Generation Mix toward Fossil Fuels? Empirical Evidence from the United States

Jonathan Eyer, USC, Casey Wichman

Using an econometric model of plant-level electricity generation between 2001 and 2012, we estimate the effect of water scarcity on the US electricity mix. We find that hydroelectric generation decreases substantially in response to drought, and the replacement fuel varies by region. We quantify the substantial social costs associated with the increased carbon emissions.

Co-Chair: Eunshin Byon, University of Michigan, Ann Arbor, MI, 48109, United States

#### 1 - Variance Reduction Method for Wind Turbine Extreme Load Estimation

Qiyun Pan, University of Michigan, Department of IOE, Ann Arbor, MI, 48109-2117, United States, Eunshin Byon, Henry Lam

This study develops a computationally efficient variance reduction method for wind turbine extreme load estimation with the stochastic simulation model. We propose an adaptive method that iteratively refines the input sampling density so that sampling efforts can be steered to focus on important input regions. We devise a parameter updating rule to make the sampling density parameter converge to the unknown target extreme load and prove the extreme load estimation uncertainty becomes smaller than that from crude Monte Carlo simulation.

#### 2 - Quantifying the Effect of Vortex Generator Installation on Wind Power Production

Hoon Hwangbo, Texas A&M University, College Station, TX, 77840, United States, Yu Ding

Vortex generator installation is known to improve wind power production, and how much to improve is a fundamental managerial question to be addressed. Quantifying the effect of the installation is, though, quite challenging due to the presence of multiple sources of variation causing difference in power output between pre- and post-installation periods. For more accurate quantification, we use a machine learning model to control for some environmental effects in power

output and consider the temporal change of wind power production between the two periods of installation, which shows quite consistent results.

#### 3 - Update on NREL Work in UQ for Loads Analysis

Katherine Dykes, NREL, Golden, CO, United States

This presentation will provide an update on NREL work using statistical methods applied to wind turbine extreme and fatigue loads analysis. Loads analysis is a cumbersome part of wind turbine design and analysis with significant uncertainty; advanced statistical methods can help improve the accuracy and computational efficiency of this process.

### Electrical Markets

Contributed Session

Chair: G ray Kara, Norwegian University of Science and Technology, Høgskoleringen 1, Trondheim, 7491, Norway

#### 1 - Long- and Short-term Uncertainties in the Capacity Expansion Problem with Renewables and Electric Vehicles

Miguel Carrion, Universidad de Castilla-La Mancha, Campus Tecnológico Fabrica de Armas, Toledo, 45071, Spain, Ruth Dominguez, Rafael Zárate-Miñano

This paper solves a coordinated generation and storage expansion problem considering long- and short-term uncertainties. We assume that the power system operator is able to control the charging processes of those electric vehicles that are willing to get involved in the power system operation in exchange for a financial reimbursement. The day-ahead energy and reserve capacity markets are explicitly considered in this capacity expansion problem. The resulting stochastic mixed-integer linear problem is solved using Benders decomposition. The proposed formulation is tested on a realistic case study based on an actual isolated power system in Spain.

#### 2 - An Enhanced Argonne Least Cost Electricity Analysis Framework: Impact of High Penetration of Electrified Vehicles

Jonghwan Kwon, Argonne National Laboratory, Lemont, IL, United States, Zhi Zhou

This study investigates the impact of electrified vehicles with fast charging technology on electricity grid operations, market efficiency, and emission. An enhanced Argonne Least Cost Electricity Analysis Framework (ALEAF) will be used to analyze the impact of fast charging station deployment and status profile in Chicago urban region, which will be provided by a transportation system simulation tool (POLARIS). The modeling framework includes electric grid and market operation models, formulated into multi-stage mixed integer programming problems. This study will allow the industry to understand economic viability of infrastructure and energy implications of vehicle electrification.

#### 3 - The Value of Flexibility in Electricity Markets from Gas Turbine Upgrades: A Stochastic Mixed Integer Programming Approach

Sourabh Dalvi, Pennsylvania State University, Leonhard Building, University Park, PA, 16802, United States, Mort Webster

The expected increase in generation from renewables and the consequent increased variability in net load has led to calls for more flexible resources in the generation mix. One potential source of flexibility is from performance improvements to existing gas turbines, including higher maximum output, lower minimum output, faster ramping, and less time and lower cost for startups. We apply a stochastic multi-stage mixed integer linear program to model the power system of Public Service of New Mexico, and demonstrate the relative value of different upgrades to the system and to the unit owner.

#### 4 - Production Intermittence in Spot Electricity Markets

Arthur Thomas, PhD Student, IFP Energies Nouvelles, 4 avenue de Bois-Préau, Rueil-Malmaison, 92852, France University of Nantes, Chemin de la Censive du Tertre-Batiment Erdre, Nantes, 44322, France, Albert Banal-Estañol, Olivier Massol, Augusto Rupirez Micola

This paper analyses the influence of production intermittence on spot markets. We use both game theory and an adaptation of the Camerer and Ho (1999) behavioural model. Controlling for costs, we find that intermittent technologies yield lower prices when incumbents have individual market power, but are higher when they do not have it. This happens both when firms are risk-neutral and risk-averse, and also under different intermittence and ownership configurations. Replacing high-cost assets with low-cost ones results in higher prices than when they are left to co-exist. The findings have implications for, among others, wholesale electricity markets in which wind power is increasingly important.

### 5 - Modeling Demand-side Flexibility in Electricity Markets

G ray Kara, PhD Candidate, Norwegian University of Science and Technology, Trondheim, Norway, Asgeir Tomasgard, Hossein Farahmand

Increase in variable renewable energy sources, electrical vehicles, batteries etc. shaped load profiles and generation plans. The term flexibility is not new in supply-side power markets studies. However, the flexibility in demand-side gathered attraction in recent times by the support of developing technologies. In this study, our aim is the characterization of flexibility resources in energy markets along three classes: Time, spatial, and provision. We examine demand-side flexibility in stochastic optimization models by considering availability and geographical relevance from different flexibility providers.

#### 1 - Scenario Grouping for Stochastic Unit Commitment

Amelia Musselman, Postdoctoral Researcher, Lawrence Livermore National Laboratory, Livermore, CA, 94551, United States, Kevin C. Ryan, Deepak Rajan, Jean-Paul Watson

In this research, we introduce an algorithm to intelligently group scenarios within a scenario decomposition algorithmic framework for solving stochastic programs. Two variations of the algorithm are implemented as fully general extensions to PySP's (Pyomo's stochastic programming library) implementation of the iterative progressive hedging algorithm for solving stochastic programs. In the first, scenario grouping is used as a pre-processing step to progressive hedging. In the second, scenarios are grouped in each iteration until the bounds given by grouping converge. The two algorithms are applied to solve increasingly difficult instances of stochastic unit commitment.

#### 2 - The Midcontinent Independent System Operator Renewable Integration Impact Assessment

Armando Figueroa, PhD, MISO

This presentation will show an overview of the Renewable Integration Impact Assessment study conducted at the Mid-Continent Independent System Operator. The study framework will be highlighted, including preliminary results related to the resource adequacy, energy adequacy, and operating reliability modules.

#### 3 - Sustainable Electric Generation Portfolios: A Multi-criteria Decision Analysis Framework Applied to the New England Power System

Destenie Supreece Nock, Univ. of Mass-Amherst, Hadley, MA, 01035, United States, Erin Baker

We evaluate the sustainability of electric generation portfolios, using a multi-criteria decision analysis approach applied to the New England power system. We evaluate sustainability of generation portfolios using a set of seven sustainability criteria. Here generation portfolios with varying levels of offshore wind, natural gas, hydro, and nuclear, are considered under various preference scenarios. We find that when the most weight on air pollution and climate change, adding nuclear capacity is a dominant choice. If avoiding nuclear and conserving water is most important, then retiring oil and nuclear while adding high levels of offshore wind rises to the top.

#### 1 - The Value of Quality Grading in Remanufacturing under Quality Level Uncertainty

Meltem Denizel, Iowa State University, 2340 Gerdin Business Building, 2167 Union Dr., Ames, IA, 50011-2027, United States, Ihsan Yanikoglu

In remanufacturing, variability in quality levels of cores has an impact on both the process cost and time. While previous research suggest that quality grading adds value, there are also concerns about how reliably the grades can be identified. We develop a robust optimization model for remanufacturing planning. Both the unit cost and time of remanufacturing are uncertain parameters that are assumed to reside in two uncertainty sets; box or ellipsoidal. We analyze

un capacitated and capacitated cases and based on extensive numerical analysis, conclude that while there is still value in grading on average, it becomes significantly smaller than the case when uncertainty is not accounted for.

#### 2 - Firm Performance through Corporate Social Responsibility Leveraging the Supply Chain

Feng Cheng, PhD Candidate, Arizona State University, Tempe, AZ, United States

This study examines the effect of supply-chain CSR adoption - i.e. adoption of Corporate Social Responsibility in the value chain (from supply base to customer base) - on the focal firm's financial performance. Our results show that supply-chain CSR does not necessarily lead to superior firm performance. We uncover pathways that can benefit a firm from the adoption of supply-chain CSR; namely, (1) innovation driven from both focal firm CSR and supply-chain CSR and (2) employee performance. The results suggest that a firm benefits from supply-chain CSR only if the adoption inspires innovation and high employee productivity. Such positive effect becomes larger in less eco-friendly industries.

#### 3 - Optimal Fleet Size and the Efficiency-effectiveness-equity Trade-offs in Humanitarian Procurement Policies

Laura Turrini, European Business School, Oestrich Winkel, Germany

We focus on fleet management and empirically estimate the real needs of a decentralized humanitarian organization that operates both relief and development operations. We study the optimal allocation of vehicle procurement, based on a set of constraints, in order to satisfy organizational needs as efficiently, effectively and equitably as possible.

#### 4 - Sustainable Consumption Behavior

Anita Lee-Post, University of Kentucky, Department of Marketing and Supply Chain, 435Q Business & Economics Bldg, Lexington, KY, 40506, United States, Chon-Huat Goh

The purpose of this research is to further our understanding on sustainable consumption behavior. An empirical study is sought to investigate the pathway linking attitude, social influence, and sustainable consumption behavior using a survey methodology. Operational and marketing implications of findings from this study will be presented.

### Uncertainty-Driven Power Systems Planning and Operation Supporting Resilience

Sponsored: Energy, Natural Res & the Environment/Energy

Sponsored Session

Chair: Dehghanian Payman, George Washington University, 800 22nd St. NW, Science and Engineering Hall (SEH) 6630, Washington, DC, 20052, United States

#### 1 - Big Data Analytics in Large Scale Power Grid Economic Planning

Yingzhong Gu, PhD, GE Energy Consulting, Schenectady, NY, 12345, United States

Power system economic planning is a core part of a comprehensive power system planning process, which not only considers the needs for reliability, public policy and resource adequacy but also it well addresses the long-term needs for a more economical and efficient power grid operation. The power system economic planning, using production simulation tool, evaluate the current and future state of bulk power grid and the economic impact of various projects to reduce the overall operation cost in the long run. GE Multi-Area Production Simulation (MAPS) is widely adopted to conduct various power system economic planning studies including renewable integration studies, market efficiency evaluation studies, transmission planning studies, and congestion assessment studies, etc. One of the major challenge of power system economic planning is to conduct long-term (i.e. 20-30 years) production simulation for large scale power systems. The big data analytics technology is a key to facilitate the state-of-the-art power system economic planning. This seminar introduces some major efforts GE is taking toward this new era.

#### 2 - Resilience of Power Systems to Black Sky Hazards – Methods, Metrics and Thoughts

Mathaios Panteli, The University of Manchester, Manchester, United Kingdom

Recent extreme events, such as severe storms and earthquakes, have placed resilience in the spotlight for power system operators and regulators worldwide. Hence, there is a growing concern over the critical need to address and boost resilience to such disastrous events, which are referred to as Black Sky hazards. This talk will share experiences gained from relevant research projects in United Kingdom in the area of resilient power systems planning and operation. Amongst other, insights will be provided on conceptual frameworks, methods and metrics suitable for resilience analysis and further thoughts will be provided towards designing future resilient power systems.

### 3 - Online Resilience Support for Grid Cyber-Physical Situational Awareness

Katherine Davis, PhD, Texas A&M University, College Station, TX, 77843, United States

High-quality situational awareness enables rational tactical and strategic decision support. This talk describes work on bringing together expertise and methodologies for cyber-physical grid resilience that each make significant progress toward this goal. We explore synergies of these efforts and describe how they can lead to enhanced situational awareness across domains, where the focus is on the decision-making process in real-time cyber-physical systems through the steps of observe-orient-decide-act. The talk will investigate the design of the decision-making process in the CyPSA framework with a focus on decisions that promote grid cyber-physical resilience.

### 4 - Networked Community Microgrids Planning for Enhancing the Resilience in Power Grids

Masoud Barati, PhD, University of Pittsburgh, Pittsburgh, PA, 15260, United States

We proposed a resilient planning problem of networked microgrids with DERs. We integrate the investment problem and two sets of operating problems associated with the grid-connected and islanding modes of microgrids into a two-stage stochastic model to capture randomness nature of hazard events and long-term load growth, as well as the islanding risk caused by external disturbances with a joint-chance constraint to prevent the risks. A SOCP formulation is presented to incorporate AC-OPF in short-term operation. Numerical results on distribution systems prove the effectiveness of the model.

### 5 - AC Optimal Power Flow with Robust Feasibility Guarantees

Line Roald, Los Alamos National Laboratory, Los Alamos, NM, 87544, United States

With increasing uncertainty from renewable energy, optimization problems that explicitly consider uncertainty are increasingly important to the operation of electric power systems. We discuss our work towards a robust AC Optimal Power Flow (OPF) algorithm. Ensuring robust feasibility requires 1) ensuring solvability of the power flow equations and 2) guaranteeing feasibility of the engineering constraints for all uncertainty realizations. We use convex relaxations to bound the impact of uncertainty, leading to conservative results. The solution is obtained using an alternating solution algorithm, and the approach is illustrated via analyses of two small test cases.

### Energy Policy and Planning IV

Contributed Session

Chair: Mark Rodgers, Rutgers Business School, South Orange, NJ, 07079-1466, United States

#### 1 - Electric Business Modeling for Optimal Design of Isolated Power Systems

Aito Yasuda, Osaka University, Osaka, Japan, Hiroshi Morita

In recent years, long-term cut off of power supply is anticipated by large-scale disasters. An isolated electric system is an electric power model in which power demand equipment is operated by a power generation and a storage battery without using power supply from the grid. We derive an optimal design of the capacity of solar panel and storage battery of isolated electric system to keep the quality of life in the event of disaster. We also investigate an operation model for multiple isolated electric systems connected by a network.

#### 2 - Risky Capacity Equilibrium Models for Risk Averse Investment Equilibria with Incomplete Markets

Daniel Ralph, University of Cambridge, Judge Business School, Trumpington Street, Cambridge, CB2 1AG, United Kingdom, Gauthier de Maere, Andreas Ehrnemann, Yves Smeers

Risky Capacity Equilibrium Problems" incorporate (i) risk averse investment in power plants, (ii) financial trading to hedge those investments, and (iii) strategic production in a stochastic spot market. These models concatenate short-term electricity market (perfect competition or Cournot) with long-term investments (risk neutral or risk averse behaviour in different risk trading settings). We focus on incomplete financial markets, when not all risks can be traded, using results from "Risky Design Equilibrium Problems" and standard Nash game techniques to show existence of equilibria. Numerical results show the impact of incompleteness on equilibrium capacity and spot prices.

#### 3 - Solving the Bi-level Problem of a Closed Optimization of Price Zone Configurations in Europe Using a Genetic Algorithm

Tim Felling, Research Assistant, University Duisburg-Essen, Berliner Platz 6-8, Essen, 45127, Germany

In Europe, the reconfiguration of price zones (PZ) is under discussion in both politics and academia. Yet, current research focusses either on approximations using algorithms that cluster nodes to PZ for large-scale grids or on closed optimizations on smaller scale. We contribute to the discussion by formulating the problem of optimal PZs as a closed bi-level problem that considers day-ahead and

redispatch markets. The PZ configuration is reflected by a node-to-zone assignment using binary variables. For its solution, we apply a suited genetic algorithm on a large-scale grid of Western Europe.

#### 4 - Market Model for Electric Vehicle Battery Aggregator

Ivan Pavic, University of Zagreb, Unska 3, Zagreb, 10000, Croatia, Hrvoje Pandzic, Tomislav Capuder

There are more than three million EVs on the roads which accounts to more than 70 GWh of storage capacity. Controlled charging can become an interesting option to provide flexibility to power system. EV aggregator is an entity which groups EV chargers and submit their aggregated power on electricity or balancing markets. Such entity can use EVs' flexibility only when they connected to their dedicated chargers. We propose a new entity called electric vehicle battery aggregator (EVBA) which follows EV as part of internet of things concept and charge them optimally for end-users throughout longer periods. EVBA concept can be part of EV routing and infotainment application responsible for power supply.

#### 5 - System Implications of Continuous-time Dispatching in Electricity Markets

Mark Rodgers, Assistant Professor, Rutgers Business School, 1 Washington Park, Newark, NJ, 07102, United States, Wenbo (Selina) Cai, Xiaowei Xu, Frank A. Felder

In centralized electricity markets, supply and demand are balanced on discrete time intervals, but demand volatility occurs on a more granular level. Additionally, markets with large renewable shares experience higher levels of supply volatility due to intermittent weather patterns. While batteries partially reduce supply volatility, there is a need for a real-time, load-balancing mechanism. In this research, we study the supply and demand volatility in the context of a continuous time, load-balancing framework. Additionally, we assess the resulting effects of this framework, along with the impact of battery storage investments, on wholesale electricity prices.

#### 1 - In Need of Aid: Funding Uncertainty and Diversification in Humanitarian Operations

Gloria Urrea, Indiana University, 3631 East Park Lane, Bloomington, IN, 47408, United States, Sebastian Villa, Eric Quintane

Research on resource dependence focuses on the strategies dependent organizations follow to access resources in order to survive. In the humanitarian context, humanitarian organizations (HOs) depend on resources from donors and diminish their dependence by accessing multiple sources of funding. We argue that while finding additional sources of funding reduces current uncertainty and enables survival, it decreases the organization's capacity to diversify (i.e. to venture into new service sectors and geographical regions) because it does not reduce future uncertainty. We use information from over 30,000 donations provided by 222 donors to 845 HOs during 1999-2016 to test our hypotheses.

#### 2 - Tracking Passengers' Routes in Urban Railway Networks Using Integer Programming

Daichi Tahara, Osaka University, Osaka, Japan, Shunji Umetani, Hiroshi Morita

The analysis of a population's mobility patterns has become much important in recent years. However, it still remains much difficult due to incompleteness and unreliability of public traffic survey data. We now propose an integer programming approach to track individual passengers' routes in urban railway networks from a given spatiotemporal distribution of anonymous passengers. We evaluated the proposed method numerically based on Japanese public traffic survey data, and observed that it tracked actual passengers' routes with high accuracy.

#### 3 - Launching Next Generation Products in a Competitive Market

Rob A. Zuidwijk, Professor Ports in Global Networks, Erasmus University Rotterdam, RSM Erasmus University, P.O. Box 1738, Rotterdam, 3000 DR, Netherlands, Xishu Li, Rene de Koster, Suresh P. Sethi

We report on our research on how two competing firms launch a next-generation product (NGP) in terms of timing and capacity allocation between the NGP and an existing basic product. Our research focuses on the impact of a two-dimensional competition: the internal competition between the two products and the external competition between the two firms. We demonstrate that demand uncertainty and competition between the firms should be taken into account jointly while deciding on timing and capacity allocation.

#### 4 - Data-driven Decision Making in Last Mile Delivery Problems

Sami Serkan Zarik, PhD Candidate, Eindhoven University of Technology, School of Industrial Engineering (Pav. F08), P.O. Box 513, Eindhoven, 5600 MB, Netherlands, Lucas Petrus Veelenturf, Tom Van Woensel, Gilbert Laporte

The recent increase in online orders leads to logistical challenges such as low hit rates (number of successful deliveries) and unattended deliveries. In this paper, we consider exact and heuristic approaches in order to solve last mile delivery problems in which customers' attendance probability data is considered for each of the time buckets in the planning horizon. We aim to improve the hit rate by considering routing and scheduling decisions. We develop an efficient heuristic approach by iteratively solving routing and scheduling problems. Numerical results will be presented.

#### 5 - Partnership Uncertainty and Jugaad

Achal Bassamboo, Northwestern University, 2001 Sheridan Road, Evanston, IL, 60208, United States, Sanket Patil, Prateek Raj

The paper models how partnership uncertainty influences the level of investment in new projects. When businesses can delay their decisions to invest and instead search for an outside option (do Jugaad) uncertainty in commitment can emerge. We find that Jugaad can lead to a tragedy of commons, where it is individually rational to expand the option set, but such a large option set reduces commitment to new projects and hampers overall level of investment.

##### 1 - Truck Appointment Systems Considering Impact to Drayage Truck Tours

Mohammad Torkjazi, University of South Carolina, Columbia, SC, 29205, United States, Nathan Huynh, Samaneh Shiri

This study proposes a novel approach for designing a Truck Appointment System (TAS) intended to serve both the marine container terminal operator and drayage operators. The aim of the proposed TAS is to minimize the impact to both terminal and drayage operations.

##### 2 - Design and Operation of China Railway Express under Market Competition

Yingzi Peng, Tsinghua University, Beijing, 100084, China, Lefei Li

As an important symbol of "The Belt and Road transportation interconnection, China Railway Express has obtained a great increase in the number of commodity freight. Most mathematical models of intermodal network design have been developed as stakeholder of an intermodal operator. In this research, we develop a network design and operation model in order to help China Railway Express, as a carrier, to solve for better freight routes and schedules considering competition with other carriers. The model is formulated as a bilevel nonlinear integer program, which is difficult to solve.

##### 3 - Design of a Relay Network in Long-haul Transportation

Amin Ziaefar, Southern Methodist University, Dallas, TX, 75205, United States, Halit Uster

We present a new model to strategically design a relay network for long-haul transportation by considering alternative routings. We devise a Benders decomposition based solution algorithm that is enhanced by strengthened benders cuts, heuristics, and surrogate constraints to solve it efficiently. We present the computational results to demonstrate the efficiency of our algorithm on large-scale instances.

##### 4 - Freight Demand Modeling in Bangladesh: A World Bank Project

Abdelrahman Ismael, Rensselaer Polytechnic Institute, Troy, NY, 12180, United States, Jose Holguin-Veras, Lokesh Kumar Kalahasthi, Wilfredo Yushimito

This presentation explains the freight modeling performed as a part of a project funded by the World Bank group. Freight generation, freight trip generation were modelled at district level in Bangladesh, using the survey conducted by the team. Freight Origin-Destination Synthesis, a process of obtaining the loaded and empty flows between the districts was performed, using the confidential Census datasets, road network, link travel time estimated using the GPS data, and the traffic count data for year 2013. Imports and export traffic flows were modeled using the Customs data. A doubly constrained gravity model is used for trip distribution, and Noortman and van E's model is used for empty trips.

##### 5 - Using Electric Vehicles for Commercial Urban Transports

Allan Larsen, Professor, Technical University of Denmark, DTU Management Engineering, Building 424, DTU, Lyngby, DK-2800, Denmark, Dario Pacino, Michael Bruhn Barfod, Jonas Mark Christensen, Satya Sarvani Malladi

Electric vehicles (EVs) are facing a rapid development enabling such vehicles to be used in commercial transport. The EU project, EUFAL (Electric Urban Freight and Logistics), sets out to examine the potentials of using EVs in city logistics. This presentation will provide an overview of the planning and management problems met when implementing EVs in urban freight transport. Two real-life optimization problems dealing with routing EVs for collection of blood samples from private physicians and the fleet management of electric service vehicles visiting construction sites will be introduced.

#### Behavioral Operations II

Contributed Session

Chair: Hsuanwei Chen, San Jose State University, One Washington Square, San Jose, CA, 95192, United States

##### 1 - Decision Making under Uncertain Demand and Uncertain Supply

Somak Paul, The Ohio State University, Columbus, OH, 43202, United States, Elliot Bendoly, Nathan C. Craig

There has been little empirical effort to distinguish the implications of demand and supply uncertainty separately on inventory decisions when both are present. In this study we design a controlled laboratory experiment to investigate the impact of demand and supply variability, as well as feedback frequency and experience on the optimality of the inventory decisions made. While we find the impact of demand uncertainty to be in line with standard assumptions, the impact of supply uncertainty appears counter-intuitive. We find that supply variability has a dampening effect on order deviation from the optimal and imposes limits on the extent to which experience benefits optimal ordering choice.

##### 2 - Ordering Behavior in the Beer Game: An Agent-based Simulation Approach

Jaime Andr s Castañeda, Universidad del Rosario, CL 12 C. 6 25, School of Management, Bogotá, 111711, Colombia, John Vargas, Daniel Rodríguez, David Anzola, Nelson Gómez

This study analyzes the bullwhip effect through an agent-based simulation approach. We simulate the Beer Game, where an agent simulates each echelon. The agents place their orders according to Stermann (1989)'s ordering rule. We systematically manipulate the behavioral parameters of the rule across the agents and use clustering techniques to determine what behavioral configurations are beneficial for the supply chain.

##### 3 - How Market Power Impacts Investment in Supply Chain Theory and Experiment

Jingjie Su, University of Texas at Arlington, Box 19437, Arlington, TX, 76019, United States, Kay-Yut Chen

Consider a supply chain network with two players, OEM and CM. They have relationships both as downstream supplier and competitor in the market. Now, when OEM has an option to invest in CM, based on different investment cost and market power, the theory predicts the different decision. Behavior experiment differs.

##### 4 - A Novel Approach to Propensity Score Matching Incohort Construction Forbehavioral Nudging in Health Care

Ryan Croke, Data Scientist, NextHealth Technologies, Denver, CO, 80202, United States

A novel approach to cohort construction in a health care application is presented. Propensity score matching is used as a baseline to construct a control group to a given trial set. The experiment is aimed at illiciting positive health decisions by insured consumers and with large and rich datasets. In an effort to ameliorate the concerns of various researchers a hybrid method is used that optimizes over the member attributes as well as the propensity score.

##### 5 - A Semantic Analysis of Super Bowl Word of Mouth on Tourism Social Media

Hsuanwei Chen, Assistant Professor, San Jose State University, One Washington Square, San Jose, CA, 95192, United States, Yinghua Huang

This study investigates how tourism social media word-of-mouth changes before and after a mega event. Using Super Bowl 2016-2018 as an example, semantic analysis is applied to explore the popular topics among tourists' interactions on Twitter. Specifically, two questions will be answered: 1) what do tourists discuss about Super Bowl and its host destination on Twitter? and 2) how do tourists' topics of interest evolve as the event progresses? The findings will help the destination event planners to better understand tourists' opinions and monitor the issues emerged from the trajectory of the event.

#### 1 - Motivating Employees' Information Security Compliance: Leadership Style or Protection Motivation?

Jiawen Zhu, Xi'an Jiaotong University, Xi'an, China  
Jiawen Zhu, City University of Hong Kong, Hong Kong, China,  
Gengzhong Feng, Kwok Leung Tsui

This study investigates the moderation effect of Paternalistic Leadership on the relationship between Protection Motivation Theory and employees' Information Security Compliance behavior. Using questionnaire data from 760 employees, we found that, Paternalistic Leadership dimensions, Authoritarianism, Benevolence, Morality, dampen the weight of most protection motivation elements to employees' compliance. This suggests that when certain leadership style is salient, employees' protection motivation perceptions, such as threat severity, self-efficacy and maladaptive reward perception, may have no significant influence on employees' information security compliance.

#### 2 - Asymmetric Information Sharing in Information System Security

Yueran Zhuo, University of Massachusetts Amherst, 121 Presidents Drive, Amherst, MA, 01003, United States, Senay Solak

In information security practice, the asymmetry in information sharing levels might hurt the information sharing firms' incentives. A possible solution to the problem is to impose charges on the shared information and treat it as a commodity. In this study we try to answer the questions: What fair price should a firm pay when also sharing a certain level of information? How would the price of information vary as more firms join an information sharing alliance? We develop analytical expressions to identify the pricing of information in an information sharing community with multiple firms and explore the overall benefits to the information sharing community due the implementation of pricing strategies.

#### 3 - Introducing a Predator-prey System with Michaelis-menten Type of Prey and Predator Harvesting Considering Diffusion Terms and Inconstant Carrying Capacity for the Prey

Aram Bahrini, University of Virginia, Thornton Hall,  
P.O. Box 400259, Charlottesville, VA, 22904-4259, United States  
University of British Columbia, 1984 Mathematics Road, UBC,  
Vancouver, BC, V6T1Z2, Canada, Behnam Malmir,  
Mohammad Najjartabar Bisheh

In this paper, we made a modification on the Hu and Cao (2017) model in which in our model the effect of harvesting for the prey is non-zero and considered as a Holling II functional response predator-prey system. In addition, since by changing the reproduction rate, the carrying capacity may change as well, the scenario in which the carrying capacity is considered as unfixed and a function of reproduction rate for the prey is taken into consideration. Additionally, a diffusion term is added to make the model more realistic especially in fishery application. Results show that the model analyzed in this paper can cause more realistic behaviors compared with other presented systems.

#### 4 - Long-term Capacity Planning of a Workforce with Hierarchical Skills and Random Resignations

Christian Ruf, TU München, Arcisstr. 33, Munich, 80333, Germany, Jonathan F. Bard, Rainer Kolisch

We address a multistage capacity planning problem for a hierarchically skilled workforce. Recruits are hired and trained over multiple periods to perform jobs that require ever greater skills. The training comprises a combination of off-the-job and on-the-job elements. Random resignations result in labor shortfalls that jeopardize continuous operations. The problem is modeled as a Markov decision process for which a parameterized decision rule is proposed. To determine good parameter values, we present a very large-scale neighborhood search. Experimental results on real-world industry data is presented.

Sponsored Session

Chair: Taewoo Lee, University of Houston, Houston, TX, 77204-4008, United States

#### 1 - A Two-stage Stochastic Model for the Operating Room Scheduling Problem with Chance Constraints

Amirhossein Najjarbashi, University of Houston, E206 Engineering Bldg 2, 4722 Calhoun Rd, Houston, TX, 77204, United States,  
Gino J. Lim

High variability of surgery durations is a major challenge towards creating practical OR schedules. To address this issue, we proposed a two-stage stochastic model with chance constraints. The first stage makes decisions on OR openings and case assignments to minimize fixed costs. The second stage aims to minimize the expected penalty costs after observing the surgery durations. Chance constraints control the risk of having OR overtimes. A decomposition-based method is developed based on the structure of the model. Coefficient strengthening and bounding are performed to accelerate the solution process. Numerical results show that our algorithm can handle large instances in a timely manner.

#### 2 - Online Scheduling for Outpatients

Kimia Ghobadi, MIT, 100 Main Street, E62-459, Cambridge, MA, 02142, United States, Retsef Levi, Michael Hu

In this talk, we demonstrate the use of real-time algorithms to improve patient care. We discuss resource utilization in infusion clinics. Many outpatient clinics, including infusion clinics, struggle to meet their demand due to crippling congestion in peak hours. At the same time, these clinics are often underutilized at non-peak hours. This underutilization is induced primarily by inappropriate scheduling practices. Therefore, we introduce a new scheduling model and employ real-time algorithms to improve efficiency by allowing the clinics to treat more patients with fewer resources. We show 30% empirical improvement and theoretical worst-case bounds on the performance of the algorithm.

#### 3 - Inferring Objective Functions from Inconsistent Data in Healthcare and Energy Applications

Taewoo Lee, University of Houston, E209 Engineering Bldg 2, 4722 Calhoun Rd, Houston, TX, 77204-4008, United States, Zahed Shahmoradi

Given often inconsistent observations as input data, we develop a new inverse optimization model that determines a set of objective functions of a linear program that render the most relevant subset of the observations near-optimal. We analyze the feasibility and optimality of the nonconvex inverse model and propose an algorithm that finds all inverse-feasible objective functions. Our approach addresses the infeasibility and instability issues of the previous inverse models. We demonstrate the model in the context of multi-objective diet recommendation and electricity demand forecasting.

#### 4 - Data-driven Objective Selection in Multi-objective Optimization

Temitayo Ajayi, Rice University, Houston, TX, 77025, United States, Taewoo Lee, Andrew J. Schaefer

A challenge in radiation therapy treatment planning is selecting which clinical objectives to use in the optimization. We propose an inverse optimization method with a cardinality constraint to infer the most important objectives from historical treatment plans. We use a greedy algorithm to select objectives and provide theory, a generalization of a result by Nemhauser (1978), to support our results. We compare the proposed method to the cardinality-constrained inverse problem and show that our method efficiently finds a small number of objectives that generates clinically acceptable treatment plans.

Chair: Jian Li, Northeastern Illinois University, 5500 N. St Louis Avenue, Chicago, IL, 60625, United States

#### 1 - Supplier Development and Learning Spillover in a Triadic Supply Chain under Competition

Abhishek Srivastava, Doctoral Student, Indian Institute of Management Kozhikode, IIMK PO Kunnammangalam, Kozhikode, 673570, India, Arqum Mateen

We model a triadic supply chain in which two competing asymmetric buyers source from common supplier, invest in supplier development to improve profits. Buyers may benefit from each other's investment equally (uniform spillover; US) or unequally (differential spillover; DS). The supplier offers a uniform wholesale price (UWP) and buyer-specific wholesale price (BWSP). Our results indicate that optimal wholesale price increases with market share, intensity of competition, spillover effect. UWP under US works against the larger buyer, who consequently prefers a DS structure. We establish that both the buyers prefer investment under DS structure for higher values of competition and spillover.

#### 2 - A Study on Logistics Companies' Financial and Supply Chain Performance

Hossein Najmi, University of North Texas, 1307 W. Highland Street, Denton, TX, 76201, United States, Seock Hong

Financial performance indicators (FPIs) are long used to find supply chain excellence. But examining FPIs specific to a sector is understudied. To address this gap, we applied discriminant analysis, logistic regression, and MANOVA to analyze 103 logistics companies. We found the FPIs that measure the performance of logistics companies supply chain and differences among industries.

### 3 - Rush Purchasing for Hoarding during Natural Hazards – An Empirical Study in Agricultural Products Supply Chain

Hsintsz Kuo, National Taiwan University, New Taipei, 24943, Taiwan, Jiuh-Biing Sheu

Disruption management is the important part in the recovery process. This paper proposes a research model to investigate the causal relationships among internal influence and external influence, rush purchasing behavior and its antecedents after huge natural hazards. We argue that the emotional contagions can moderate the relationship among rush purchasing behavior and psychological response after a huge natural hazard.

### 4 - A Baseline Approach to Supply Chain Risk Assessment

João Dias da Silva, PhD Researcher, University of Porto, Porto, 4149-002, Portugal, Alcib ades Guedes

Over the past decades, global manufacturing and logistics networks have attained unprecedented levels of complexity, with supply chains becoming ever more prone to operational disruptions of unforeseen causes and consequences. This research project takes a fresh look at fundamental supply chain risk definitions and determinants, and proposes a new generic, coherent, repeatable and primarily intrinsic methodology to measure and rate the propensity for operational disruptions in supply chain systems. The rationale of the construct, some implementation examples, the relevance for theory and practice, as well as some anticipated limitations and potential improvements are discussed.

### 6 - Commodity Farming in Developing Countries with an Application to the Cotton Supply Chain in Mozambique

Jian Li, Northeastern Illinois University, 5500 N. St Louis Avenue, Chicago, IL, 60625, United States, Maqbool Dada, Panos Kouvelis

We develop a model of cotton supply chains in which two farmers, who are supported by two ginners, make two types of fundamental decisions under yield uncertainty: how much land to allocate to cotton production before the start of the growing season, and, the pricing rules followed by ginners that purchase the cotton harvest. The focus of the study is on characterizing the optimal decisions and the impact of a government-specified minimum price.

#### 1 - Studying the Efficiency Limit of Ride Sharing

Mustafa Lokhandwala, PhD Candidate, Purdue University, West Lafayette, IN, 47906, United States, Hua Cai

Dynamic ride sharing offers passengers a facility to share a ride with others with the flexibility of choosing their own pick up and drop off locations while increasing the occupancy of vehicles up to a certain limit. We study this efficiency limit of ride sharing in autonomous electric vehicles using an agent-based model. Preliminary results have indicated that during peak hours, about 30% of the vehicles are available to accept new shares, but an approximately equal number of vehicles do not accept new shares. The most common reason (about 80%) that a taxi does not search for new shares has been found to be the tolerance limit of the rider to deviate from his route.

#### 2 - Dynamic Origin Destination Estimation Based on Time Delay Correlation Among Zonal Location-based Social Network Check-in Data

Jing Jin, Assistant Professor, Rutgers, The State University of New Jersey, CORE 613, 96 Frelinghuysen Rd., Piscataway, NJ, 08854, United States, Wangsu Hu

Location-based Social Network (LBSN) services allow users to confirm their current locations by “check-in with places of interests. Through analyzing the check-in arrival sequences, LBSN data can identify and quantify the spatial-temporal correlation of travel demand between pairwise zones to generate the dynamic Origin-Destination (OD) flow matrix. Empirical insights can be obtained by analyzing the predicted dynamic OD flow patterns for different land use types, day-of-week, and time-of-day periods.

#### 1 - Algorithms for the Upper Bound Mean Waiting Time in the Single-server Queue

Yan Chen, Columbia University, New York, NY, 10027, United States, Ward Whitt

Effective algorithms are developed to compute the tight upper bound of the mean steady-state waiting time in the GI/GI/1 queue given the first two moments of the interarrival-time and service-time distributions. A key step is to exploit the Marshall (1968) representation of the mean waiting time in terms of the idle-time distribution, which is insensitive to the rare event of the large service time. The algorithms are aided by reductions of these special queues to D/GI/1 and GI/D/1 models. One numerical algorithm exploits a negative binomial recursive formula, while another exploits a discrete-time Markov chain recursion. The computational efficiency for different methods is compared.

#### 2 - Baum Welch Method with Limiting Distribution Constraints

Daniel Waymouth Steeneck, Air Force Institute of Technology, Wright-Patterson AFB, OH, United States, Fredrik Eng Larsson

Training hidden Markov models (HMMs) is traditionally done using the Baum-Welch algorithm. However, in many cases, limiting distribution information is known about the hidden states via infrequent and expensive tests. Exploiting this information, we show how to modify the Baum-Welch algorithm to obtain a more accurate estimate for an HMM's transition matrix.

#### 3 - Robust Estimation of Controlled Hawkes Process

Michael Mark, PhD Candidate, EPFL, Route Cantonale, Lausanne, 1015, Switzerland, Thomas A. Weber

The identification of Hawkes-like processes can pose significant challenges. This applies even in a linear setting, as in an established model for the repayment arrivals of delinquent credit-card accounts where a bank controls the payment-arrival intensity using suitable account-treatment actions. Despite substantial amounts of data, standard estimation methods show significant bias or entirely fail to converge. To overcome these issues, we propose an alternative method based on expectation-maximization algorithm, that exploits the natural internal branching-structure of the process, thus providing additional information to the estimator.

#### 4 - Unsupervised Modeling and its Effectiveness for Fault Detection in Lacking Labeled Data

Hyunseop Park, PhD Candidate, Pohang University of Science and Technology, 77 Cheongam-Ro, Pohang, 37673, Korea, Republic of, Junhyuk Choi, Youngho Cho, Hyunbo Cho, JaeHyuk Kim

Fault detection in advance can reduce production losses due to equipment failure and unplanned stoppage. However, development of a supervised prediction model to detect faults is hindered by a lack of labeled data. Here, we present several unsupervised modeling methods for fault detection in cases that lack labeled data. The accuracy and computational time of the proposed modeling methods will be detailed and illustrated for various application conditions. Experimental results show that the unsupervised modeling methods yield significant accuracy when application conditions are considered.

#### 5 - Product Stage Analysis with Growth Curve Models

Yasin Unlu, Senior Operations Research Scientist, LLamasoft Inc, McKinley Towne Center, Ann Arbor, MI, 48104, United States

A typical product usually goes through different stages during its existence in the market; namely, launch (born), growth, maturity, decline and obsolescence. The duration of each stage is often of interest for making short or longer managerial decisions in an organization. We use s-shape growth models to predict the duration of each stage; namely, Logistics, Modified Logistic, Richards, Gompertz, Bass and Monomolecular as well as a tournament of these 6 models to provide the best modeling option. In order to improve the accuracy of predictions, we present different strategies for the parameter estimations of these models.

Sponsored Session

Chair: Babak Zafari, Babson College, Babson Hall 218C, Babson Park, MA, 02457, United States

**1 - Text Mining Analysis of Business Data Analytics and Data Science Jobs Requirements**

Zinovy Radovitsky, Professor, California State University-East Bay, 25800 Carlos Bee Boulevard, Hayward, CA, 94506, United States, Vishwanath Hegde, Anuja Acharya, Uma Uma

We identify and compare knowledge and skills for business data analytics (BDA) and data science (DS) professions. We collected primary BDA and DS job posting data from online job-related websites, developed document data matrix, and applied text mining analysis including singular vector decomposition, VARIMAX rotation, and latent class analysis. Based on this text mining analysis, we identified main similarities of and important differences between the BDA and DS job requirements. These results provide vital insights for designing curriculum and training in the evolving BDA and DS areas, and also enable professional to sharpen their skills aligned with job market requirements.

**2 - Deception or Truth? The Impact of Linguistic Cues to Fraud on Capital-giving Willingness: Evidence from Crowdfunding Market**

Xicheng Yin, Tongji University, Shanghai, China, Wei Wang, Kevin Zhu, Hongwei Wang, Pei Yin, Wei Chen

We adopt the following indicators to measure the linguistic cues to fraud: Cognitive Load, Internal Imagination, Dissociation, Negative Emotion, Lexical Diversity, Lexical Ease of Read, Lexical Complexity and New Word Ratio as well. Locational prepositions and temporal prepositions in reward statement, non-first-person prepositions in blurb and reward statement, and cohesion in project description normally result in successful campaigns. The concreteness of blurb and detailed description makes the project look like a deception. We provide a method to detect linguistic cues to fraud on crowdfunding campaigns and provide suggestions to project founders to better describe their projects.

**3 - Knowledge Mining in Scientific Literature for Complex Social Problems: An Example using Multi-stakeholder Performance Management**

Victor Zitian Chen, University of North Carolina, Charlotte, NC, United States, Reza Mousavi, Wlodek Zadrozny

The volume of scientific publications and the degree of knowledge fragmentation creates information overload problems and makes knowledge synthesis for solving complex social problems exceedingly difficult. Built on text mining techniques and keyword dictionaries, we develop a literature review algorithm to automate the search, comparing, and grouping of predictors of corporate performance measures from multiple stakeholders' perspectives (customers, employees, societies, and investors).

**4 - Expanding a Theoretical Model with Survey Simulations**

Seyede Yasaman Amirikiaee, PhD Candidate and Teaching Fellow, University of North Texas, 1307 West Highland Street, BLB 357D, Denton, TX, 76201, United States, Nicholas Evangelopoulos

Traditional survey design involves iterations of instrument development steps that include assessments of item reliability, and construct convergent and discriminant validity. These iterations are time consuming and tend to overuse human subjects. In an effort to economize on these resources, this research uses traditional survey methods to fit a theoretical model for the intention to ride a self-driving vehicle, and then expands the model to include additional constructs by performing survey simulations that do not involve human participants.

**5 - Topic Modelling for Medical Prescription Fraud and Abuse Detection**

Babak Zafari, Babson College, Babson Hall 218C, Babson Park, MA, 02457, United States, Tahir Ekin

Medical prescription fraud and abuse has been a pressing issue in the U.S. resulting in large financial losses and adverse effects on human health. In this work, we use the real world Medicare Part D prescription data to analyze prescriber-drug associations. In particular, we propose the use of topic models to group drugs with respect to the billing patterns and exhibit the potential aberrant behaviors. The prescription patterns of the providers are retrieved with an emphasis on opioids, and aggregated into distance based measures which are visualized by concentration functions. This output can enable medical auditors to identify leads for audits of medical providers.

Chair: Bhupesh Shetty, University of Iowa, Iowa City, IA, 07030, United States

**1 - Real-time Data-driven Monitoring for High Dimensional Multistage Manufacturing Process**

Mohammadhossein Amini, PhD Candidate, Kansas State University, 2061 Rathbone Hall 1701B Platt St, Manhattan, KS, 66506, United States

Today's manufacturing processes are much more complex including multiple stages, and sensors are embedded throughout the processes that generate a huge amount of data in high dimensions. However, current quality engineering practices still do not efficiently use the generated data. This study aims to develop predictive models using machines production data to monitor the high dimensional multistage process in real-time.

**2 - Dual Response Surface Optimization of One Side Single Quality Characteristic Using the CPK Process Indicator Index**

Michael Bendersky, Ben Gurion University of the Negev, Beersheba, Israel

Dual Response Surface methodology is a powerful tool for simultaneously optimizing the mean and the variance of a quality characteristic in the field of quality engineering. The optimization of dual response systems in order to achieve better quality has played a major role in the design of industrial products and processes. In this work we derive a new method to optimize the mean and variance of a product or process defined by a single quality characteristic and has a one sided specification limit. For this aim, we suggest the usage of the process capability index as the objective function to find the optimal values of the control variables thus allowing to maximize the yield of the process.

**3 - An Image Based Multivariate EWMA Control Chart with PCA for Faults Detection under Multiple Capturing Settings**

Shengfeng Chen, Western Michigan University, Kalamazoo, MI, 49008, United States, Lee Wells

Machine vision systems are increasingly being used in manufacturing shop floor in product quality control. Our approach extends the current research that use only one image capturing setting for fault detection. As image quality can be affected by light intensity, color and glare, we propose multiple capturing settings for better fault detection. In addition, the use of a multivariate EWMA for monitoring industrial products in conjunction with PCA analysis are used to deal with the increased data dimensions. Extensive computer simulations show that the proposed multiple capturing settings outperform the single capturing setting with greater in-control and out-of-control ratios.

**4 - Identifying Sources of Assignable Error via Process Pattern Mining**

Bhupesh Shetty, PhD Student, University of Iowa, Iowa City, IA, 52245, United States, Nick Street, Jeffrey W. Ohlmann

We explore the problem of identifying the root cause of product defects using event logs in a manufacturing process. We use a pattern mining algorithm based on Apriori to identify frequent patterns, and use binary correlation measures to identify patterns associated with elevated error rate. We design a simulation model to generate synthetic datasets to test our algorithm. We compare the effectiveness of different correlation measures, target pattern complexities, and sample sizes with and without knowledge of the underlying process. We show that knowledge of the underlying process helps in identifying the pattern that is associated with defects.

**1 - A New Integer Programming Formulation and Refined Social Choice Property for Expediting the Solution to the Consensus Ranking Problem**

Yeawon Yoo, Arizona State University, Tempe, AZ, United States, Adolfo Raphael Escobedo

We introduce an integer programming formulation for ranking aggregation with ties and compare it to a modified version of a recently developed formulation. This new formulation provides computational advantages when solving large size problems. Moreover, we develop a refined social-choice related property for group decision-making, called the Generalized Condorcet Criterion, which can be regarded as a natural extension of the Condorcet criterion. Unlike its parent properties, it is adequate for complete rankings with ties as well as for incomplete rankings. It allows us to simplify the solution process for certain types of very large instances of the NP-hard ranking aggregation problem.

**2 - Rank Aggregation New Bounds for MCx**

Daniel Freund, Cornell University, 109 Lake St, Ithaca, NY, 14850, United States, David P. Williamson

Rank aggregation is a fundamental problem in combinatorial optimization: for a set of input rankings the goal is to find a ranking that minimizes the average Kendall tau distance to the input rankings. Proposed by Dwork et al. for metasearch engines, its applications today range far beyond the original aim to problems in ML, recommendation systems and more. Though several algorithms, including a PTAS, have been proposed for these problems, it is known that some Markov chain based algorithms perform extremely well in practice. In this talk we, somewhat surprisingly, prove supra-constant lower bounds on approximation guarantees for all of them.

**3 - Joint Aggregation of Cardinal and Ordinal Evaluations**

Adolfo Raphael Escobedo, Arizona State University, P.O. Box 878809, Tempe, AZ, 85287-8809, United States, Dorit Simona Hochbaum, Erick Moreno-Centeno

An important problem in decision theory concerns the aggregation of individual cardinal and ordinal evaluations (ratings and rankings). We illustrate a new aggregation framework in the context of the 2007 MSOM's student paper competition, which posed two unique challenges: (1) each paper was reviewed by relatively few judges, heightening the potential influence of subjective scales; (2) each judge submitted both cardinal and ordinal evaluations of their assigned papers. To address these challenges, we employ axiomatic distances and derive new non-convex exact formulations and convex relaxations. The solution methodologies are further tested and analyzed via randomly generated instances.

**4 - Elaborating or Aggregating? The Joint Effects of Group Decision-making Structure and Systematic Errors on the Value of Group Interactions**

Wenjie Tang, NUS Business School, 15 Kent Ridge Dr, Singapore, 119245, Singapore, Steffen Keck

We explore when group interactions will have a positive effect on the accuracy of quantitative judgments. The results from two laboratory experiments revealed that compared to a statistical aggregation of individual judgments, group interactions only provide values when the level of systematic error is high and when there is a designated group leader. Moreover, our analysis showed that this effect was mediated by information elaboration which was generally higher in leader groups but only had a significant effect on the value of group interactions when there was a high level of systematic error among group members, and not otherwise.

**1 - A Cross-study Analysis for Reproducible Sub-classification of Mild Traumatic Brain Injury**

Bing Si, Arizona State University, Mesa, AZ, 85201, United States

The current stratification of traumatic brain injury (TBI) into "mild", "moderate", or "severe" does not adequately account for the patient heterogeneity. The

objective of this study was to identify reproducible clusters of mild TBI patients based on rich data available at the time of the initial post-TBI patient evaluation. A sparse hierarchical clustering is applied to simultaneously select informative variables and identify underlying clusters with selected variables. Two independent datasets were utilized. Clusters found in one dataset are tried to be reproduced in another dataset. Reproducible clusters with different patient outcomes could be used to guide mTBI patient prognosis.

**2 - Recent Advances in Calibration of Computer Models**

Rui Tuo, Atlanta, GA, 30318, United States

In this talk I will show some recent advances in calibration for computer models and an application example. The goal of calibration is to identify the model parameters in deterministic computer experiments, which cannot be measured or are not available in physical experiments. In a study of the prevailing Bayesian method we find that this method may render unreasonable estimation for the calibration parameters. Inspired by a new advance in Gaussian process modeling, called orthogonal Gaussian process models, I have proposed a novel methodology for calibration. This new method is proven to enjoy nice properties.

**3 - Modeling and Change Detection for Count-weighted Multi-layer Networks**

Hang Dong, Tsinghua University, Beijing, 100084, China, Nan Chen, Kaibo Wang

In a typical network with a set of individuals, it is common to have multiple types of interactions between two individuals. In practice, these interactions are usually sparse and correlated, which is not sufficiently accounted for in the literature. This work proposes a multi-layer weighted stochastic block model (MZIP-SBM) to characterize the sparse and correlated interactions of individuals among different layers. A variational-EM algorithm is developed in order to estimate the parameters in this model. We further propose a monitoring statistic based on the score test of model parameters for change detection in multi-layer networks and evaluate the performance of this method.

**4 - An Effective and Efficient Algorithm for Moving Targets Detection and Tracking with a Moving Camera**

Yinwei Zhang, University of Arizona, Tucson, AZ, United States, Young-Jun Son, Jian Liu

Detecting and tracking moving targets with video surveillance systems is challenging, especially when using a moving camera. Conventional algorithms using projective transformation and frame differencing are inaccurate and slow. A new algorithm that combines a type of optical flow and color features is proposed to improve both detection accuracy and tracking speed. Case studies of a variety of complex scenarios were conducted to demonstrate its effectiveness and efficiency.

**1 - A Mechanism Design Approach to Blockchain Protocols**

Hong Wan, Purdue University, West Lafayette, IN, 47907, United States, Abhishek Ray, Mario Ventresca, Xinqi Gao

Blockchain-based systems such as cryptocurrencies are achieving widespread usage, with a market capitalization of \$150B as of September 2017. However, the most prominent platforms that account for over 70% of this market - Bitcoin & Ethereum - are exhibiting increasingly lower levels of decentralization. This poses the problem of concentrating levers of consensus to a select group of agents in the system. Essentially, centralization in a system designed to be decentralized can lead to security threats such as 51% attack. In this paper, we demonstrate the use of game theory and mechanism design to find ways of solving the problem of centralization in blockchain systems. Since decentralization vs centralization is related to non-cooperative vs. cooperative behavior, using simple models based on non-cooperative and cooperative game theory we propose a way of designing payoffs in order to disincentivize certain exhibited behaviors and incentivize desired behaviors of miners or validators in such systems.

### 3 - BitExTract: Interactive Visualization for Extracting Bitcoin Exchange Intelligence

Siyuan Liu, Pennsylvania State University, University Park, PA, United States

The emerging prosperity of cryptocurrencies, for example, Bitcoin, has come into the spotlight during the past few years. In this paper, we present BitExTract, an interactive visual analytics system, which, to the best of our knowledge, is the first attempt to explore the evolutionary transaction patterns of Bitcoin exchanges from two perspectives, namely, exchange versus exchange and exchange versus client. The effectiveness and usability of BitExTract are demonstrated through three case studies with novel insights and further interviews with domain experts and senior Bitcoin practitioners.

Chair: Hiroko Okajima, Towson University, 8000 York Road, Towson, MD, 21252-0001, United States

#### 1 - On the Consistency and Computation of Maximum Likelihood Estimators for Multivariate Hawkes Processes

Anran Hu, PhD Student, UC Berkeley, Albany, CA, 94706, United States, Xin Guo, Renyuan Xu, Junzi Zhang

We establish the first consistency result for the maximum likelihood estimators (MLEs) of multivariate Hawkes processes (MHPs) with general linear intensity processes, under mild and verifiable conditions. We also develop an alternating minimization type algorithm with guaranteed global convergence to the set of critical/stationary points. The performance of the proposed algorithm on both synthetic and real-world data is reported, showing the advantage of our approach.

#### 2 - Balance Optimization Subset Selection with Multiple Treatment Levels

Hee Youn Kwon, Northwestern University, 2211 Campus Drive, Evanston, IL, 60208, United States, Jason J. Sauppe, Sheldon H. Jacobson

Matching and Balance Optimization Subset Selection (BOSS) are two frameworks for causal inference with observational data. These methods find an estimate for the treatment effect either by matching each treatment unit to a control unit or by finding a control group that is balanced with respect to the treatment group. However, when there are multiple - more than two - treatment levels, methods of comparing two levels are not directly applicable. The goal of this talk is to generalize the BOSS framework which was developed under a binary treatment setting to a multi-treatment setting. The BOSS estimator is computationally compared to the matching estimators.

#### 3 - A Balancing Block Based Formulation for the Police Districting Problem: The Case of Antofagasta Police Department

Evelyn Arrey, Universidad Catolica del Norte, Avenida Angamos 0610, Building Y1, Antofagasta, Chile, Hernan Caceres

Preventive security is one of the most critical social priorities of a community, for which a typical strategy is to design patrol areas. Such designs consist on dividing a city according to one or several features of its neighborhoods, that are area-based indicators in most cases. In this work, we propose a mixed integer program that splits an urban area by balancing a cumulative block-based indicator among a given number of sub-divisions. For our numerical example, we present a case study of the Police Department of Antofagasta, Chile. We compare our results with the division that the city currently uses, that is based on the nation-wide program Quadrant Plan.

#### 4 - Can Group Giving Boost Contribution?

Hiroko Okajima, Assistant Professor, Towson University, 8000 York Road, Towson, MD, 21252-0001, United States

Group giving (collective giving) has been gaining popularity in practice, but little has been studied in literature. This study supplements the existing literature by providing empirical results on group giving. Our laboratory experiment reveals that group giving is especially effective in increasing giving rates when it is used in combination with stepwise rebates.

### Combinatorial Optimization over Graphs

Sponsored: Computing

Sponsored Session

Chair: Illya V. Hicks, Rice University, Houston, TX, 77005-1892, United States

#### 1 - Catching a Robber Quickly with Few Cops

Boris Brimkov, Rice University

Cops and Robbers is a pursuit-evasion game played on a graph, between a team of cops and a single robber. The cops and the robber take turns moving to adjacent vertices; the goal for the cops is to capture the robber by occupying the same vertex as the robber, and the goal of the robber is to avoid capture. We consider the cop-throttling number of a graph  $G$ , which is defined as the minimum possible value of  $(k + \text{the minimum number of turns needed for } k \text{ cops to capture the robber on } G \text{ over all possible games})$ . This talk will provide some tools for computing and bounding the cop-throttling number, and relate it to other graph parameters.

#### 2 - SAT and SMT Encodings of the Zero Forcing Problem

Derek Mikesell, Rice University, Houston, TN, United States

Zero forcing is an iterative graph coloring process in which a colored vertex forces a neighboring vertex to be colored if it is the only uncolored vertex in its neighborhood. The Zero Forcing Problem asks for the smallest set of initially colored vertices such that the entire graph becomes colored under this rule. In this work, computational methods are proposed for the Zero Forcing Problem and related variants. The methods are based on a Boolean Satisfiability and Satisfiability Modulo Theories encoding of an infection model. The methods yield competitive results to state-of-the-art integer programming and combinatorial algorithms.

#### 3 - A Set Cover Formulation for Power Domination in Graphs

Logan Smith, Rice University, Houston, TX, United States

To observe electrical networks, sensors are installed at power substations. Sensors directly observe adjacent substations and may indirectly observe others. In graphs representing power grids, vertices corresponding to substations with sensors are initially colored; the power domination color rule indicates which substations are observable. Previous computational methods rely on modeling the coloring rules and vertex coloring sequences. Here, an alternative exploiting graph structures that prevent colorings is introduced. Unlike previous work, this approach permits a separation algorithm. Computational experiments show significant runtime improvement for the proposed algorithm.

#### 1 - Supply Network Effects on the Scalability of Online Grocery Retail Platforms

Lina Wang, Student, Arizona State University, Tempe, AZ, 85257, United States, Timothy Richards, Elliot Rabinovich

A grocery retail platform acts as a two-sided market connecting consumers and suppliers. Its scalability depends on the type and the number of vendors participating in the platform. We study empirically indirect network effects on scalability in one of these platforms. Whether these effects are positive will depend on the impact that the number and types of vendors participating in the platform have on consumers' demand. Results obtained from a consumer demand model and a supply provision equilibrium model confirm the existence of a positive indirect network effect on the scalability of these platforms.

#### 2 - Keep the Buzz and Binge on Optimal Content Release Strategies

Clint Ho, Imperial College Business School, London, SW2 7AZ, United Kingdom, Esma Koca, Wolfram Wiesemann

Video-on-demand platforms unveiled a game-changing media consumption phenomenon, binge-watching, with the release of all episodes of series at once (entire season at once policy) and hence generate a binge-watching driven buzz among viewers. As opposed to this, traditional strategy (episodic release strategy) creates a viewer-generated chatter around the story, commonly called as the water-cooler effect. We argue that a hybrid and a personalized strategy may activate both levers and investigate three aspects of the optimal content release: (1) optimal release of a series, (2) optimal order of multiple series, and (3) discrimination on the content across heterogeneous viewers.

### 3 - Entry of Pseudo Sharing

Siyi Wang, University of Science & Technology of China, Hefei, China

Pseudo sharing—the phenomenon of professional agents participating in the sharing market—has caused a huge uproar among the affected traditional markets and governments. It exists in different sharing platforms that involved in different mechanisms. We develop a game-theoretic model to exam the sharing platforms' interaction with pseudo sharers, as well as the genuine one. Our equilibrium results suggest that, to some extent at least, it enhances the matching rate when the clutter of genuine sharing supply and demand caused most occasional transaction failed.

### 4 - When Should Retailers Integrate Online and Offline Channels Under Competition?

Jinpeng Xu, Xidian University, School of Economics and Management, Xi'an, 710126, China, Yufei Huang

This paper considers two multichannel retailers selling a product to consumers with different channel preferences. Retailers can choose to operate their online and offline channels separately, with different prices and unit costs in different channels. They can also choose to integrate the two channels, thereby achieving the same price and unit cost in different channels. We use a game-theoretical model to study when one or two retailers should integrate their channels in competition.

### 5 - Product Quality Decision and Return Channel Choice with Uncertain Demand

Buqing Ma, Doctor Student, University of Science and Technology of China, Baohe District, hefei, Anhui province, China, Hefei, 230035, China, Yunchuan Liu

The practice of accepting product returns from consumers directly is understudied in previous literature where consumers return products to manufacturers through retailers. In this paper, we study a manufacturer's return channel choice and product quality decision with demand uncertainty, and find some interesting relationship between product qualities, return channel choice, and demand uncertainty.

#### 1 - Minimizing Robotic Arm Travelling Distance for LED Sorting Problem

Jo-Ying Chang, National Chiao Tung University, 1001 University Road, Hsinchu, 300, Taiwan, Lo-Min Su, Sheng-I Chen

The LED sorting problem is to determine a sequence to transfer dies from a wafer to bins in different quality levels. The objective is to minimize traveling distance of a robotic arm that is used for classifying LED dies. This problem can be seen as the hierarchical travelling salesman problem. We propose a two-stage algorithm, where the sequence of picking same quality level dies is solved in the first stage, and the shortest distance to connect adjacent tours is determined in the second stage. The results demonstrate the capable of the proposed algorithm to solved real-world cases.

#### 2 - Modeling and Solving LED Dies Picking Problems

Sheng I. Chen, National Chiao Tung University, 1001 University Road, HsinChu, 30010, Taiwan, W.L. Pearn, Yen Che Tseng, Wei Ting Hsu

We consider LED dies picking problem as a graph representation, where each die refers to a node and the objective is to find a shortest walk covered all nodes in a fully connected graph. To reduce the problem size, we transform adjacent nodes located at the same column as a required arc and each pair of vertexes connected two different columns as a non-required arc. The optimization problem is formulated as a rural postman problem (RPP). We propose an algorithm for solving the RPP. Computational results compare both exact and approximate solutions using general die distributions.

#### 3 - On Mathematical Models of Optimal Video Memory Design

Yiwen Xu, Assistant Professor, North Dakota State University, 1410 14th Avenue North, Room 202 Civil & Industrial Engineering, Fargo, ND, 58102, United States

The big video data size today imposes huge pressure on storage. Designing memory is a challenging problem due to design constraints, multiple memory bitcell design options, and layout integration under different memory technologies. We develop mathematical models for optimizing embedded video memory design without applying a traditional time-consuming and laborious ASIC design process. The problems are formulated as nonlinear programs and integer linear programs. Different SRAM designs and hybrid SRAM and DRAM designs are considered in our models. The numerical studies show that by applying our proposed method the average mean square error of the video storage can be greatly reduced.

#### 4 - A Branch-and-price Algorithm for Solving Multi-site Production Planning Problem in TFT-LCD Manufacturing

Yen-Che Tseng, National Chiao Tung University, Hsinchu, Taiwan, Hsin-Lan Tseng, Sheng-I Chen

We study the production planning problem with multiple products and multiple plants for a TFT-LCD manufacturer. A MIP model is formulated to determine production quantity at each plant with the considerations of inventory, capacity, and materials. This problem can be viewed as an extension of generalized assignment problem (GAP), where each customer order corresponds to a task and each factory refers to an agent of a typical GAP problem. A branch-and-price algorithm is implemented for solving large-scale problem instances. We develop a parallel computational framework for solving pricing problems, as well as discover dominance relations between scenarios to enhance runtime.

#### 5 - A Parallel Search Algorithm for Solving LED Sorter Scheduling Problem

Wei-Ting Hsu, National Chiao Tung University, Hsinchu, Taiwan, Chang-Feng Li, Sheng-I Chen

This study considers the assignment of wafers to identical machines in LED sorting. A mixed integer programming (MIP) model is presented with the objective to minimize the completion time of sorting and merging processes. We reformulate the MIP as upper-bound feasibility problems and each feasibility problem is evaluated using a parallel environment. To enhance run time, we further propose a hybrid method including reducing the problem size by predetermining decision variables, recovering infeasibility, and applying valid inequalities. Finally, a bi-sectional search scheme is adapted for exploring problem instances that exceeded the runtime limit.

#### 6 - Queue Time Simulation

Maryam Anvar, Industrial Engineer, Applied Materials, Santa Clara, CA, United States

A typical wafer process flow contains up to 1,000 individual steps. Some of these steps have time-sensitive processes which limit the queue time between consecutive operations. Wafers that exceed the time limit will either be scrapped or will experience significant yield loss. In this paper, we use a series of simulation experiments to study the effects of these time limits on wafer scraps and tool capacity to understand and quantify the relationship between tool capacity, lot cycle times through these steps, and the associated rate of time limit violations.

#### 1 - Building Total Cost of Ownership Model for Power Battery Consumer

Chunyan Duan, Tongji University, Room 1114, Tongji Building A, Siping Road 1500, Shanghai, 200092, China  
Chunyan Duan, University of Arkansas, Fayetteville, AR, 72701, United States, Jianxin You, Hu-Chen Liu, Luning Shao, Mengmeng Shan

Power battery's economic performance is the main influence on the economic performance of the electric vehicle. We are modeling power battery consumer's total cost ownership by applying the mathematical modeling method, and exploring the factors of the power battery consumer's total cost ownership and its relationship between these factors under the fast charging mode and the slow charging mode.

#### 2 - Continuous-time Principal-agent Model in Regulating Disruptive Technology

Qi Luo, University of Michigan-Ann Arbor, Ann Arbor, MI, 48109, United States, Romesh Saigal, Zhibin Chen

Innovative technologies can achieve a faster penetration and therefore disrupt an existing market. For example, self-driving technology may have massive impact on the transportation network, and consequently the government needs to regulate the market by financial subsidies. We study the decentralized decision-making problem as a principal-agent model in continuous time. The market dynamics is described by the diffusion of innovation and the problem can be converted to solving a Hamilton-Jacobi-Bellman (HJB) equation. Similar applications include the regulations of new drugs, electric vehicles and wireless networks.

**3 - Dynamic Tracking of Software Errors: A Big Data Approach**

John G. Wilson, Professor, Ivey Business School, 1255 Western Road, London, ON, N6G 0N1, Canada, Dov Te'eni

In the internet age, a proliferation of services appear on the web. Errors in using the internet service or app are dynamically introduced as new devices/interfaces/software are produced. The number of users who can detect various errors changes dynamically. Allowing new users and errors to enter dynamically poses considerable modeling and estimation difficulties. In the era of Big Data, methods for dynamically updating as new observations arise are important. We provide a general model that allows for a procedure for finding maximum likelihood estimators of key parameters where the number of errors and the number of users can change.

**4 - Aggregate Production Planning in Stochastic Manufacturing Systems: A Simulation Study**

Gerd J. Hahn, Professor, German Graduate School of Management and Law, Bildungscampus 2, Heilbronn, 74076, Germany

This paper studies the issue of integrated capacity and batch planning in stochastic manufacturing systems. Classical mathematical programming-based approaches to production planning typically omit the impact of variability on the performance of manufacturing systems. Therefore, a hierarchical planning approach is presented that integrates a queuing network model to anticipate the stochastic behavior of the manufacturing system. A simulation study is conducted to show the benefit of this approach using a real-life case example.

**5 - A Queueing System with Disaster Events under Different Policies**

George C. Mytalas, CUNY, New York, NY, 11209, United States

We consider an M/G/1 queueing system with batch arrivals subject to disasters and server breakdowns under N-policy. The server is turned off as soon as the system empties. When the queue length reaches or exceeds a value N (threshold), the server is turned on and begins to serve the customers. When a disaster occurs the system is cleared of all customers and the server initiates a repair period. During the repair period arriving batches of customers accumulate in the queue without receiving service. Besides, the server has an exponential lifetime in addition to the catastrophe process.

**1 - Food Aid Modality Selection Problem**

Feyza Guliz Sahinyazan, McGill University, Desautels Faculty of Management, Bronfman Building, 1001 Rue Sherbrooke O, Montreal, QC, H3A 1G5, Canada, Marie-Eve Rancourt, Vedat Verter

Delivering food aid to rural areas requires significant operational effort by the aid agencies. Empirical evidence shows that implementing cash and voucher programs can decrease the logistics costs, improve the nutritional outcomes, and contribute to the local economy. In this paper, we develop a model that selects the aid modality by measuring the improvements in these three program objectives. We also incorporate the consumption behaviour of the beneficiaries in a bilevel optimization model structure to capture their cash spending preferences and solve the problem for Garissa county of Kenya.

**2 - Allocation of Nonprofits' Funds among Program, Fundraising, and Administration**

Telesilla Olympia Kotsi, Bloomington, IN, 47401, United States, Goker Aydin, Alfonso J. Pedraza-Martinez

Nonprofits allocate their budget among three types of expenses: program spending to deliver services to beneficiaries; fundraising spending to raise donations; and administration spending to build infrastructure. We analyze how a nonprofit can balance the immediate reward of program spending versus the future reward of fundraising and administration spending. We determine when program spending becomes relatively more attractive, perhaps at the expense of fundraising and administration spending, and vice versa. Our case study uses IRS data to show that budget allocation decisions reflect nonprofits' choices about the most appropriate type of assistance to help beneficiaries.
